- a. develop, implement, and enforce a program to reduce pollutants in any storm water runoff to your small MS4 from construction activities that result in a land disturbance of greater than or equal to one acre. Reduction of storm water discharges from construction activity disturbing less than one acre must be included in your program if that construction activity is part of a larger common plan of development or sale that would disturb one acre or more or has been designated by the permitting authority.

Your program must include the development and implementation of, at a minimum:

- i. an ordinance or other regulatory mechanism to require erosion and sediment controls, as well as sanctions to ensure compliance, to the extent allowable under state or local law;
- ii. requirements for construction site operators to implement appropriate erosion and sediment control best management practices;
- iii. requirements for construction site operators to control waste such as discarded building materials, concrete truck washout, chemicals, litter, and sanitary waste at the construction site that may cause adverse impacts to water quality;
- iv. require all regulated construction sites to have a storm water pollution prevention plan that meets the requirements of Part IV of NPDES permit No. ILR10 including management practices, controls, and other provisions at least as protective as the requirements contained in the Illinois Urban Manual, 2002;
- v. procedures for site plan review which incorporate consideration of potential water quality impacts and review of individual pre-construction site plans to ensure consistency with local sediment and erosion control requirements;
- vi. procedures for receipt and consideration of information submitted by the public; and
- vii. procedures for site inspections and enforcement of control measures.

- b. define appropriate BMPs for this minimum control measure and measurable goals for each BMP. These measurable goals must ensure the reduction of all of the pollutants of concern in your storm water discharges to the maximum extent practicable.

5. Post-construction storm water management in new development and redevelopment

You must:

- a. develop, implement, and enforce a program to address storm water runoff from new development and redevelopment projects that disturb greater than or equal to one acre, including projects less than one acre that are part of a larger common plan of development or sale or that have been designated to protect water quality, that discharge into your small MS4. Your program must ensure that controls are in place that would protect water quality and reduce the discharge of pollutants to the maximum extent practicable;
- b. develop and implement strategies which include a combination of structural and/or non-structural BMPs appropriate for your community that will reduce the discharge of pollutants to the maximum extent practicable;
- c. use an ordinance or other regulatory mechanism to address post-construction runoff from new development and redevelopment projects to the extent allowable under state or local law;
- d. require all regulated construction sites to have post-construction management that meets or exceeds the requirements of Section IV (D)(2)(b) of NPDES permit No. ILR10 including management practices, controls, and other provisions at least as protective as the requirements contained in the Illinois Urban Manual, 2002;
- e. ensure adequate long-term operation and maintenance of BMPs; and

General NPDES Permit No. ILR40

- f. define appropriate BMPs for this minimum control measure and measurable goals for each BMP. These measurable goals must ensure the reduction of all of the pollutants of concern in your storm water discharges to the maximum extent practicable.

6. Pollution prevention/good housekeeping for municipal operations

You must:

- a. develop and implement an operation and maintenance program that includes a training component and is designed to prevent and reduce the discharge of pollutants to the maximum extent practicable;
- b. using training materials that are available from EPA, the state of Illinois, or other organizations, your program must include employee training to prevent and reduce storm water pollution from activities such as park and open space maintenance, fleet and building maintenance, operation of storage yards, snow disposal, new construction and land disturbances, and storm water system maintenance procedures for proper disposal of street cleaning debris and catch basin material, address ways that flood management projects impact water quality, nonpoint source pollution control, and aquatic habitat; and
- c. define appropriate BMPs for this minimum control measure and measurable goals for each BMP. These measurable goals must ensure the reduction of all of the pollutants of concern in your storm water discharges to the maximum extent practicable.

C. Qualifying State, County, or Local Program

If an existing qualifying local program requires you to implement one or more of the minimum control measures of B. above, you may follow that qualifying program's requirements rather than the requirements of B. above. A qualifying local program is a local, county or state municipal storm water management program that imposes, at a minimum, the relevant requirements of Section B. Any qualifying local programs that you intend to follow shall be specified in your storm water management plan.

D. Sharing Responsibility

1. Implementation of one or more of the minimum measures may be shared with another entity, or the entity may fully take over the measure. You may rely on another entity only if:
 - a. The other entity, in fact, implements the control measure;
 - b. The particular control measure, or component of that measure is at least as stringent as the corresponding permit requirement.
 - c. The other entity agrees to implement the control measure on your behalf. Written acceptance of this obligation is expected. This obligation must be maintained as part of the description of your storm water management program. If the other entity agrees to report on the minimum measure, you must supply the other entity with the reporting requirements contained in Section V (C) of this permit. If the other entity fails to implement the control measure on your behalf, then you remain liable for any discharges due to that failure to implement.

E. Reviewing and Updating Storm Water Management Programs

1. Storm Water Management Program Review: You must do an annual review of your Storm Water Management Program in conjunction with preparation of the annual report required under Part V.(C).
2. Storm Water Management Program Update: You may change your Storm Water Management Program during the life of the permit in accordance with the following procedures:
 - a. Changes adding (but not subtracting or replacing) components, controls, or requirements to the Storm Water Management Program may be made at any time upon written notification to the Agency; and
 - b. Changes replacing an ineffective or unfeasible BMP specifically identified in the Storm Water Management Program with an alternate BMP may be requested at any time. Unless denied by the Agency, changes proposed in accordance with the criteria below shall be deemed approved and may be implemented 60 days from submittal of the request. If request is denied, the Agency will send you a written response giving a reason for the decision. Your modification requests must include the following:
 1. An analysis of why the BMP is ineffective or infeasible (including cost prohibitive);
 2. Expectations on the effectiveness of the replacement BMP; and
 3. An analysis of why the replacement BMP is expected to achieve the goals of the BMP to be replaced.
 - c. Change requests or notifications must be made in writing and signed in accordance with Standard Condition II of Attachment H.

3. Storm Water Management Program Updates Required by the Agency. The Agency may require changes to the Storm Water Management Program as needed to:
 - a. Address impacts on receiving water quality caused, or contributed to, by discharges from the municipal separate storm sewer system;
 - b. Include more stringent requirements necessary to comply with new federal statutory or regulatory requirements; or
 - c. Include such other conditions deemed necessary by the Agency to comply with the goals and requirements of the Clean Water Act.
 - d. Changes requested by the Agency must be made in writing, set forth the time schedule for you to develop the changes, and offer you the opportunity to propose alternative program changes to meet the objective of the requested modification. All changes required by the Permitting Authority will be made in accordance with 40 CFR 124.5, 40 CFR 122.62, or as appropriate 40 CFR 122.63.

PART V. MONITORING, RECORDKEEPING AND REPORTING

A. Monitoring

You must evaluate program compliance, the appropriateness of your identified best management practices, and progress towards achieving your identified measurable goals, which must include reducing the discharge of pollutants to the maximum extent practicable (MEP).

B. Recordkeeping

You must keep records required by this permit for at least 3 years. All records shall be kept onsite or locally available and shall be made accessible to the Agency for review at the time of an on-site inspection. You must submit your records to the Agency only when specifically asked to do so. You must make your records, including your notice of intent (NOI) and your storm water management plan, available to the public at reasonable times during regular business hours within 10 working days of its approval by the permitting authority. (You may assess a reasonable charge for copying. You may require a member of the public to provide advance notice, not to exceed seven working days.) Storm sewer maps may be withheld for security reasons.

C. Reporting

You must submit annual reports to the Agency by the first day of June for each year that this permit is in effect. The first report is due June 1, 2004. Each report shall cover the period from March of the previous year through March of the current year. Your report must include:

1. The status of compliance with permit conditions, an assessment of the appropriateness of your identified best management practices and progress towards achieving the statutory goal of reducing the discharge of pollutants to the MEP, and your identified measurable goals for each of the minimum control measures;
2. Results of information collected and analyzed, including monitoring data, if any, during the reporting period;
3. A summary of the storm water activities you plan to undertake during the next reporting cycle (including an implementation schedule);
4. A change in any identified best management practices or measurable goals that apply to the program elements; and
5. Notice that you are relying on another government entity to satisfy some of your permit obligations (if applicable).
6. Municipal storm water inspection reports shall be submitted to the following address:

Illinois Environmental Protection Agency
Division of Water Pollution Control
Compliance Assurance Section
Municipal Annual Inspection Report
1021 North Grand Avenue East
P.O. Box 19276
Springfield, Illinois 62794-9276

PART VI. DEFINITIONS AND ACRONYMS (SEE ALSO SPECIAL CONDITIONS)

All definitions contained in Section 502 of the Clean Water Act, 40 CFR 122, and 35 Ill. Adm. Code 309 shall apply to this permit and are incorporated herein by reference. For convenience, simplified explanations of some regulatory/statutory definitions have been provided, but in the event of a conflict, the definition found in the statute or regulation takes precedence.

Best Management Practices (BMPs) means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the state. BMPs also include treatment requirements, operating procedures, and practices to control runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

BMP is an acronym for "Best Management Practices."

CFR is an acronym for "Code of Federal Regulations."

Control Measure as used in this permit, refers to any Best Management Practice or other method used to prevent or reduce the discharge of pollutants to waters of the United States.

CWA or The Act means the Clean Water Act (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972) Pub. L. 92-500, as amended Pub. L. 95-217, Pub. L. 95-576, Pub. L. 96-483 and Pub. L. 97-117, 33 U.S.C. 1251 et. seq.

Discharge, when used without a qualifier, refers to discharge of a pollutant as defined at 40 CFR 122.2.

Illicit Connection means any man-made conveyance connecting an illicit discharge directly to a municipal separate storm sewer.

Illicit Discharge is defined at 40 CFR 122.26(b)(2) and refers to any discharge to a municipal separate storm sewer that is not composed entirely of storm water, except discharges authorized under an NPDES permit (other than the NPDES permit for discharges from the MS4) and discharges resulting from fire fighting activities.

MEP is an acronym for "Maximum Extent Practicable," the technology-based discharge standard for Municipal Separate Storm Sewer Systems to reduce pollutants in storm water discharges that was established by CWA ? Section 402(p). A discussion of MEP as it applies to small MS4s is found at 40 CFR 122.34.

MS4 is an acronym for "Municipal Separate Storm Sewer System" and is used to refer to either a Large, Medium, or Small Municipal Separate Storm Sewer System (e.g. "the Dallas MS4"). The term is used to refer to either the system operated by a single entity or a group of systems within an area that are operated by multiple entities (e.g., the Houston MS4 includes MS4s operated by the city of Houston, the Texas Department of Transportation, the Harris County Flood Control District, Harris County, and others).

Municipal Separate Storm Sewer is defined at 40 CFR 122.26(b)(8) and means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains): (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under Section 208 of the CWA that discharges to waters of the United States; (ii) Designed or used for collecting or conveying storm water; (iii) Which is not a combined sewer; and (iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

NOI is an acronym for "Notice of Intent" to be covered by this permit and is the mechanism used to "register" for coverage under a general permit.

NPDES is an acronym for "National Pollutant Discharge Elimination System."

Outfall is defined at 40 CFR 122.26(b)(9) and means a point source as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.

Owner or Operator is defined at 40 CFR 122.2 and means the owner or operator of any "facility or activity" subject to regulation under the NPDES program.

Permitting Authority means the Illinois EPA.

Point Source is defined at 40 CFR 122.2 and means any discernable, confined and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

Qualifying Local Program is defined at 40 CFR 122.34(c) and means a local, state, or Tribal municipal storm water management program that imposes, at a minimum, the relevant requirements of paragraph (b) of Section 122.34.

Small Municipal Separate Storm Sewer System is defined at 40 CFR 122.26(b)(16) and refers to all separate storm sewers that are owned or operated by the United States, a State [sic], city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State [sic] law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under Section 208 of the CWA that discharges to waters of the United States, but is not defined as "large" or "medium" municipal separate storm sewer system. This term includes systems similar to separate storm sewer systems in municipalities, such as systems at military bases, large hospital or prison complexes, and highways and other thoroughfares. The term does not include separate storm sewers in very discrete areas, such as individual buildings.

Storm Water is defined at 40 CFR 122.26(b)(13) and means storm water runoff, snowmelt runoff, and surface runoff and drainage.

Storm Water Management Program (SWMP) refers to a comprehensive program to manage the quality of storm water discharged from the municipal separate storm sewer system.

SWMP is an acronym for "Storm Water Management Program."

TMDL is an acronym for "Total Maximum Daily Load."

Waters (also referred to as waters of the state or receiving water) is defined at Section 301.440 of Title 35: Subtitle C: Chapter I of the Illinois Pollution Control Board Regulations and means all accumulations of water, surface and underground, natural, and artificial, public and private, or parts thereof, which are wholly or partially within, flow through, or border upon the State of Illinois, except that sewers and treatment works are not included except as specially mentioned; provided, that nothing herein contained shall authorize the use of natural or otherwise protected waters as sewers or treatment works except that in-stream aeration under Agency permit is allowable.

"You" and "Your" as used in this permit is intended to refer to the permittee, the operator, or the discharger as the context indicates and that party's responsibilities (e.g., the city, the country, the flood control district, the U.S. Air Force, etc.).

ILR00DLK.-mdWPD

Attachment H
Standard Conditions
Definitions

Act means the Illinois Environmental Protection Act, 415 ILCS 5 as Amended.

Agency means the Illinois Environmental Protection Agency.

Board means the Illinois Pollution Control Board.

Clean Water Act (formerly referred to as the Federal Water Pollution Control Act) means Pub. L 92-500, as amended. 33 U.S.C. 1251 et seq.

NPDES (National Pollutant Discharge Elimination System) means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under Sections 307, 402, 318 and 405 of the Clean Water Act.

USEPA means the United States Environmental Protection Agency.

Daily Discharge means the discharge of a pollutant measured during a calendar day or any 24-hour period that reasonably represents the calendar day for purposes of sampling. For pollutants with limitations expressed in units of mass, the Adaily discharge@ is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurements, the Adaily discharge@ is calculated as the average measurement of the pollutant over the day.

Maximum Daily Discharge Limitation (daily maximum) means the highest allowable daily discharge.

Average Monthly Discharge Limitation (30 day average) means the highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Discharge Limitation (7 day average) means the highest allowable average of daily discharges over a calendar week, calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Best Management Practices (BMPs) means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the State. BMPs also include treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

Aliquot means a sample of specified volume used to make up a total composite sample.

Grab Sample means an individual sample of at least 100 milliliters collected at a randomly-selected time over a period not exceeding 15 minutes.

24 Hour Composite Sample means a combination of at least 8 sample aliquots of at least 100 milliliters, collected at periodic intervals during the operating hours of a facility over a 24-hour period.

8 Hour Composite Sample means a combination of at least 3 sample aliquots of at least 100 milliliters, collected at periodic intervals during the operating hours of a facility over an 8-hour period.

Flow Proportional Composite Sample means a combination of sample aliquots of at least 100 milliliters collected at periodic intervals such that either the time interval between each aliquot or the volume of each aliquot is proportional to either the stream flow at the time of sampling or the total stream flow since the collection of the previous aliquot.

- (1) Duty to comply. The permittee must comply with all conditions of this permit. Any permit noncompliance constitutes a violation of the Act and is grounds for enforcement action, permit termination, revocation and reissuance, modification, or for denial of a permit renewal application. The permittee shall comply with effluent standards or prohibitions established under Section 307(a) of the Clean Water Act for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if the permit has not yet been modified to incorporate the requirement.
- (2) Duty to reapply. If the permittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the permittee must apply for and obtain a new permit. If the permittee submits a proper application as required by the Agency no later than 180 days prior to the expiration date, this permit shall continue in full force and effect until the final Agency decision on the application has been made.
- (3) Need to halt or reduce activity not a defense. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.
- (4) Duty to mitigate. The permittee shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.
- (5) Proper operation and maintenance. The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with conditions of this permit. Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls, including appropriate quality assurance procedures. This provision requires the operation of back-up, or auxiliary facilities, or similar systems only when necessary to achieve compliance with the conditions

of the permit

- (6) Permit actions. This permit may be modified, revoked and reissued, or terminated for cause by the Agency pursuant to 40 CFR 122.62. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance, does not stay any permit condition.
- (7) Property rights. This permit does not convey any property rights of any sort, or any exclusive privilege.
- (8) Duty to provide information. The permittee shall furnish to the Agency within a reasonable time, any information which the Agency may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit, or to determine compliance with the permit. The permittee shall also furnish to the Agency, upon request, copies of records required to be kept by this permit.
- (9) Inspection and entry. The permittee shall allow an authorized representative of the Agency, upon the presentation of credentials and other documents as may be required by law, to:
 - (a) Enter upon the permittee=s premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this permit;
 - (b) Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit;
 - (c) Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; and
 - (d) Sample or monitor at reasonable times, for the purpose of assuring permit compliance, or as otherwise authorized by the Act, any substances or parameters at any location.
- (10) Monitoring and records.
 - (a) Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.
 - (b) The permittee shall retain records of all monitoring information, including all calibration and maintenance records, and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least 3 years from the date of this permit, measurement, report or application. This period may be extended by request of the Agency at any time.
 - (c) Records of monitoring information shall include:
 - (1) The date, exact place, and time of sampling or measurements;
 - (2) The individual(s) who performed the sampling or measurements;
 - (3) The date(s) analyses were performed;
 - (4) The individual(s) who performed the analyses;
 - (5) The analytical techniques or methods used; and
 - (6) The results of such analyses.
 - (d) Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, unless other test procedures have been specified in this permit. Where no test procedure under 40 CFR Part 136 has been approved, the permittee must submit to the Agency a test method for approval. The permittee shall calibrate and perform maintenance procedures on all monitoring and analytical instrumentation at intervals to ensure accuracy of measurements.
- (11) Signatory requirement. All applications, reports or information submitted to the Agency shall be signed and certified.
 - (a) Application. All permit applications shall be signed as follows:
 - (1) For a corporation: by a principal executive officer of at least the level of vice president or a person or position having overall responsibility for environmental matters for the corporation;
 - (2) For a partnership or sole proprietorship: by a general partner or the proprietor, respectively; or
 - (3) For a municipality, State, Federal, or other public agency: by either a principal executive officer or ranking elected official.
 - (b) Reports. All reports required by permits, or other information requested by the Agency shall be signed by a person described in paragraph (a) or by a duly authorized representative of that person. A person is a duly authorized representative only if:
 - (1) The authorization is made in writing by a person described in paragraph (a); and

General NPDES Permit No. ILR40

- (2) The authorization specifies either an individual or a position responsible for the overall operation of the facility, from which the discharge originates, such as a plant manager, superintendent or person of equivalent responsibility; and
- (3) The written authorization is submitted to the Agency.
- (c) Changes of Authorization. If an authorization under (b) is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of (b) must be submitted to the Agency prior to or together with any reports, information, or applications to be signed by an authorized representative.
- (12) Reporting requirements.
- (a) Planned changes. The permittee shall give notice to the Agency as soon as possible of any planned physical alterations or additions to the permitted facility.
- (b) Anticipated noncompliance. The permittee shall give advance notice to the Agency of any planned changes in the permitted facility or activity which may result in noncompliance with permit requirements.
- (c) Compliance schedules. Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit shall be submitted no later than 14 days following each schedule date.
- (d) Monitoring reports. Monitoring results shall be reported at the intervals specified elsewhere in this permit.
- (1) Monitoring results must be reported on a Discharge Monitoring Report (DMR).
- (2) If the permittee monitors any pollutant more frequently than required by the permit, using test procedures approved under 40 CFR 136 or as specified in the permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR.
- (3) Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified by the Agency in the permit.
- (e) Twenty-four hour reporting. The permittee shall report any noncompliance which may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the permittee becomes aware of the circumstances. A written submission shall also be provided within 5 days of the time the permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and time; and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance. The following shall be included as information which must be reported within 24 hours:
- (1) Any unanticipated bypass which exceeds any effluent limitation in the permit;
- (2) Violation of a maximum daily discharge limitation for any of the pollutants listed by the Agency in the permit to be reported within 24 hours.
- The Agency may waive the written report on a case-by-case basis if the oral report has been received within 24 hours.
- (f) Other noncompliance. The permittee shall report all instances of noncompliance not reported under paragraphs (12)(c), (d), or (e), at the time monitoring reports are submitted. The reports shall contain the information listed in paragraph (12)(e).
- (g) Other information. Where the permittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application, or in any report to the Agency, it shall promptly submit such facts or information.
- (13) Transfer of permits. A permit may be automatically transferred to a new permittee if:
- (a) The current permittee notifies the Agency at least 30 days in advance of the proposed transfer date;
- (b) The notice includes a written agreement between the existing and new permittees containing a specific date for transfer of permit responsibility, coverage and liability between the current and new permittees; and
- (c) The Agency does not notify the existing permittee and the proposed new permittee of its intent to modify or revoke and reissue the permit. If this notice is not received, the transfer is effective on the date specified in the agreement.
- (14) All manufacturing, commercial, mining, and silvicultural dischargers must notify the Agency as soon as they know or have reason to believe:
- (a) That any activity has occurred or will occur which would result in the discharge of any toxic pollutant identified under Section 307 of the Clean Water Act which is not limited in the permit, if that discharge will exceed the highest of the following notification levels:
- (1) One hundred micrograms per liter (100 ug/l):
- (2) Two hundred micrograms per liter (200 ug/l) for acrolein and acrylonitrile; five hundred micrograms per liter (500 ug/l) for 2,4-dinitrophenol and for 2-methyl-4,6 dinitrophenol; and one milligram per liter (1 mg/l) for antimony.
- (3) Five (5) times the maximum concentration value reported for that pollutant in the NPDES permit application; or
- (4) The level established by the Agency in this permit.
- (b) That they have begun or expect to begin to use or manufacture as an intermediate or final product or byproduct any toxic pollutant which was not reported in the NPDES permit application.
- (15) All Publicly Owned Treatment Works (POTWs) must provide adequate notice to the Agency of the following:
- (a) Any new introduction of pollutants into that POTW from an indirect discharge which would be subject to Sections 301 or 306 of the Clean Water Act if it were directly discharging those pollutants; and
- (b) Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of issuance of the permit.
- (c) For purposes of this paragraph, adequate notice shall include information on (i) the quality and quantity of effluent introduced into the POTW, and (ii) any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW.
- (16) If the permit is issued to a publicly owned or publicly regulated treatment works, the permittees shall require any industrial user of such treatment works to comply with federal requirements concerning:
- (a) User charges pursuant to Section 204(b) of the Clean Water Act, and applicable regulations appearing in 40 CFR 35;
- (b) Toxic pollutant effluent standards and pretreatment standards pursuant to Section 307 of the Clean Water Act; and
- (c) Inspection, monitoring and entry pursuant to Section 308 of the Clean Water Act.
- (17) If an applicable standard or limitation is promulgated under Section 301(b)(2)(C) and (D), 304(b)(2), or 307(a)(2) and that effluent standard or limitation is more stringent than any effluent limitation in the permit, or controls a pollutant not limited in the permit, the permit shall be promptly modified or revoked, and reissued to conform to that effluent standard or limitation.
- (18) Any authorization to construct issued to the permittee pursuant to 35 Ill. Adm. Code 309.154 is hereby incorporated by reference as a condition of this permit.
- (19) The permittee shall not make any false statement, representation or certification in any application, record, report, plan or other document submitted to the Agency or the USEPA, or required to be maintained under this permit.
- (20) The Clean Water Act provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Clean Water Act is subject to a civil penalty not to exceed \$10,000 per day of such violation. Any person who willfully or negligently violates permit conditions implementing Sections 301, 302, 306, 307, or 308 of the Clean Water Act is subject to a fine of not less than \$2,500 nor more than \$25,000 per day of violation, or by imprisonment for not more than one year, or both.
- (21) The Clean Water Act provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under permit shall, upon conviction, be punished by a fine of not more than \$10,000 per violation, or by imprisonment for not more than 6 months per violation, or by both.
- (22) The Clean Water Act provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit shall, including monitoring reports or reports of compliance or non-compliance shall, upon conviction, be punished by a fine of not more than \$10,000 per violation, or by imprisonment for not more than 6 months per violation, or by both.
- (23) Collected screening, slurries, sludges, and other solids shall be disposed of in such a manner as to prevent entry of those wastes (or runoff from the wastes) into waters of the State. The proper authorization for such disposal shall be obtained from the Agency and is incorporated as part hereof by reference.
- (24) In case of conflict between these standard conditions and any other condition(s) included in this permit, the other condition(s) shall govern.
- (25) The permittee shall comply with, in addition to the requirements of the permit, all applicable provisions of 35 Ill. Adm. Code, Subtitle C, Subtitle D, Subtitle E, and all applicable orders of the Board.
- (26) The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit is held invalid, the remaining provisions of this permit shall continue in full force and effect.
- (Rev. 3-13-98)

For Office Use Only – Permit No. ILR40_____

Part I. General Information

1. MS4 Operator Name:

2. MS4 Operator Mailing Address:

Street- _____ City- _____
 State- Illinois Zip Code- _____

3. Operator Type: City

4. Operator Status: State

5. Name(s) of Governmental Entity(ies) in which MS4 is located:

6. Area of land that drains to your MS4 (in square miles):

5. Latitude/Longitude at approximate geographical center of MS4 for which you are requesting authorization to discharge:

Latitude: _____ Longitude: _____
DEG. MIN. SEC. DEG. MIN. SEC.

8. Name(s) of known receiving waters: *Attach additional sheets (Attachment 1) as necessary:*

- | | |
|----------|-----------|
| 1. _____ | 2. _____ |
| 3. _____ | 4. _____ |
| 5. _____ | 6. _____ |
| 7. _____ | 8. _____ |
| 9. _____ | 10. _____ |

9. Persons Responsible for Implementation/Coordination of Storm Water Management Program:

<u>Name</u>	<u>Title</u>	<u>Telephone No.</u>	<u>Area of Responsibility</u>
_____	_____	_____	_____
_____	_____	_____	_____
_____	_____	_____	_____
_____	_____	_____	_____
_____	_____	_____	_____

Information required by this form must be provided to comply with 415 ILCS 5/39 (2000). Failure to do so may prevent this form from being processed and could result in your application being denied.

Part II. Best Management Practices (include shared responsibilities) Proposed to be Implemented in the MS4 Area

(Details of BMP implementation for each checked BMP number, e.g., A.1, E.2, is required in Part IV of this NOI.)

A. Public Education and Outreach

- A.1 Distributed Paper Material
- A.2 Speaking Engagement
- A.3 Public Service Announcement
- A.4 Community Event
- A.5 Classroom Education Material
- A.6 Other Public Education

B. Public Participation/Involvement

- B.1 Public Panel
- B.2 Educational Volunteer
- B.3 Stakeholder Meeting
- B.4 Public Hearing
- B.5 Volunteer Monitoring
- B.6 Program Coordination
- B.7 Other Public Involvement

C. Illicit Discharge Detection and Elimination

- C.1 Storm Sewer Map Preparation
- C.2 Regulatory Control Program
- C.3 Detection/Elimination Prioritization Plan
- C.4 Illicit Discharge Tracing Procedures
- C.5 Illicit Source Removal Procedures
- C.6 Program Evaluation and Assessment
- C.7 Visual Dry Weather Screening
- C.8 Pollutant Field Testing
- C.9 Public Notification
- C.10 Other Illicit Discharge Controls

D. Construction Site Runoff Control

- D.1 Regulatory Control Program
- D.2 Erosion and Sediment Control BMPs
- D.3 Other Waste Control Program
- D.4 Site Plan Review Procedures
- D.5 Public Information Handling Procedures
- D.6 Site Inspection/Enforcement Procedures
- D.7 Other Construction Site Runoff Controls

E. Post-Construction Runoff Control

- E.1 Community Control Strategy
- E.2 Regulatory Control Program
- E.3 Long Term O&M Procedures
- E.4 Pre-Const Review of BMP Designs
- E.5 Site Inspections During Construction
- E.6 Post-Construction Inspections
- E.7 Other Post-Const Runoff Controls

F. Pollution Prevention/Good Housekeeping

- F.1 Employee Training Program
- F.2 Inspection and Maintenance Program
- F.3 Muni Operations Storm Water Control
- F.4 Municipal Operations Waste Disposal
- F.5 Flood Management/Assess Guidelines
- F.6 Other Municipal Operations Controls

Part III. Qualifying Local Programs

Attach additional sheets (Attachment 2) as necessary:

(Describe any qualifying local programs that you will implement in lieu of new permitting requirements.)

1. Public Education and Outreach:

2. Public Participation/Involvement:

3. Illicit Discharge Detection and Elimination:

4. Construction Site Runoff Control:

5. Post-Construction Runoff Control:

6. Pollution Prevention/Good Housekeeping:

Part IV. Measurable Goals (include shared responsibilities) Proposed to be Implemented by the MS4

Attach additional sheets (Attachment 3) as necessary

(BMP No. should match that checked in Part II of this NOI. The applicant may repeat the same BMP No. where more than one BMP of similar type is to be implemented. Where necessary, attach additional sheets to provide more detail on each specific BMP.)

Storm Water Phase II Compliance Assistance Guide

Compliance Guide Notice

The statements in this document are intended solely as guidance to aid regulated entities in complying with the Storm Water Phase II final rule. The guidance is not a substitute for reading the regulation and understanding all its requirements as it applies to your facility. This guidance does not constitute rulemaking by the EPA and may not be relied on to create a substantive or procedural right or benefit enforceable, at law or in equity, by any person. EPA may decide to update this guide without public notice to reflect changes in EPA's approach to implementing Storm Water Phase II or to clarify and update text. To determine whether EPA has revised this document and/or to obtain copies, go to EPA's web site at www.epa.gov/owm/sw/phase2.

1.0 INTRODUCTION

After reading this introduction, you should know whether you need to use this guide, what the guide covers, and where to get the latest information on the regulation.

The U.S. Environmental Protection Agency (EPA) published the regulation entitled “National Pollutant Discharge Elimination System - Regulations for Revision of the Water Pollution Control Program Addressing Storm Water Discharges” (*Federal Register*, Volume 64, Number 235, pages 68722-68852) on December 8, 1999 as required by Section 402(p) of the Clean Water Act (CWA). This guide explains how to tell if you are subject to the regulation and what to do if you are required to comply.

1.1 Who should use this guide?

This new rule regulates storm water discharges from two categories:

First, the rule covers storm water discharges to certain ***municipal separate storm sewer systems*** (MS4s). Public entities which operate these MS4s, such as cities, counties, States, and the Federal government, could be regulated under this rule. MS4 operators should read section 4 for more information.

Second, the rule also covers storm water discharges from ***construction activity*** generally disturbing between 1 and 5 acres. A construction operator could include the site owner, developer, contractor, or subcontractor. Construction site operators should read section 5 for more information.

The storm water Phase II final rule also provide regulatory relief for certain ***industrial facilities*** (currently permitted under EPA’s storm water regulations) where storm water runoff is not exposed to industrial activities. Operators of industrial facilities interested in the no exposure exclusion should read section 6.

1.2 What Does this Guide Cover?

The purpose of this guide is to help the regulated community comply with the Storm Water Phase II Rule. This guide answers the following basic questions:

- Why is the Storm Water Phase II Rule important?
- Am I subject to the Storm Water Phase II Rule?
- What must I do to comply with the Storm Water Phase II Rule?

1.3 How Do I Use this Guide?

This guide is organized into seven major sections plus three appendices.

- | | |
|-------------|--|
| Section 1.0 | Introduces you to this guide and the Storm Water Phase II Rule. Describes basic types of entities regulated so you can determine if you are affected by the rule. |
| Section 2.0 | Provides background on why the Storm Water Phase II Rule is needed. Topics such as the environmental impacts of storm water and why storm water should be controlled are discussed. The history of the NPDES Storm Water program is briefly described. |
| Section 3.0 | Delivers an overview of the Storm Water Phase II requirements. The basic components of the program are described and schedules and timelines are highlighted. |
| Section 4.0 | Gives step-by-step procedures for operators of small MS4s to determine if they are subject to the regulation and provides information on how to demonstrate compliance. |
| Section 5.0 | Gives step-by-step procedures for operators of small construction activities to determine if they are subject to the regulation and provides information on how to demonstrate compliance. |
| Section 6.0 | Provides a discussion of how the Rule affects industrial facilities, including which industrial facilities are covered, and an explanation of the No Exposure exclusion and how to determine if you qualify. |
| Section 7.0 | Documents the Compliance Assurance Process - Discusses how EPA will determine compliance, what happens if you or EPA discovers noncompliance, and the legal status of the guide. |
| Appendices | Provides additional references and where to go for more information on storm water. |

1.4 Where Can I Get More Information on the Storm Water Phase II Rule?

Additional information on the NPDES storm water Phase II rule, including a series of fact sheets and a full copy of the final rule, can be found on EPA's web pages at <http://www.epa.gov/owm/sw/phase2>.

Compliance assistance will be covered in Section 7 of the guide. One source for compliance assistance and information on the rule is the Local Government Environmental Assistance Network (LGEAN). LGEAN is one of EPA's compliance

assistance centers and can be found on the web at www.lgean.org or contacted by phone at 1-877-TO-LGEAN.

2.0 BACKGROUND

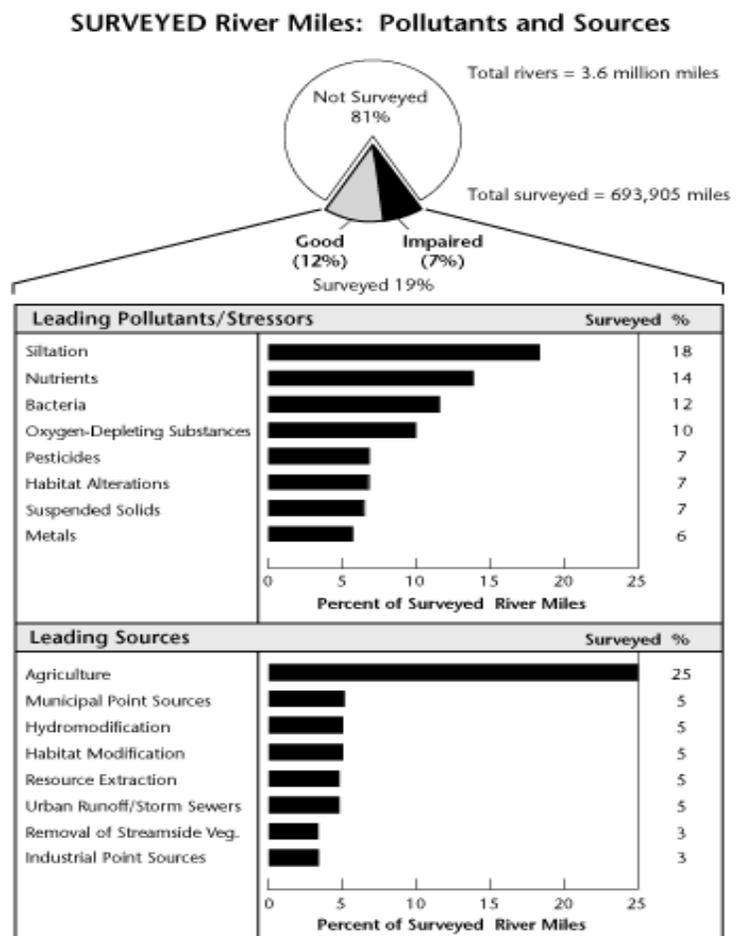

After reading section 2, you should understand the environmental impacts of storm water and the history of the storm water program, including existing regulations to control storm water (Phase I).

2.1 What are the Environmental Impacts from Storm Water Discharges?

Storm water runoff from lands modified by human activities can harm surface water and, in turn, cause or contribute to an exceedance of water quality standards by changing natural hydrologic patterns, accelerating natural stream flows, destroying aquatic habitat, and elevating pollutant concentrations and loadings. Such runoff may contain high levels of contaminants, such as sediment, suspended solids, nutrients (phosphorus and nitrogen), heavy metals, pathogens, toxins, oxygen-demanding substances (organic material), and floatables (U.S. EPA. 1992.

Environmental Impacts of Storm Water Discharges: A National Profile. EPA 841-R-92-001. Office of Water. Washington, DC). After a rain, storm water runoff carries these pollutants into nearby streams, rivers, lakes, estuaries, wetlands, and oceans. Individually and combined, these pollutants impair water quality, threatening designated beneficial uses and causing habitat alteration and destruction.

The 1996 305(b) Report (U.S. EPA. 1998. The National Water Quality Inventory, 1996 Report to Congress. EPA 841-R-97-008. Office of Water. Washington, DC), provides a national assessment of water quality based on biennial reports submitted by the States as required under CWA section 305(b) of the CWA. In the CWA 305(b) reports, States, Tribes, and Territories assess their individual water quality control programs by examining the attainment or

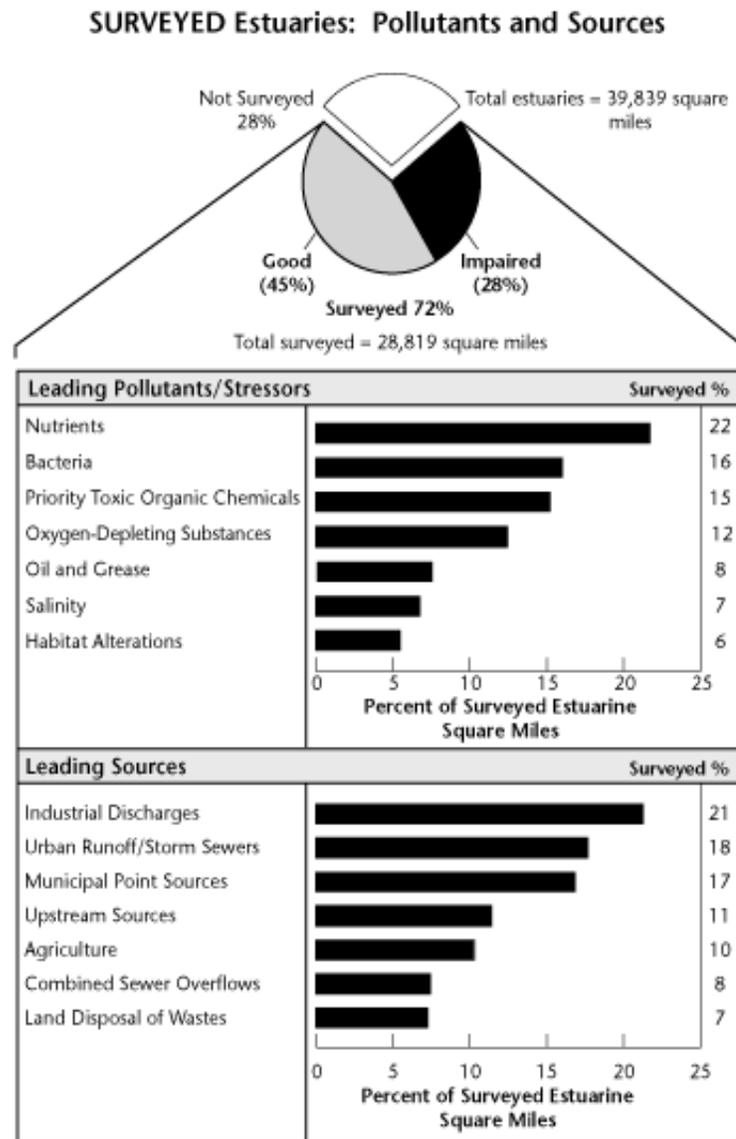

NOTE: Percentages do not add up to 100% because more than one pollutant or source may impair a river segment.

Figure 2-1. Pollutants and Sources in Surveyed River Miles (EPA, 1998)

nonattainment of the designated uses assigned to their rivers, lakes, estuaries, wetlands, and ocean shores. The 1996 Inventory indicated that approximately 40 percent of the Nation's assessed rivers, lakes, and estuaries are impaired.

The 1996 Inventory also found urban runoff/discharges from storm sewers to be a major source of water quality impairment nationwide. Urban runoff/storm sewers were found to be a source of pollution in 13 percent of impaired rivers; 21 percent of impaired lakes, ponds, and reservoirs; and 45 percent of impaired estuaries (second only to industrial discharges). See Figures 2-1 and 2-2 for an illustration of the pollutants and sources of pollution for both rivers and estuaries. In addition to these waterbodies, urban runoff was found to be the leading cause of ocean impairment for those ocean miles surveyed.

Urbanization alters the natural infiltration capability of the land and generates a host of pollutants that are associated with the activities of dense populations, thus causing an increase in storm water runoff volumes and pollutant loadings in storm water discharged to receiving waterbodies (U.S. EPA, 1992). Urban development increases the amount of impervious surface in a watershed as farmland, forests, and meadowlands are converted into buildings with rooftops, driveways, sidewalks, roads, and parking lots with virtually no ability to absorb storm water. Storm water and snow-melt runoff wash over these impervious areas, picking up pollutants along the way while gaining speed and volume because of their inability to disperse and filter into the ground (see Figure 2-3 which illustrates the increased runoff resulting from increased impervious area). The resulting storm water flows are higher in volume, pollutants, and temperature than the flows in less impervious areas, which have more natural vegetation and soil to filter the runoff (U.S. EPA, 1997. *Urbanization and Streams: Studies of Hydrologic Impacts*).

NOTE: Percentages do not add up to 100% because more than one pollutant or source may impair an estuary.

Figure 2-2. Pollutants and Sources in surveyed Estuaries (EPA, 1998)

EPA 841-R-97-009. Office of Water. Washington, DC).

In addition to the pollutants picked up by storm water runoff before it enters a storm drain, studies have shown that discharges from a storm drain system often include wastes and wastewater from non-storm water sources, referred to as illicit discharges. These discharges are 'illicit' because municipal storm sewer systems are not designed to accept, process, or discharge such wastes. Sources of illicit discharges can include sanitary wastewater illegally connected to the storm drain system; effluent from septic tanks; car wash, laundry, and other industrial wastewaters; improper disposal of auto and household toxics, such as used motor oil and pesticides; and spills from roadways.

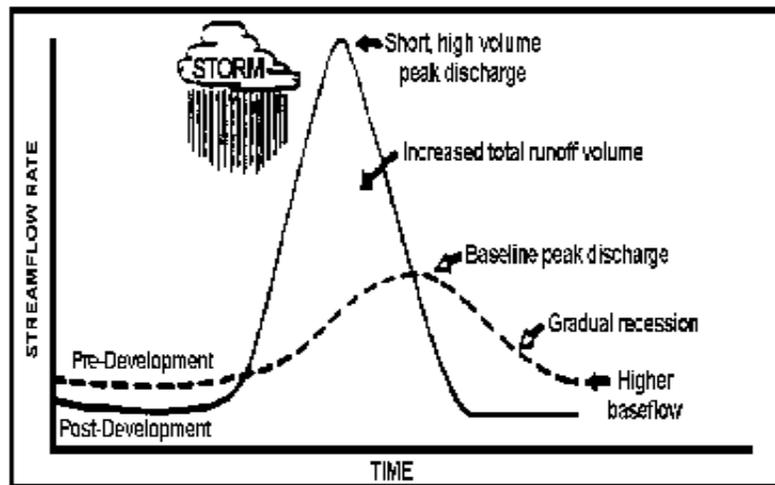

Figure 1. Impacts of urbanization on stream flow (Schueler, 1987).

Illicit discharges enter the system through either direct connections (e.g., wastewater piping either mistakenly or deliberately connected to the storm drains) or indirect connections (e.g., infiltration into the MS4 from cracked sanitary systems, spills collected by drain outlets, and paint or used oil dumped directly into a drain). The result is untreated discharges that contribute high levels of pollutants, including heavy metals, toxics, oil and grease, solvents, nutrients, viruses and bacteria into receiving waterbodies.

2.2 Summary of EPA's Storm Water Program

In 1972, Congress amended the Federal Water Pollution Control Act (commonly referred to as the Clean Water Act (CWA)) to prohibit the discharge of any pollutant to waters of the United States from a point source unless the discharge is authorized by an NPDES permit. The NPDES program is designed to track point sources and require the implementation of the controls necessary to minimize the discharge of pollutants. Initial efforts to improve water quality under the NPDES program primarily focused on reducing pollutants in industrial process wastewater and municipal sewage. These discharge sources were easily identified as responsible for poor water quality.

As pollution control measures for industrial process wastewater and municipal sewage were implemented and refined, it became increasingly evident that more diffuse sources of water pollution were also significant causes of water quality impairment. Specifically, storm water runoff was found to be a major cause of water quality impairment.

In 1987, Congress amended the CWA to require implementation, in two phases, of a comprehensive national program for addressing storm water discharges. The first phase of the program, commonly referred to as “Phase I,” was promulgated on November 16, 1990 (55 FR 47990). Phase I requires NPDES permits for storm water discharge from a large number of priority sources including medium and large municipal separate storm sewer systems (“MS4s”) generally serving populations of 100,000 or more and several categories of industrial activity, including construction activity that disturbs five or more acres of land.

The Phase I permits for municipal separate storm sewer systems mostly cover larger cities, and require them to develop a storm water management program, track and oversee industrial facilities regulated under the NPDES storm water program, conduct some monitoring, and submit periodic reports.

The operators of construction activities disturbing greater than 5 acres have been required to obtain NPDES permit coverage since 1992. General permits for large construction activity require construction operators to develop and implement a storm water pollution prevention plan to control erosion, sediment and other wastes on the site.

The Phase I industrial storm water program also regulates the following industrial sectors:

- facilities subject to EPA storm water effluent guidelines, new source performance standards, or toxic pollutant effluent standards
- heavy manufacturing facilities
- mining/oil and gas
- hazardous waste facilities
- landfills
- recycling facilities
- steam electric power
- transportation facilities
- sewage treatment plants
- construction activity (described above), and
- light manufacturing facilities.

The second phase of the storm water program, which this guide addresses, requires permits for storm water discharges from certain small municipal separate storm sewer systems and construction activity generally disturbing between 1 and 5 acres. See Figure 2-4 for a summary of the federal storm water permit requirements under Phases I and II.

Figure 2-4. Summary of Federal Permit Requirements Under the NPDES Storm Water Program

	Municipal Separate Storm Sewer Systems (MS4s)	Construction Activity	Industrial Activity
Requirements in Effect Now (Phase I)	<p>Medium and Large MS4s (§ 122.26(d))</p> <ul style="list-style-type: none"> Storm Water Management Program: <ul style="list-style-type: none"> - Public education and outreach - Public participation efforts - Illicit discharge detection and elimination program - Construction and post-construction runoff control program for all construction activity (no size threshold) - BMPs to reduce pollutants from industrial, commercial, and residential areas Track/oversee industrial facilities regulated under the NPDES storm water program Conduct analytical and visual monitoring of MS4 discharges Submit periodic program assessment reports 	<p>Category (x) Construction Activity (5+ Acres)*</p> <p><u>CGP:</u></p> <ul style="list-style-type: none"> Storm Water Pollution Prevention Plan (SWPPP) <ul style="list-style-type: none"> - Site description - Description of BMPs for erosion and sediment, post-construction storm water management, and other controls - Self-evaluation and reporting <p><i>*Category (x) is one of the categories of "storm water discharges associated with industrial activity." 3.0 REGULATION REQUIREMENTS

After reading section 3.0, you should understand the basic components and requirements of the Storm Water Phase II Rule and the rule's compliance schedule/timeline. This information is meant to serve as a basis for understanding the details of the Rule as discussed in further sections of this guidance.

3.1 What Does The Storm Water Phase II Rule Require?

This regulation can be divided into three main components, each with distinct requirements, affecting three types of entities. These components and the requirements for each are summarized below.

Regulated Small MS4s (see section 4.0)

A certain subset of operators of small MS4s (primarily those located in urbanized areas) are required to implement programs and practices to control polluted storm water runoff from the jurisdiction serviced by the MS4. The operator must design its storm water management program to satisfy applicable CWA water quality requirements and technology standards. The program must include the development and implementation of best management practices (BMPs) and measurable goals for the following six minimum measures, and include evaluation and reporting efforts:

- Public education and outreach,
- Public participation/involvement,
- Illicit discharge detection and elimination,
- Construction site runoff control,
- Post-construction runoff control, and
- Pollution prevention/good housekeeping for municipal operations.

Two waivers from coverage are available for small MS4s brought into the program by the Phase II regulation.

Small Construction Activity (see section 5.0)

All construction operators disturbing more than 1 acre and less than 5 acres are required to apply for an NPDES storm water permit for small construction activity. EPA already regulates construction activity disturbing more than 5 acres. A construction operator is usually the developer or landowner, but can also be the contractor or another party responsible for the operational control of erosion and sediment control practices on site.

Unlike the requirements for regulated small MS4s, the requirements for small construction activity (primarily activity disturbing between 1 and 5 acres of land) are not detailed in the Phase II regulation. Rather, the requirements are left to the discretion of the NPDES permitting authority when it develops the small construction activity permit. EPA expects the permit for small construction activity to be similar to the existing storm water general permits for large construction activity regulated under the Phase I program. EPA's existing Construction General Permit includes requirements to:

- Submit a Notice of Intent (NOI);
- Develop and implement a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP includes erosion and sediment controls, controls on waste at the site, self-inspection/monitoring, and reporting efforts; and
- Submit a Notice of Termination (NOT) when permit coverage is no longer necessary.

Two waivers from coverage are available for small construction activity.

Industrial Activity (see section 6.0)

Eleven categories of industrial activity are regulated under Phase I of the NPDES Storm Water Program. Under the Phase II Rule, no new categories of industrial activity are designated into the storm water program. The Rule does, however, include a revised no exposure exclusion that is available to all regulated categories of industrial activity (except category (x) - large construction activity) if the facility operator can certify that storm water runoff is not exposed to industrial activities.

Also, this regulation further extends the deadline to obtain permit coverage for those industrial activities operated by municipalities with populations of less than 100,000 that were temporarily exempted from permitting under the Intermodal Surface Transportation Enforcement Act (ISTEA) of 1991.

3.2 What Is the Phase II Rule's Compliance Schedule/Timeline?

The Phase II Final Rule was published in the *Federal Register* on December 8, 1999 (64 *FR* 68722). The following table lists milestones for EPA, the NPDES permitting authorities, and the regulated community under this program.

Storm Water Phase II Program Compliance Timeline

ACTIVITY	DEADLINE
Conditional No Exposure Exclusion option available in States where EPA is the NPDES permitting authority	February 7, 2000
Submission of No Exposure Certification	Every 5 years
EPA issues a menu of BMPs for small MS4 programs	October 2000
EPA issues a model general permit for small MS4s	October 2000
EPA issues guidance on measurable goals for small MS4 programs	October 2001
NPDES permitting authority determines designation of small MS4s located outside of an urbanized area that serve a jurisdiction with a population of 10,000 and population density of 1,000	By December 9, 2002; or by December 8, 2004 if apply designation criteria on a watershed basis under a comprehensive watershed plan
NPDES permitting authority determines waivers for regulated small MS4s in urbanized areas	By December 9, 2002
NPDES permitting authority issues general permits for regulated small MS4s and small construction activity	By December 9, 2002
Operators of regulated small MS4s and small construction activity designated by the rule must obtain permit coverage	By March 10, 2003
Operators of regulated small MS4s and small construction activity designated by NPDES permitting authority must obtain permit coverage	Within 180 days of notice
Temporarily exempted municipal operators of industrial activity must obtain permit coverage (ISTEA moratorium)	By March 10, 2003
The NPDES permitting authority may phase in coverage for small MS4s serving jurisdictions with a populations less than 10,000 on a schedule consistent with a State watershed permitting approach	Completion of phase-in by March 8, 2007
The regulated small MS4s must fully implement their storm water management programs	By the end of the first permit term – typically a 5-year period
Re-evaluation of the Phase II small MS4 regulations by EPA	By December 2012
NPDES permitting authority determination on a petition for designation of a non-regulated storm water discharger	Within 180 days of receipt

4.0 REGULATED SMALL MS4S

After reading section 4.0, you should understand what an MS4 is, which operators of MS4s are subject to the Phase II small MS4 regulations (including who may be waived from coverage), the small MS4 permit options, and the permit requirements for a small MS4 storm water management program. The discussion of these elements concludes with a step-by-step review of the process for compliance with the small MS4 program and possible funding options. Special concerns regarding Federal and State-operated small MS4s are also addressed.

4.1 MS4 DEFINITIONS

EPA's National Pollutant Discharge Elimination System (NPDES) storm water permitting program labels municipal separate storm sewer systems (MS4s) as either "small," "medium," or "large" for the purposes of regulation. The definitions of each are included herein. The Phase I storm water program covers medium and large MS4s. The Phase II storm water regulation covers a certain subset of small MS4s, known as "regulated small" MS4s. Regulated small MS4 coverage under the rule is discussed in section 4.2.

4.1.1 What is an "MS4"?

What constitutes a municipal separate storm sewer system (MS4) is often misinterpreted and misunderstood. The term MS4 does not solely refer to municipally-owned storm sewer systems, but rather is a term of art with a much broader application that can include, in addition to local jurisdictions, State departments of transportation, universities, local sewer districts, hospitals, military bases, and prisons. An MS4 also is not always just a system of underground pipes – it can include roads with drainage systems, gutters, and ditches. The regulatory definition of an MS4 is provided in the text box below.

According to 40 CFR 122.26(b)(8), “*municipal separate storm sewer* means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains):

- (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law)...including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the Clean Water Act that discharges into waters of the United States.
- (ii) Designed or used for collecting or conveying storm water;
- (iii) Which is not a combined sewer; and
- (iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2."

4.1.2 What is a "large" MS4?

A **large MS4** is any MS4 located in an incorporated place or county with a population of 250,000 or greater as of the 1990 Census. The Phase II Final Rule revised the original large MS4 definition (found in the 1990 Phase I regulations) by freezing it as of the 1990 Census so that no new large MS4s could be automatically designated based on the 2000 Census, or any subsequent Census. Listings of incorporated places and counties with populations of 250,000 or greater as of the 1990 Census are included in the revised Appendices F and H to Part 122, found in the Phase II Final Rule.

4.1.3 What is a "medium" MS4?

A **medium MS4** is any MS4 located in an incorporated place or county with a population between 100,000 - 249,999 as of the 1990 Census. The Phase II Final Rule revised the original medium MS4 definition (found in the 1990 Phase I regulations) by freezing it as of the 1990 Census so that no new medium MS4s could be automatically designated based on the 2000 Census, or any subsequent Census. Listings of incorporated places and counties with populations between 100,000 - 249,999 as of the 1990 Census are included in the revised Appendices G and I to Part 122, found in the Phase II Final Rule.

Important Note: Many MS4s in areas below 100,000 in population have been individually brought into the Phase I program by NPDES permitting authorities. Such already regulated MS4s are considered Phase I MS4s and are not required to develop a Phase II program.

4.1.4 What is a "small" MS4?

A **small MS4** is any MS4 that is not already regulated under the Phase I storm water program. Unlike the definitions of medium and large MS4s, the definition of a small MS4: 1) is not dependant on a population threshold, and 2) includes Federally-owned systems, such as military bases and veterans hospitals.

4.2 COVERAGE: Who Is Subject to the Phase II Final Rule?

4.2.1 Are All Small MS4s Covered by the Phase II Final Rule?

No. The universe of small MS4s is quite large since it includes every MS4 except for the approximately 900 medium and large MS4s already regulated under the Phase I storm water program. Only a select sub-set of small MS4s, referred to as **regulated small MS4s**, are covered by the Phase II Final Rule, either through automatic nationwide designation by the rule or designation on a case-by-case basis by the NPDES permitting authority.

4.2.2 How Is A Small MS4 Designated as a Regulated Small MS4 under Phase II?

A *small MS4* can be designated as a *regulated small MS4*, and thereby be subject to the Phase II rule, in any one of the three ways explained in the following subsections.

4.2.2.1 Automatic Nationwide Designation by the Rule

The Phase II Final Rule requires "automatic" nationwide coverage of all operators of small MS4s that are located within the boundaries of a Bureau of the Census-delineated "urbanized area" (UA) based on the latest decennial Census. This doesn't just include municipal operators of small MS4s, but also universities, highway departments, and any other operator of a storm sewer system that is located fully or partially within the UA. **Refer to section 4.3 for more information on how to determine if a particular small MS4 is located within a UA.**

Important Note: Only the portion of the small MS4 that is located within the UA boundaries is regulated under Phase II. For example, if a county operates a small MS4 that serves the whole county but only half of the MS4 falls within the UA boundary, then the county must obtain permit coverage (and implement a storm water management program) only for the half of the MS4 in the UA.

Once a small MS4 is designated into the program based on the UA boundaries, it cannot be waived from the program if in a subsequent UA calculation the small MS4 is no longer within the UA boundaries. An automatically designated small MS4 remains regulated unless, or until, it meets the criteria for a waiver. See section 4.4 for more information on waivers from coverage for regulated small MS4s in urbanized areas.

An operator of a small MS4 located outside of a UA boundary may be designated as a regulated small MS4 if the NPDES permitting authority determines that the small MS4's discharges cause, or have the potential to cause, an adverse impact on water quality. See sections 4.2.2.2 and 4.2.2.3 below for more information on designations by the permitting authority.

Preamble of the Phase II Final Rule: Appendix 6

A listing of governmental entities that are located either fully or partially within a UA according to the 1990 Census can be found in Appendix 6 to the Preamble of the Phase II Final Rule. The list is a general geographic reference intended to help operators of small MS4s determine whether or not they are located in a UA and, consequently, required to comply with the regulation; it is not a list of all Phase II regulated MS4s and it may contain errors. For example, the list does not include small MS4 operators such as colleges and universities, Federal prison complexes, and State highway departments located within a UA.

4.2.2.2 Potential Designation by the NPDES Permitting Authority — Required Evaluation of 10,000/1,000 Areas

The Phase II Final Rule requires the NPDES permitting authority to develop a set of designation criteria and apply them, *at a minimum*, to all small MS4s located outside of a UA that serve a jurisdiction with a population of at least 10,000 and a population density of at least 1,000 people/square mile. The permitting authority is required to *evaluate* such small MS4s but is not required to *designate* them into the program unless they meet the designation criteria.

Recommended Designation Criteria

EPA recommends in the Phase II regulations that the NPDES permitting authority use a balanced consideration of the following designation criteria on a watershed or other local basis:

- ✓ Discharge to sensitive waters;
- ✓ High population density;
- ✓ High growth or growth potential;
- ✓ Contiguity to a UA;
- ✓ Significant contributor of pollutants to waters of the United States; and
- ✓ Ineffective protection of water quality concerns by other programs.

Preamble of the Phase II Final Rule: Appendix 7

A listing of governmental entities located outside of a UA that have a population of at least 10,000 and a population density of at least 1,000 people per square mile, can be found in Appendix 7 to the Preamble of the Phase II Final Rule. Similar to Appendix 6, the list is a geographic reference only – it is not a list of regulated entities and it may contain errors. Operators of small MS4s located within a listed area could be examined by their NPDES permitting authority for potential designation into the Phase II

program. Furthermore, the NPDES permitting authority reserves the right to designate for regulation any small MS4 that is contributing pollutants to waters of the United States, whether or not its jurisdiction is found in Appendix 7.

Deadline for Designation

The NPDES permitting authority is required to designate small MS4s meeting the designation criteria by December 9, 2002, or by December 8, 2004 if a comprehensive State watershed plan is in place and the criteria are being applied on a watershed basis.

4.2.2.3 Potential Designation by the NPDES Permitting Authority — Physically Interconnected

The Phase II Final Rule requires the NPDES permitting authority to designate any small MS4 located outside of a UA that contributes substantially to the pollutant loadings of a *physically interconnected* MS4 that is permitted by the NPDES storm water program. This means the other MS4 could be a large, medium, or regulated small MS4.

Small MS4s located right outside the boundary of an urbanized area are the ones most likely to meet this criterion for designation and, therefore, should make an effort to become aware of whether they discharge pollutants directly into a regulated MS4. The sooner a small MS4 operator is prepared for potential designation and implementation of the Phase II program, the better.

Physically interconnected means that one MS4 is connected to a second MS4 in such a way that it allows for *direct* discharges into the second system.

Deadline for Designation

The final rule does not set a deadline for designation of small MS4s meeting this criterion.

4.3 URBANIZED AREAS: What Are They and How Does a Small MS4 Operator Determine If It Is Located in One?

As discussed in section 4.2, the Phase II Final Rule covers all small municipal separate storm sewer systems (MS4s) located within an “urbanized area” (UA). Based on the 1990 Census, there are 405 UAs in the United States that cover 2 percent of total U.S. land area and contain approximately 63 percent of the Nation’s population. These numbers include Puerto Rico — the only U.S. Territory with UAs.

UAs constitute the largest and most dense areas of settlement. UA calculations delineate boundaries around these dense areas of settlement and, in doing so, identify the areas of concentrated development. UA designations are used for several

purposes in both the public and private sectors. For example, the Federal Government has used UAs to calculate allocations for transportation funding, and some planning agencies and development firms use UA boundaries to help ascertain current, and predict future, growth areas.

4.3.1. What Is the Definition of an Urbanized Area (UA)?

The Bureau of the Census determines UAs by applying a detailed set of published UA criteria (see 55 *FR* 42592, October 22, 1990) to the latest decennial census data. Although the full UA definition is complex, the Bureau of the Census' general definition of a UA, based on population and population density, is provided below.

An *urbanized area (UA)* is a land area comprising one or more places – central place(s) – and the adjacent densely settled surrounding area – urban fringe – that together have a residential population of at least 50,000 and an overall population density of at least 1,000 people per square mile. It is a calculation used by the Bureau of the Census to determine the geographic boundaries of the most heavily developed and dense urban areas.

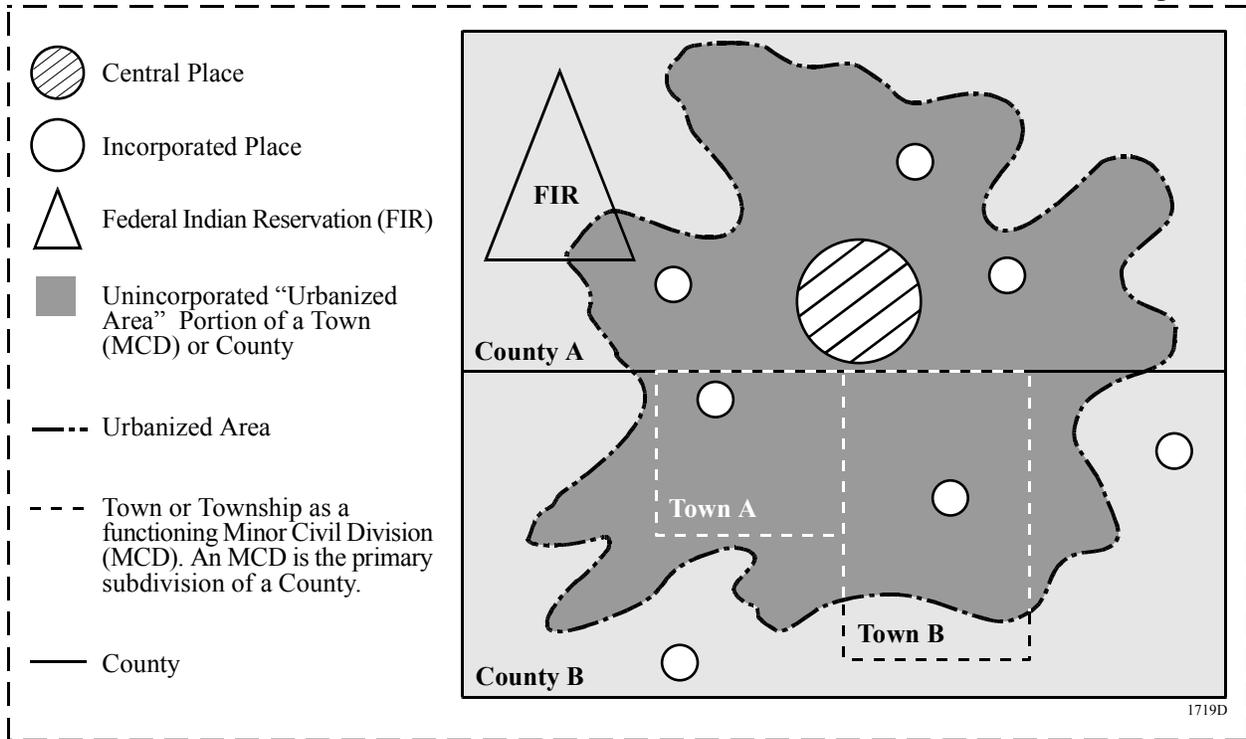

UA Facts:

- The basic unit for delineating the UA boundary is the census block. Census blocks are based on visible physical boundaries, such as the city block, when possible, or on invisible political boundaries, when not. An urbanized area can comprise places, counties, Federal Indian Reservations, and minor civil divisions (MCDs - towns and townships).
- A UA can include governmental entities of every population size: 200; 7,000; 15,000; 30,000, 200,000; or 3 million! Entities with small populations are commonly found in the urban fringe of the UA.
- Before the time of permit issuance (by December 9, 2002), new UA calculations based on the 2000 Census should be published. The regulated small MS4 universe then will be based on these new calculations.

4.3.2. What Does A UA Look Like?

The drawing below (see Figure 4-1) is a simplified UA illustration that demonstrates the concept of UAs in relation to the Phase II Final Rule. This “urbanized area” includes within its boundaries incorporated places, a portion of a Federal Indian reservation, an entire MCD, a portion of another MCD, and portions of two counties. Any and all operators of small MS4s located within the boundaries of the UA are covered under the Phase II Final Rule, regardless of political boundaries. Operators of small MS4s located outside of the UA are subject to potential designation into the Phase II MS4 program by the NPDES permitting authority, as explained in section 4.2.

Figure 4-1

4.3.3 How Can An Operator of a Regulated Small MS4 Determine If It Is Located Within a UA?

Operators of small MS4s can determine if they are located within a UA, and therefore covered under the Phase II storm water program, through the following two steps:

— STEP 1 —

Refer to a listing of incorporated places, MCDs, and counties that are located entirely or partially within a UA. Such a listing, based on the 1990 Census and including only those entities not regulated under Phase I, can be found in Appendix 6 to the Preamble of the Phase II Final Rule. If a small MS4 is located in a listed incorporated place, MCD, or county, then the operator of the small MS4 should follow step (2) below. It is important to note that Appendix 6 is general guidance only and may contain errors. For this reason, even if a particular small MS4 isn't located in a listed area, EPA recommends that the small MS4 operator follow Step 2.

— STEP 2 —

Some operators of small MS4s may find that they are located within an

entity listed in Appendix 6 but not know if their systems are within the urbanized portion of the listed entity, or they are not on the list but want to confirm their status as recommended above. In such cases, they should contact one or more of the following institutions for more detailed information on the location of UA boundaries:

❑ **The State or NPDES Permitting Authority**

Storm Water Coordinators: The NPDES permitting authority may be the State or the U.S. EPA Region. The Storm Water Coordinators for each U.S. EPA Region are listed in Section 8. These regional contacts can assist with UA information and provide the names of State storm water contacts.

State Data Centers: Each State's Data Center receives listings of all entities that are located in UAs, as well as detailed maps and electronic files of UA boundaries. The Bureau of the Census web site includes a list of contact names and phone numbers for the Data Center in each State at www.census.gov/sdc/www.

State Planning/Economic/Transportation Agencies: These agencies typically use UAs to assess current development and forecast future growth trends and, therefore, should have detailed UA information readily available to help determine the UA boundaries in any given area.

❑ **County or Regional Planning Commissions/ Boards**

As with State agencies, these entities are likely to have detailed UA data and maps to help determine UA boundaries.

❑ **The Bureau of the Census**

Urbanized Areas Staff: 301 457-1099

Web Site: www.census.gov

The site provides information on purchasing UA maps and electronic files for use with computerized mapping systems. Obtain free UA cartographic boundary files (Arc/Info export format) for Geographical Information System (GIS) use at: www.census.gov:80/geo/www/cob/ua.html.

UA Maps: Detailed UA maps are available for purchase with a \$25 minimum order (\$5 per map sheet). Each map sheet measures 36 by 42 inches. For prices and a listing of UAs, visit www.census.gov/mp/www/geo/msgeo12.html. Order from the Department of Commerce, Bureau of the Census (MS 1921), P.O. Box 277943, Atlanta, GA 30384-7943 (Phone: 301 457-4100; Toll-free fax: 1-888-249-7295).

❑ **U.S. EPA**

EPA is currently modifying a web-based geographic program called *Enviromapper* for use in determining UA boundaries. This program will allow users to enter a location (by name, zip code, or street address) and see a map that will show if the location is within a UA boundary. EPA is committed to using *Enviromapper* to create a tool that, someday, will be the only tool necessary to determine the location of UA boundaries. Information about *Enviromapper* will be available at www.epa.gov/owm/phase2.

4.3.4 How Will the Year 2000 Census Affect the Determination of Status as a Regulated Small MS4?

The listing of incorporated places, MCDs, and counties located within UAs in the United States and Puerto Rico, found in Appendix 6, is based on the 1990 Census. New listings for UAs based on the 2000 Census are scheduled to be available by August of 2001. Once the official 2000 Census listings are published by the Bureau of the Census, operators of small MS4s located within the revised boundaries of former 1990 UAs, or in any newly defined 2000 UAs, become regulated small MS4s and must develop a storm water management program.

Any additional automatic designations of small MS4s based on subsequent census years is governed by the Bureau of the Census' definition of a UA in effect for that year and the UA boundaries determined as a result of the definition.

Once a small MS4 is designated into the Phase II storm water program based on the UA boundaries, it can not be waived from the program if in a subsequent UA calculation the small MS4 is no longer within the UA boundaries. An automatically designated small MS4 will remain regulated unless, or until, it meets the criteria for a waiver.

4.4 WAIVERS: Which Regulated Small MS4s May Obtain a Waiver From Coverage?

Two waiver options are available to operators of regulated small MS4s in urbanized areas if the NPDES permitting authority determines that their discharges do not cause, or have the potential to cause, water quality impairment.

Important Note: The waivers are granted by the NPDES permitting authority, the operator of the regulated small MS4 can not determine for itself that it meets the waiver criteria. If the permitting authority is not proactive in assessing small MS4s for potential waivers, an operator may petition for a waiver assessment.

If a permitting authority decides to grant waivers, it is required to do so by December 9, 2002 to coincide with the expected date of the small MS4 permit issuance. The

permitting authority is also required to periodically review any waivers granted to small MS4 operators to determine whether any information required for granting the waiver has changed. Minimally, such a review needs to be conducted once every five years. The waiver options are described in the following two subsections.

Deadline for Waivers

The NPDES permitting authorities are required to make their waiver determinations by March 9, 2002 to coincide with the expected issuance of their small MS4 general permit. If the permit authority chooses to phase in permit coverage based on a comprehensive watershed plan (see section 4.5.2.2), then regulated small MS4s may be waived on the same schedule. The phase-in of permit coverage and waivers is to be completed no later than March 8, 2007.

4.4.1 Option 1: Less than 1,000 Population in a UA

The first waiver option applies where:

- (1) the jurisdiction served by the system is less than 1,000 people;
- (2) the system is not contributing substantially to the pollutant loadings of a physically interconnected regulated MS4; and
- (3) if the small MS4 discharges any pollutants identified as a cause of impairment of any water body to which it discharges, storm water controls are not needed based on wasteload allocations that are part of an EPA approved or established "total maximum daily load" (TMDL) that addresses the pollutant(s) of concern.

TMDLs are water quality assessments that determine the source or sources of pollutants of concern for a particular waterbody, consider the maximum amount of pollutants the waterbody can assimilate, and then allocate to each source a set level of pollutants that it is allowed to discharge (i.e., a "wasteload allocation"). Small MS4s that are not given a wasteload allocation would meet the third criterion above.

The third criterion of this waiver option need only be met if the small MS4 is discharging into a impaired water body and the discharge contains a pollutant or pollutants that are the cause of the impairment (i.e., the "pollutants of concern").

4.4.2 Option 2: Less than 10,000 Population in a UA

The second waiver option applies where:

- (1) the jurisdiction served by the system is less than 10,000 people;

- (2) an evaluation of all waters of the U.S. that receive a discharge from the system shows that storm water controls are not needed based on wasteload allocations that are part of an EPA approved or established TMDL that addresses the pollutant(s) of concern or an equivalent analysis; and
- (3) it is determined that future discharges from the small MS4 do not have the potential to result in exceedances of water quality standards.

Pollutants of Concern include biochemical oxygen demand (BOD), sediment or a parameter that addresses sediment (such as total suspended solids, turbidity or siltation), pathogens, oil and grease, and any pollutant that has been identified as a cause of impairment in any water body to which the MS4 discharges.

This waiver option differs from the first option in that: 1) it applies to a larger jurisdiction size (up to 10,000 rather than 1,000), 2) it requires a determination that the discharges are not affecting the receiving water body, whether the water body is impaired or not (in the first option an assessment is only necessary if the water body is impaired and the MS4 is discharging a pollutant of concern), 3) the determination must be based on a TMDL or an equivalent analysis (the first option does not allow for an equivalent analysis), and 4) an assessment of the impacts of future discharges must be performed (no such assessment is necessary under the first option).

4.5 PERMITTING OPTIONS: What Permitting Choices are Available?

The Storm Water Phase II Final Rule requires operators of a particular subset of small MS4s in urbanized areas to obtain National Pollutant Discharge Elimination System (NPDES) permit coverage because their storm water discharges are considered “point sources” of pollution. All point source discharges, unlike nonpoint sources such as agricultural runoff, are required under the Clean Water Act (CWA) to be covered by federally enforceable NPDES permits. Those MS4s already permitted under the NPDES Phase I storm water program, even MS4s serving less than 100,000 people, are not required to be permitted under the Phase II storm water program.

NPDES storm water permits are issued by an NPDES permitting authority, which may be an NPDES-authorized State or a U.S. EPA Region in non-authorized States. Once a permit application is submitted by the operator of a regulated small MS4 and a permit is obtained, the conditions of the permit must be satisfied (i.e., development and implementation of a storm water management program) and periodic reports must be submitted on the status and effectiveness of the program. This section addresses the flexible permit options the Phase II regulations allow for the regulated small MS4 operator, as well as for the permitting authority. The permit requirements are discussed in section 4.6.

4.5.1 For Regulated Small MS4 Operators**4.5.1.1 The Types of Permit Coverage Available**

Unlike the Phase I program that requires individual permits for medium and large MS4s, the Phase II approach allows operators of regulated small MS4s to choose from as many as three permitting options as listed below. Each NPDES permitting authority reserves the authority to determine, however, which options are available to the regulated small MS4s in their jurisdiction.

1) General Permits

- # General permits are strongly encouraged by EPA. The Phase II program has been designed specifically to accommodate a general permit approach.
- # General permits prescribe one set of requirements for all applicable permittees. General permits are drafted by the NPDES permitting authority, then published for public comment before being finalized and issued.
- # A Notice of Intent (NOI) serves as the application for the general permit. The regulated small MS4 operator complies with the permit application requirements by submitting an NOI to the NPDES permitting authority that describes the storm water management plan, including best management practices (BMPs) and measurable goals. The operator has the flexibility to develop an individualized storm water program that addresses the particular characteristics and needs of its system, provided the requirements of the general permit are satisfied.
- # For general permit coverage, the regulated small MS4 operator must follow the Phase II permit application requirements (see section 4.6.2).

2) Individual Permits

- # Individual permits are required for Phase I medium and large MS4s, but not recommended by EPA for Phase II program implementation.
- # Individual permits prescribe a particular set of requirements for a particular permittee or a group of co-permittees. Individual permits require the submission of a more comprehensive permit application than an NOI that is submitted under a general permit. Once the permit application is received, an individual permit is drafted by the NPDES permitting authority, then published for public comment before being finalized and issued.
- # The Phase II rule allows a regulated small MS4 to submit an individual application for coverage under either the:

- Phase II MS4 regulation (see § 122.34 of the Phase II rule), or
- Phase I MS4 regulation (see 40 CFR §122.26(d)).

3) Modification of an Existing Phase I Individual Permit – A Co-Permittee Option with Medium and Large MS4s

The operator of a regulated small MS4 could participate as a limited co-permittee in a neighboring Phase I MS4's storm water management program by seeking a modification of the existing Phase I individual permit. As a limited co-permittee the small MS4 operator would be responsible for compliance with the permit's conditions applicable to its jurisdiction.

Note: A list of Phase I medium and large MS4s can be obtained from the EPA Office of Wastewater Management (OWM) or downloaded from the OWM web site.

The permittee must comply with the applicable terms of the modified Phase I individual permit rather than the minimum control measures in the Phase II Final Rule.

4.5.1.2 Co-permittee with Another Operator of a Regulated Small MS4

Section 4.5.1.1 explained the permitting option of a modification of an existing Phase I individual permit in order to be a co-permittee with a medium or large MS4. Regulated small MS4 operators may also choose to share responsibilities for meeting the Phase II program requirements with another regulated small MS4 operator under a general or individual permit. Those operators choosing to do so may submit jointly an NOI or individual permit application that identifies who will implement which minimum measures within the area served by the MS4s.

4.5.1.3 Relying on Another Entity to Satisfy One or More of the Minimum Control Measures

Under either a general or individual permit, the Phase II small MS4 permittee has the option of relying on other entities that are already performing one or more of the minimum control measures to implement the measure(s) on the permittee's behalf. This is only allowable where the existing control measure, or component thereof, is at least as stringent as the Phase II rule requirements (under § 122.34(b)) and the other entity has agreed to the arrangement.

For example, a county may already have an illicit discharge detection and elimination program in place and may allow an operator of a regulated small MS4 within the county's jurisdiction to rely on the county program instead of formulating and implementing a new program. In such a case, the permittee would not need to

implement the particular measure, but would still be ultimately responsible for its effective implementation. For this reason, EPA recommends that the permittee enter into a legally binding agreement with the other entity. If the permittee chooses to rely on another entity, they must note this in their permit application and subsequent reports.

Note: Also, the other entity does not necessarily need to be a governmental entity. For example, a permittee could rely on a non-profit organization that is performing public education efforts on environmental issues to satisfy the public education and outreach minimum measure.

A Phase II permittee also has the option to rely on another entity to satisfy all of the permittee's small MS4 permit obligations – but only if the other entity is a governmental entity permitted under the NPDES storm water program. Should this option be chosen, the permittee must note this in its NOI, but does not need to file the otherwise required periodic reports on the status of the program. Again, it is important to note that the permittee would remain ultimately liable under the small MS4 permit. This option is particularly beneficial for operators that serve a low population, have limited resources or legal authority, or are surrounded by an NPDES regulated municipality. For example, let's assume a college campus or a veteran's hospital are operators of small MS4s and they are located in the middle of a Phase II regulated city. Negotiating with the city to implement the storm water management program for them in their jurisdictions could be a cost-effective and less burdensome option than for each to implement their own programs.

4.5.2 For the NPDES Permitting Authority

4.5.2.1 Alternative Options for Writing Permit Requirements

Two permitting options tailored to minimize duplication of effort by the regulated small MS4 permittee can be incorporated into the general or individual permit by the NPDES permitting authority:

1) Recognizing Another Governmental Entity's Program

The permitting authority can recognize in a small MS4 permit that another governmental entity is responsible under an NPDES permit for implementing any or all of the minimum control measures. In such a case, responsibility for implementation of the measure(s) would rest with the other governmental entity, thereby relieving the small MS4 permittee of its responsibility to implement that particular measure(s). See Table 4-1 for examples of both this option and the following option.

4.0 Regulated Small MS4s

STORM WATER PHASE II RULE SMALL MS4 FLEXIBLE PERMITTING OPTIONS

	Referencing a QUALIFYING LOCAL PROGRAM (QLP)	RECOGNIZING an NPDES-Regulated Entity	RELYING on Another Entity	CO-PERMITTEE with an NPDES-Regulated Entity
NPDES PERMITTING AUTHORITY Responsibilities	<ul style="list-style-type: none"> • PA assesses local, State, and Tribal NPDES and non-NPDES programs to determine if their requirements are equivalent to one or more Phase II minimum measures for regulated small MS4s • PA chooses whether to reference a QLP in small MS4 permit. Requires permittee to follow requirements of QLP rather than new permit requirements. • PA does not need to notify the administrator of the QLP or obtain permission since referencing the QLP has no bearing/no affect on the administrator. 	<ul style="list-style-type: none"> • PA assesses entities that are, or will be, performing the equivalent of 1 or more of the small MS4 minimum measures under an NPDES permit. • PA chooses whether to recognize such an entity in a small MS4 permit. 	N/A	N/A
SMALL MS4 OPERATOR Responsibilities	<ul style="list-style-type: none"> • The operator should already be complying with any QLP referenced in the permit. • Compliance with the QLP is considered compliance with the NPDES permit; therefore operator <u>held liable</u> if doesn't comply with the QLP. 	<ul style="list-style-type: none"> • Operator has <u>no responsibility</u> to perform the measure(s) that is being done by the recognized entity. • <u>Not held liable</u> if the other entity fails to perform the measure effectively; however, PA may then require the operator to implement the measure itself. 	<ul style="list-style-type: none"> • Operator <u>chooses</u>, under its own permit, whether to rely on another entity to implement 1 or more minimum measure on its behalf – can be a non-NPDES regulated entity. • Operator notes in NOI or indiv. permit application that it is relying on another entity to implement a measure. • Remain liable if other entity fails to perform the measure effectively. 	<ul style="list-style-type: none"> • Operator <u>chooses</u> whether to be a co-permittee with another regulated MS4 and submits a single NOI or individual permit application • The operators determine who will do what and include this information in the permit application
EXAMPLES	<p>The QLP in the small MS4 permit could be a State program that requires MS4 operators to detect & eliminate illicit discharges into their systems.</p>	<p>A county doing educational outreach for the whole county under a Phase I NPDES permit could be recognized, thereby relieving all small MS4s in the county from having to have their own educational outreach programs.</p>	<ol style="list-style-type: none"> 1. An environmental group is doing educational outreach on the impacts of storm water runoff. 2. A county is already implementing a construction runoff control program under a Phase I NPDES permit. 	

2) Referencing a Qualifying Local Program

The NPDES permitting authority can include conditions in a small MS4 permit that direct a permittee to follow the requirements of an existing qualifying local program rather than the requirements of particular minimum control measure(s). A qualifying local program is defined as a local, State or Tribal municipal storm water program that imposes requirements that are equivalent to those of the Phase II MS4 minimum measures (as found in § 122.34(b) of the rule). Unlike in Option 1 above, under this option the permittee remains responsible for the implementation of the minimum measure through its compliance with the qualifying local program.

4.5.2.2. Alternative Option for Permit Coverage: Phase-in Coverage for Regulated Small MS4s with Populations under 10,000

Permitting authorities may phase-in permit coverage for regulated small MS4s serving jurisdictions with a population under 10,000 on a schedule consistent with a State watershed permitting approach. Under this alternative option, the permitting authority must develop and implement a schedule to phase-in permit coverage for approximately 20 percent annually of all regulated small MS4s that qualify, completing the phase-in schedule in no more than five years. In such a case, the regulated small MS4 operators would be notified by the permitting authority concerning the operator's deadlines for permit coverage.

Deadlines for Phase-In

- Permitting authorities are required to have their phase-in schedule approved by the USEPA Regional Administrator no later than December 10, 2001.
- Under the phase-in option, all regulated small MS4s are required to have coverage under an NPDES permit no later than March 8, 2007.

4.6 REQUIREMENTS: What Requirements Are Regulated Small MS4s Subject To?

A regulated small MS4 operator is required to submit a permit application and obtain coverage under a NPDES storm water permit. Under the permit, the operator will be required to develop and implement a storm water management program that includes six minimum control measures, evaluation/assessment and reporting efforts, and recordkeeping, as described herein. This section begins by highlighting the standards an operator must meet to ensure compliance with the Phase II regulations.

4.6.1 Applicable Standards

A Phase II small MS4 operator must design a storm water management program so that it:

- Reduces the discharge of pollutants to the “maximum extent practicable”

(MEP);

- Protects water quality; and
- Satisfies the appropriate water quality requirements of the Clean Water Act.

The standard of MEP is the same standard applied to Phase I medium and large MS4 programs. There is no regulatory definition of MEP in order to allow the permitting authority and regulated MS4s maximum flexibility in their interpretation of it as appropriate.

Compliance with the technical standard of MEP requires the successful implementation of approved BMPs. The Phase II Final Rule considers narrative effluent limitations that require the implementation of BMPs and the achievement of measurable goals as the most appropriate form of effluent limitations to achieve the protection of water quality, rather than requiring that storm water discharges meet numeric effluent limitations.

EPA intends to issue Phase II NPDES permits consistent with its August 1, 1996, Interim Permitting Approach policy, which calls for BMPs in first-round storm water permits and expanded or better tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards. In cases where information exists to develop more specific conditions or limitations to meet water quality standards, these conditions or limitations should be incorporated into the storm water permit. Monitoring is not required under the Phase II Rule, but the NPDES permitting authority has the discretion to require monitoring if deemed necessary.

4.6.2 Permit Application Requirements

The permit application requirements differ depending on the type of permit chosen. The following subsections describe the applicable requirements for each type of permit option allowable under the Phase II regulation.

Deadline for Submission of Permit Application

The deadline for submission of each type of permit application is the same – it must be done no later than March 10, 2003 unless the NPDES permitting authority chooses to phase-in permit coverage on a watershed basis and establishes other deadlines (see section 4.5.2.2).

4.6.2.1 General Permit Under Phase II Regulations

Operators of regulated small MS4s are required to submit in their NOI the following information:

- Best management practices (BMPs) for each of the six minimum control measures:
 - ❶ Public education and outreach on storm water impacts
 - ❷ Public participation/involvement
 - ❸ Illicit discharge detection and elimination
 - ❹ Construction site storm water runoff control
Post-construction storm water management in new development/
redevelopment
 - ❺ Pollution prevention/good housekeeping for municipal operations
- Measurable goals for each minimum control measure (i.e, narrative or numeric standards used to gauge program effectiveness);
- Estimated months and years in which actions to implement each measure will be undertaken, including interim milestones and frequency; and
- The person or persons responsible for implementing or coordinating the storm water program.

The operator of a regulated small MS4 has the flexibility to determine the BMPs and measurable goals, for each minimum control measure, that are most appropriate for the system. The chosen BMPs and measurable goals, submitted in the permit application, become the required storm water management program; however, the NPDES permitting authority can require changes in the mix of chosen BMPs and measurable goals if all or some of them are found to be inconsistent with the provisions of the Phase II Final Rule. Likewise, the permittee can change its mix of BMPs if it determines that the program is not as effective as it could be. Section 4.6.2 fully describes the minimum control measures, including sample BMPs and measurable goals for each, while section 4.6.3 describes the permit requirements concerning evaluation/assessment and recordkeeping activities.

4.6.2.2 Individual Permit Under the Phase II Regulation

For individual permit coverage under Phase II, the regulated small MS4 operator must follow the requirements of 40 CFR § 122.21(f) and the Phase II permit application requirements as described in section 4.6.2.1 above. The operator must also provide an estimate of the square mileage served by the system and any additional information requested by the NPDES permitting authority. A storm sewer map that satisfies the requirements of § 122.34(b)(3)(i) of the Phase II rule will satisfy the map requirements of § 122.21(f)(7).

4.6.2.3 Individual Permit Under the Phase I Regulation

For individual permit coverage under Phase I, the regulated small MS4 operator must follow the permit application requirements detailed at 40 CFR § 122.26(d). The operator must submit both Part 1 and Part 2 of the application requirements in §§ 122.26(d)(1) and (2) by March 10, 2003. The operator would not need to submit the information required by §§ 122.26(d)(1)(ii) and (d)(2) regarding legal authority unless it wanted the permitting authority to take that information into account when developing the individual permit.

4.6.2.4 Modification of an Existing Phase I Individual Permit

Under this permit option, the operator of a regulated small MS4 must follow Phase I permit application requirements in § 122.26(d), with some exclusions, rather than Phase II permit application requirements. The operator would not need to follow the application requirements of §§ 122.26(d)(1)(iii) and (iv) and (d)(2)(iii) – *discharge characterization*. The operator may satisfy the requirements in §§ 122.26(d)(1)(v) and (d)(2)(iv) – *identification of a management program* – by referring to the Phase I MS4's storm water management program.

EPA Recommendations

In referencing a Phase I's MS4's storm water management program, the operator should briefly describe how the existing plan will address discharges from the small MS4 or would need to be supplemented in order to adequately address the small MS4 discharges. The small MS4 operator should explain their role in coordinating storm water pollutant control activities in their MS4 service area and detail the resources available to accomplish the plan.

If a small MS4 is considering this option, it should find out when the Phase I MS4's permit is scheduled for renewal and become thoroughly familiar with the Phase I MS4's permit conditions. This co-permitting approach will be most successful if both MS4s have had thorough discussions of their storm water programs and if the small MS4 submits its application at the time that the Phase I MS4 is submitting its reapplication.

4.6.2 Program Requirements: The Six Minimum Control Measures

If coverage is obtained under a general permit or an individual permit under the Phase II regulations, the operator of a regulated small MS4 is required to implement a storm water management program that includes, at a minimum, the six minimum control measures described in the following subsections. As you read these subsections, keep in mind that the operator has a great deal of flexibility in determining the best management practices they will use to accomplish each measure. The rule allows the operators to choose the BMPs and measurable goals for each measure as appropriate for their particular MS4 service area – as long as the chosen BMPs and measurable goals result in effective control of pollutants in storm water runoff. Otherwise, the permitting authority may require changes in the chosen mix of BMPs and measurable goals to result in a more effective program.

4.6.2.1 Public Education and Outreach on Storm Water Impacts

Why Is Public Education and Outreach Necessary?

An informed and knowledgeable community is crucial to the success of a storm water management program since it helps to ensure the following:

Greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important. Public support is particularly beneficial when operators of small MS4s attempt to institute new funding initiatives for the program or seek volunteers to help implement the program; and

Greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters.

What Is Required?

To satisfy this minimum control measure, the operator of a regulated small MS4 must:

- Implement a public education program to distribute educational materials to the community, or conduct equivalent outreach activities about the impacts of storm water discharges on local waterbodies and the steps that can be taken to reduce storm water pollution; and
- Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Some program implementation approaches, BMPs (i.e., the program actions/activities), and measurable goals are suggested below.

What Are Some Guidelines for Developing and Implementing This Measure?

Three main action areas are important for successful implementation of a public education and outreach program:

① ***Forming Partnerships***

Operators of regulated small MS4s are encouraged to enter into partnerships with other governmental entities to fulfill this minimum control measure's requirements. It is generally more cost-effective to use an existing program, or to develop a new regional or state-wide education program, than to have numerous operators developing their own local programs. Operators also are encouraged to seek assistance from non-governmental organizations (e.g., environmental, civic, and industrial organizations), since many already have educational materials and perform outreach activities.

② Using Educational Materials and Strategies

Operators of regulated small MS4s may use storm water educational information provided by their State, Tribe, EPA Region, or environmental, public interest, or trade organizations instead of developing their own materials. Operators should strive to make their materials and activities relevant to local situations and issues, and incorporate a variety of strategies to ensure maximum coverage. Some examples include:

Brochures or fact sheets for general public and specific audiences;

Recreational guides to educate groups such as golfers, hikers, paddlers, climbers, fishermen, and campers;

Alternative information sources, such as web sites, bumper stickers, refrigerator magnets, posters for bus and subway stops, and restaurant placemats;

A library of educational materials for community and school groups;

Volunteer citizen educators to staff a **public education task force**;

Event participation with educational displays at home shows and community festivals;

Educational programs for school-age children;

Storm drain stenciling of storm drains with messages such as “Do Not Dump - Drains Directly to Lake;”

Storm water hotlines for information and for citizen reporting of polluters;

Economic incentives to citizens and businesses (e.g., rebates to homeowners purchasing mulching lawnmowers or biodegradable lawn products);and

Tributary signage to increase public awareness of local water resources.

③ Reaching Diverse Audiences

The public education program should use a mix of appropriate local strategies to address the viewpoints and concerns of a variety of audiences and communities, including minority and disadvantaged communities, as well as children. Printing posters and brochures in more than one language or posting large warning signs (e.g., cautioning against fishing or swimming) near storm sewer outfalls are methods that can be used to reach audiences less likely to read standard materials. Directing materials or outreach programs toward specific groups of commercial, industrial, and institutional entities likely to have significant storm water impacts is also recommended. For example, information could be provided to restaurants on the effects of grease clogging storm drains and to auto garages on the effects of dumping used oil into storm drains.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should reflect the needs and characteristics of the operator and the area served by its small MS4. Furthermore, they should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following measurable goals:

<u>Target Date</u>	<u>Activity</u>
1 year.....	Brochures developed (bilingual, if appropriate) and distributed in water utility bills; a storm water hotline in place; volunteer educators trained.
2 years.....	A web site created school curricula developed; storm drains stenciled.
3 years.....	A certain percentage of restaurants no longer dumping grease and other pollutants down storm sewer drains.
4 years.....	A certain percentage reduction in litter or animal waste detected in discharges.

4.6.2.2 Public Participation/Involvement

Why Is Public Participation and Involvement Necessary?

EPA believes that the public can provide valuable input and assistance to a regulated small MS4's municipal storm water management program and, therefore, suggests that the public be given opportunities to play an active role in both the development and implementation of the program. An active and involved community is crucial to the success of a storm water management program because it allows for:

Broader public support since citizens who participate in the development and decision making process are partially responsible for the program and, therefore, may be less likely to raise legal challenges to the program and more likely to take an active role in its implementation;

Shorter implementation schedules due to fewer obstacles in the form of public and legal challenges and increased sources in the form of citizen volunteers;

A broader base of expertise and economic benefits since the community can be a valuable, and free, intellectual resource; and

A conduit to other programs as citizens involved in the storm water program development process provide important cross-connections and relationships with other community and government programs. This benefit is particularly valuable when trying to implement a storm water program on a watershed basis, as encouraged by EPA.

What Is Required?

To satisfy this minimum control measure, the operator of a regulated small MS4 must:

- ❑ Comply with applicable State, Tribal, and local public notice requirements; and
- ❑ Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Possible implementation approaches, BMPs (i.e., the program actions and activities), and measurable goals are described below.

What Are Some Guidelines for Developing and Implementing This Measure?

Operators of regulated small MS4s should include the public in developing, implementing, and reviewing their storm water management programs. The public participation process should make every effort to reach out and engage all economic and ethnic groups. EPA recognizes that there are challenges associated with public involvement. Nevertheless, EPA strongly believes that these challenges can be addressed through an aggressive and inclusive program. Challenges and example practices that can help ensure successful participation are discussed below.

Implementation Challenges

The best way to handle common notification and recruitment challenges is to know the audience and think creatively about how to gain its attention and interest. Traditional methods of soliciting public input are not always successful in generating interest, and subsequent involvement, in all sectors of the community. For example, municipalities often rely solely on advertising in local newspapers to announce public meetings and other opportunities for public involvement. Since there may be large sectors of the population who do not read the local press, the audience reached may be limited. Therefore, alternative advertising methods should be used whenever possible, including radio or television spots, postings at bus or subway stops, announcements in neighborhood newsletters, announcements at civic organization meetings, distribution of flyers, mass mailings, door-to-door visits, telephone notifications, and multilingual announcements. These efforts, of course, are tied closely to the efforts for the public education and outreach minimum control measure.

In addition, advertising and soliciting for help could and should be targeted at specific population sectors, including ethnic, minority, and low-income communities; academia and educational institutions; neighborhood and community groups; outdoor recreation groups; and business and industry. The goal is to involve a diverse cross-section of people who could offer a multitude of concerns, ideas, and connections during the program development process.

Possible Practices (BMPs)

There are a variety of practices that could be incorporated into a public participation and involvement program, such as:

Public meetings/citizen panels allow citizens to discuss various viewpoints and provide input concerning appropriate storm water management policies and BMPs;

Volunteer water quality monitoring gives citizens first-hand knowledge of the quality of local water bodies and provides a cost-effective means of collecting water quality data;

Volunteer educators/speakers who can conduct workshops, encourage public participation, and staff special events;

Storm drain stenciling is an important and simple activity that concerned citizens, especially students, can do;

Community clean-ups along local waterways, beaches, and around storm drains;

Citizen watch groups can aid local enforcement authorities in the identification of polluters; and

“Adopt A Storm Drain” programs encourage individuals or groups to keep storm drains free of debris and to monitor what is entering local waterways through storm drains.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, would greatly depend on the needs and characteristics of the operator and the area served by its small MS4. Furthermore, they should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following measurable goals:

Target Date	Activity
1 year.....	Notice of a public meeting in several different print media and bilingual flyers; citizen panel established; volunteers organized to locate outfalls/illicit discharges and stencil drains.
2 years.....	Final recommendations of the citizen panel; radio spots promoting program and participation.
3 years.....	A certain percentage of the community participating in community clean-ups.
4 years.....	Citizen watch groups established in a certain percentage of neighborhoods; outreach to every different population sector completed.

4.6.2.3 Illicit Discharge Detection and Elimination

What Is An “Illicit Discharge”?

Federal regulations define an illicit discharge as “...any discharge to an MS4 that is not composed entirely of storm water...” with some exceptions. These exceptions include discharges from NPDES-permitted industrial sources and discharges from fire-fighting activities. Illicit discharges (see Table 4-2) are considered “illicit” because MS4s are not designed to accept, process, or discharge such non-storm water wastes. It is important to note that “illicit” does not mean “illegal.” Not every illicit discharge is necessarily a prohibited illegal discharge.

Why Are Illicit Discharge Detection and Elimination Efforts Necessary?

Discharges from MS4s often include wastes and wastewater from non-storm water sources. A study conducted in 1987 in Sacramento, California, found that almost one-half of the water discharged from a local MS4 was not directly attributable to precipitation runoff. A significant portion of these dry weather flows were from illicit and/or inappropriate discharges and connections to the MS4.

Illicit discharges enter the system through either direct connections (e.g., wastewater piping either mistakenly or deliberately connected to the storm drains) or indirect connections (e.g., infiltration into the MS4 from cracked sanitary systems, spills collected by drain outlets, or paint or used oil dumped directly into a drain). The result is untreated discharges that contribute high levels of pollutants, including heavy metals, toxics, oil and grease, solvents, nutrients, viruses, and bacteria to receiving waterbodies. Pollutant levels from these illicit discharges have been shown in EPA studies to be high enough to significantly degrade receiving water quality and threaten aquatic, wildlife, and human health.

Table 4-2

Sources of Illicit Discharges
Sanitary wastewater
Effluent from septic tanks
Car wash wastewaters
Improper oil disposal
Radiator flushing disposal
Laundry wastewaters
Spills from roadway accidents
Improper disposal of auto and household toxics

What Is Required?

Recognizing the adverse effects illicit discharges can have on receiving waters, the final rule requires an operator of a regulated small MS4 to develop and implement an illicit discharge detection and elimination program. This program must include the following:

- ❑ A storm sewer system map, showing the location of all outfalls and the names and location of all waters of the United States that receive discharges from those outfalls;

- Through an ordinance, or other regulatory mechanism, a prohibition (to the extent allowable under State, Tribal, or local law) on non-storm water discharges into the MS4, and appropriate enforcement procedures and actions;
- A plan to detect and address non-storm water discharges, including illegal dumping, into the MS4;
- The education of public employees, businesses, and the general public about the hazards associated with illegal discharges and improper disposal of waste; and
- The determination of appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Some program implementation approaches, BMPs (i.e., the program actions/activities), and measurable goals are suggested below.

Does This Measure Need to Address All Illicit Discharges?

No. The illicit discharge detection and elimination program does not need to address the following categories of non-storm water discharges or flows unless the operator of the regulated small MS4 identifies them as significant contributors of pollutants to its MS4:

- | | |
|---|--|
| <input type="checkbox"/> Water line flushing | <input type="checkbox"/> Irrigation water |
| <input type="checkbox"/> Landscape irrigation | <input type="checkbox"/> Springs |
| <input type="checkbox"/> Diverted stream flows | <input type="checkbox"/> Water from crawl space pumps |
| <input type="checkbox"/> Rising ground waters | <input type="checkbox"/> Footing drains |
| <input type="checkbox"/> Uncontaminated ground water infiltration | <input type="checkbox"/> Lawn watering |
| <input type="checkbox"/> Uncontaminated pumped ground water | <input type="checkbox"/> Individual residential car washing |
| <input type="checkbox"/> Discharges from potable water sources | <input type="checkbox"/> Flows from riparian habitats and wetlands |
| <input type="checkbox"/> Foundation drains | <input type="checkbox"/> Dechlorinated swimming pool discharges |
| <input type="checkbox"/> Air conditioning condensation | <input type="checkbox"/> Street wash water. |

What Are Some Guidelines for Developing and Implementing This Measure?

The objective of the illicit discharge detection and elimination minimum control measure is to have regulated small MS4 operators gain a thorough awareness of their systems. This awareness allows them to determine the types and sources of illicit discharges entering their system, and establish the legal, technical, and educational means needed to eliminate these discharges. Permittees could meet these objectives

in a variety of ways depending on their individual needs and abilities, but some general guidance for each requirement is provided below.

The Map

The storm sewer system map is meant to demonstrate a basic awareness of the intake and discharge areas of the system. It is needed to help determine the extent of discharged dry weather flows, the possible sources of the dry weather flows, and the particular waterbodies these flows may be affecting. An existing map, such as a topographical map, on which the location of major pipes and outfalls can be clearly presented would demonstrate such an awareness.

EPA recommends collecting all existing information on outfall locations (e.g., review city records, drainage maps, storm drain maps), and then conducting field surveys to verify locations. It probably will be necessary to walk (i.e., wade through small receiving waters or use a boat for larger waters) the streambanks and shorelines for visual observation. More than one trip may be needed to locate all outfalls.

Legal Prohibition and Enforcement

EPA recognizes that some permittees may have limited authority under State, Tribal or local law to establish and enforce an ordinance, or other regulatory mechanism, prohibiting illicit discharges. In such a case, the permittee is encouraged to obtain the necessary authority, if at all possible. Otherwise, the NPDES permitting authority assumes responsibility for implementation of this component of the minimum measure, yet the permittee would remain ultimately responsible for the quality of its MS4 discharge. Model ordinances, including examples of amendments to local codes or existing ordinances, will be provided in the Phase II storm water guidance for regulated small MS4s, which is part of EPA's planned implementation "tool box" for the rule.

The Plan

The plan to detect and address illicit discharges is the central component of this minimum control measure. The plan is dependant upon several factors, including the permittee's available resources, size of staff, and degree and character of its illicit discharges. EPA envisions a plan similar to the one recommended for use in meeting Michigan's general storm water NPDES permit for small MS4s. As guidance only, the four steps of a recommended plan are outlined below:

① Locate Problem Areas

EPA recommends that priority areas be identified for detailed screening of the system based on the likelihood of illicit connections (e.g., areas with older sanitary sewer lines). Some methods that could be used to locate problem areas include: public complaints; visual screening; water sampling from manholes and outfalls during dry weather; and use of infrared and thermal photography.

② Find the Source

Once a problem area or discharge is found, additional efforts usually would be

necessary to determine the source of the problem. Some methods that could be used to find the source of the illicit discharge include: dye-testing buildings in problem areas; dye- or smoke-testing buildings at the time of sale; tracing the discharge upstream in the storm sewer; employing a certification program that shows that buildings have been checked for illicit connections; implementing an inspection program of existing septic systems; and using video to inspect the storm sewers.

④ **Remove/Correct Illicit Connections**

Once the source is identified, the offending discharger should be notified and directed to correct the problem. Education efforts and working with the discharger can be effective in resolving the problem before taking legal action.

④ **Document Actions Taken**

As a final step, all actions taken under the plan should be documented. Doing so would illustrate that progress is being made to eliminate illicit connections and discharges. Documented actions should be included in the required annual reports and include information such as: the number of outfalls screened; any complaints received and corrected; the number of discharges and quantities of flow eliminated; and the number of dye or smoke tests conducted.

Educational Outreach

Outreach to public employees, businesses, property owners, the general community, and elected officials regarding ways to detect and eliminate illicit discharges is an integral part of this minimum measure that will help gain support for the permittee's storm water program. Suggested educational outreach efforts include:

- Developing ***informative brochures, and guidances*** for specific audiences (e.g., carpet cleaning businesses) and school curricula;
- Designing a program to ***publicize and facilitate public reporting*** of illicit discharges;
- ***Coordinating volunteers*** for locating, and visually inspecting, outfalls or to stencil storm drains; and
- Initiating ***recycling programs*** for commonly dumped wastes, such as motor oil, antifreeze, and pesticides.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should reflect the needs and characteristics of the operator and the area served by its small MS4. Furthermore, they should be chosen using an integrated approach that would fully address the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could

include the following measurable goals:

Target Date	Activity
1 year.....	Sewer system map completed; recycling program for household hazardous waste in place.
2 years.....	Ordinance in place; training for public employees completed; a certain percentage of sources of illicit discharges determined.
3 years.....	A certain percentage of: illicit discharges detected; illicit discharges eliminated; and households participating in quarterly household hazardous waste special collection days.
4 years.....	Most illicit discharge sources detected and eliminated.

The educational outreach measurable goals for this minimum control measure could be combined with the measurable goals for the Public Education and Outreach minimum control measure.

4.6.2.4 Construction Site Storm Water Runoff Control

Why Is The Control of Construction Site Runoff Necessary?

Polluted storm water runoff from construction sites often flows to MS4s and ultimately is discharged into local rivers and streams. Of the pollutants listed in Table 4-3, sediment is usually the main pollutant of concern. Sediment runoff rates from construction sites are typically 10 to 20 times greater than those of agricultural lands, and 1,000 to 2,000 times greater than those of forest lands. During a short period of time, construction sites can contribute more sediment to streams than can be deposited naturally during several decades. The resulting siltation, and the contribution of other pollutants from construction sites, can cause physical, chemical, and biological harm to our nation’s waters. For example, excess sediment can quickly fill rivers and lakes, requiring dredging and destroying aquatic habitats.

Table 4-3

Pollutants Commonly Discharged From Construction Sites
Sediment
Solid and sanitary wastes
Phosphorous (fertilizer)
Nitrogen (fertilizer)
Pesticides
Oil and grease
Concrete truck washout
Construction chemicals
Construction debris

What Is Required?

The Phase II Final Rule requires an operator of a regulated small MS4 to develop, implement, and enforce a program to reduce pollutants in storm water runoff to their MS4 from construction activities that result in a land disturbance of greater than or equal to one acre. The small MS4 operator is required to:

- Have an ordinance or other regulatory mechanism requiring the implementation of proper erosion and sediment controls, and controls for other wastes, on applicable construction sites;

- Have procedures for site plan review of construction plans that consider potential water quality impacts;
- Have procedures for site inspection and enforcement of control measures;
- Have sanctions to ensure compliance (established in the ordinance or other regulatory mechanism);
- Establish procedures for the receipt and consideration of information submitted by the public; and
- Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Suggested BMPs (i.e., the program actions/activities) and measurable goals are presented below.

What Are Some Guidelines for Developing and Implementing This Measure?

Further explanation and guidance for each component of a regulated small MS4's construction program is provided below.

Regulatory Mechanism

Through the development of an ordinance or other regulatory mechanism, the small MS4 operator needs to establish a construction program that requires controls for polluted runoff from construction sites with a land disturbance of greater than or equal to one acre. Because there may be limitations on regulatory legal authority, the small MS4 operator is required to satisfy this minimum control measure only to the maximum extent practicable and allowable under State, Tribal, or local law. If an operator is unable to establish an enforceable construction program due to a lack of legal authority, and is unsuccessful in trying to obtain the necessary authority, the NPDES permitting authority would then assume responsibility.

EPA intends to develop a model ordinance that a small MS4 operator could use as a basis for its construction program. Alternatively, amendments to existing erosion and sediment control programs, or other ordinances, can also provide the basis for the program.

Site Plan Review

The small MS4 operator is required to include in its construction program requirements for the implementation of appropriate BMPs on construction sites to control erosion and sediment, as well as waste at the site. To determine if a construction site is in compliance with such provisions, the small MS4 operator should review the site plans submitted by the construction site operator before ground is broken.

Site plan review aids in compliance and enforcement efforts since it alerts the small MS4 operator early in the process to the planned use or non-use of proper BMPs and provides a way to track new construction activities. The tracking of sites is useful not only for the small MS4 operator's recordkeeping and reporting purposes, which will be required activities under their NPDES storm water permit (see Fact Sheet 2.9), but also for members of the public interested in ensuring that the sites are in compliance.

Inspections and Penalties

Once construction commences, the BMPs should be in place and the small MS4 operator's enforcement activities should begin. To ensure that the BMPs are properly installed, the small MS4 operator is required to develop procedures for site inspection and enforcement of control measures to deter infractions. Procedures could include steps to identify priority sites for inspection and enforcement based on the nature and extent of the construction activity, topography, and the characteristics of soils and receiving water quality. Inspections give the MS4 operator an opportunity to provide additional guidance and education, issue warnings, or assess penalties. To conserve staff resources, one possible option for small MS4 operators could be to have these inspections performed by the same inspector that visits the sites to check compliance with health and safety building codes.

Information Submitted by the Public

A final requirement of the small MS4 program for construction activity is the development of procedures for the receipt and consideration of public inquiries, concerns, and information submitted regarding local construction activities. This provision is intended to further reinforce the public participation component of the regulated small MS4 storm water program and to recognize the crucial role that the public can play in identifying instances of noncompliance.

The small MS4 operator is required only to *consider* the information submitted, and may not need to follow-up and respond to every complaint or concern. Although some form of enforcement action or reply is not required, the small MS4 operator is required to demonstrate acknowledgment and consideration of the information submitted. A simple tracking process in which submitted public information, both written and verbal, is recorded and then given to the construction site inspector for possible follow-up would suffice.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should reflect the needs and characteristics of the operator and the area served by its small MS4. Furthermore, they should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following measurable goals:

Target Date	Activity
1 year.....	Ordinance or other regulatory mechanism in place; procedures for information submitted by the public in place.
2 years.....	Procedures for site inspections implemented; a certain percentage rate of compliance achieved by construction operators.
3 years.....	Maximum compliance with ordinance; improved clarity and reduced sedimentation of local waterbodies.
4 years.....	Increased numbers of sensitive aquatic organisms in local waterbodies.

Am I Correct in Thinking that Construction Sites Are Already Covered Under the NPDES Storm Water Program?

Yes. EPA’s Phase I NPDES storm water program requires operators of construction activities that disturb five or more acres to obtain a NPDES construction storm water permit. General permit requirements include the submission of a Notice of Intent and the development of a storm water pollution prevention plan (SWPPP). The SWPPP must include a site description and measures and controls to prevent or minimize pollutants in storm water discharges. The Phase II Final Rule similarly regulates discharges from smaller construction sites disturbing equal to or greater than one acre and less than five acres.

Even though all construction sites that disturb more than one acre are covered nationally by an NPDES storm water permit, the construction site runoff control minimum measure for the small MS4 program is needed to induce more localized site regulation and enforcement efforts, and to enable operators of regulated small MS4s to more effectively control construction site discharges into their MS4s.

To aid operators of regulated construction sites in their efforts to comply with both local requirements and their NPDES permit, the Phase II Final Rule includes a provision that allows the NPDES permitting authority to reference a “qualifying State, Tribal or local program” in the NPDES general permit for construction. This means that if a construction site is located in an area covered by a qualifying local program, then the construction site operator’s compliance with the local program would constitute compliance with their NPDES permit. A regulated small MS4’s storm water program for construction could be a “qualifying program” if the MS4 operator requires a SWPPP, in addition to the requirements summarized in this fact sheet.

The ability to reference other programs in the NPDES permit is intended to reduce confusion between overlapping and similar requirements, while still providing for both local and national regulatory coverage of the construction site. The provision allowing NPDES permitting authorities to reference other programs has no impact on, or direct relation to, the small MS4 operator’s responsibilities under the construction site runoff control minimum measure profiled in this fact sheet.

Is a Small MS4 Operator Required to Regulate Construction Sites that the Permitting Authority has Waived from the NPDES Construction Program?

No. If the NPDES permitting authority waives requirements for storm water discharges associated with small construction activity (see § 122.26(b)(15) of the Phase II rule), the small MS4 operator is not required to develop, implement, and/or enforce a program to reduce pollutant discharges from such sites.

4.6.2.5 Post-construction Storm Water Management in New Development/Redevelopment**Why Is The Control of Post-Construction Runoff Necessary?**

Post-construction storm water management in areas undergoing new development or redevelopment is necessary because runoff from these areas has been shown to significantly effect receiving waterbodies. Many studies indicate that prior planning and design for the minimization of pollutants in post-construction storm water discharges is the most cost-effective approach to storm water quality management.

There are generally two forms of substantial impacts of post-construction runoff. The first is caused by an increase in the type and quantity of pollutants in storm water runoff. As runoff flows over areas altered by development, it picks up harmful sediment and chemicals such as oil and grease, pesticides, heavy metals, and nutrients (e.g., nitrogen and phosphorus). These pollutants often become suspended in runoff and are carried to receiving waters, such as lakes, ponds, and streams. Once deposited, these pollutants can enter the food chain through small aquatic life, eventually entering the tissues of fish and humans. The second kind of post-construction runoff impact occurs by increasing the quantity of water delivered to the waterbody during storms. Increased impervious surfaces interrupt the natural cycle of gradual percolation of water through vegetation and soil. Instead, water is collected from surfaces such as asphalt and concrete and routed to drainage systems where large volumes of runoff quickly flow to the nearest receiving water. The effects of this process include streambank scouring and downstream flooding, which often lead to a loss of aquatic life and damage to property.

What Is Required?

The Phase II Final Rule requires an operator of a regulated small MS4 to develop, implement, and enforce a program to reduce pollutants in post-construction runoff to their MS4 from new development and redevelopment projects that result in the land disturbance of greater than or equal to 1 acre. The small MS4 operator is required to:

- Develop and implement strategies which include a combination of structural and/or non-structural best management practices (BMPs);

- ❑ Have an ordinance or other regulatory mechanism requiring the implementation of post-construction runoff controls to the extent allowable under State, Tribal or local law;
- ❑ Ensure adequate long-term operation and maintenance of controls;
- ❑ Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure.

What Is Considered a “Redevelopment” Project?

The term “redevelopment” refers to alterations of a property that change the “footprint” of a site or building in such a way that the disturbance of equal to or greater than 1 acre of land results. The term does not include such activities as exterior remodeling. Because redevelopment projects may have site constraints not found on new development sites, the rule provides flexibility for implementing post-construction controls on redevelopment sites that consider these constraints.

What Are Some Guidelines for Developing and Implementing This Measure?

This section includes some sample non-structural and structural BMPs that could be used to satisfy the requirements of the post-construction runoff control minimum measure. It is important to recognize that many BMPs are climate-specific, and not all BMPs are appropriate in every geographic area. Because the requirements of this measure are closely tied to the requirements of the construction site runoff control minimum measure (see Fact Sheet 2.6), EPA recommends that small MS4 operators develop and implement these two measures in tandem. Sample BMPs follow.

❑ Non-Structural BMPs

- **Planning and Procedures.** Runoff problems can be addressed efficiently with sound planning procedures. Master Plans, Comprehensive Plans, and zoning ordinances can promote improved water quality by guiding the growth of a community away from sensitive areas and by restricting certain types of growth (industrial, for example) to areas that can support it without compromising water quality.
- **Site-Based Local Controls.** These controls can include buffer strip and riparian zone preservation, minimization of disturbance and imperviousness, and maximization of open space.

❑ Structural BMPs

- **Storage Practices.** Storage or detention BMPs control storm water by gathering runoff in wet ponds, dry basins, or multichamber catch basins and slowly

releasing it to receiving waters or drainage systems. These practices both control storm water volume and settle out particulates for pollutant removal.

- **Infiltration Practices.** Infiltration BMPs are designed to facilitate the percolation of runoff through the soil to ground water, and, thereby, result in reduced storm water quantity and reduced mobilization of pollutants. Examples include infiltration basins/trenches, dry wells, and porous pavement.
- **Vegetative Practices.** Vegetative BMPs are landscaping features that, with optimal design and good soil conditions, enhance pollutant removal, maintain/improve natural site hydrology, promote healthier habitats, and increase aesthetic appeal. Examples include grassy swales, filter strips, artificial wetlands, and rain gardens.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should reflect needs and characteristics of the operator and the area served by its small MS4. Furthermore, the measurable goals should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following goals:

Target Date	Activity
1 year.....	Strategies developed that include structural and/or non-structural BMPs.
2 years.....	Strategies codified by use of ordinance or other regulatory mechanism.
3 years.....	Reduced percent of new impervious surfaces associated with new development projects.
4 years.....	Improved clarity and reduced sedimentation of local waterbodies.

4.6.2.6 Pollution Prevention/Good Housekeeping for Municipal Operations

Why Is Pollution Prevention/Good Housekeeping Necessary?

The Pollution Prevention/Good Housekeeping for municipal operations minimum control measure is a key element of the small MS4 storm water management program. This measure requires the small MS4 operator to examine and subsequently alter own actions to help ensure a reduction in the amount and type of pollution that (1) collects on streets, parking lots, open spaces, and storage and vehicle maintenance areas and is discharged into local waterways; and (2) results from actions such as environmentally damaging land development and flood management practices or poor maintenance of storm sewer systems.

While this measure is meant primarily to accomplish the goal of improving or protecting the quality of receiving waters by altering the performance of municipal or facility operations, it also can result in a cost savings for the small MS4 operator, since proper and timely maintenance of storm sewer systems can help avoid repair costs from damage caused by age and neglect.

What Is Required?

Recognizing the benefits of pollution prevention practices, the rule requires an operator of a regulated small MS4 to:

- ❑ Develop and implement an operation and maintenance program with the ultimate goal of preventing or reducing pollutant runoff from municipal operations into the storm sewer system;
- ❑ Include employee training on how to incorporate pollution prevention/good housekeeping techniques into municipal operations such as park and open space maintenance, fleet and building maintenance, new construction and land disturbances, and storm water system maintenance. To minimize duplication of effort and conserve resources, the MS4 operator could use training materials that are available from EPA, their State or Tribe, or relevant organizations;
- ❑ Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Some program implementation approaches, BMPs (i.e., the program actions/activities), and measurable goals are suggested below.

What Are Some Guidelines for Developing and Implementing This Measure?

The intent of this control measure is to ensure that existing municipal, State or Federal operations are performed in ways that will minimize contamination of storm water discharges. EPA encourages the small MS4 operator to consider the following components when developing their program for this measure:

Maintenance activities, maintenance schedules, and long-term inspection procedures for structural and non-structural controls to reduce floatables and other pollutants discharged from the separate storm sewers;

Controls for reducing or eliminating the discharge of pollutants from areas such as roads and parking lots, maintenance and storage yards (including salt/sand storage and snow disposal areas), and waste transfer stations. These controls could include programs that promote recycling (to reduce litter), minimize pesticide use, and ensure the proper disposal of animal waste;

Procedures for the proper disposal of waste removed from the separate

storm sewer systems and the areas listed in the bullet above, including dredge spoil, accumulated sediments, floatables, and other debris; and

Ways to ensure that new flood management projects assess the impacts on water quality and examine existing projects for incorporation of additional water quality protection devices or practices. EPA encourages coordination with flood control managers for the purpose of identifying and addressing environmental impacts from such projects.

The effective performance of this control measure hinges on the proper maintenance of the BMPs used, particularly for the first two bullets above. For example, structural controls, such as grates on outfalls to capture floatables, typically need regular cleaning, while non-structural controls, such as training materials and recycling programs, need periodic updating.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are meant to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should consider the needs and characteristics of the operator and the area served by its small MS4. The measurable goals should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following measurable goals:

<u>Target Date</u>	<u>Activity</u>
1 year.....	Pollution prevention plan (the new BMPs and revised procedures) completed; employee training materials gathered or developed; procedures in place for catch basin cleaning after each storm and regular street sweeping.
2 years.....	Training for appropriate employees completed; recycling program fully implemented.
3 years.....	Some pollution prevention BMPs incorporated into master plan; a certain percentage reduction in pesticide and sand/salt use; maintenance schedule for BMPs established.
4 years.....	A certain percentage reduction in floatables discharged; a certain compliance rate with maintenance schedules for BMPs; controls in place for all areas of concern.

4.6.3 Program Requirements: Evaluation/Assessment & Reporting

If coverage is obtained under a general permit or an individual permit under the Phase II regulations, the operator of a regulated small MS4 is required to comply with the evaluation/assessment and reporting requirements summarized in this section.

Frequency of Reports

Reports must be submitted annually during the first permit term – permit terms are typically a 5-year period. For subsequent permit terms, reports must be submitted in years 2 and 4 only, unless the NPDES permitting authority requests more frequent reports. Reports do not need to be submitted if the operator of the regulated small MS4 is relying on another entity to satisfy all permit obligations (see section 4.5.1.3)

Required Report Content

The reports must include the following:

- The status of compliance with permit conditions, including an assessment of the appropriateness of the selected BMPs and progress toward achieving the selected measurable goals for each minimum measure;
- Results of any information collected and analyzed, including monitoring data, if any;
- A summary of the storm water activities planned for the next reporting cycle;
- A change in any identified best management practices or measurable goals for any minimum measure; and
- Notice of relying on another governmental entity to satisfy some of the permit obligations (if applicable – see section 4.5.1.3).

A Change in Selected BMPs

If, upon evaluation of the program, improved controls are identified as necessary, permittees should revise their mix of BMPs to provide for a more effective program. Such a change, and an explanation of the change, must be noted in a report to the NPDES permitting authority.

Recordkeeping Requirements

Records required by the NPDES permitting authority must be kept for at least 3 years and made accessible to the public at reasonable times during regular business hours. Records need not be submitted to the NPDES permitting authority unless the permittee is requested to do so.

4.7 SMALL MS4 PROGRAM COMPLIANCE PROCESS: What Do I Need to Do To Comply?

Sections 4.1 through 4.6 of this guidance have provided a details on who's covered and what's required under the Phase II regulations for regulated small MS4s. Now that you are familiar with the Phase II program, this section walks you through the process, from beginning to end, that an operator of a regulated small should take to comply with the regulation. This step-by-step "walk-through" references the appropriate sections of the

guidance along the way as a means for understanding how the information in sections 4.1 through 4.6 fits together.

The last page of this section includes a permitting decision tree to help operators of MS4s determine if they need an NPDES storm water permit. By starting in the upper left hand corner, an operator can follow the decision tree to determine if they fall under Phase I or Phase II, and if they are eligible for a waiver.

- Step 1:** Determine if you are an operator of an MS4 (see section 4.1.1).
- Step 2:** As an operator of an MS4, determine if you are an operator of a small MS4 (see section 4.1.4).
- Step 3:** As an operator of a small MS4, determine if you are an operator of a regulated small MS4 (see section 4.2). You need to find out if you are:
- A. Automatically designated by the rule**
- First, determine if your system is located partially or fully within an urbanized area (See section 4.3),
 - Second, determine if you may qualify for a waiver (waivers are at the discretion of the permitting authority). If you qualify for a waiver, stop here. (See section 4.4)
- B. Potentially designated by the NPDES permitting authority**
- Determine if your system, located outside of a UA, may fit the criteria for potential designation. Since designations are at the discretion of the permitting authority, a final determination is made by the permitting authority and not the small MS4 operator. If designated, continue with Step 4.
- Step 4:** Read Phase II Rule and guidance materials to get a sense of the permitting options (see section 4.5) and program requirements (see section 4.6).
- Step 5:** Determine which neighbors are regulated as Phase I MS4s (refer to list on the EPA web site) or Phase II MS4s (refer to Appendix 6 and maps of your UA). This information will be used to base your decision as to whether to:
- Be a co-permittee with another regulated MS4. (See section 4.5.1.2)
 - Rely on another regulated MS4 for partial or full implementation of the minimum measures on your behalf. (See section 4.5.1.3)
- Step 6:** Determine if programs similar to one or more of the minimum measures is already being performed by another entity. This information will be used to decide whether you wish to rely on another entity for partial implementation of the minimum measures on your behalf. (See section 4.5.1.3)

- Step 7:** Determine which permit option to choose (depends on which are made available by the your NPDES permitting authority) (See section 4.5.1)
- General permit under the Phase II regulation
 - Individual permit under the Phase I or Phase II regulation
 - Modification of a Phase I individual permit (Co-permittee with a large or medium MS4)

In determine which option to choose, think about...

- If you wish to be a co-permittee and share responsibilities based on information from Step 5
- If, instead of the co-permittee option, you wish to have own permit but rely on another entity for implementing a measure or measures based on information from Steps 5 & 6.

- Step 8:** Begin planning and development of your storm water management program

- Use menu of BMPs as a guide (provided by EPA or the permitting authority). The EPA web site will also have references and links to helpful guidance on every facet of a storm water management program for MS4s.
- Meet with staff who will be responsible for implementing the storm water management program (may be a multi-departmental team). Task them with:
 - Assessing the storm water management characteristics and needs of the area served by the regulated small MS4.
 - Determining appropriate BMPs and measurable goals
 - Determining who will be responsible for what under the program
- Form a citizen advisory panel to help develop the program and give them similar tasks as those given to the staff.
- Meet with local Phase I and Phase II MS4 operators to discuss co-permittee status or sharing of resources, such as: hiring one enforcement inspector for multiple areas, co-sponsoring household hazardous waste collection events, or sharing a street sweeper, recycling truck, illicit discharge detection cameras, or any other equipment. (Note: Nothing listed here is required by the Phase II rule -- they are only examples)
- Meet with other entities that you may rely on to implement one or more of the minimum measures to discuss the arrangement and any legal agreements.

- Step 9:** **A. Under a General Permit:**

- 1) Once a general permit is issued, read it carefully. You may not be

required to implement every minimum measure due to the permitting authority recognizing or referencing other similar programs (see section 4.5.2.1). For this reason, before the permit is issued (which is expected to be no later than December 9, 2002) follow Step 8 but only do a preliminary storm water management program until the final permit requirements are known. Once the permit is issued, if you have chosen this option you will need to make final decisions on the following issues and complete the development of your storm water management plan:

- Do you want to be a co-permittee with another regulated small MS4?
- Do you want to rely on another entity for some or all of the permit requirements?
- Which BMPs and measurable goals will you use for each minimum measure you will be implementing?

2) Fill out an NOI in accordance with the Phase II regulation. (See section 4.6.2.1)

B. Under an Individual Permit (new or modified):

If you have chosen one of the individual permit options (i.e., under Phase II, under Phase I, or modified existing Phase I), you will need to continue efforts in Step 8, as applicable, and complete development of your permit application in accordance with the Phase II regulation. (See sections 4.6.2.2 through 4.6.2.4)

- Step 10:** Submit your NOI under a general permit or your individual permit application to the NPDES permitting authority by March 10, 2003; unless your NPDES permitting authority phases-in permit coverage and establishes alternative deadlines (see section 4.5.2.2).
- Step 11:** Implement your storm water management program in accordance with applicable standards (see section 4.6.1). The Phase II rule allows you up to five years to fully implement your program, although the exact timeframe is at the discretion of the your NPDES permitting authority.
- Step 12:** Write annual reports in your first permit term assessing the effectiveness of BMPs and if measurable goals were met, and submit the reports to your NPDES permitting authority. You may change the mix of BMPs originally selected if you find that such a change is necessary to ensure a more effective program. This step, as required in the Phase II regulations at § 122.34(g) and described in section 4.6.3, is not applicable if you sought coverage under an individual permit under the Phase I regulations or under a modification of an existing Phase I MS4 permit.

Step 13: Be aware that you may need to take over implementation of a minimum control measure if you are relying on another entity for its implementation and the other entity fails to perform it effectively. This is why EPA encourages a legally-binding agreement when choosing to rely on another entity. Also, the permitting authority may choose to change your mix of BMPs and measurable goals as submitted in your permit application if it determines that your program is not effectively controlling pollutant discharges.

4.8 FEDERAL AND STATE-OPERATED REGULATED SMALL MS4S: Unique Program Implementation Issues

In addition to local government jurisdictions, small MS4s include certain Federal and State-operated MS4s. Federal facilities were not designated for regulation by the NPDES Phase I storm water program for MS4s. The Phase II Final Rule, however, includes the “United States” in the definition of a small MS4, thereby including Federal MS4 operators in the NPDES Phase II storm water program. Federal and State-operated small MS4s can include universities, prisons, hospitals, roads (i.e., departments of transportation), military bases (e.g., State Army National Guard barracks), parks, and office buildings/complexes.

The small MS4 program, largely designed with municipally-operated small MS4s in mind, raises a number of implementation issues for Federal and State operators of regulated small MS4s who must obtain an NPDES permit that requires the development and implementation of a storm water management program that includes the six minimum control measures. This section highlights potential implementation issues related to the minimum control measures, and then discusses the implementation options included in the rule that may help resolve these issues.

4.8.1 What Are Some Implementation Concerns?

This section profiles the three most common implementation issues raised in the public comments submitted regarding Federal/State implementation of the small MS4 program.

How Does the Final Rule Account for Unique Characteristics?

Federal and State small MS4s possess a number of characteristics that set them apart from their municipal counterparts. For example, whereas municipally-operated MS4s largely serve resident populations, many Federal or State-operated MS4s, such as medical clinics and departments of transportation (DOTs), do not. Other types of Federal and State MS4s, such as military bases, prisons, and State universities, serve populations that are different from a typical municipal population. Their unique characteristics might lead Federal or State MS4 operators to question either the need to implement the entire suite of minimum control measures or their ability to comply fully with their Phase II storm water permit. The flexibility within the minimum measures allows Federal and State MS4s to develop a storm water program that comprises the

minimum measures in a way that makes sense for their circumstances.

What If the Operator Lacks Legal Authority?

Three of the minimum control measures (illicit discharge detection and elimination, and the two construction-related measures) require enforceable controls on third party activities to ensure successful implementation of the measure. Some Federal and State operators, however, may not have the necessary legal regulatory authority to adopt these enforceable controls in the same manner as do local governments.

For example, a State DOT that is responsible for the portions of its roads running through urbanized areas may not have the legal authority to impose restrictions on, and penalties against, illicit (i.e., non-storm water) discharges into its MS4 if the source of the discharge is outside the DOT's right-of-way or jurisdiction. As in the case of local governments that lack such authority, State and Federal MS4s are expected to utilize the authority they do possess and to seek cooperative arrangements.

How Can the Program Be Implemented in Areas Where There Are Multiple Regulated Entities?

Since the final rule provides automatic coverage of all small MS4s within an urbanized area, regardless of political boundaries, coverage of multiple governments and agencies in a single area is likely. For example, a city government that operates a small MS4 within an urbanized area must obtain permit coverage alongside the county, State, and Federal DOTs if they all operate a portion of the roads (i.e., MS4s) in the city. All four entities are responsible for developing a storm water management program for their MS4s (or portions thereof) within the urbanized area. EPA encourages State and Federal small MS4 operators to establish cooperative agreements with cities and counties in implementing their storm water programs.

4.8.2 Are There Implementation Strategies that Help Facilitate Program Implementation?

This section offers two hypothetical strategies for resolving the implementation issues raised above. The best solution may include a creative combination of strategies.

STRATEGY #1 *A Focus on Choosing Appropriate BMPs*

The final rule requires the permittee to choose *appropriate* best management practices (BMPs) for each minimum control measure. In other words, EPA expects Phase II permittees to tailor their storm water management plans and their BMPs to fit the particular characteristics and needs of the permittee and the area served by its MS4. Therefore, the Federal or State operator of a regulated storm sewer system can take advantage of the flexibility provided by the rule to utilize the most suitable minimum control measures for its MS4. Below is an example of tailored activities and BMPs that

Federal or State operators can implement for each measure:

- ❑ **Public Education and Outreach.** Distribute brochures and post fliers to educate employees of a Federal hospital about the problems associated with storm water runoff and the steps they can take to reduce pollutants in storm water discharges. For example, employees could be advised against carelessly discarding trash on the ground or allowing their cars to leak oil/fluids in the parking lot.
- ❑ **Public Participation/Involvement.** Provide notice of storm water management plan development and hold meetings at which employees of a Federal office complex are encouraged to voice their ideas and opinions about the effort. Request volunteers to help develop the plan.
- ❑ **Illicit Discharge Detection and Elimination.** Develop a map of the storm sewer system on a military base. Perform visual dry weather monitoring of any outfalls to determine whether the storm sewer system is receiving any non-storm water discharges from the base. If a dry weather flow is found, trace it back to the source and stop the discharge. Should a Federal military base identify an illicit discharge, the source of which is traced to the boundary of its system, the Federal operator should refer the discharge to the adjoining regulated MS4 for further action.
- ❑ **Construction Site Runoff Control.** Require the implementation of erosion and sediment controls, and control of waste, for any Federal or State DOT road construction. The DOT would review site plans for proper controls, perform inspections, and establish penalties in the construction contract if controls are not implemented. If construction is done directly by the regulated DOT instead of a private contractor, the DOT could be penalized by the NPDES permitting authority for non-compliance with its small MS4 permit in the event that controls are not properly implemented.
- ❑ **Post-Construction Runoff Control.** Require the implementation of post-construction storm water controls for any new construction on the grounds of a prison. This can be required as part of a construction contract, instituted as internal policy, and considered during site plan review.
- ❑ **Pollution Prevention/Good Housekeeping for Municipal Operations.** Train maintenance staff at a State university to employ pollution prevention techniques whenever possible. For example, routinely pick up trash/litter from the university grounds, use less salt on the parking lots and access roads in the winter, perform any maintenance of university vehicles under shelter only, limit pesticide use to the minimum needed, use vegetative buffer strips in the parking lots to filter runoff, and keep dumpster lids closed.

STRATEGY #2

Working with Other Entities

There may be instances when the Federal or State permittee has limited capabilities to satisfy one or more of the minimum control measures. As discussed above, the permittee may lack the proper legal authority to enforce controls (although it should try to obtain the necessary legal authority if at all possible).

In the case of limited capabilities, the permittee can work with neighboring operators of regulated small MS4s, preferably on a watershed basis, to form a shared storm water management program in which each permittee is responsible for activities that are within individual legal authorities and abilities. The final rule allows the permittee to rely on other entities, with their permission, to implement those minimum measures that the permittee is otherwise unable to implement. Three examples are:

- ❑ A State DOT with limited regulatory legal authority can reference a local sewer district's illicit detection and elimination program in its permit application, provided the program sufficiently addresses illicit discharges into the DOT's storm sewer system.
- ❑ The permittee or NPDES permitting authority can reference such programs as coastal nonpoint pollution control programs, State or local watershed programs, State or local construction programs, and environmental education efforts by public or private entities.
- ❑ The permittee can become a co-permittee with a neighboring Phase I MS4 through a modification of the Phase I MS4's individual permit. This may be the most logical and preferable option for those Federal and State entities located in close proximity to Phase I MS4s.

Choosing to work with other governmental entities as a co-permittee, or referencing parts of each other's plans, can help resolve issues that may arise where multiple regulated jurisdictions exist in the same area. Permittees can avoid duplicative efforts, as well as territorial or regulatory disputes, by working together to implement the storm water program.

Suggested Steps for Working with Other Entities

- (1) Identify the boundaries of the urbanized area.
- (2) Identify the operators of storm sewer systems or portions of the systems within the urbanized area such as local, State, Tribal or Federal governments or other entities.
- (3) In seeking permit coverage:

Identify where another entity's program may satisfy one or more minimum control measure. If a program has requirements that are equivalent to a minimum control measure's required elements, the operator of the regulated small MS4 may reference the program in its permit application, provided the other entity gives it permission to do so. While such an arrangement relieves the operator from performing the minimum measure itself, the operator remains ultimately responsible for the measure's effective implementation.

OR

Team with an operator of a Phase I MS4 and become a co-permittee on its existing Phase I individual permit.

4.9 FUNDING OPTIONS

Possibly the biggest challenge for an operator of a regulated small MS4 in implementing a storm water management program is finding funding for the program. Funding is needed to maintain the staff, equipment and materials necessary to develop and implement an effective program. Adequate funding is critical to the success of the program but attaining it can be difficult as many other important programs compete for the same limited revenues from a general fund. Therefore, the operator of a regulated small MS4 will need to consider alternative funding options. This section provides brief introductions to some of the various funding options currently in use across the country. The following information on funding options was written by the American Public Works Association (AWPA) as part of their Storm Water Phase II workshops:

Debt Financing: Typically used for capital-intensive projects, local governments can issue debt to finance storm water management programs and facilities. Revenue bonds - or bonds that rely on ongoing source of revenue may be used. Alternatively, a general obligation bond can be issued which are backed by the full faith and credit of your municipality (based on your ability to generate revenues through taxes and other fees).

Grants and Loans: Federal, State, or Regional grant or loan funds may be available for some elements of the storm water program, depending on the BMP's selected and the location. Grants and loans are usually applicable to specific projects and not on-going activities, such as operation and maintenance.

Users /Utility Fees: Utility services charges are rates billed to customers for providing storm water management services. The service charges may be flat rates, or variable rates based on classes of

customers. Utility service charges may represent a dedicated source of funding and an ongoing method of funding some or all storm water management programs.

Special Assessment: Properties can be assessed annually to fund storm water management programs. Often, special assessments are used to fund a special district or authority that can implement all or portions of a region's storm water management program.

Local Improvement Under this type of funding system, individual properties benefitted by storm water projects are assessed to fund the project. Some states require special enabling legislation to establish this type of special benefits district.

General Fund: General fund monies are used for many storm water programs. If storm water programs are funded from your General Fund, the programs are at risk in each budget cycle. In addition, in order to increase funding levels for your program, other local government services may be affected or a general tax increase may be required.

Inspection Fees: Plan review and inspection fees allows the community to recover some or all of the direct cost associated with performing design reviews for pre and post construction BMP's.

Developer Fees: The developers construct needed facilities as a condition of development and bear associated costs.

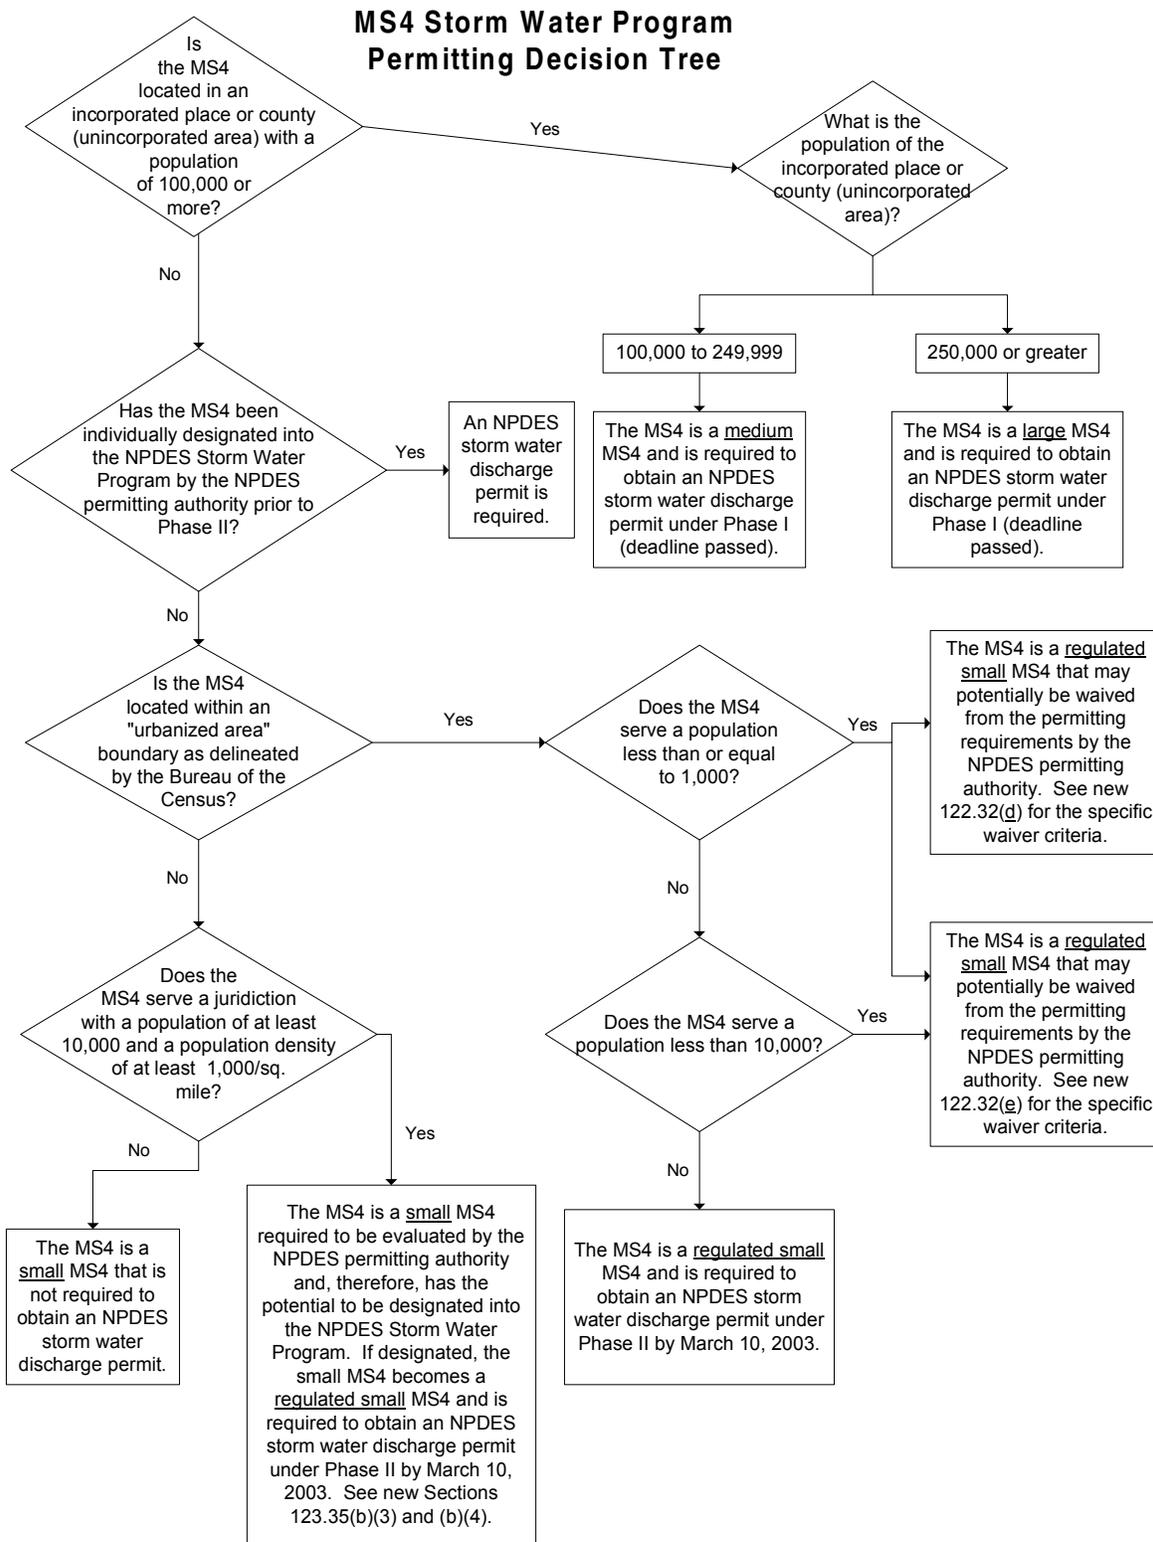

Alternative Fees: Instead of constructing on-site facilities to meet development requirements, developers may be given the option of paying a comparable fee to be used by the local government to build regional facilities that are designed to meet the same objectives as the developer-constructed on-site mitigation.

Connection Fees: A one time charge assessed at the time of development to recover a proportionate share of the cost of existing facilities and planned future facilities. The applicability depends upon legislation in each state.

- Storm Water Management Utility Implementation Manual. South Carolina Land Resources Commission, Columbia, S.C.

- Storm Water Maintenance and Financing Options (draft). 1987. State of Maryland, Maryland Department of Natural Resources.

1. See Appendices F, G, H, and I to Part 122 (as revised by the Phase II Final Rule) for the list of incorporated places and counties (unincorporated areas) with a population of 100,000 or greater. If the MS4 is located in a listed entity, then the answer to this question is "Yes" and the MS4 is covered under the Phase I MS4 program as a medium or large MS4.

5.0 SMALL CONSTRUCTION ACTIVITY

After reading Section 5.0, you should understand what type of construction activity is subject to the Phase II small construction activity regulations (including who may be waived from coverage), who is considered an operator of small construction activity, the permit options and requirements for small construction activity, and the interaction of the NPDES storm water program for construction with the NPDES storm water program for regulated MS4s. The discussion of these elements concludes with a step-by-step review of the process for compliance with the Phase II regulations for small construction activity.

5.1 COVERAGE: Who Is Subject to the Phase II Rule?

The NPDES Storm Water Program defines construction activities as "small" and "large" for the purposes of regulation. The Phase I storm water program covers large construction activity. The Phase II storm water regulation covers small construction activity. To understand who is covered under the Phase II Rule, it is necessary to understand who is already covered under the Phase I Rule. Toward this end, this section provides a definition of the type of construction activity covered by Phase I and Phase II, as well as other definitions essential to understanding the construction component of the NPDES Storm Water Program.

5.1.1 What Type of Construction Activity Is Covered Under the Phase I Regulations?

The Phase I Rule identifies eleven categories of industrial activity in the definition of "storm water discharge associated with industrial activity" that must obtain an NPDES storm water discharge permit (see section 6.1). Category (x) of this definition includes construction activity (including clearing, grading and excavation) that results in **a total land disturbance of 5 acres or greater**. Disturbances of less than 5 acres are also regulated under category (x) if they are part of a "larger common plan of development or sale" with a planned land disturbance of 5 acres or greater. Phase I construction activity is commonly referred to as "large"

Construction activities can include road building, construction of residential houses, office buildings, industrial sites, or demolition.

Land Disturbance means exposed soil due to clearing, grading, or excavation activities.

Larger common plan of development or sale describes a situation in which multiple construction activities are occurring, or will occur, on a contiguous area.

An operator is the person or persons that has either operational control of construction project plans and specifications, or day-to-day operational control of activities necessary to ensure compliance with storm water permit conditions.

construction activity. The Phase I rule requires all operators of large construction activity to obtain an NPDES storm water discharge permit before discharging storm water runoff to a municipal separate storm sewer system or waters of the United States.

5.1.2 What Type of Construction Activity Is Covered Under the Phase II Regulations?

In 1992, the Ninth Circuit court remanded for further proceedings the portion of EPA's Phase I storm water regulation related to category (x) construction activity (NRDC v. EPA, 966 F.2d at 1292). EPA responded to the court's decision by designating under Phase II storm water discharges from construction site activities that ultimately will result in a **land disturbance of equal to or greater than 1 and less than 5 acres** as "storm water discharges associated with *small construction* activity" (see § 122.26(b)(15)). The Phase II rule requires all operators of small construction activity to obtain an NPDES storm water discharge permit before discharging storm water runoff to a municipal separate storm sewer system or waters of the United States.

Construction activities disturbing less than 1 acre are also included in Phase II of the NPDES storm water program if they are part of a larger common plan of development or sale with a planned disturbance of equal to or greater than 1 acre and less than 5 acres, or if they are designated by the NPDES permitting authority. The NPDES permitting authority or EPA Region may designate construction activities disturbing less than 1 acre based on the potential for contribution to a violation of a water quality standard or for significant contribution of pollutants to waters of the United States.

The definition of small construction activity does not apply where the construction operator can certify to one of two waivers – see section 5.2 for more information on waiver options.

5.1.3 What is meant by the terms "land disturbance," "larger common plan of development or sale," and "operator" of a construction site?

The definitions of "land disturbance," "larger common plan of development or sale," and "operator" of a construction site are key in understanding coverage under the NPDES Storm Water Program for construction activity. These definitions originate from the NPDES storm water general permit for large construction activity.

- **Land disturbance** refers to exposed soil resulting from activities such as clearing, grading and excavating.
- **Larger common plan of development or sale** is a contiguous area where multiple separate and distinct construction activities are occurring under one plan (e.g., the operator is building on three half-acre lots in a 6-acre development). The "plan" in a common plan of development or sale is broadly defined as any announcement or piece of documentation (including a sign, public notice or hearing, sales pitch,

advertisement, drawing, permit application, zoning request, computer design, etc.) or physical demarcation (including boundary signs, lot stakes, surveyor markings, etc.) indicating that construction activities may occur on a specific plot.

- **An operator** of a construction site is the person (or persons) responsible for obtaining coverage under an NPDES storm water permit for construction activity, and complying with the permit requirements. An operator is the person or persons that meet either of the following criteria:
 - ❑ Has operational control of construction project plans and specifications, including the ability to make modifications to those plans and specifications; or
 - ❑ Has day-to-day operational control of those activities at a project which are necessary to ensure compliance with a storm water pollution prevention plan (SWPPP) for the site or other permit conditions (e.g., they are authorized to direct workers at a site to carry out activities required by the SWPPP or comply with other permit conditions).

There may be more than one party at a site responsible for “operational control.” Depending on the project and the distinction between the parties’ (e.g., owner’s vs. developer’s) responsibilities, there can either be a single party acting as a site operator needing permit coverage or there can be two (or more) operators who may share permit responsibilities. In cases where there are two or more operators, both parties will need permit coverage if they choose to keep the responsibilities as described in the above bullets separate, or they choose to separately maintain operational control for different portions of the site, etc. In such cases both operators should obtain permit coverage as co-permittees by co-submitting separate Notice of Intent forms, and should share in meeting permit conditions (e.g., generating the storm water pollution prevention plan, performing inspections, etc.). The option to have one sole operator who is willing to assume complete responsibility / liability for all permit requirements still exists and, in many cases, may be the less overall burdensome way to comply with storm water requirements.

There are other instances where parties conduct earth disturbing activities at a site but do not need their own permit coverage. Examples for whom this may apply include a subcontractor who is under the supervision of the operator, or an entity that is neither a subcontractor nor has operational control (e.g., a utility line installer).

Additional information on the responsibilities of operators can be found in Part III.E of EPA's NPDES Construction General Permit, published on February 17, 1998 (63 FR 7858). Part II of the fact sheet contained in the NPDES Construction General Permit also provides answers to common questions regarding roles and responsibilities of different parties involved on a construction site.

Important note: NPDES-authorized States may use a different definition of "operator" than the one provided above.

5.2 WAIVERS: Which Small Construction Activity Sites May Obtain a Waiver From Coverage?

Under the Phase II Rule, NPDES permitting authorities have the option of providing a waiver from Phase II coverage and requirements to operators of small construction activity who certify to one of two conditions:

- ① Low predicted rainfall potential (i.e., activity occurs during a negligible rainfall period), where the rainfall erosivity factor ("R" in the Revised Universal Soil Loss Equation [RUSLE]) would be less than 5 during the period of construction activity.
- ② A determination that storm water controls are not necessary based on either:
 - (A) A "total maximum daily load" (TMDL) that address the pollutant(s) of concern for construction activities; **OR**
 - (B) For nonimpaired waters that don't require TMDLs, an equivalent analysis that determines allocations for small construction sites for the pollutants of concern or determines that such allocations are not needed to protect water quality based on consideration of instream concentrations, expected growth in pollutant concentrations from all sources, and a margin of safety.

Pollutants of concern include sediment or a parameter that addresses sediment (such as total suspended solids, turbidity, or siltation) and any other pollutant that has been identified as a cause of impairment of a receiving waterbody.

The intent of these waiver provisions (see §§ 122.26(b)(15)(A) and(B)) is to waive only those sites that are highly unlikely to have a negative effect on water quality. Therefore, before applying for a waiver, operators of small construction activity are encouraged to consider the potential water quality impacts that may result from their project and to carefully examine such factors as proximity to water resources and sensitivity of receiving waters. Small construction activities disturbing less than 1 acre that are designated by the permitting authority are not eligible for these waivers.

5.2.1 Waiver 1: The Rainfall Erosivity Factor Waiver

The Rainfall Erosivity Factor waiver is based on the potential for a construction activity to occur in an area, or during a certain period of time, where there is low

predicted rainfall potential and, therefore, less likelihood of causing impacts. This waiver is time-sensitive and is dependent on when during the year a construction activity takes place, how long it lasts, and the expected rainfall and intensity during that time. It creates an incentive for construction site operators to build during the dry part of the year.

How would an operator qualify for, and certify to, this waiver?

To qualify for this waiver, the construction site operator must determine the value of the rainfall erosivity factor (R factor) in the Revised Universal Soil Loss Equation (RUSLE) and then certify to the permitting authority that the value of the factor is less than 5 during the period of construction. The RUSLE is a refinement of the Universal Soil Loss Equation (USLE), which is a method developed by the U.S. Department of Agriculture to measure soil loss from agricultural lands at various times of the year on a regional basis. The R factor varies based on location and time period during the year.

A construction site operator will need site-specific data to calculate the values for rainfall erosivity using the RUSLE. The rainfall erosivity factor is determined in accordance with Chapter 2 of *Agriculture Handbook Number 703, Predicting Soil Erosion by Water: A Guide to Conservation Planning With the Revised Universal Soil Loss Equation (RUSLE)*. This handbook is no longer in print but Chapter 2 can be obtained from EPA's web site or by contacting EPA's Water Resource Center.

5.2.1 Waiver 2: The Water Quality Waiver

The Water Quality waiver consists of: 1) a component for small construction sites that will discharge to an impaired waterbody where total maximum daily load (TMDL) assessments have been performed, and 2) a component for small construction sites that will discharge to non-impaired waters where an analysis equivalent to the TMDL assessments have been performed.

For impaired waters where technology-based controls required by NPDES permits are not achieving State water quality standards, the CWA requires implementation of the TMDL process.

The **TMDL process** establishes the maximum amount of pollutants a waterbody can assimilate before water quality is impaired, then requires that this maximum level not be exceeded. A TMDL assessment determines the source or sources of a pollutant of concern, considers the maximum allowable level of that pollutant for the waterbody, then allocates to each source or category of sources a set level of the pollutant that it is allowed to discharge into the waterbody. Allocations to point sources are called wasteload allocations.

A TMDL is developed for each pollutant that is found to be contributing to the impairment of a waterbody or a segment of a waterbody. To allow a waiver for construction activities, a TMDL would need to address sediment, or a parameter that addresses sediment such as total suspended solids, turbidity, or siltation. Additional TMDLs addressing common pollutants from construction sites such as nitrogen, phosphorus, and oil and grease also may be necessary to ensure water quality protection and allow a waiver from the NPDES storm water program. More information on TMDLs can be found at <http://www.epa.gov/owow/tmdl/>.

Non-impaired waterbodies do not require TMDL assessments. However, construction site operators that discharge to non-impaired waterbodies are still eligible for this waiver. A construction site operator is eligible for a waiver if an analysis equivalent to a TMDL assessment is conducted for the pollutants of concern and it is determined through this analysis that small construction sites would not have to control their contribution of pollutants of concern to the waterbody to protect water quality. The analysis may also determine that allocations are not needed to protect water quality based on consideration of variables including existing in-stream concentrations; expected growth in pollutant contributions from all sources; and a margin of safety. In this situation, the construction site operator also qualifies for a waiver.

How would an operator qualify for, and certify to, this waiver?

EPA expects that when TMDLs, or equivalent analyses are completed, there may be a determination that certain classes of sources, such as small construction sites, would not have to control their contribution of pollutants of concern to the waterbody in order for the waterbody to be in attainment with water quality standards (i.e., these sources were not assigned wasteload allocations). In such a case, to qualify for the Water Quality waiver, the operator of the construction site would need to certify that its construction activity will take place, and the storm water discharges will occur, within the area covered either by the TMDLs or equivalent analysis. A certification form would likely be provided by the NPDES permitting authority.

5.3 PERMIT OPTIONS

The Storm Water Phase II Rule requires operators of small construction activities to obtain National Pollutant Discharge Elimination System (NPDES) permit coverage because their storm water discharges are considered “point sources” of pollution. Point source pollutant discharges, unlike nonpoint sources such as agricultural runoff, are required under the Clean Water Act (CWA) to be covered by federally enforceable NPDES permits.

NPDES storm water permits are issued by an NPDES permitting authority, which may be an NPDES-authorized State or a U.S. EPA Region in non-authorized States (see *Appendix A* for a list of U.S. EPA Regions). Once a permit application is submitted by the operator of a small construction activity, the conditions of the permit must be

satisfied (i.e., implementation of a storm water pollution prevention plan). This section addresses the permit options under the Phase II regulations for operators of small construction activity, as well as for the permitting authority. The permit requirements are discussed in Section 5.4.

5.3.1 For Operators of Small Construction Activity: What Types of Permit Coverage Are Available?

Similar to the Phase I program for large construction activity, the Phase II approach allows operators of small construction activities to choose between two permitting options. Each NPDES permitting authority has the discretion, however, to determine which options are available to operators of small construction activities in their jurisdiction.

1) General Permits

- # General permits are strongly encouraged by EPA for small construction activity. EPA anticipates that the existing general permit for large construction activity will serve as a model for small construction activity general permits.
- # General permits prescribe one set of requirements for all applicable permittees. General permits are drafted by the NPDES permitting authority, then published for public comment before being finalized and issued.
- # A Notice of Intent (NOI) serves as the application for the general permit. Under the Phase II Rule, NPDES permitting authorities have the discretion to not require submittal of an NOI under a general permit for small construction activity.
- # Small construction operators must submit an NOI and obtain coverage under a general permit by March 10, 2003 or an earlier date set by the permitting authority (if this option is available).

2) Individual Permits

- # NPDES permitting authorities may deny coverage under general permits and require operators to submit an individual NPDES permit application based on information such as water quality data.
- # In the event that an NPDES permitting authority decides to issue an individual construction permit for small construction activity, operators are subject to the individual application requirements found at 40 CFR §122.26(c)(1)(ii).
- # For any discharges of storm water associated with small construction activity identified in §122.26(b)(15) that are not authorized by a general permit, an individual permit application must be submitted to the permitting authority by

March 10, 2003.

5.3.2 For the NPDES Permitting Authority

5.3.2.1 Alternative Option for Writing Permit Requirements: Referencing a Qualifying State, Tribal or Local Erosion and Sediment Control Program

Under §122.44(s) of the Phase II Rule, permitting authorities have the flexibility to develop permit conditions that incorporate by reference qualifying State, Tribal, or local erosion and sediment control programs into permits for large and small construction activity.

To be considered a qualifying State, Tribal, or local program, the program must require construction site operators to:

- Implement appropriate erosion and sediment control BMPs;
- Control waste such as discarded building materials, concrete truck washout, chemicals, litter, and sanitary waste at the site that may cause adverse impacts to water quality;
- Submit a site plan for review that incorporates consideration of potential water quality impacts; and
- Develop and implement a storm water pollution prevention plan (SWPPP) containing elements similar to those required by other NPDES construction storm water permits.

In addition to these elements, a qualifying program for large construction activities must also include any additional requirements necessary to achieve the applicable technology-based standards of “Best Available Technology” (BAT) and “Best Conventional Technology” (BCT) based on the best professional judgment of the permit writer.

Important Note: Not all the construction programs administered by NPDES-permitted MS4s would qualify. A primary reason for this is because NPDES-permitted MS4s are not obligated under their permit to require construction operators to develop a SWPPP.

Should a State, Tribal, or local program include one or more, but not all, of the elements listed above, the NPDES permitting authority can reference the program in the permit, provided it also lists the missing element(s) as a condition in the permit.

5.3.2.2 Permit Application: Optional Use of NOIs

Under the Phase II Rule, EPA is providing NPDES permitting authorities with the

discretion to not require NOIs under a general permit for discharges from small construction activity, if desired. EPA does, however, recommend the use of NOIs for tracking permit coverage and prioritizing inspections and enforcement. This alternative option does not apply to general permits for large construction activity.

5.4 PERMIT REQUIREMENTS

The Phase II Rule requires operators of small construction sites, nationally, to obtain an NPDES permit and implement practices to minimize pollutant runoff. The Phase II Rule directs permitting authorities to develop and issue permits for small construction activity no later than December 9, 2002. Operators of small construction activity will be required to obtain permit coverage by March 10, 2003, or an earlier date set by the permitting authority. However, operators may have to comply with local, State, or Tribal construction runoff control programs (see section 4.6.2.4 for information on the Phase II small MS4's construction program).

For the Phase II small construction program, EPA has taken an approach similar to Phase I where the program requirements are not fully defined in the rule but rather in the NPDES permit by the NPDES permitting authority. EPA recommends that the NPDES permitting authorities use their existing Phase I NPDES construction general permits as a guide to developing their Phase II construction permits. In doing so, the Phase II requirements would be similar to the Phase I requirements described in subsection 5.4.2, although the applicable standards for small construction activity are different as outlined in subsection 5.4.1.

5.4.1 Applicable Water Quality Standards

Unlike the technology-based standards of BAT and BCT that are applicable to large construction activity, an operator of small construction activity is required to design its pollutant control plan so that it:

- Protects water quality (under CWA section 402(p)(6)); and
- Satisfies the appropriate water quality requirements of the CWA.

The water quality standards for large and small construction activity are different because they were designated into the NPDES storm water program under two separate sections of the CWA with differing standards. Practically, though, the standard for small construction activity would be substantively the same as the standard for large construction activity.

5.4.2 Potential Small Construction Activity Permit Requirements

EPA currently has only one type of permit available for construction activity operators, the NPDES Construction General Permit. This permit provides coverage to

large construction activities only. EPA expects any general permit for small construction activity to be very similar to the CGP. To gain familiarity with the CGP, the three main elements of the CGP are included below.

Important note: This section on the CGP requirements is included for informational purposes only in order to provide a sense of what the permit requirements for small construction activity may be – these are not the requirements for small construction activity.

5.4.2.1 Notice of Intent

A complete and accurate NOI must be submitted to the NPDES permitting authority. An NOI includes general information and a certification that the activity will not impact endangered or threatened species. This certification is unique to EPA's NOI and is not a requirement of most NPDES-delegated State's NOIs.

An NOI must be postmarked at least two days prior to commencement of any work on site (if the operator has control over plans and specifications) or two days prior to commencement of the operator's portion of the work (if the operator has only day-to-day operational control).

5.4.2.2 Storm Water Pollution Prevention Plan (SWPPP)

The most important requirement of the CGP is the construction storm water pollution prevention plan (SWPPP) that includes the appropriate BMPs to minimize the discharge of pollutants from the site. The CGP requires at least one SWPPP for each construction project or site.

The construction site operator, or operators, must develop the SWPPP prior to submitting the NOI to obtain permit coverage. Unlike the NOI and other reporting forms, the operator(s) does not submit the SWPPP to the permitting authority. Instead, the SWPPP remains onsite and made accessible according to the requirements described in the CGP.

The SWPPP comprises several elements:

- **Site description.** This will contain a description of potential pollutant sources and other information.
- **Controls (BMPs).** This part of the SWPPP must clearly describe not only the controls, but also the timing and responsible permittee for implementing the controls in the following categories:

- ✓ Erosion and Sediment Controls
- ✓ Storm Water Management Controls

✓ Other Controls

- **Inspections.** Another critical element of the SWPPP is regular inspections of disturbed areas of the site that has not been stabilized; exposed materials storage areas; structural controls; and vehicle entrances and exits.
- **Maintenance.** The SWPPP also requires that operators perform maintenance on the controls (BMPs) to ensure they are in effective operating condition.
- **Signatures.** The SWPPP must be signed by at least one of the persons responsible for submitting an NOI for the project.
- **Accessibility.** The CGP requires the operator(s) to retain a copy of the SWPPP at the construction site or other local location accessible to the permitting authority.

More information on the construction SWPPP requirements can be found in the CGP, published on February 17, 1998 (63 *FR* 7858, p. 7906). EPA has also issued a construction general permit for Regions IV and VI. Contact your EPA Regional office or State environmental agency for information on construction permits in your State. In addition, EPA published a construction SWPPP guidance in a document entitled *Storm Water Management for Construction Activities: Developing Storm Water Pollution Prevention Plans and Best Management Practices* (EPA 832-R-92-005, September 1992).

5.4.2.3 Notice of Termination (NOT)

A completed Notice of Termination (NOT) must be submitted to the NPDES permitting authority within 30 days after one or more of the following conditions have been met:

- Final stabilization has been achieved on all portions of the site for which the permittee is responsible;
- Another operator/permittee has assumed control over all areas of the site that have not been finally stabilized; or
- For residential construction only: temporary stabilization of a lot has been completed prior to transference of ownership to the homeowner, with the homeowner being made aware of the need to perform final stabilization.

5.5 INTEGRATION OF NPDES PROGRAM FOR CONSTRUCTION WITH NPDES PROGRAM FOR MS4S

There is often confusion about the interaction between the NPDES Storm Water Program for construction activity, which has been the topic of discussion in this section, and the construction runoff control program implemented by NPDES-regulated MS4s, which was the topic of discussion in section 4.6.2.4.

- These are two separate and distinct construction programs.
- A construction operator is subject to requirements under BOTH programs if it is located in an NPDES-regulated MS4's jurisdiction.

The NPDES Storm Water Program for Construction is administered by the NPDES permitting authority, either the State or an EPA Regional Office.

- This program requires the construction site operator to seek coverage under an NPDES storm water discharge permit for construction. The current permit, the Construction General Permit, requires the operator to submit an NOI, develop a SWPPP, and comply with other applicable NPDES storm water discharge permit requirements.
- The Construction General Permit (CGP) currently only applies to large construction activity disturbing greater than 5 acres. Permits for small construction activity will be issued by each NPDES permitting authority by December 9, 2002.

The NPDES Storm Water Program for MS4s: MS4 Construction Runoff Control Programs are administered by the MS4 operator. The MS4 operator's NPDES storm water discharge permit requires it to establish requirements to control storm water discharges from construction activity and new development and redevelopment.

- Regulated small MS4s must control 1 acre and above.
- Medium and large MS4s have no particular size thresholds that they must control – differs among MS4s
- The specific requirements of the construction programs will vary among MS4s. An MS4 permit typically does not specify that the MS4 operator must require a SWPPP or that a permit application be submitted.

5.6 SMALL CONSTRUCTION ACTIVITY COMPLIANCE PROCESS: What Do I Need To Do To Comply?

Sections 5.1 through 5.5 of this guidance have provided details on who's covered, who may be waived, and what may be required under the Phase II regulations for small construction activity. Now that you are familiar with the Phase II program, this section

walks you through the process, from beginning to end, that an operator of a small construction activity should take to comply with the regulation. This step-by-step "walk-through" assumes the issuance of a general permit for small construction activity that is similar to the CGP. Remember, the general permit for small construction activity may have different requirements, timeframes, and deadlines than what is noted here. Repeat the steps for each individual construction site.

The last page of this section includes a permitting decision tree to help operators of construction activity determine if they need an NPDES storm water permit. By starting in the upper left hand corner, an operator can follow the decision tree to determine if they fall under Phase I, Phase II, or are eligible for a waiver.

Step 1: Determine if your construction site will discharge storm water runoff into a MS4 (see section 4.1.1 for definition) or to waters of the United States. If so, proceed to Step 2. If not, stop here.

Waters of the United States include interstate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce. (Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA are not waters of the United States.) A complete definition can be found at 40 CFR 122.2.

Step 2: Determine if your construction site's storm water discharge will meet the definition of a "storm water discharge associated with small construction activity." If so, proceed to Step 3. If not, stop here. (See section 5.1.2)

Step 3: If your site meets the definition of small construction activity, determine if it qualifies for a waiver from the permit requirements. If so, stop here. If not, proceed to Step 4. (See section 5.2)

Step 4: Obtain and read the applicable storm water discharge permit for small construction activity (or the CGP until the small construction permit has been issued to get a sense of the upcoming permit requirements). The small construction permit should be issued by the NPDES permitting authority by December 9, 2002. (See section 5.4.2 for potential requirements)

Step 5: Determine which parties are considered *operators* and, therefore, are responsible for complying with the requirements described in the storm water permit for small construction activity (See section 5.1.3)

Step 6: Develop a SWPPP. (See section 5.4.2.2)

- SWPPPs must be developed prior to submitting the NOI.
- You do not need to submit the SWPPP to your NPDES permitting authority, however, it should be accessible to the public.

Step 7: Complete and submit an NOI. (See section 5.4.2.1)

- Your NPDES permitting authority may or may not require a NOI. If so, the Phase II regulation requires that you submit your NOI no later than March 10, 2003 (or 90 days after the NPDES permitting authority issues the permit, whichever comes first).
- Submit a completed NOI to your NPDES permitting authority two days prior to beginning work at the construction site.

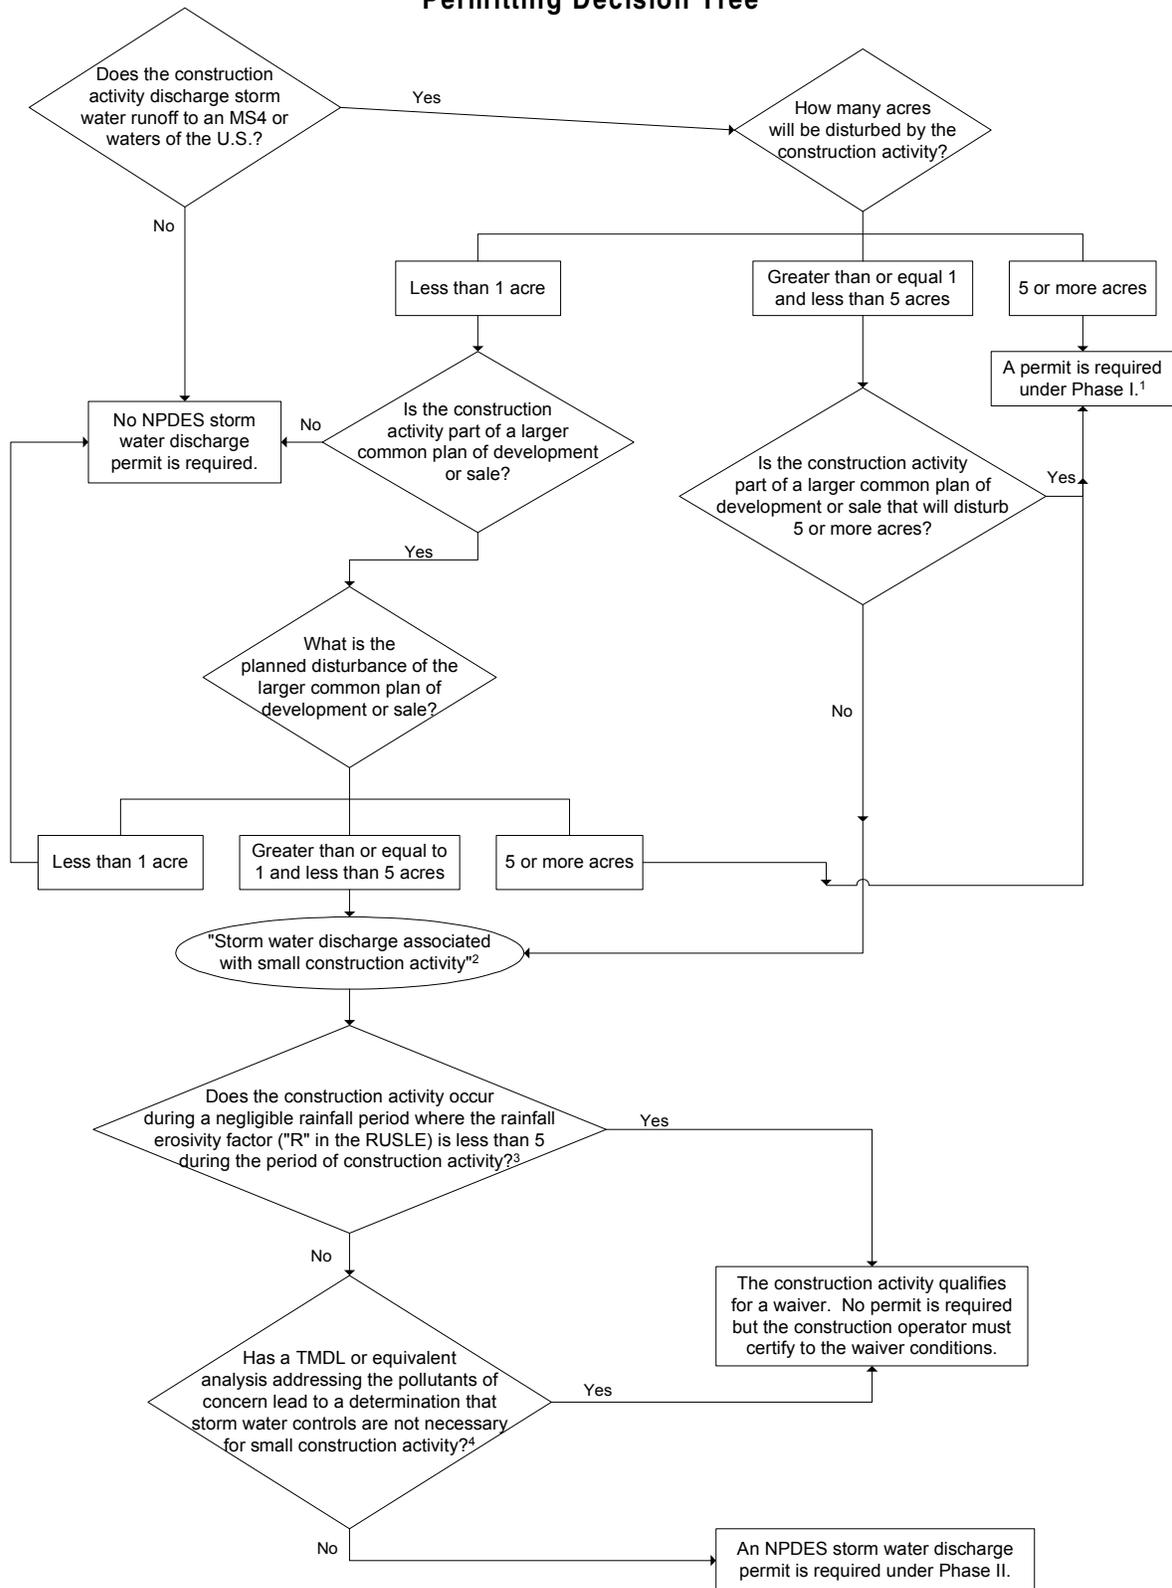

Step 8: Implement the SWPPP.

- Includes generation of inspection reports that are to be kept on-site.

Step 9: Complete and submit an NOT. (See section 5.4.2.3)

- Submit a completed NOT to your NPDES permitting authority within 30 days after one or more of the appropriate conditions have been met.

**Construction Activities Storm Water Program
Permitting Decision Tree**

1. Construction activity disturbing, or part of a planned disturbance of, five or more acres is a "storm water discharge associated with industrial activity" under category (x). See 40 CFR 122.26(b)(14)(x).
 2. See new 122.26(b)(15) for the definition of "storm water discharge associated with small construction activity."
 3. See new 122.26(b)(15)(i)(A) for more details.
 4. See new 122.26(b)(15)(i)(B) for more details.

6.0 INDUSTRIAL ACTIVITY

After reading section 6.0, you should understand the basic components and requirements of the Phase II regulations as they affect the categories of industrial activity covered by the Phase I regulations. Phase II revises the original Phase I industrial no exposure exemption and also sets a new deadline for permit coverage for the municipally-owned industrial activity that had been temporarily exempted from storm water permit coverage.

6.1 PHASE I INDUSTRIAL ACTIVITY: What Industrial Activities are Covered by Phase I of EPA's Storm Water Program?

The 1990 storm water regulations for Phase I of the federal storm water program identify eleven categories of industrial activities under the definition of a "storm water discharge associated with industrial activity" that must obtain a National Pollutant Discharge Elimination System (NPDES) permit. The categories contain industries listed either by reference to an industry's Standard Industrial Classification (SIC) code, or by a short narrative description of the activity found at the industrial site (see text box at right for more detailed descriptions). For facilities that match the SIC codes or description in one of the categories, only those that have a storm water discharge to a *municipal separate storm sewer system (MS4)* or *waters of the United States* are required to seek permit coverage. The NPDES permit requirements vary between individual and general permits, but in general involve the development of a storm water pollution prevention plan based upon site assessments, monitoring and reporting data on storm water discharges, and mitigating any possible effects of discharges on endangered species and national historic properties (for EPA issued permits).

Storm Water Discharge Associated with Industrial Activity (40 CFR 122.26(b)(14)(i) - (xi))

- Facilities subject to storm water effluent limitation guidelines; new source performance standards, or toxic pollutant effluent standards under 40 CFR Subchapter N.
- "Heavy" industrial facilities with SIC codes listed in 40 CFR 122.26(b)(14)(ii), (iii), and (vi)
- "Light" industrial facilities with SIC codes listed in 40 CFR 122.26(b)(14)(xi), which conduct the activities specified in that sections.
- Hazardous waste treatment, storage, or disposal facilities.
- Landfills, land application sites, and open dumps that receive or have received industrial waste.
- Steam electric power generating facilities.
- Sewage treatment works.
- Construction activity (including clearing, grading, and excavation) disturbing five or more acres of land, or less than five acres of land if it is part of a larger common plan of development or sale of five acre or greater.

Under the Phase I regulations, operators of facilities within category eleven (xi), commonly referred to as “light industry,” were exempted from the definition of “storm water discharge associated with industrial activity,” and the subsequent requirement to obtain an NPDES permit, provided their industrial materials or activities were not “exposed” to storm water. This Phase I no exposure exemption from permitting was limited to those facilities identified in category (xi), and did not require category (xi) facility operators to submit any information supporting their no exposure claim.

In 1992, the Ninth Circuit court remanded to EPA for further rulemaking the no exposure exemption for light industry after making a determination that the limited exemption was arbitrary and capricious. The result was a revised no exposure exemption (now an "exclusion") as part of the Phase II regulation.

6.2 PHASE II NO EXPOSURE EXCLUSION: What is the Conditional No Exposure Exclusion for Industrial Activity as Revised by this Regulation?

The intent of the no exposure provision is to provide a simplified method for complying with the Clean Water Act to all industrial facilities that are entirely indoors. This includes facilities that are located within a large office building, or at which the only items permanently exposed to precipitation are roofs, parking lots, vegetated areas, and other non-industrial areas or activities.

As revised in the Phase II regulation, if a condition of No Exposure exists at a Phase I industrial facility, then permits will not be required for storm water discharges from these facilities. All industrial facilities that have no exposure of materials to storm water, including the "light industrial" facilities, must submit a certification to the permitting authority. The facility must certify that a condition of No Exposure exists at its facility and either maintain a condition of no exposure or obtain a permit. The following subsections discuss who is eligible for the revised no exposure exclusion, the definition of no exposure, and the requirement to submit a written certification of no exposure in place of a permit application.

6.2.1 Who is Eligible to Qualify for the No Exposure Exclusion?

The Phase II Conditional No Exposure Exclusion represents a significant expansion in the scope of the original no exposure provision in terms of eligibility. Now, all Phase I industrial categories with a condition of no exposure, except for construction activity, are eligible for the no exposure exclusion. The exclusion from permitting is available on a facility-wide basis only, not for individual outfalls

6.2.2 What is the Definition of No Exposure?

The Phase II regulatory definition of no exposure is as follows:

No exposure means all industrial materials and activities are protected

by a storm resistant shelter to prevent exposure to rain, snow, snowmelt, and/or runoff. Industrial materials or activities include, but are not limited to, material handling equipment or activities, industrial machinery, raw materials, intermediate products, by-products, final products, or waste products.

A storm resistant shelter is not required for the following industrial materials and activities:

- Drums, barrels, tanks, and similar containers that are tightly sealed, provided those containers are not deteriorated and do not leak. “Sealed” means banded or otherwise secured and without operational taps or valves;
- Adequately maintained vehicles used in materials handling;
- Final products, other than products that would be mobilized in storm water discharges (e.g., rock salt).

The term “storm-resistant shelter,” as used in the no exposure definition, includes completely roofed and walled buildings or structures, as well as structures with only a top cover but no side coverings, provided material under the structure is not otherwise subject to any run-on and subsequent runoff of storm water.

While the intent of the no exposure provision is to promote a condition of permanent no exposure, certain machinery, such as trucks, may become temporarily exposed to rain and snow while passing between buildings. Adequately maintained mobile equipment (e.g., trucks, automobiles, forklifts, trailers, or other such general purpose vehicles found at the industrial site that are not industrial machinery, and that are not leaking contaminants or are not otherwise a source of industrial pollutants) also can be exposed to precipitation or runoff. Such activities alone would not prevent a facility from certifying to no exposure. Similarly, trucks or other vehicles awaiting maintenance at vehicle maintenance facilities that are not leaking contaminants or are not otherwise a source of industrial pollutants, would not be considered exposed.

EPA recognizes that there are circumstances where permanent no exposure of industrial activities or materials is not possible and, therefore, under such conditions, materials and activities could be sheltered with temporary covers (e.g., tarps) between periods of permanent enclosure. The No Exposure provision does not specify every such situation, but NPDES permitting authorities can address this issue on a case-by-case basis.

The Phase II regulation also addresses particulate matter emissions from roof stacks/vents. If regulated by, and in compliance with, other environmental protection programs (i.e., air quality control programs) and not causing storm water contamination, they are considered not exposed. Particulate matter or visible deposits of residuals from roof stacks and/or vents not otherwise regulated (i.e., under an air quality control program) and evident in storm water outflow are considered “exposed.” Likewise,

visible “track out” (i.e., pollutants carried on the tires of vehicles) or windblown raw materials are considered “exposed.” Leaking pipes containing contaminants exposed to storm water are deemed “exposed,” as are past sources of storm water contamination that remain onsite. General refuse and trash, not of an industrial nature, is not considered exposed as long as the container is completely covered and nothing can drain out holes in the bottom, or is lost in loading onto a garbage truck. Industrial refuse and trash that is left uncovered, however, is considered “exposed.”

6.2.3 What Do I Need To Know About Certifying to a Condition of No Exposure?

In order to obtain the Conditional No Exposure exclusion, you will have to submit written certification that your facility meets the definition of “no exposure,” even if you are a category (xi) facility operator. The Phase II Rule included as an appendix to the preamble a four-page No Exposure Certification form to be used for this purpose in areas where EPA is the NPDES permitting authority. EPA's certification form uses a series of yes/no questions which you must answer regarding the your industrial activity. You may certify to no exposure if you can answer "no" to all of the questions.

Important note: EPA's No Exposure Certification form applies only in areas where EPA is the NPDES permitting authority. Where a State is the NPDES permitting authority, the State will issue its own form. Since most aspects of EPA's form are also regulatory requirements as to what must be included within a written certification of no exposure, you may expect the State forms to be very similar to EPA's.

The Certification form serves two purposes: 1) as an aid to help you in determining whether you have a condition of No Exposure at your facility or site, and 2) as the necessary written certification of No Exposure, provided you are able to answer all the questions in the negative.

- If, after you have completed the form, you find that you answered "yes" to one or more of the questions about possible exposure, you must make the appropriate changes at the facility if you still wish to apply for the conditional exclusion. These changes must remove the particular material, process, or activity at the facility or site from exposure to storm water.
- If, after completing the form, you find that you were able to check "no" to every question, you qualify for the no exposure exclusion and must sign and submit the form to your NPDES permitting authority.

Certification Facts:

- The certification must be completed and submitted to your permitting authority once every 5 years, and can only be done so if the condition of no exposure continues to exist at the facility.
- The Certification must be provided for each facility qualifying for the no exposure

exclusion.

- The form is non-transferable. If a new operator takes over your facility, they must complete, sign, and submit a new form to claim the no exposure exclusion when they assume control over the operations of the facility.

6.2.4 Are There Any Concerns Related to Water Quality Standards?

Yes. An operator certifying that its facility qualifies for the conditional no exposure exclusion may, nonetheless, be required by the permitting authority to obtain permit authorization. Such a requirement would follow the permitting authority's determination that the facility's discharge is likely to have an adverse impact on water quality.

Many efforts to achieve no exposure can employ simple good housekeeping and contaminant cleanup activities such as moving materials and activities indoors into existing buildings or structures. In limited cases, however, industrial operators may make major changes at a site to achieve no exposure. These efforts may include constructing a new building or cover to eliminate exposure or constructing structures to prevent run-on and storm water contact with industrial materials and activities. Major changes undertaken to achieve no exposure, however, can increase the impervious area of the site, such as when a building is placed in a formerly vegetated area. Increased impervious area can lead to an increase in the volume and velocity of storm water runoff, which, in turn, can result in a higher concentration of pollutants in the discharge, since fewer pollutants are naturally filtered out.

The concern of increased impervious area is addressed in one of the last questions on the Certification form, which asks, "Have you paved or roofed over a formerly exposed, pervious area in order to qualify for the no exposure exclusion? If yes, please indicate approximately how much area was paved or roofed over." This question is intended to aid the NPDES permitting authority in assessing the likelihood of such actions interfering with water quality standards. Where this is a concern, the facility operator and its NPDES permitting authority should take appropriate actions to ensure that water quality standards can be achieved.

6.2.5 Industrial Program Compliance Process: What Do I Need To Do To Obtain the No Exposure Exclusion and Comply with Applicable Requirements?

Sections 6.1 through 6.2.4. of this guidance have provided information necessary to understand the conditional no exposure exclusion. Now that you are familiar with the no exposure exclusion, this section walks you through the process, from beginning to end, that an operator of industrial activity will need to take to comply with the Phase II regulation. This step-by-step "walk-through" assumes the issuance of a no exposure certification form that is similar to EPA's form. Remember, a State's certification form may have different requirements and deadlines than what is noted here. Repeat the steps for each individual facility or site.

Step 1: Determine if your industrial activity meets the definition of a "discharge associated with industrial activity." If so, proceed to Step 2. If not, stop here. (See section 6.1)

- If you are a regulated industrial operator, you need to **either** apply for a storm water permit, **or** submit a no exposure certification, in order to be in compliance with the NPDES storm water regulations. Any storm water permit you may currently hold becomes null and void once a completed conditional no exposure certification form is submitted

Step 2: Obtain the no exposure certification form from your NPDES permitting authority. Determine if your regulated industrial activity meets the definition of "no exposure" and qualifies for the exclusion from permitting. If it does, proceed to Step 3. If not, stop here and obtain industrial storm water permit coverage (probably through the multi-sector general permit or similar permit).

- The conditional no exposure exclusion option is currently available only for facilities in areas where EPA is the NPDES permitting authority. In all other areas, where the State is the NPDES permitting authority, the facility operators will need to wait until the State makes the option available.

Step 3: Submit the certification form to your NPDES permitting authority -- a new form must be submitted once every 5 years.

- Be aware that even when you certify to no exposure, your NPDES permitting authority still retains the authority to require you to apply for an individual or general permit if it has determined that your discharge is contributing to the violation of, or interfering with the attainment or maintenance of, water quality standards, including designated uses.

Step 4: Submit a copy, upon request, of the certification form to the municipality in which the facility is located.

Step 5: Allow your NPDES permitting authority or, if discharging into a municipal separate storm sewer system, the operator of the system, to (1) inspect the facility and (2) make such inspection reports publicly available upon request.

Step 6: Maintain a condition of no exposure.

- The no exposure exclusion is conditional and not an outright exemption. Therefore, if there is a change in circumstances that causes exposure of industrial activities or materials to storm water, the you are required to comply immediately with all the requirements of the NPDES Storm Water Program, including applying for and obtaining a storm water discharge permit.

- Failure to maintain the condition of no exposure or obtain coverage under an NPDES permit can lead to the unauthorized discharge of pollutants to waters of the United States, resulting in penalties under the CWA.

6.3 ISTEAMORATORIUM: How Has this Regulation Affected the Municipally-Operated Industrial Activity Subject to the Intermodal Surface Transportation Enforcement Act (ISTEA) Moratorium?

Provisions within ISTEAM temporarily delayed the deadline for Phase I industrial activities operated by municipalities with populations of less than 100,000 people to obtain an NPDES storm water discharge permit. Congress delayed the permitting deadline to allow small municipalities additional time to comply with NPDES requirements. This moratorium on permitting did not apply to power plants, airports, and uncontrolled sanitary landfills operated by small municipalities.

The Phase II Rule slightly extended this temporary exemption from permitting and set a deadline of no later than March 10, 2003 for all ISTEAM-exempted municipally-operated industrial activities to obtain NPDES permit coverage. Of course, like any other regulated industrial activity, these municipally-operated industrial activities are eligible to qualify for the no exposure exclusion from permitting if a condition of no exposure exists. Municipal-operators must follow the same procedures outlined in Section 6.2.4 in order to obtain an exclusion from permitting.

Many of the small municipalities that will now have to obtain permit coverage for their industrial activity will also have to obtain permit coverage for their small MS4 (see section 4.0) and small construction activity (see section 5.0). The Phase II regulation deadlines for industrial, small MS4, and small construction permit coverage are all the same – no later than March 10, 2003 – to allow the NPDES permitting authority to issue one individual permit that covers all three components if it chooses to do so.

7.0 THE COMPLIANCE ASSURANCE PROCESS

After reading section 7, you should understand how EPA will determine compliance, what happens if you or the EPA discovers noncompliance, and where to go for compliance assistance information.

7.1 How Will EPA Determine Compliance?

EPA employs several approaches to monitor compliance with its environmental regulations, including both EPA-initiated and facility-initiated methods.

1. **Inspections** – EPA may conduct periodic inspections at facilities subject to this regulation. Inspections may be initiated by disclosures to EPA, randomly selecting facilities, or a variety of targeting methods. Inspections may be used, for instance, to monitor recordkeeping requirements, visit sites where storm water controls should be in place, and/or verify that facilities have permits.
2. **Permits, Records, and Reports** – Permits are not required for small construction sites and regulated small MS4s for up to three years and 90 days from the effective date of the final rule. After general permits are issued, the NPDES permitting authorities intend to use the data in storm water permit applications, construction waiver certifications, storm water pollution prevention plans (SWPPPs), no exposure certifications, records, and reports (as required by the Phase II regulation) to set appropriate permit conditions and track discharges covered by a storm water permit. Compliance and enforcement authorities will use the information to assess the regulated entity's level of compliance.
3. **Review of No Exposure Certifications** – Operators of industrial facilities that are eligible for a no exposure exclusion from the NPDES permitting requirements may prepare, and submit for review, a no exposure certification. NPDES authorities will use the information contained in the certification in determining compliance with the no exposure provisions. This information will particularly assist in determining compliance with the no exposure certification in conjunction with complaints from the public.
4. **Self-audit and Self Disclosure** – Facilities have the primary responsibility for ensuring that they are in continuous compliance. EPA encourages the facility to take advantage of EPA's Audit Policy, Small Business Policy, or Small Community Policy (these will be discussed in more detail in section 7.2).

In addition to this document, to aid in determining whether it is in compliance, the facility might use a document currently being developed by EPA entitled "Protocol for Conducting Environmental Compliance Audits under the Storm

Water Program.” This protocol, which is a part of a set containing other statute-specific audit protocols, is a tool to assist and encourage businesses and organizations to perform environmental audits and disclose violations in accordance with EPA’s Audit Policy. The protocol provides guidance on key requirements, defines regulatory terms, gives an overview of the federal laws affecting a particular environmental management area, and includes a checklist for review of the facility. EPA anticipates making the document available for public use in summer 2000. To see a sample of protocols that have been completed under other statutes (RCRA, EPCRA, CERCLA), visit the Internet site: <http://es.epa.gov/oeca/ccsmd/profile.html>.

7.2 If I Discover a Violation, How Can I Work With The Agency to Correct It?

EPA promotes environmental compliance by providing incentives. By participating in compliance assistance programs or voluntarily disclosing violations and promptly correcting violations, businesses may get penalty waivers or reductions. EPA has three policies that potentially apply to entities regulated by the Storm Water Phase II Rule. These policies do not apply if an enforcement action has already been initiated.

Audit Policy. The first of these policies is *“Incentives for Self-Policing: Discovery, Disclosure, Correction and Prevention of Violations”* (60 FR 66706), known as the “Audit Policy”. EPA initiated this policy to provide entities of all sizes with incentives to voluntarily discover and promptly disclose and correct violations of environmental regulations. For a more detailed description of the Audit Policy, visit the Internet site at: www.epa.gov/oeca/polguid/polyguid1.html.

Small Business Policy. EPA’s *“Policy on Compliance Incentives for Small Business”* was developed to help small businesses with 100 or fewer employees achieve environmental compliance by creating benefits for businesses that make a good faith effort to comply with environmental regulations before a government agency discovers a violation or otherwise takes an enforcement action. The Policy currently provides incentives, such as penalty waivers or penalty reduction, for businesses that participate in on-site compliance assistance programs or conduct environmental audits to discover, disclose, and correct violations. The Policy is presently being modified to broaden when and how a small business can take advantage of the Policy. Revisions are expected in spring of 2000. Please see www.epa.gov/oeca/polguid or contact Ginger Gotliffe (202-564-7072) for more information.

Small Community Policy. The *“Policy on Flexible State Enforcement Responses to Small Community Violations”* (November, 1995) promotes alternative strategies for communities to achieve environmental and economic goals. States are encouraged to use multimedia compliance assistance and prioritize compliance issues to address specific needs of their small communities. As long as states work within the parameters of the Policy, EPA will generally defer to their decision to waive part or all of the penalty for a small community’s environmental violations. This approach allows small

communities to apply their limited resources to fixing their environmental problems, rather than to paying penalties. The policy applies to communities generally comprised of fewer than 2,500 residents. In the context of the Storm Water Phase II Rule, small MS4s that are not eligible for waivers from their regulatory requirements would be most likely to take advantage of this policy. For a more detailed description of the Small Communities Policy, visit the Internet sites: www.epa.gov/oeca/scpolicy.html or www.epa.gov/oeca/ccsmd/mun.html.

7.3 Where Can I Go for Compliance Assistance on the Storm Water Phase II Rule?

The permitting authority is the leading source for information on the Storm Water Phase II Rule. EPA is also developing a "tool box" to assist States, Tribes, municipalities, and other parties involved in the Phase II program. This tool box will facilitate implementation of the storm water program in an effective and cost-efficient manner. The tool box is available on EPA's web page at <http://www.epa.gov/owm/sw/phase2> and consists of the following eight major components:

- Fact Sheets
- Guidance Documents
- Menu of BMPs
- Training and Outreach Efforts
- Information Clearinghouse
- Technical Research
- Support for Demonstration Projects
- Compliance Monitoring/Assistance Tools

In addition, EPA provides widely available compliance assistance through the establishment of national compliance assistance centers, in partnership with industry, academic institutions, and other federal and state agencies. Centers have been established that provide services for several industries that contain many small businesses. Compliance assistance centers offer a range of communications services, including Web sites, e-mail groups, fax-back systems, and telephone assistance lines. Each Center is targeted to a specific sector and explains relevant federal environmental regulations. For instance, local governments can use the services of the Local Government Environmental Assistance Network (LGEAN). LGEAN is a "first-stop shop" providing environmental management, planning, and regulatory information for local government elected and appointed officials, managers, and staff. It provides 24-hour access to regulatory and pollution prevention information, message boards, regulatory updates, grants and information, and more. It is a good source for compliance assistance information on the Storm Water Phase II Rule.

For more information on EPA's compliance assistance centers, please contact Tracy Back (202-564-7076). You can access all the centers through www.epa.gov/oeca/mcfac.html or individually at:

EPA's Compliance Assistance Centers

Center	Phone	Web Address

Paints and Coatings Resource Center	1-800-286-6372	www.paintcenter.org

7.4 If the Agency Discovers a Violation, What Might Be Its Response?

To maximize compliance, EPA implements a balanced program of compliance assistance, compliance incentives, and traditional law enforcement. EPA knows that small businesses which must comply with complicated new statutes or rules often want to do the right thing, but may lack the requisite knowledge, resources, or skills. Compliance assistance information and technical advice helps small businesses to understand and meet their environmental obligations. Compliance incentives, such as our Small Business Policy, encourage persons to voluntarily discover, disclose, and correct violations before they are identified by the government. EPA's strong law enforcement program protects all of us by targeting persons who neither comply nor cooperate to address their problems.

EPA uses a variety of methods to determine whether regulated entities are complying, including inspecting facilities, reviewing records and reports, and responding to citizen complaints. If we learn an entity is violating the law, EPA (or a State, if the program is delegated) may file an enforcement action seeking penalties of up to \$27,500, per violation, per day. While the statutory maximum penalty is currently \$27,500, it may be increased periodically based on inflation in accordance with the Debt Collection Improvement Act of 1996. The proposed penalty in a given case will depend on many factors, including the number, length, and severity of the violations, the economic benefit obtained by the violator, and its ability to pay. EPA has policies in place to ensure penalties are calculated fairly. These policies are available to the public. In addition, any company charged with a violation has the right to contest EPA's allegations and proposed penalty before an impartial judge or jury.

EPA recognizes that we can achieve the greatest possible protection by encouraging businesses and organizations to work with us to discover, disclose, and correct violations. That is why we have issued Audit, Small Business, and Small Community policies to eliminate or reduce penalties for small and large entities which cooperate with EPA to address compliance problems. To help the regulated community in understanding their requirements for compliance with the rule, EPA provides compliance assistance through its regional offices, Office of Enforcement and Compliance Assurance at Headquarters, and national compliance assistance centers partners.

ABBREVIATIONS:

BAT	Best Available Technology Economically Achievable (applies to non-conventional and toxic pollutants)
BCT	Best Conventional Pollutant Control Technology (applies to conventional pollutants)
BMP	Best Management Practice
BPJ	Best Professional Judgment
BPT	Best Practicable Control Technology Currently Available (generally applies to conventional pollutants and some metals)
CFR	Code of Federal Regulations
CGP	Construction General Permit
COD	Chemical Oxygen Demand
CSO	Combined Sewer Overflow
CWA	Clean Water Act (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972)
CZARA	Coastal Zone Act Reauthorization Amendments
D.O.	Dissolved Oxygen
DMR	Discharge Monitoring Report
ELG	Effluent Limitations Guidelines
EPA	Environmental Protection Agency
FR	Federal Register
MEP	Maximum Extent Practicable
MS4	Municipal Separate Storm Sewer System
MSGP	Multi Sector General Permit
NOI	Notice of Intent
NOT	Notice of Termination
NOV	Notice of Violation
NPDES	National Pollutant Discharge Elimination System
NPS	Non-point Source
O&M	Operation and Maintenance
OW	Office of Water
OWM	Office of Wastewater Management
PA	Permitting Authority
POTW	Publicly Owned Treatment Works
SIC	Standard Industrial Classification
SWPPP	Storm Water Pollution Prevention Plan
TMDL	Total Maximum Daily Load
TSS	Total Suspended Solids
UA	Urbanized Area

DEFINITIONS:

Best Available Treatment(BAT)/Best Control Technology (BCT): A level of technology based on the very best (state of the art) control and treatment measures that have been developed or are capable of being developed and that are economically achievable within the appropriate industrial category.

Best Management Practices (BMPs): Activities or structural improvements that help reduce the quantity and improve the quality of storm water runoff. BMPs include treatment requirements, operating procedures, and practices to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

Category (xi) facilities: Specific facilities classified as light industry with equipment or materials exposed to storm water.

Clean Water Act (Water Quality Act): (formerly the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972). Public law 92-500; 33 U.S.C. 1251 et seq.; legislation which provides statutory authority for the NPDES program. Also know as the Federal Water Pollution Control Act.

Conveyance: The process of water moving from one place to another.

Discharge: The volume of water (and suspended sediment if surface water) that passes a given location within a given period of time.

Erosion: When land is diminished or worn away due to wind, water, or glacial ice. Often the eroded debris (silt or sediment) becomes a pollutant via storm water runoff. Erosion occurs naturally but can be intensified by land clearing activities such as farming, development, road-building, and timber harvesting.

Excavation: The process of removing earth, stone, or other materials from land.

General Permit: A permit issued under the NPDES program to cover a certain class or category of storm water discharges. These permits reduce the administrative burden of permitting storm water discharges.

Grading: The cutting and/or filling of the land surface to a desired slope or elevation.

Illicit Connection: Any discharge to a municipal separate storm sewer that is not composed entirely of storm water and is not authorized by an NPDES permit, with some exceptions (e.g., discharges due to fire fighting activities).

Industrial Activity: Any activity which is directly related to manufacturing, processing or raw materials storage areas at an industrial plant.

Large Municipal Separate Storm Sewer System (MS4): An MS4 located in an incorporated place or county with a population of 250,000 or more, as determined by

the latest U.S. Census

Light Manufacturing Facilities: Described under Category (xi) of the definition of "storm water discharges associated with industrial activity." [40 CFR 122.26(b)(14)(xi)] Under the Phase I NPDES Storm Water Program, these facilities were eligible for exemption from storm water permitting requirements if certain areas and activities were not exposed to storm water. As a result of the Phase II Final Rule, these facilities must now certify to a condition of no exposure.

Maximum Extent Practicable (MEP): A standard for water quality that applies to all MS4 operators regulated under the NPDES Storm Water Program. Since no precise definition of MEP exists, it allows for maximum flexibility on the part of MS4 operators as they develop and implement their programs.

Medium Municipal Separate Storm Sewer System (MS4): MS4 located in an incorporated place or county with a population of 100,000 or more but less than 250,000, as determined by the latest U.S. Census.

Municipal Separate Storm Sewer System (MS4): A publically-owned conveyance or system of conveyances that discharges to waters of the U.S. and is designed or used for collecting or conveying storm water, is not a combined sewer, and is not part of a publicly-owned treatment works (POTW).

Multi-Sector General Permit (MSGP): An NPDES permit that regulates storm water discharges from eleven categories of industrial activities.

No exposure: All industrial materials or activities are protected by a storm resistant shelter to prevent exposure to rain, snow, snowmelt, and/or runoff. Industrial materials or activities include, but are not limited to, material handling equipment or activities, industrial machinery, raw materials, intermediate products, by-products, final products, or waste products. Material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product or waste product.

Non-authorized States: any State that does not have the authority to regulate the NPDES Storm Water Program.

Non-point Source (NPS) Pollutants: Pollutants from many diffuse sources. NPS pollution is caused by rainfall or snowmelt moving over and through the ground. As the runoff moves, it picks up and carries away natural and human-made pollutants, finally depositing them into lakes, rivers, wetlands, coastal waters, and even our underground sources of drinking water.

Notice of Intent (NOI): An application to notify the permitting authority of a facility's intention to be covered by a general permit; exempts a facility from having to submit an individual or group application.

NPDES: "National Pollutant Discharge Elimination System" the name of the surface water quality program authorized by Congress as part of the 1987 Clean Water Act. This is EPA's program to control the discharge of pollutants to waters of the United States (see 40 CFR 122.2).

O&M Expenditures: The operating and maintenance costs associated with the continual workings of a project.

Outfall: The point where wastewater or drainage discharges from a sewer pipe, ditch, or other conveyance to a receiving body of water.

Permitting Authority (PA): The NPDES-authorized state agency or EPA regional office that administers the NPDES Storm Water Program. PAs issue permits, provide compliance assistance, and inspect and enforce the program.

Physically interconnected MS4: This means that one MS4 is connected to a second MS4 in such a way that it allows for direct discharges into the second system.

Point Source Pollutant: Pollutants from a single, identifiable source such as a factory or refinery.

Pollutant Loading: The total quantity of pollutants in storm water runoff.

Qualifying local program: A local, State or Tribal municipal storm water management program that imposes, at a minimum, the relevant requirements of one or more of the minimum control measures included in 122.34(b).

Regulated MS4: Any MS4 covered by the NPDES Storm Water Program (regulated small, medium, or large MS4s).

Retrofit: The modification of storm water management systems through the construction and/or enhancement of wet ponds, wetland plantings, or other BMPs designed to improve water quality

Runoff: Drainage or flood discharge that leaves an area as surface flow or as pipeline flow. Has reached a channel or pipeline by either surface or sub-surface routes.

Sanitary Sewer: A system of underground pipes that carries sanitary waste or process wastewater to a treatment plant.

Sediment: Soil, sand, and minerals washed from land into water, usually after rain. Sediment can destroy fish-nesting areas, clog animal habitats, and cloud waters so that sunlight does not reach aquatic plants.

Sheet flow: The portion of precipitation that moves initially as overland flow in very shallow depths before eventually reaching a stream channel.

Site Plan: A graphical representation of a layout of buildings and facilities on a parcel of land.

Site Runoff: Any drainage or flood discharge that is released from a specified area.

Small Municipal Separate Storm Sewer System (MS4): Any MS4 that is not regulated under Phase I of the NPDES Storm Water Program and Federally-owned MS4s.

Stakeholder: An entity that holds a special interest in an issue or program -- such as the storm water program -- since it is or may be affected by it.

Standard Industrial Classification (SIC) Code: A four digit number which is used to identify various types of industries.

Storm Drain: A slotted opening leading to an underground pipe or an open ditch for carrying surface runoff.

Storm Water: Precipitation that accumulates in natural and/or constructed storage and storm water systems during and immediately following a storm event.

Storm Water Management: Functions associated with planning, designing, constructing, maintaining, financing, and regulating the facilities (both constructed and natural) that collect, store, control, and/or convey storm water.

Storm Water Pollution Prevention Plan (SWPPP): A plan to describe a process whereby a facility thoroughly evaluates potential pollutant sources at a site and selects and implements appropriate measures designed to prevent or control the discharge of pollutants in storm water runoff.

Surface Water: Water that remains on the surface of the ground, including rivers, lakes, reservoirs, streams, wetlands, impoundments, seas, estuaries, etc.

Total Maximum Daily Load (TMDL): The maximum amount of pollutants which can be released into a water body without adversely affecting the water quality.

Tool Box: A term to describe the activities and materials that EPA plans to perform/produce to facilitate implementation of the storm water program in an effective and cost-efficient manner. The eight components include: 1) fact sheets; 2) guidance documents; 3) menu of BMPs; 4) compliance assistance; 5) information clearing house; 6) training and outreach efforts; 7) technical research; and 8) support for demonstration projects.

Urbanized Area (UA): A Bureau of the Census determination of a central place (or places) and the adjacent densely settled surrounding territory that together have a minimum residential population of 50,000 people and a minimum average density of 1,000 people/square mile. This is a simplified definition of a UA, the full definition is very complex.

Urban Runoff: Storm water from urban areas, which tends to contain heavy concentrations of pollutants from urban activities.

Watershed: That geographical area which drains to a specified point on a water course, usually a confluence of streams or rivers (also known as drainage area, catchment, or river basin).

Wet Weather Flows: Water entering storm drains during rainstorms/wet weather events.

Why Is the Phase II Storm Water Program Necessary?

Since the passage of the Clean Water Act (CWA), the quality of our Nation's waters has improved dramatically. Despite this progress, however, degraded waterbodies still exist. According to the 1996 National Water Quality Inventory (Inventory), a biennial summary of State surveys of water quality, approximately 40 percent of surveyed U.S. waterbodies are still impaired by pollution and do not meet water quality standards. A leading source of this impairment is polluted runoff. In fact, according to the Inventory, 13 percent of impaired rivers, 21 percent of impaired lake acres and 45 percent of impaired estuaries are affected by urban/suburban storm water runoff and 6 percent of impaired rivers, 11 percent of impaired lake acres and 11 percent of impaired estuaries are affected by construction site discharges.

Phase I of the U.S. Environmental Protection Agency's (EPA) storm water program was promulgated in 1990 under the CWA. Phase I relies on National Pollutant Discharge Elimination System (NPDES) permit coverage to address storm water runoff from: (1) “medium” and “large” municipal separate storm sewer systems (MS4s) generally serving populations of 100,000 or greater, (2) construction activity disturbing 5 acres of land or greater, and (3) ten categories of industrial activity.

The Storm Water Phase II Final Rule is the next step in EPA's effort to preserve, protect, and improve the Nation's water resources from polluted storm water runoff. The Phase II program expands the Phase I program by requiring additional operators of MS4s in urbanized areas and operators of small construction sites, through the use of NPDES permits, to implement programs and practices to control polluted storm water runoff. See Fact Sheets 2.0 and 3.0 for overviews of the Phase II programs for MS4s and construction activity.

Phase II is intended to further reduce adverse impacts to water quality and aquatic habitat by instituting the use of controls on the unregulated sources of storm water discharges that have the greatest likelihood of causing continued environmental degradation. The environmental problems associated with discharges from MS4s in urbanized areas and discharges resulting from construction activity are outlined below.

MS4s in Urbanized Areas

Storm water discharges from MS4s in urbanized areas are a concern because of the high concentration of pollutants found in these discharges. Concentrated development in urbanized areas substantially increases impervious surfaces, such as city streets, driveways, parking lots, and sidewalks, on which pollutants from concentrated human activities settle and remain until a storm event washes them into nearby storm drains. Common pollutants include pesticides, fertilizers, oils, salt, litter and other debris, and sediment. Another concern is the possible illicit connections of sanitary sewers, which can result in fecal coliform bacteria entering the storm sewer system. Storm water runoff picks up and transports these and other harmful pollutants then discharges them – untreated – to waterways via storm sewer systems. When left uncontrolled, these discharges can result in fish kills, the destruction of spawning and wildlife habitats, a loss in aesthetic value, and contamination of drinking water supplies and recreational waterways that can threaten public health.

Construction Activity

Uncontrolled runoff from construction sites is a water quality concern because of the devastating effects that sedimentation can have on local waterbodies, particularly small streams. Numerous studies have shown that the amount of sediment transported by storm water runoff from construction sites with no controls is significantly greater than from sites with controls. In addition to sediment, construction activities yield pollutants such as pesticides, petroleum products, construction chemicals, solvents, asphalts, and acids that can contaminate storm water runoff. During storms, construction sites may be the source of sediment-laden runoff, which can overwhelm a small stream channel's capacity, resulting in streambed scour, streambank erosion, and destruction of near-stream vegetative cover. Where left uncontrolled, sediment-laden runoff has been shown to result in the loss of in-stream habitats for fish and other aquatic species, an increased difficulty in filtering drinking water, the loss of drinking water reservoir storage capacity, and negative impacts on the navigational capacity of waterways.

Are Municipally Operated Sources Exempted by the Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991 Affected by the Final Rule?

Provisions within ISTEA temporarily delayed the deadline for Phase I industrial activities (with the exception of power plants, airports, and uncontrolled sanitary landfills) operated by municipalities with populations of less than 100,000 people to obtain an NPDES storm water discharge permit. Congress delayed the permitting deadline for these facilities to allow small municipalities additional time to comply with NPDES requirements. The Phase II Final Rule ended this temporary exemption from permitting and set a deadline of no later than March 10, 2003 for all ISTEA-exempted municipally operated industrial activities to obtain permit coverage.

How Was the Phase II Final Rule Developed?

EPA developed the Phase II Final Rule during extensive consultations with a cross-section of interested stakeholders brought together on a subcommittee chartered under the Federal Advisory Committee Act, and with representatives of small entities participating in an advisory process mandated under the Small Business Regulatory Enforcement Fairness Act. In addition, EPA considered comments submitted by over 500 individuals and organizations during a 90-day public comment period on the proposed rule.

Why Does Part of the Phase II Final Rule Use a Question and Answer Format?

The provisions pertaining to operators of small MS4s are written in a “readable regulation” form that uses the “plain language” method. Questions and answers are used to create more reader-friendly and understandable regulations. The plain language method uses “must” instead of “shall” to indicate a requirement and words like “should,” “could,” or “encourage” to indicate a recommendation or guidance.

Who Is Covered by the Phase II Final Rule?

The final rule “automatically” covers two classes of storm water dischargers on a nationwide basis:

- (1) Operators of small MS4s located in “urbanized areas” as delineated by the Bureau of the Census. A “small” MS4 is any MS4 not already covered by Phase I of the NPDES storm water program. See Fact Sheets 2.1 and 2.2 for more information on small MS4 coverage.
- (2) Operators of small construction activities that disturb equal to or greater than 1 (one) and less than 5 (five) acres of land. See Fact Sheet 3.0 for more information on small construction activity coverage.

Waivers

Permitting authorities may waive “automatically designated” Phase II dischargers if the dischargers meet the necessary criteria. See Fact Sheets 2.1 (small MS4 waivers overview), 3.0 (construction waivers overview) and 3.1 (construction rainfall erosivity waiver) for details.

Phased-in Permit Coverage

Permitting authorities may phase-in permit coverage for small MS4s serving jurisdictions with a population under 10,000 on a schedule consistent with a State watershed permitting approach.

Additional Designations by the Permitting Authority

Small MS4s located outside of urbanized areas, construction activity disturbing less than 1 acre, and any other storm water discharges can be designated for coverage if the NPDES permitting authority or EPA determines that storm water controls are necessary. See Fact Sheet 2.1 for more information on the designation of small MS4s located outside of urbanized areas.

What Does the Phase II Final Rule Require?

Operators of Phase II-designated small MS4s and small construction activity are required to apply for NPDES permit coverage, most likely under a general rather than individual permit, and to implement storm water discharge management controls (known as “best management practices” (BMPs)). Specific requirements for each type of discharge are listed below.

Small MS4s

- A regulated small MS4 operator must develop, implement, and enforce a storm water management program designed to reduce the discharge of pollutants from their MS4 to the “maximum extent practicable,” to protect water quality, and to satisfy the appropriate water quality requirements of the CWA. The rule assumes the use of narrative, rather than numeric, effluent limitations requiring implementation of BMPs.
- The small MS4 storm water management program must include the following six minimum control measures: public education and outreach; public participation/involvement; illicit discharge detection and elimination; construction site runoff control; post-construction runoff control; and pollution prevention/good housekeeping. See Fact Sheets 2.3 through 2.8 for more information on each measure, including BMPs and measurable goals.
- A regulated small MS4 operator must identify its selection of BMPs and measurable goals for each minimum measure in the permit application. The evaluation and assessment of those chosen BMPs and measurable goals must be included in periodic reports to the NPDES permitting authority. See Fact Sheet 2.9 for more information on permitting and reporting.

Small Construction Activity

- The specific requirements for storm water controls on small construction activity will be defined by the NPDES permitting authority on a State-by-State basis.
- EPA expects that the NPDES permitting authorities will use their existing Phase I general permits for large construction activity as a guide for their Phase II permits for small construction activity. If

this occurs, a storm water pollution prevention plan will likely be required for small construction activity. See Fact Sheet 3.0 for more information on potential program requirements and appropriate BMPs for small construction activity.

What Is the Phase II Program Approach?

The Phase II program, based on the use of federally enforceable NPDES permits:

- Encourages the use of general permits;
- Provides flexibility for regulated operators to determine the most appropriate storm water controls;
- Allows for the recognition and inclusion of existing NPDES and non-NPDES storm water programs in Phase II permits;
- Includes public education and participation efforts as primary elements of the small MS4 program;
- Attempts to facilitate and promote watershed planning and to implement the storm water program on a watershed basis; and
- Works toward a unified and comprehensive NPDES storm water program with Phase I of the program.

How Does the Phase II Final Rule Address the Phase I Industrial “No Exposure” Provision?

In addition to establishing a deadline for ISTEAs and designating two new classes of dischargers, the Phase II Final Rule revises the “no exposure” provision originally included in the 1990 regulations for Phase I of the NPDES storm water program. The provision was remanded to EPA for further rulemaking and, subsequently, included in its revised form in the Phase II rule.

Under the Phase II Final Rule, a conditional no exposure exclusion is available to operators of *all* categories of Phase I regulated industrial activity (except category (x) construction activity) who can certify that all industrial materials and activities are protected by a storm resistant shelter to prevent exposure to rain, snow, snowmelt, and/or runoff. To obtain the no exposure exclusion, written certification must be submitted to the NPDES permitting authority. The final rule includes a *No Exposure Certification* form for use only by operators of industrial activity in areas where EPA is the NPDES permitting authority. See Fact Sheet 4.0 for more information on the conditional no exposure exclusion for industrial activity.

What Is the Phase II Program Implementation “Tool Box?”

EPA is committed to providing tools to facilitate implementation of the final Phase II storm water program in an effective and cost-efficient manner. The “tool box” will include the following components:

- ⇒ Fact Sheets;
- ⇒ Guidance Documents;
- ⇒ Menu of BMPs;
- ⇒ Information Clearinghouse/Web Site;
- ⇒ Training and Outreach Efforts;
- ⇒ Technical Research;
- ⇒ Support for Demonstration Projects; and
- ⇒ Compliance Monitoring/Assistance Tools.

A preliminary working toolbox is available on EPA’s web site at www.epa.gov/owm/sw/toolbox. Three years after publication of the final rule, when the general permits are issued, a fully operational tool box is scheduled to be available.

What Is the Schedule for the Phase II Rule?

- The Phase II Final Rule was published in the *Federal Register* on December 8, 1999 (64 *FR* 68722).
- The Conditional No Exposure Exclusion option is available February 7, 2000, in States where EPA is the permitting authority.
- The NPDES permitting authority will issue general permits for Phase II-designated small MS4s and small construction activity by December 9, 2002.
- Operators of Phase II “automatically” designated regulated small MS4s and small construction activity must obtain permit coverage within 90 days of permit issuance.
- The NPDES permitting authority may phase-in coverage for small MS4s serving jurisdictions with a population under 10,000 on a schedule consistent with a State watershed permitting approach.
- Operators of regulated small MS4s must fully implement their storm water management programs by the end of the first permit term, typically a 5-year period.

Industrial "No Exposure"

4.0 – Conditional No Exposure Exclusion for Industrial Activity

Polluted storm water runoff is often transported to municipal separate storm sewer systems (MS4s) and ultimately discharged into local rivers and streams without treatment. EPA's Storm Water Phase II Rule establishes an MS4 storm water management program that is intended to improve the Nation's waterways by reducing the quantity of pollutants that storm water picks up and carries into storm sewer systems during storm events. Common pollutants include oil and grease from roadways, pesticides from lawns, sediment from construction sites, and carelessly discarded trash, such as cigarette butts, paper wrappers, and plastic bottles. When deposited into nearby waterways through MS4 discharges, these pollutants can impair the waterways, thereby discouraging recreational use of the resource, contaminating drinking water supplies, and interfering with the habitat for fish, other aquatic organisms, and wildlife.

In 1990, EPA promulgated rules establishing Phase I of the National Pollutant Discharge Elimination System (NPDES) storm water program. The Phase I program for MS4s requires operators of "medium" and "large" MS4s, that is, those that generally serve populations of 100,000 or greater, to implement a storm water management program as a means to control polluted discharges from these MS4s. The Storm Water Phase II Rule extends coverage of the NPDES storm water program to certain "small" MS4s but takes a slightly different approach to how the storm water management program is developed and implemented.

What Is a Phase II Small MS4?

A small MS4 is any MS4 not already covered by the Phase I program as a medium or large MS4. The Phase II Rule automatically covers on a nationwide basis all small MS4s located in "urbanized areas" (UAs) as defined by the Bureau of the Census (unless waived by the NPDES permitting authority), and on a case-by-case basis those small MS4s located outside of UAs that the NPDES permitting authority designates. For more information on Phase II small MS4 coverage, see Fact Sheets 2.1 and 2.2.

What Are the Phase II Small MS4 Program Requirements?

Operators of regulated small MS4s are required to design their programs to:

- Reduce the discharge of pollutants to the "maximum extent practicable" (MEP);
- Protect water quality; and
- Satisfy the appropriate water quality requirements of the Clean Water Act.

Implementation of the MEP standard will typically require the development and implementation of BMPs and the achievement of measurable goals to satisfy each of the six minimum control measures.

The Phase II Rule defines a small MS4 storm water management program as a program comprising six elements that, when implemented in concert, are expected to result in significant reductions of pollutants discharged into receiving waterbodies.

The six MS4 program elements, termed “minimum control measures,” are outlined below. For more information on each of these required control measures, see Fact Sheets 2.3 – 2.8.

- ① **Public Education and Outreach**
Distributing educational materials and performing outreach to inform citizens about the impacts polluted storm water runoff discharges can have on water quality.
- ② **Public Participation/Involvement**
Providing opportunities for citizens to participate in program development and implementation, including effectively publicizing public hearings and/or encouraging citizen representatives on a storm water management panel.
- ③ **Illicit Discharge Detection and Elimination**
Developing and implementing a plan to detect and eliminate illicit discharges to the storm sewer system (includes developing a system map and informing the community about hazards associated with illegal discharges and improper disposal of waste).
- ④ **Construction Site Runoff Control**
Developing, implementing, and enforcing an erosion and sediment control program for construction activities that disturb 1 or more acres of land (controls could include silt fences and temporary storm water detention ponds).
- ⑤ **Post-Construction Runoff Control**
Developing, implementing, and enforcing a program to address discharges of post-construction storm water runoff from new development and redevelopment areas. Applicable controls could include preventative actions such as protecting sensitive areas (e.g., wetlands) or the use of structural BMPs such as grassed swales or porous pavement.
- ⑥ **Pollution Prevention/Good Housekeeping**
Developing and implementing a program with the goal of preventing or reducing pollutant runoff from municipal operations. The program must include municipal staff training on pollution prevention measures and techniques (e.g., regular street sweeping, reduction in the use of pesticides or street salt, or frequent catch-basin cleaning).

What Information Must the NPDES Permit Application Include?

The Phase II program for MS4s is designed to accommodate a general permit approach using a Notice of Intent (NOI) as the permit application. The operator of a regulated small MS4 must include in its permit application,

or NOI, its chosen BMPs and measurable goals for each minimum control measure. To help permittees identify the most appropriate BMPs for their programs, EPA will issue a “menu,” of BMPs to serve as guidance. NPDES permitting authorities can modify the EPA menu or develop their own list. For more information on application requirements, see Fact Sheet 2.9.

What Are the Implementation Options?

The rule identifies a number of implementation options for regulated small MS4 operators. These include sharing responsibility for program development with a nearby regulated small MS4, taking advantage of existing local or State programs, or participating in the implementation of an existing Phase I MS4's storm water program as a co-permittee. These options are intended to promote a regional approach to storm water management coordinated on a watershed basis.

What Kind of Program Evaluation/Assessment Is Required?

Permittees need to evaluate the effectiveness of their chosen BMPs to determine whether the BMPs are reducing the discharge of pollutants from their systems to the “maximum extent practicable” and to determine if the BMP mix is satisfying the water quality requirements of the Clean Water Act. Permittees also are required to assess their progress in achieving their program’s measurable goals. While monitoring is not required under the rule, the NPDES permitting authority has the discretion to require monitoring if deemed necessary. If there is an indication of a need for improved controls, permittees can revise their mix of BMPs to create a more effective program. For more information on program evaluation/assessment, see Fact Sheet 2.9.

Who Is Affected by the Phase II Small MS4 Program?

The Storm Water Phase II Final Rule applies to operators of *regulated small* municipal separate storm sewer systems (MS4s), which are designated based on the criteria discussed in this fact sheet. In this fact sheet, the definition of an MS4 and the distinction between small, medium, and large MS4s is reviewed. Conditions under which a small MS4 may be designated as a *regulated small MS4*, as well as the conditions for a waiver from the Phase II program requirements, are outlined. This fact sheet also attempts to clarify possible implementation issues related to determining one's status as an operator of a regulated small MS4.

What Is a Municipal Separate Storm Sewer System (MS4)?

What constitutes an MS4 is often misinterpreted and misunderstood. The term MS4 does not solely refer to municipally-owned storm sewer systems, but rather is a term of art with a much broader application that can include, in addition to local jurisdictions, State departments of transportation, universities, local sewer districts, hospitals, military bases, and prisons. An MS4 also is not always just a system of underground pipes – it can include roads with drainage systems, gutters, and ditches. The regulatory definition of an MS4 is provided below.

According to 40 CFR 122.26(b)(8), "*municipal separate storm sewer* means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains):

- (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law)...including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the Clean Water Act that discharges into waters of the United States.
- (ii) Designed or used for collecting or conveying storm water;
- (iii) Which is not a combined sewer; and
- (iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2."

What Is a Small, Medium, or Large MS4?

- ❑ EPA’s NPDES (National Pollutant Discharge Elimination System) storm water permitting program labels MS4s as either “small,” “medium,” or “large” for the purposes of regulation.
- ❑ A **small MS4** is any MS4 that is not already covered by the Phase I storm water program. Small MS4s include Federally-owned systems, such as military bases.
- ❑ The Phase I storm water program covers *medium* and *large* MS4s. Phase I MS4s were automatically designated nationwide as **medium MS4s** if they were located in an incorporated place or county with a population between 100,000 - 249,999 or as **large MS4s** if located in an incorporated place or county with a population of 250,000 or greater. Many MS4s in areas below 100,000 in population, however, have been individually brought into the Phase I program by NPDES permitting authorities. Such already regulated MS4s do not have to develop a Phase II program.

Are All Small MS4s Covered by the Phase II Final Rule?

No. The universe of small MS4s is quite large since it includes every MS4 except for the approximately 900 medium and large MS4s already regulated under the Phase I storm water program. Only a select sub-set of small MS4s, referred to as **regulated small MS4s**, is covered by the Phase II Final Rule, either through automatic nationwide designation or designation on a case-by-case basis by the NPDES permitting authority.

How Is A Small MS4 Designated as a Regulated Small MS4?

A small MS4 can be designated by the permitting authority as a **regulated** small MS4 in one of three ways:

① Automatic Nationwide Designation

The Phase II Final Rule requires nationwide coverage of all operators of small MS4s that are located within the boundaries of a Bureau of the Census-defined “urbanized area” (UA) based on the latest decennial Census. Once a small MS4 is designated into the program based on the UA boundaries, it cannot be waived from the program if in a subsequent UA calculation the small MS4 is no longer within the UA boundaries. An automatically designated small MS4 remains regulated unless, or until, it meets the criteria for a waiver.

❑ **Urbanized Areas**

An **urbanized area (UA)** is a land area comprising one or more places – central place(s) – and the adjacent densely settled surrounding area – urban fringe – that together have a residential population of at least 50,000 and an overall population density of at least 1,000 people per square mile. It is a calculation used by the Bureau of the Census to determine the geographic boundaries of the most heavily developed and dense urban areas.

Before the time of permit issuance (which must be by December 9, 2002), UA calculations based on the 2000 Census should be published. The regulated universe then will be based on these new calculations. For more information on UAs, see Fact Sheet 2.2.

❑ **Preamble of the Phase II Final Rule: Appendix 6**

A listing of governmental entities that are located either fully or partially within a UA according to the 1990 Census can be found in Appendix 6 to the Preamble. The list is a general geographic reference intended to help operators of small MS4s determine whether or not they are located in a UA and, consequently, required to comply with the regulation; it is not a list of all Phase II regulated MS4s. For example, the list does not include small MS4 operators such as colleges and universities, Federal prison complexes, and State highway departments located within a UA. See Fact Sheet 2.2 for more information on how to determine potential coverage under the Phase II program. Appendix 6 can be obtained from the EPA Office of Wastewater Management (OWM) or downloaded from the OWM web site.

② Potential Designation by the NPDES Permitting Authority – Required Evaluation

An operator of small MS4 located outside of a UA may be designated as a regulated small MS4 if the NPDES permitting authority determines that its discharges cause, or have the potential to cause, an adverse impact on water quality. The Phase II Final Rule requires the NPDES permitting authority to develop a set of designation criteria and apply them, *at a minimum*, to all small MS4s located outside of a UA serving a jurisdiction with a population of at least 10,000 and a population density of at least 1,000 people/square mile.

❑ **Designation Criteria**

EPA recommends that the NPDES permitting authority use a balanced consideration of the following designation criteria on a watershed or other local basis:

- ✓ Discharge to sensitive waters;
- ✓ High population density;
- ✓ High growth or growth potential;
- ✓ Contiguity to a UA;
- ✓ Significant contributor of pollutants to waters of the United States; and
- ✓ Ineffective protection of water quality concerns by other programs.

❑ **Preamble of the Phase II Final Rule: Appendix 7**

A listing of governmental entities located outside of a UA, that have a population of at least 10,000 and a population density of at least 1,000 people per square mile can be found in Appendix 7 to the Preamble of the Phase II Final Rule. Similar to Appendix 6, the list is a geographic reference only – it is not a list of regulated entities. Operators of small MS4s located within a listed area could be examined by their NPDES permitting authority for potential designation into the Phase II program. Furthermore, the NPDES permitting authority reserves the right to designate for regulation any small MS4 that is contributing pollutants to waters of the United States, whether or not its jurisdiction is found in Appendix 7. Appendix 7 can be obtained from the EPA Office of Wastewater Management or downloaded from the OWM web site.

❑ **Deadline for Designation**

The NPDES permitting authority is required to designate small MS4s meeting the designation criteria by December 9, 2002 or by December 8, 2004 if a watershed plan is in place.

③ **Potential Designation by the NPDES Permitting Authority – Physically Interconnected**

Under the final rule, the NPDES permitting authority is required to designate any small MS4 located outside of a UA that contributes substantially to the pollutant loadings of a *physically interconnected* MS4 regulated by the NPDES storm water program. The final rule does not set a deadline for designation of small MS4s meeting this criterion.

Physically interconnected means that one MS4 is connected to a second MS4 in such a way that it allows for *direct* discharges into the second system.

Are Waivers from the Phase II Permit/Program Requirements Possible?

Yes, two waiver options are available to operators of automatically designated small MS4s if discharges do not cause, or have the potential to cause, water quality impairment.

The first applies where:

- (1) the jurisdiction served by the system is less than 1,000 people;
- (2) the system is not contributing substantially to the pollutant loadings of a physically interconnected regulated MS4; and
- (3) if the small MS4 discharges any pollutants identified as a cause of impairment of any water body to which it discharges, storm water controls are not needed based on wasteload allocations that are part of an EPA approved or established “total maximum daily load” (TMDL) that addresses the pollutant(s) of concern.

TMDLs are water quality assessments that determine the source or sources of pollutants of concern for a particular waterbody, consider the maximum amount of pollutants the waterbody can assimilate, and then allocate to each source a set level of pollutants that it is allowed to discharge (i.e., a “wasteload allocation”). Small MS4s that are not given a wasteload allocation would meet the third criterion above.

Pollutants of Concern include biochemical oxygen demand (BOD), sediment or a parameter that addresses sediment (such as total suspended solids, turbidity or siltation), pathogens, oil and grease, and any pollutant that has been identified as a cause of impairment in any water body to which the MS4 discharges.

The second applies where:

- (1) the jurisdiction served by the system is less than 10,000 people;
- (2) an evaluation of all waters of the U.S. that receive a discharge from the system shows that storm water controls are not needed based on wasteload allocations that are part of an EPA approved or established TMDL that addresses the pollutant(s) of concern or an equivalent analysis; and
- (3) it is determined that future discharges from the small MS4 do not have the potential to result in exceedances of water quality standards.

The NPDES permitting authority is required to periodically review any waivers granted to MS4 operators to determine whether any information required for granting the waiver has changed. Minimally, such a review needs to be conducted once every five years.

Are There Allowances for Phasing-in Permit Coverage?

Yes. Small MS4s serving a jurisdiction with a population under 10,000 can be phased-in for permit coverage, following establishment of a State watershed permitting approach. NPDES permitting authorities that choose this option must establish a schedule to phase-in permit coverage annually for approximately 20 percent of all small MS4s that qualify for such phased-in coverage. Where this option is followed, all regulated small MS4s are required to have permit coverage no later than March 8, 2007.

Can More than One MS4 in the Same Political Jurisdiction Be Automatically Designated?

Yes. Since the final rule provides automatic coverage of all small MS4s within a UA, the result would likely be coverage of several governments and agencies with multiple, perhaps overlapping, jurisdictions. For example, a city that is located within a UA and operates its own small MS4 could be designated alongside the State’s department of transportation (DOT) and the county’s DOT if the State and county operate roads that are within the borders of the city. All three entities would be responsible for developing a storm water management program for the portion of their respective MS4s within the city limits. In such a case, the permittees are strongly encouraged to work together to form a unified storm water management program.

Who Is Responsible if the Small MS4 Operator Lacks the Necessary Legal Authority?

Some regulated small MS4s may lack the necessary legal authority to implement one or more of the required minimum control measures that comprise the Phase II storm water management program. For example, a local government that is a small MS4 operator may be in a State that does not have an enabling statute that allows local regulatory control of construction site runoff into the sewer system. Another example is a State DOT that may not have the legal authority to require and enforce controls on illicit discharges into its system. In these situations the small MS4 is encouraged to work with the neighboring regulated small MS4s. As co-permittees, they could form a shared storm water management program in which each permittee is responsible for activities that are within their individual legal authorities and abilities.

Industrial "No Exposure"

4.0 – Conditional No Exposure Exclusion for Industrial Activity

The program for small municipal separate storm sewer systems (MS4s) under the Storm Water Phase II Final Rule includes, in addition to local government jurisdictions, certain Federal and State-operated small MS4s. Federal facilities were not designated for regulation by the NPDES Phase I storm water program for MS4s. The Phase II Final Rule, however, includes the "United States" in the definition of a small MS4, thereby including Federal MS4 operators in the NPDES Phase II storm water program. Federal and State-operated small MS4s can include universities, prisons, hospitals, roads (i.e., departments of transportation), military bases (e.g., State Army National Guard barracks), parks, and office buildings/complexes.

The small MS4 program, largely designed with municipally-operated small MS4s in mind, raises a number of implementation issues for Federal and State operators of regulated small MS4s who must obtain an NPDES permit that requires the development and implementation of a storm water management program that includes the following six minimum control measures: public education and outreach, public participation/involvement, illicit discharge detection and elimination, construction site runoff control, post-construction runoff control, and good housekeeping/pollution prevention for municipal operations (for more information on each measure, see Fact Sheets 2.3 through 2.8). This fact sheet highlights potential implementation issues related to the minimum control measures, then discusses the implementation options included in the rule that may resolve these issues.

What Are Some Implementation Concerns?

This section profiles the three most common implementation issues raised in the public comments submitted regarding Federal/State implementation of the small MS4 program.

How Does the Final Rule Account for Unique Characteristics?

Federal and State small MS4s possess a number of characteristics that set them apart from their municipal counterparts. For example, whereas municipally-operated MS4s largely serve resident populations, many Federal or State-operated MS4s, such as medical clinics and departments of transportation (DOTs), do not. Other types of Federal and State MS4s, such as military bases, prisons, and State universities, serve populations that are different from a typical municipal population. Their unique characteristics might lead Federal or State MS4 operators to question either the need to implement the entire suite of minimum control measures or their ability to comply fully with their Phase II storm water permit. Responsibility for developing a storm water program that comprises the minimum measures lies with the operator of the Federal or State MS4.

What If the Operator Lacks Legal Authority?

Three of the minimum control measures (illicit discharge detection and elimination, and the two construction-related measures) require enforceable controls on third party activities to ensure successful implementation of the measure. Some Federal and State operators, however, may not have the necessary legal regulatory authority to adopt these enforceable controls in the same manner as do local governments.

For example, a State DOT that is responsible for the portions of its roads running through urbanized areas may not have the legal authority to impose restrictions on, and penalties against, illicit (i.e., non-storm water) discharges into its MS4 if the source of the discharge is outside the DOT's right-of-way or jurisdiction. As in the case of local governments that lack such authority, State and Federal MS4s are expected to utilize the authority they do possess and to seek cooperative arrangements.

How Can the Program Be Implemented in Areas Where There Are Multiple Regulated Entities?

Since the final rule provides automatic coverage of all small MS4s within an urbanized area, regardless of political boundaries, coverage of multiple governments and agencies in a single area is likely. For example, a city government that operates a small MS4 within an urbanized area must obtain permit coverage alongside the county, State, and Federal DOTs if they all operate a portion of the roads (i.e., MS4s) in the city. All four entities are responsible for developing a storm water management program for their MS4s (or portions thereof) within the urbanized area. EPA encourages State and Federal small MS4 operators to establish cooperative agreements with cities and counties in implementing their storm water programs.

Are There Implementation Strategies that Help Facilitate Program Implementation?

This section offers two hypothetical strategies for resolving the implementation issues raised above. The best solution may include a creative combination of strategies.

STRATEGY #1

A Focus on Choosing Appropriate BMPs

The final rule requires the permittee to choose *appropriate* best management practices (BMPs) for each minimum control measure. In other words, EPA expects Phase II permittees to tailor their storm water management plans and their BMPs to fit the particular characteristics and needs of the permittee and the area served by its MS4. Therefore, the Federal or State operator of a regulated storm sewer system can take advantage of the flexibility provided by the rule to utilize the most suitable minimum control measures for its MS4. Below is an example of tailored activities and BMPs that Federal or State operators can implement for each measure:

- ❑ **Public Education and Outreach.** Distribute brochures and post fliers to educate employees of a Federal hospital about the problems associated with storm water runoff and the steps they can take to

reduce pollutants in storm water discharges. For example, employees could be advised against carelessly discarding trash on the ground or allowing their cars to leak oil/fluids in the parking lot.

- ❑ **Public Participation/Involvement.** Provide notice of storm water management plan development and hold meetings at which employees of a Federal office complex are encouraged to voice their ideas and opinions about the effort. Request volunteers to help develop the plan.
- ❑ **Illicit Discharge Detection and Elimination.** Develop a map of the storm sewer system on a military base. Perform visual dry weather monitoring of any outfalls to determine whether the storm sewer system is receiving any non-storm water discharges from the base. If a dry weather flow is found, trace it back to the source and stop the discharge. Should a Federal military base identify an illicit discharge, the source of which is traced to the boundary of its system, the Federal operator should refer the discharge to the adjoining regulated MS4 for further action.
- ❑ **Construction Site Runoff Control.** Require the implementation of erosion and sediment controls, and control of waste, for any Federal or State DOT road construction. The DOT would review site plans for proper controls, perform inspections, and establish penalties in the construction contract if controls are not implemented. If construction is done directly by the regulated DOT instead of a private contractor, the DOT could be penalized by the NPDES permitting authority for non-compliance with its small MS4 permit in the event that controls are not properly implemented.
- ❑ **Post-Construction Runoff Control.** Require the implementation of post-construction storm water controls for any new construction on the grounds of a prison. This can be required as part of a construction contract, instituted as internal policy, and considered during site plan review.
- ❑ **Pollution Prevention/Good Housekeeping for Municipal Operations.** Train maintenance staff at a State university to employ pollution prevention techniques whenever possible. For example, routinely pick up trash/litter from the university grounds, use less salt on the parking lots and access roads in the winter, perform any maintenance of university vehicles under shelter only, limit pesticide use to the minimum needed, use vegetative buffer strips in the parking lots to filter runoff, and keep dumpster lids closed.

STRATEGY #2

Working with Other Entities

There may be instances when the Federal or State permittee has limited capabilities to satisfy one or more of the minimum control measures. As discussed above, the permittee may lack the proper legal authority to enforce controls (although it should try to obtain the necessary legal authority if at all possible).

In the case of limited capabilities, the permittee can work with neighboring operators of regulated small MS4s, preferably on a watershed basis, to form a shared storm water management program in which each permittee is responsible for activities that are within individual legal authorities and abilities. The final rule allows the permittee to rely on other entities, with their permission, to implement those minimum measures that the permittee is otherwise unable to implement. Three examples are:

- ❑ A State DOT with limited regulatory legal authority can reference a local sewer district's illicit detection and elimination program in its permit application, provided the program sufficiently addresses illicit discharges into the DOT's storm sewer system.
- ❑ The permittee or NPDES permitting authority can reference such programs as coastal nonpoint pollution control programs, State or local watershed programs, State or local construction programs, and environmental education efforts by public or private entities.
- ❑ The permittee can become a co-permittee with a neighboring Phase I MS4 through a modification of the Phase I MS4's individual permit. This may be the most logical and preferable option for those Federal and State entities located in close proximity to Phase I MS4s.

Choosing to work with other governmental entities as a co-permittee, or referencing parts of each other's plans, can help resolve issues that may arise where multiple regulated jurisdictions exist in the same area. Permittees can avoid duplicative efforts, as well as territorial or regulatory disputes, by working together to implement the storm water program. See Fact Sheet 2.9 for more information on permitting options for regulated small MS4s.

Suggested Steps for Working with Other Entities

- (1) Identify the boundaries of the urbanized area (see Fact Sheet 2.2 for more information on urbanized areas)
- (2) Identify the operators of storm sewer systems or portions of the systems within the urbanized area such as local, State, Tribal or Federal governments or other entities.
- (3) In seeking permit coverage:
 - (A) Identify where another entity's program may satisfy one or more minimum control measure. If a program has requirements that are equivalent to a minimum control measure's required elements, the operator of the regulated small MS4 may reference the program in its permit application, provided the other entity gives it permission to do so. While such an arrangement relieves the operator from performing the minimum measure itself, the operator remains ultimately responsible for the measure's effective implementation (see Fact Sheet 2.9 for more information on this option)

OR

- (B) Team with an operator of a Phase I MS4 and become a co-permittee on its existing Phase I individual permit (see Fact Sheet 2.9 for more information on this option)

Industrial "No Exposure"

4.0 – Conditional No Exposure Exclusion for Industrial Activity

As discussed in Fact Sheet 2.1, *Who's Covered? Designation and Waivers of Regulated Small MS4s*, the Phase II Final Rule covers all small municipal separate storm sewer systems (MS4s) located within an "urbanized area" (UA). Based on the 1990 Census, there are 405 UAs in the United States that cover 2 percent of total U.S. land area and contain approximately 63 percent of the Nation's population. These numbers include Puerto Rico — the only U.S. Territory with UAs.

UAs constitute the largest and most dense areas of settlement. UA calculations delineate boundaries around these dense areas of settlement and, in doing so, identify the areas of concentrated development. UA designations are used for several purposes in both the public and private sectors. For example, the Federal Government has used UAs to calculate allocations for transportation funding, and some planning agencies and development firms use UA boundaries to help ascertain current, and predict future, growth areas.

What Is an Urbanized Area (UA)?

The Bureau of the Census determines UAs by applying a detailed set of published UA criteria (see 55 *FR* 42592, October 22, 1990) to the latest decennial census data. Although the full UA definition is complex, the Bureau of the Census' general definition of a UA, based on population and population density, is provided below.

An *urbanized area* is a land area comprising one or more places — central place(s) — and the adjacent densely settled surrounding area — urban fringe — that together have a residential population of at least 50,000 and an overall population density of at least 1,000 people per square mile.

The basic unit for delineating the UA boundary is the census block. Census blocks are based on visible physical boundaries, such as the city block, when possible, or on invisible political boundaries, when not. An urbanized area can comprise places, counties, Federal Indian Reservations, and minor civil divisions (MCDs - towns and townships).

How Can Status as a Regulated Small MS4 Be Determined?

The drawing below (see Figure 1) is a simplified UA illustration that demonstrates the concept of UAs in relation to the Phase II Final Rule. The "urbanized area" includes within its boundaries incorporated places, a portion of a Federal Indian reservation, an entire MCD, a portion of another MCD, and portions of two counties. Any and all operators of small MS4s located within the boundaries of the UA are covered under the Phase II Final Rule, regardless of political boundaries. Operators of small MS4s located outside of the UA are subject to potential designation into the Phase II MS4 program by the NPDES permitting authority.

Operators of small MS4s can determine if they are located within a UA, and therefore covered by the Phase II storm water program, through the following two steps:

— **STEP 1** —

Refer to a listing of incorporated places, MCDs, and counties that are located entirely or partially within a UA. Such a listing, based on the 1990 Census, can be found in Appendix 6 to the Preamble of the Phase II Final Rule; it does not include governmental entities already permitted under Phase I. If a small MS4 is located in a listed incorporated place, MCD, or county, then the operator of the small MS4 should follow step (2) below. (Note: Appendix 6 can be obtained from the EPA Office of Wastewater Management (OWM) or downloaded from the OWM web site.)

— **STEP 2** —

Some operators of small MS4s may find that they are located within an entity listed in Appendix 6 but not know if their systems are within the urbanized portion of the listed entity. In such a case, they should contact one or more of the following institutions for more detailed information on the location of the UA boundary:

- ❑ **The State or NPDES Permitting Authority (may be the State or the U.S. EPA Region)**

Storm Water Coordinators: The NPDES permitting authority may be the State or the U.S. EPA Region. The Storm Water Coordinators for each U.S. EPA Region are listed in the *For Additional Information* section in Fact Sheet 2.9. These regional contacts can assist with UA information and provide the names of State storm water contacts. Regional and State contact information can also be obtained from OWM.

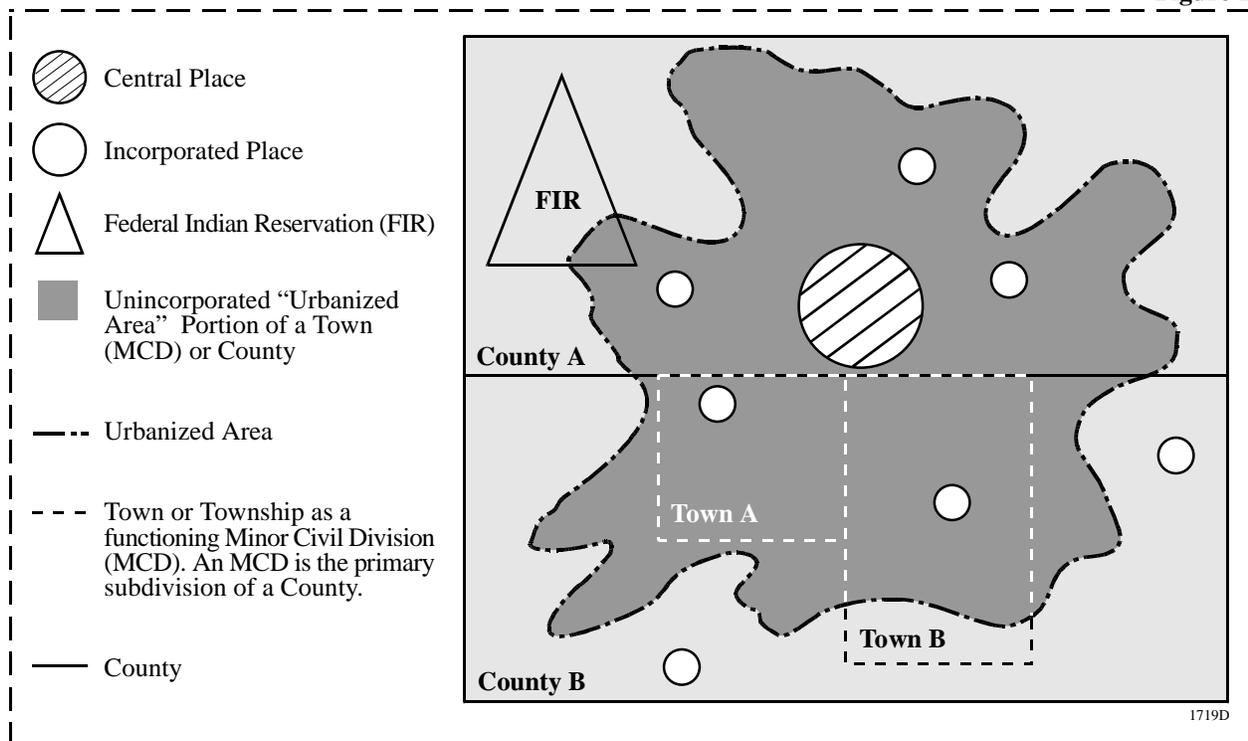

State Data Centers: Each State’s Data Center receives listings of all entities that are located in UAs, as well as detailed maps and electronic files of UA boundaries. The Bureau of the Census web site includes a list of contact names and phone numbers for the data in each State at www.census.gov/sdc/www.

State Planning/Economic/Transportation Agencies: These agencies typically use UAs to assess current development and forecast future growth trends and, therefore, should have detailed UA information readily available to help determine the UA boundaries in any given area.

- ❑ **County or Regional Planning Commissions/Boards**

As with State agencies, these entities are likely to have detailed UA data and maps to help determine UA boundaries.

Figure 1

1719D

□ The Bureau of the Census

Urbanized Areas Staff: 301 457-1099

Web Site: www.census.gov

The site provides information on purchasing UA maps and electronic files for use with computerized mapping systems. Obtain free UA cartographic boundary files (Arc/Info export format) for Geographical Information System (GIS) use at: www.census.gov:80/geo/www/cob/ua.html.

UA Maps: Detailed UA maps are available for purchase with a \$25 minimum order (\$5 per map sheet). Each map sheet measures 36 by 42 inches. For prices and a listing of UAs, visit www.census.gov/mp/www/geo/msgeo12.html. Order from the Department of Commerce, Bureau of the Census (MS 1921), P.O. Box 277943, Atlanta, GA 30384-7943 (Phone: 301 457-4100; Toll-free fax: 1-888-249-7295).

□ U.S. EPA

EPA is modifying a web-based geographic program called *Enviromapper*. This will allow MS4 operators to enter a location and see a detailed map of the UA boundary. Information about *Enviromapper* will be available at www.epa.gov/owm/phase2.

How Will the Year 2000 Census Affect the Determination of Status as a Regulated Small MS4?

The listing of incorporated places, MCDs, and counties located within UAs in the United States and Puerto Rico, found in Appendix 6, is based on the 1990 Census. New listings for UAs based on the 2000 Census are scheduled to be available by July or August of 2001. Once the official 2000 Census listings are published by the Bureau of the Census, operators of small MS4s located within the revised boundaries of former 1990 UAs, or in any newly defined 2000 UAs, become regulated small MS4s and must develop a storm water management program.

Any additional automatic designations of small MS4s based on subsequent census years is governed by the Bureau of the Census' definition of a UA in effect for that year and the UA boundaries determined as a result of the definition.

Once a small MS4 is designated into the Phase II storm water program based on the UA boundaries, it can not be waived from the program if in a subsequent UA calculation the small MS4 is no longer within the UA boundaries. An automatically designated small MS4 will remain regulated unless, or until, it meets the criteria for a waiver (see Fact Sheet 2.1 for more information on the regulated small MS4 waiver option).

Industrial "No Exposure"

4.0 – Conditional No Exposure Exclusion for Industrial Activity

This fact sheet profiles the Public Education and Outreach minimum control measure, one of six measures an operator of a Phase II-regulated small municipal separate storm sewer system (MS4) is required to include in its storm water management program to meet the conditions of its National Pollutant Discharge Elimination System (NPDES) storm water permit. This fact sheet outlines the Phase II Final Rule requirements and offers some general guidance on how to satisfy them. It is important to keep in mind that the regulated small MS4 operator has a great deal of flexibility in choosing exactly how to satisfy the minimum control measure requirements.

Why Is Public Education and Outreach Necessary?

An informed and knowledgeable community is crucial to the success of a storm water management program since it helps to ensure the following:

- **Greater support** for the program as the public gains a greater understanding of the reasons why it is necessary and important. Public support is particularly beneficial when operators of small MS4s attempt to institute new funding initiatives for the program or seek volunteers to help implement the program; and
- **Greater compliance** with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters.

What Is Required?

To satisfy this minimum control measure, the operator of a regulated small MS4 needs to:

- Implement a public education program to distribute educational materials to the community, or conduct equivalent outreach activities about the impacts of storm water discharges on local waterbodies and the steps that can be taken to reduce storm water pollution; and
- Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Some program implementation approaches, BMPs (i.e., the program actions/activities), and measurable goals are suggested below.

What Are Some Guidelines for Developing and Implementing This Measure?

Three main action areas are important for successful implementation of a public education and outreach program:

1 Forming Partnerships

Operators of regulated small MS4s are encouraged to enter into partnerships with other governmental entities to fulfill this minimum control measure’s requirements. It is generally more cost-effective to use an existing program, or to develop a new regional or state-wide education program, than to have numerous operators developing their own local programs. Operators also are encouraged to seek assistance from non-governmental organizations (e.g., environmental, civic, and industrial organizations), since many already have educational materials and perform outreach activities.

2 Using Educational Materials and Strategies

Operators of regulated small MS4s may use storm water educational information provided by their State, Tribe, EPA Region, or environmental, public interest, or trade organizations instead of developing their own materials. Operators should strive to make their materials and activities relevant to local situations and issues, and incorporate a variety of strategies to ensure maximum coverage. Some examples include:

- **Brochures or fact sheets** for general public and specific audiences;
- **Recreational guides** to educate groups such as golfers, hikers, paddlers, climbers, fishermen, and campers;
- **Alternative information sources**, such as web sites, bumper stickers, refrigerator magnets, posters for bus and subway stops, and restaurant placemats;
- **A library of educational materials** for community and school groups;
- **Volunteer citizen educators** to staff a **public education task force**;
- **Event participation** with educational displays at home shows and community festivals;
- **Educational programs** for school-age children;
- **Storm drain stenciling** of storm drains with messages such as “Do Not Dump - Drains Directly to Lake;”
- **Storm water hotlines** for information and for citizen reporting of polluters;
- **Economic incentives** to citizens and businesses (e.g., rebates to homeowners purchasing mulching lawnmowers or biodegradable lawn products);and
- **Tributary signage** to increase public awareness of local water resources.

3 Reaching Diverse Audiences

The public education program should use a mix of appropriate local strategies to address the viewpoints and concerns of a variety of audiences and communities, including minority and disadvantaged communities, as well as children. Printing posters and brochures in more than one language or posting

large warning signs (e.g., cautioning against fishing or swimming) near storm sewer outfalls are methods that can be used to reach audiences less likely to read standard materials. Directing materials or outreach programs toward specific groups of commercial, industrial, and institutional entities likely to have significant storm water impacts is also recommended. For example, information could be provided to restaurants on the effects of grease clogging storm drains and to auto garages on the effects of dumping used oil into storm drains.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should reflect the needs and characteristics of the operator and the area served by its small MS4. Furthermore, they should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following measurable goals:

<u>Target Date</u>	<u>Activity</u>
1 year.....	Brochures developed (bilingual, if appropriate) and distributed in water utility bills; a storm water hotline in place; volunteer educators trained.
2 years.....	A web site created; school curricula developed; storm drains stenciled.
3 years.....	A certain percentage of restaurants no longer dumping grease and other pollutants down storm sewer drains.
4 years.....	A certain percentage reduction in litter or animal waste detected in discharges.

Industrial "No Exposure"

4.0 – Conditional No Exposure Exclusion for Industrial Activity

This fact sheet profiles the Public Participation/Involvement minimum control measure, one of six measures the operator of a Phase II regulated small municipal separate storm sewer system (MS4) is required to include in its storm water management program to meet the conditions of its National Pollutant Discharge Elimination System (NPDES) permit. This fact sheet outlines the Phase II Final Rule requirements and offers some general guidance on how to satisfy them. It is important to keep in mind that the small MS4 operator has a great deal of flexibility in determining how to satisfy the minimum control measure requirements.

Why Is Public Participation and Involvement Necessary?

EPA believes that the public can provide valuable input and assistance to a regulated small MS4's municipal storm water management program and, therefore, suggests that the public be given opportunities to play an active role in both the development and implementation of the program. An active and involved community is crucial to the success of a storm water management program because it allows for:

- **Broader public support** since citizens who participate in the development and decision making process are partially responsible for the program and, therefore, may be less likely to raise legal challenges to the program and more likely to take an active role in its implementation;
- **Shorter implementation schedules** due to fewer obstacles in the form of public and legal challenges and increased sources in the form of citizen volunteers;
- **A broader base of expertise and economic benefits** since the community can be a valuable, and free, intellectual resource; and
- **A conduit to other programs** as citizens involved in the storm water program development process provide important cross-connections and relationships with other community and government programs. This benefit is particularly valuable when trying to implement a storm water program on a watershed basis, as encouraged by EPA.

What Is Required?

To satisfy this minimum control measure, the operator of a regulated small MS4 must:

- Comply with applicable State, Tribal, and local public notice requirements; and
- Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Possible implementation approaches, BMPs (i.e., the program actions and activities), and measurable goals are described below.

What Are Some Guidelines for Developing and Implementing This Measure?

Operators of regulated small MS4s should include the public in developing, implementing, and reviewing their storm water management programs. The public participation process should make every effort to reach out and engage all economic and ethnic groups. EPA recognizes that there are challenges associated with public involvement. Nevertheless, EPA strongly believes that these challenges can be addressed through an aggressive and inclusive program. Challenges and example practices that can help ensure successful participation are discussed below.

Implementation Challenges

The best way to handle common notification and recruitment challenges is to know the audience and think creatively about how to gain its attention and interest. Traditional methods of soliciting public input are not always successful in generating interest, and subsequent involvement, in all sectors of the community. For example, municipalities often rely solely on advertising in local newspapers to announce public meetings and other opportunities for public involvement. Since there may be large sectors of the population who do not read the local press, the audience reached may be limited. Therefore, alternative advertising methods should be used whenever possible, including radio or television spots, postings at bus or subway stops, announcements in neighborhood newsletters, announcements at civic organization meetings, distribution of flyers, mass mailings, door-to-door visits, telephone notifications, and multilingual announcements. These efforts, of course, are tied closely to the efforts for the public education and outreach minimum control measure (see Fact Sheet 2.3).

In addition, advertising and soliciting for help should be targeted at specific population sectors, including ethnic, minority, and low-income communities; academia and educational institutions; neighborhood and community groups; outdoor recreation groups; and business and industry. The goal is to involve a diverse cross-section of people who can offer a multitude of concerns, ideas, and connections during the program development process.

Possible Practices (BMPs)

There are a variety of practices that could be incorporated into a public participation and involvement program, such as:

- **Public meetings/citizen panels** allow citizens to discuss various viewpoints and provide input concerning appropriate storm water management policies and BMPs;
- **Volunteer water quality monitoring** gives citizens first-hand knowledge of the quality of local water bodies and provides a cost-effective means of collecting water quality data;
- **Volunteer educators/speakers** who can conduct workshops, encourage public participation, and staff special events;

- **Storm drain stenciling** is an important and simple activity that concerned citizens, especially students, can do;
- **Community clean-ups** along local waterways, beaches, and around storm drains;
- **Citizen watch groups** can aid local enforcement authorities in the identification of polluters; and
- **“Adopt A Storm Drain” programs** encourage individuals or groups to keep storm drains free of debris and to monitor what is entering local waterways through storm drains.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, greatly depend on the needs and characteristics of the operator and the area served by the small MS4. Furthermore, they should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following measurable goals:

<u>Target Date</u>	<u>Activity</u>
1 year.....	Notice of a public meeting in several different print media and bilingual flyers; citizen panel established; volunteers organized to locate outfalls/illicit discharges and stencil drains.
2 years.....	Final recommendations of the citizen panel; radio spots promoting program and participation.
3 years.....	A certain percentage of the community participating in community clean-ups.
4 years.....	Citizen watch groups established in a certain percentage of neighborhoods; outreach to every different population sector completed.

3.1 – Construction Rainfall Erosivity Waiver

Industrial "No Exposure"

4.0 – Conditional No Exposure Exclusion for Industrial Activity

This fact sheet profiles the Illicit Discharge Detection and Elimination minimum control measure, one of six measures the operator of a Phase II regulated small municipal separate storm sewer system (MS4) is required to include in its storm water management program to meet the conditions of its National Pollutant Discharge Elimination System (NPDES) permit. This fact sheet outlines the Phase II Final Rule requirements and offers some general guidance on how to satisfy them. It is important to keep in mind that the small MS4 operator has a great deal of flexibility in choosing exactly how to satisfy the minimum control measure requirements.

What Is An "Illicit Discharge"?

Federal regulations define an illicit discharge as "...any discharge to an MS4 that is not composed entirely of storm water..." with some exceptions. These exceptions include discharges from NPDES-permitted industrial sources and discharges from fire-fighting activities. Illicit discharges (see Table 1) are considered "illicit" because MS4s are not designed to accept, process, or discharge such non-storm water wastes.

Why Are Illicit Discharge Detection and Elimination Efforts Necessary?

Discharges from MS4s often include wastes and wastewater from non-storm water sources. A study conducted in 1987 in Sacramento, California, found that almost one-half of the water discharged from a local MS4 was not directly attributable to precipitation runoff. A significant portion of these dry weather flows were from illicit and/or inappropriate discharges and connections to the MS4.

Illicit discharges enter the system through either direct connections (e.g., wastewater piping either mistakenly or deliberately connected to the storm drains) or indirect connections (e.g., infiltration into the MS4 from cracked sanitary systems, spills collected by drain outlets, or paint or used oil dumped directly into a drain). The result is untreated discharges that contribute high levels of pollutants, including heavy metals, toxics, oil and grease, solvents, nutrients, viruses, and bacteria to receiving waterbodies. Pollutant levels from these illicit discharges have been shown in EPA studies to be high enough to significantly degrade receiving water quality and threaten aquatic, wildlife, and human health.

Table 1

Sources of Illicit Discharges
Sanitary wastewater
Effluent from septic tanks
Car wash wastewaters
Improper oil disposal
Radiator flushing disposal
Laundry wastewaters
Spills from roadway accidents
Improper disposal of auto and household toxics

What Is Required?

Recognizing the adverse effects illicit discharges can have on receiving waters, the final rule requires an operator of a regulated small MS4 to develop, implement and enforce an illicit discharge detection and elimination program. This program must include the following:

- ❑ A storm sewer system map, showing the location of all outfalls and the names and location of all waters of the United States that receive discharges from those outfalls;
- ❑ Through an ordinance, or other regulatory mechanism, a prohibition (to the extent allowable under State, Tribal, or local law) on non-storm water discharges into the MS4, and appropriate enforcement procedures and actions;
- ❑ A plan to detect and address non-storm water discharges, including illegal dumping, into the MS4;
- ❑ The education of public employees, businesses, and the general public about the hazards associated with illegal discharges and improper disposal of waste; and
- ❑ The determination of appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Some program implementation approaches, BMPs (i.e., the program actions/activities), and measurable goals are suggested below.

Does This Measure Need to Address All Illicit Discharges?

No. The illicit discharge detection and elimination program does not need to address the following categories of non-storm water discharges or flows unless the operator of the regulated small MS4 identifies them as significant contributors of pollutants to its MS4:

- Water line flushing;
- Landscape irrigation;
- Diverted stream flows;
- Rising ground waters;
- Uncontaminated ground water infiltration;
- Uncontaminated pumped ground water;
- Discharges from potable water sources;
- Foundation drains;
- Air conditioning condensation;
- Irrigation water;
- Springs;
- Water from crawl space pumps;

- Footing drains;
- Lawn watering;
- Individual residential car washing;
- Flows from riparian habitats and wetlands;
- Dechlorinated swimming pool discharges; and
- Street wash water.

What Are Some Guidelines for Developing and Implementing This Measure?

The objective of the illicit discharge detection and elimination minimum control measure is to have regulated small MS4 operators gain a thorough awareness of their systems. This awareness allows them to determine the types and sources of illicit discharges entering their system; and establish the legal, technical, and educational means needed to eliminate these discharges. Permittees could meet these objectives in a variety of ways depending on their individual needs and abilities, but some general guidance for each requirement is provided below.

The Map

The storm sewer system map is meant to demonstrate a basic awareness of the intake and discharge areas of the system. It is needed to help determine the extent of discharged dry weather flows, the possible sources of the dry weather flows, and the particular waterbodies these flows may be affecting. An existing map, such as a topographical map, on which the location of major pipes and outfalls can be clearly presented demonstrates such awareness.

EPA recommends collecting all existing information on outfall locations (e.g., review city records, drainage maps, storm drain maps), and then conducting field surveys to verify locations. It probably will be necessary to walk (i.e., wade through small receiving waters or use a boat for larger waters) the streambanks and shorelines for visual observation. More than one trip may be needed to locate all outfalls.

Legal Prohibition and Enforcement

EPA recognizes that some permittees may have limited authority under State, Tribal or local law to establish and enforce an ordinance or other regulatory mechanism prohibiting illicit discharges. In such a case, the permittee is encouraged to obtain the necessary authority, if possible.

The Plan

The plan to detect and address illicit discharges is the central component of this minimum control measure. The plan is dependant upon several factors, including the permittee's available resources, size of staff, and degree and character of its illicit discharges. EPA envisions a plan similar to the one Michigan recommends for use in meeting their NPDES storm

water general permit for small MS4s. As guidance only, the four steps of a recommended plan are outlined below:

1 Locate Problem Areas

EPA recommends that priority areas be identified for detailed screening of the system based on the likelihood of illicit connections (e.g., areas with older sanitary sewer lines). Methods that can locate problem areas include: public complaints; visual screening; water sampling from manholes and outfalls during dry weather; and use of infrared and thermal photography.

2 Find the Source

Once a problem area or discharge is found, additional efforts usually are necessary to determine the source of the problem. Methods that can find the source of the illicit discharge include: dye-testing buildings in problem areas; dye- or smoke-testing buildings at the time of sale; tracing the discharge upstream in the storm sewer; employing a certification program that shows that buildings have been checked for illicit connections; implementing an inspection program of existing septic systems; and using video to inspect the storm sewers.

3 Remove/Correct Illicit Connections

Once the source is identified, the offending discharger should be notified and directed to correct the problem. Education efforts and working with the discharger can be effective in resolving the problem before taking legal action.

4 Document Actions Taken

As a final step, all actions taken under the plan should be documented. This illustrates that progress is being made to eliminate illicit connections and discharges. Documented actions should be included in annual reports and include information such as: the number of outfalls screened; any complaints received and corrected; the number of discharges and quantities of flow eliminated; and the number of dye or smoke tests conducted.

Educational Outreach

Outreach to public employees, businesses, property owners, the general community, and elected officials regarding ways to detect and eliminate illicit discharges is an integral part of this minimum measure that will help gain support for the

permittee’s storm water program. Suggested educational outreach efforts include:

- Developing *informative brochures, and guidances* for specific audiences (e.g., carpet cleaning businesses) and school curricula;
- Designing a program to *publicize and facilitate public reporting* of illicit discharges;
- *Coordinating volunteers* for locating, and visually inspecting, outfalls or to stencil storm drains; and
- Initiating *recycling programs* for commonly dumped wastes, such as motor oil, antifreeze, and pesticides.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should reflect the needs and characteristics of the operator and the area served by its small MS4. Furthermore, they should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following measurable goals:

<u>Target Date</u>	<u>Activity</u>
1 year.....	Sewer system map completed; recycling program for household hazardous waste in place.
2 years.....	Ordinance in place; training for public employees completed; a certain percentage of sources of illicit discharges determined.
3 years.....	A certain percentage of illicit discharges detected; illicit discharges eliminated; and households participating in quarterly household hazardous waste special collection days.
4 years.....	Most illicit discharge sources detected and eliminated.

The educational outreach measurable goals for this minimum control measure could be combined with the measurable goals for the Public Education and Outreach minimum control measure (see Fact Sheet 2.3).

This fact sheet profiles the Construction Site Runoff Control minimum control measure, one of six measures that the operator of a Phase II regulated small municipal separate storm sewer system (MS4) is required to include in its storm water management program to meet the conditions of its National Pollutant Discharge Elimination System (NPDES) permit. This fact sheet outlines the Phase II Final Rule requirements and offers some general guidance on how to satisfy them. It is important to keep in mind that the small MS4 operator has a great deal of flexibility in choosing exactly how to satisfy the minimum control measure requirements.

Why Is The Control of Construction Site Runoff Necessary?

Polluted storm water runoff from construction sites often flows to MS4s and ultimately is discharged into local rivers and streams. Of the pollutants listed in Table 1, sediment is usually the main pollutant of concern. Sediment runoff rates from construction sites are typically 10 to 20 times greater than those of agricultural lands, and 1,000 to 2,000 times greater than those of forest lands. During a short period of time, construction sites can contribute more sediment to streams than can be deposited naturally during several decades. The resulting siltation, and the contribution of other pollutants from construction sites, can cause physical, chemical, and biological harm to our nation's waters. For example, excess sediment can quickly fill rivers and lakes, requiring dredging and destroying aquatic habitats.

Table 1

Pollutants Commonly Discharged From Construction Sites
Sediment
Solid and sanitary wastes
Phosphorous (fertilizer)
Nitrogen (fertilizer)
Pesticides
Oil and grease
Concrete truck washout
Construction chemicals
Construction debris

What Is Required?

The Phase II Final Rule requires an operator of a regulated small MS4 to develop, implement, and enforce a program to reduce pollutants in storm water runoff to their MS4 from construction activities that result in a land disturbance of greater than or equal to one acre. The small MS4 operator is required to:

- Have an ordinance or other regulatory mechanism requiring the implementation of proper erosion and sediment controls, and controls for other wastes, on applicable construction sites;
- Have procedures for site plan review of construction plans that consider potential water quality impacts;
- Have procedures for site inspection and enforcement of control measures;
- Have sanctions to ensure compliance (established in the ordinance or other regulatory mechanism);

- ❑ Establish procedures for the receipt and consideration of information submitted by the public; and
- ❑ Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Suggested BMPs (i.e., the program actions/activities) and measurable goals are presented below.

What Are Some Guidelines for Developing and Implementing This Measure?

Further explanation and guidance for each component of a regulated small MS4’s construction program is provided below.

Regulatory Mechanism

Through the development of an ordinance or other regulatory mechanism, the small MS4 operator must establish a construction program that controls polluted runoff from construction sites with a land disturbance of greater than or equal to one acre. Because there may be limitations on regulatory legal authority, the small MS4 operator is required to satisfy this minimum control measure only to the maximum extent practicable and allowable under State, Tribal, or local law.

Site Plan Review

The small MS4 operator must include in its construction program requirements for the implementation of appropriate BMPs on construction sites to control erosion and sediment and other waste at the site. To determine if a construction site is in compliance with such provisions, the small MS4 operator should review the site plans submitted by the construction site operator before ground is broken.

Site plan review aids in compliance and enforcement efforts since it alerts the small MS4 operator early in the process to the planned use or non-use of proper BMPs and provides a way to track new construction activities. The tracking of sites is useful not only for the small MS4 operator’s recordkeeping and reporting purposes, which are required under their NPDES storm water permit (see Fact Sheet 2.9), but also for members of the public interested in ensuring that the sites are in compliance.

Inspections and Penalties

Once construction commences, BMPs should be in place and the small MS4 operator’s enforcement activities should begin. To ensure that the BMPs are properly installed, the small MS4 operator is required to develop procedures for site inspection and enforcement of control measures to deter infractions. Procedures could include steps to identify priority sites for inspection and enforcement based on the nature and extent of

the construction activity, topography, and the characteristics of soils and receiving water quality. Inspections give the MS4 operator an opportunity to provide additional guidance and education, issue warnings, or assess penalties. To conserve staff resources, one possible option for small MS4 operators is to have these inspections performed by the same inspector that visits the sites to check compliance with health and safety building codes.

Information Submitted by the Public

A final requirement of the small MS4 program for construction activity is the development of procedures for the receipt and consideration of public inquiries, concerns, and information submitted regarding local construction activities. This provision is intended to further reinforce the public participation component of the regulated small MS4 storm water program (see Fact Sheet 2.4) and to recognize the crucial role that the public can play in identifying instances of noncompliance.

The small MS4 operator is required only to *consider* the information submitted, and may not need to follow-up and respond to every complaint or concern. Although some form of enforcement action or reply is not required, the small MS4 operator is required to demonstrate acknowledgment and consideration of the information submitted. A simple tracking process in which submitted public information, both written and verbal, is recorded and then given to the construction site inspector for possible follow-up will suffice.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should reflect the needs and characteristics of the operator and the area served by its small MS4. Furthermore, they should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following measurable goals:

<u>Target Date</u>	<u>Activity</u>
1 year.....	Ordinance or other regulatory mechanism in place; procedures for information submitted by the public in place.
2 years.....	Procedures for site inspections implemented; a certain percentage rate of compliance achieved by construction operators.
3 years.....	Maximum compliance with ordinance; improved clarity and reduced sedimentation of local waterbodies.
4 years.....	Increased numbers of sensitive aquatic organisms in local waterbodies.

Are Construction Sites Already Covered Under the NPDES Storm Water Program?

Yes. EPA's Phase I NPDES storm water program requires operators of construction activities that disturb five or more acres to obtain a NPDES construction storm water permit. General permit requirements include the submission of a Notice of Intent and the development of a storm water pollution prevention plan (SWPPP). The SWPPP must include a site description and measures and controls to prevent or minimize pollutants in storm water discharges. The Phase II Final Rule similarly regulates discharges from smaller construction sites disturbing equal to or greater than one acre and less than five acres (see Fact Sheet 3.0 for information on the Phase II construction program).

Even though all construction sites that disturb more than one acre are covered nationally by an NPDES storm water permit, the construction site runoff control minimum measure for the small MS4 program is needed to induce more localized site regulation and enforcement efforts, and to enable operators of regulated small MS4s to more effectively control construction site discharges into their MS4s.

To aid operators of regulated construction sites in their efforts to comply with both local requirements and their NPDES permit, the Phase II Final Rule includes a provision that allows the NPDES permitting authority to reference a "qualifying State, Tribal or local program" in the NPDES general permit for construction. This means that if a construction site is located in an area covered by a qualifying local program, then the construction site operator's compliance with the local program constitutes compliance with their NPDES permit. A regulated small MS4's storm water program for construction could be a "qualifying program" if the MS4 operator requires a SWPPP, in addition to the requirements summarized in this fact sheet.

The ability to reference other programs in the NPDES permit is intended to reduce confusion between overlapping and similar requirements, while still providing for both local and

national regulatory coverage of the construction site. The provision allowing NPDES permitting authorities to reference other programs has no impact on, or direct relation to, the small MS4 operator's responsibilities under the construction site runoff control minimum measure profiled here.

Is a Small MS4 Required to Regulate Construction Sites that the Permitting Authority has Waived from the NPDES Construction Program?

No. If the NPDES permitting authority waives requirements for storm water discharges associated with small construction activity (see 122.26(b)(15)(i)), the small MS4 operator is not required to develop, implement, and/or enforce a program to reduce pollutant discharges from such construction sites.

Industrial "No Exposure"

4.0 – Conditional No Exposure Exclusion for Industrial Activity

This fact sheet profiles the Post-Construction Runoff Control minimum control measure, one of six measures that the operator of a Phase II regulated small municipal separate storm sewer system (MS4) is required to include in its storm water management program in order to meet the conditions of its National Pollutant Discharge Elimination System (NPDES) permit. This fact sheet outlines the Phase II Final Rule requirements for post-construction runoff control and offers some general guidance on how to satisfy those requirements. It is important to keep in mind that the small MS4 operator has a great deal of flexibility in choosing exactly how to satisfy the minimum control measure requirements.

Why Is The Control of Post-Construction Runoff Necessary?

Post-construction storm water management in areas undergoing new development or redevelopment is necessary because runoff from these areas has been shown to significantly effect receiving waterbodies. Many studies indicate that prior planning and design for the minimization of pollutants in post-construction storm water discharges is the most cost-effective approach to storm water quality management.

There are generally two forms of substantial impacts of post-construction runoff. The first is caused by an increase in the type and quantity of pollutants in storm water runoff. As runoff flows over areas altered by development, it picks up harmful sediment and chemicals such as oil and grease, pesticides, heavy metals, and nutrients (e.g., nitrogen and phosphorus). These pollutants often become suspended in runoff and are carried to receiving waters, such as lakes, ponds, and streams. Once deposited, these pollutants can enter the food chain through small aquatic life, eventually entering the tissues of fish and humans. The second kind of post-construction runoff impact occurs by increasing the quantity of water delivered to the waterbody during storms. Increased impervious surfaces interrupt the natural cycle of gradual percolation of water through vegetation and soil. Instead, water is collected from surfaces such as asphalt and concrete and routed to drainage systems where large volumes of runoff quickly flow to the nearest receiving water. The effects of this process include streambank scouring and downstream flooding, which often lead to a loss of aquatic life and damage to property.

What Is Required?

The Phase II Final Rule requires an operator of a regulated small MS4 to develop, implement, and enforce a program to reduce pollutants in post-construction runoff to their MS4 from new development and redevelopment projects that result in the land disturbance of greater than or equal to 1 acre. The small MS4 operator is required to:

- Develop and implement strategies which include a combination of structural and/or non-structural best management practices (BMPs);
- Have an ordinance or other regulatory mechanism requiring the implementation of post-construction runoff controls to the extent allowable under State, Tribal or local law,

- ❑ Ensure adequate long-term operation and maintenance of controls;
- ❑ Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure.

What Is Considered a “Redevelopment” Project?

The term “redevelopment” refers to alterations of a property that change the “footprint” of a site or building in such a way that there is a disturbance of equal to or greater than 1 acre of land. The term does not include such activities as exterior remodeling. Because redevelopment projects may have site constraints not found on new development sites, the rule provides flexibility for implementing post-construction controls on redevelopment sites that consider these constraints.

What Are Some Guidelines for Developing and Implementing This Measure?

This section includes some sample non-structural and structural BMPs that could be used to satisfy the requirements of the post-construction runoff control minimum measure. It is important to recognize that many BMPs are climate-specific, and not all BMPs are appropriate in every geographic area. Because the requirements of this measure are closely tied to the requirements of the construction site runoff control minimum measure (see Fact Sheet 2.6), EPA recommends that small MS4 operators develop and implement these two measures in tandem. Sample BMPs follow.

❑ Non-Structural BMPs

- **Planning and Procedures.** Runoff problems can be addressed efficiently with sound planning procedures. Master Plans, Comprehensive Plans, and zoning ordinances can promote improved water quality by guiding the growth of a community away from sensitive areas and by restricting certain types of growth (industrial, for example) to areas that can support it without compromising water quality.
- **Site-Based Local Controls.** These controls can include buffer strip and riparian zone preservation, minimization of disturbance and imperviousness, and maximization of open space.

❑ Structural BMPs

- **Storage Practices.** Storage or detention BMPs control storm water by gathering runoff in wet ponds, dry basins, or multichamber catch basins and slowly releasing it to receiving waters or drainage systems. These practices both control storm water volume and settle out particulates for pollutant removal.

- **Infiltration Practices.** Infiltration BMPs are designed to facilitate the percolation of runoff through the soil to ground water, and, thereby, result in reduced storm water quantity and reduced mobilization of pollutants. Examples include infiltration basins/trenches, dry wells, and porous pavement.
- **Vegetative Practices.** Vegetative BMPs are landscaping features that, with optimal design and good soil conditions, enhance pollutant removal, maintain/improve natural site hydrology, promote healthier habitats, and increase aesthetic appeal. Examples include grassy swales, filter strips, artificial wetlands, and rain gardens.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should reflect needs and characteristics of the operator and the area served by its small MS4. Furthermore, the measurable goals should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following goals:

<u>Target Date</u>	<u>Activity</u>
1 year.....	Strategies developed that include structural and/or non-structural BMPs.
2 years.....	Strategies codified by use of ordinance or other regulatory mechanism.
3 years.....	Reduced percent of new impervious surfaces associated with new development projects.
4 years.....	Improved clarity and reduced sedimentation of local waterbodies.

Industrial "No Exposure"

4.0 – Conditional No Exposure Exclusion for Industrial Activity

This fact sheet profiles the Pollution Prevention/Good Housekeeping for Municipal Operations minimum control measure, one of six measures the operator of a Phase II regulated small municipal separate storm sewer system (MS4) is required to include in its storm water management program to meet the conditions of its National Pollutant Discharge Elimination System (NPDES) permit. This fact sheet outlines the Phase II Final Rule requirements and offers some general guidance on how to satisfy them. It is important to keep in mind that the small MS4 operator has a great deal of flexibility in choosing exactly how to satisfy the minimum control measure requirements.

Why Is Pollution Prevention/Good Housekeeping Necessary?

The Pollution Prevention/Good Housekeeping for municipal operations minimum control measure is a key element of the small MS4 storm water management program. This measure requires the small MS4 operator to examine and subsequently alter their own actions to help ensure a reduction in the amount and type of pollution that: (1) collects on streets, parking lots, open spaces, and storage and vehicle maintenance areas and is discharged into local waterways; and (2) results from actions such as environmentally damaging land development and flood management practices or poor maintenance of storm sewer systems.

While this measure is meant primarily to improve or protect receiving water quality by altering municipal or facility operations, it also can result in a cost savings for the small MS4 operator, since proper and timely maintenance of storm sewer systems can help avoid repair costs from damage caused by age and neglect.

What Is Required?

Recognizing the benefits of pollution prevention practices, the rule requires an operator of a regulated small MS4 to:

- Develop and implement an operation and maintenance program with the ultimate goal of preventing or reducing pollutant runoff from municipal operations into the storm sewer system;
- Include employee training on how to incorporate pollution prevention/good housekeeping techniques into municipal operations such as park and open space maintenance, fleet and building maintenance, new construction and land disturbances, and storm water system maintenance. To minimize duplication of effort and conserve resources, the MS4 operator can use training materials that are available from EPA, their State or Tribe, or relevant organizations;
- Determine the appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Some program implementation approaches, BMPs (i.e., the program actions/activities), and measurable goals are suggested below.

What Are Some Guidelines for Developing and Implementing This Measure?

The intent of this control measure is to ensure that existing municipal, State or Federal operations are performed in ways that will minimize contamination of storm water discharges. EPA encourages the small MS4 operator to consider the following components when developing their program for this measure:

- **Maintenance activities, maintenance schedules, and long-term inspection procedures** for structural and non-structural controls to reduce floatables and other pollutants discharged from the separate storm sewers;
- **Controls for reducing or eliminating the discharge of pollutants** from areas such as roads and parking lots, maintenance and storage yards (including salt/sand storage and snow disposal areas), and waste transfer stations. These controls could include programs that promote recycling (to reduce litter), minimize pesticide use, and ensure the proper disposal of animal waste;
- **Procedures for the proper disposal of waste** removed from separate storm sewer systems and areas listed in the bullet above, including dredge spoil, accumulated sediments, floatables, and other debris; and
- **Ways to ensure that new flood management projects assess the impacts on water quality** and examine existing projects for incorporation of additional water quality protection devices or practices. EPA encourages coordination with flood control managers for the purpose of identifying and addressing environmental impacts from such projects.

The effective performance of this control measure hinges on the proper maintenance of the BMPs used, particularly for the first two bullets above. For example, structural controls, such as grates on outfalls to capture floatables, typically need regular cleaning, while non-structural controls, such as training materials and recycling programs, need periodic updating.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are meant to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should consider the needs and characteristics of the operator and the area served by its small MS4. The measurable goals should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure. An integrated approach for this minimum measure could include the following measurable goals:

<u>Target Date</u>	<u>Activity</u>
1 year.....	Pollution prevention plan (the new BMPs and revised procedures) completed; employee training materials gathered or developed; procedures in place for catch basin cleaning after each storm and regular street sweeping.
2 years.....	Training for appropriate employees completed; recycling program fully implemented.
3 years.....	Some pollution prevention BMPs incorporated into master plan; a certain percentage reduction in pesticide and sand/salt use; maintenance schedule for BMPs established.
4 years.....	A certain percentage reduction in floatables discharged; a certain compliance rate with maintenance schedules for BMPs; controls in place for all areas of concern.

Construction Program

3.0 – Construction Program Overview

3.1 – Construction Rainfall Erosivity Waiver

Industrial "No Exposure"

4.0 – Conditional No Exposure Exclusion for Industrial Activity

The Storm Water Phase II Final Rule requires operators of certain small municipal separate storm sewer systems (MS4s) to obtain National Pollutant Discharge Elimination System (NPDES) permit coverage because their storm water discharges are considered "point sources" of pollution. All point source discharges, unlike nonpoint sources such as agricultural runoff, are required under the Clean Water Act (CWA) to be covered by federally enforceable NPDES permits. Those systems already permitted under the NPDES Phase I storm water program, even systems serving less than 100,000 people, are not required to be permitted under the Phase II storm water program.

NPDES storm water permits are issued by an NPDES permitting authority, which may be a NPDES-authorized State or a U.S. EPA Region in non-authorized States (see the *For Additional Information* section for a list of U.S. EPA regional contacts). Once a permit application is submitted by the operator of a regulated small MS4 and a permit is obtained, the conditions of the permit must be satisfied (i.e., development and implementation of a storm water management program) and periodic reports must be submitted on the status and effectiveness of the program.

This fact sheet explains the various permit options that are available for operators of regulated small MS4s and details the permit application and reporting requirements. Important compliance deadlines also are highlighted. Program coverage and requirements for regulated small MS4s are explained in Fact Sheets 2.0 through 2.8.

What Permitting Options Are Available to Operators of Regulated Small MS4s?

Unlike the Phase I program that primarily utilizes individual permits for medium and large MS4s, the Phase II approach allows operators of regulated small MS4s to choose from as many as three permitting options as listed below. The NPDES permitting authority reserves the authority to determine, however, which options are available to the regulated small MS4s.

□ General Permits

- General permits are strongly encouraged by EPA. The Phase II program has been designed specifically to accommodate a general permit approach.
- General permits prescribe one set of requirements for all applicable permittees. General permits are drafted by the NPDES permitting authority, then published for public comment before being finalized and issued.
- A Notice of Intent (NOI) serves as the application for the general permit. The permittee complies with the permit requirements by submitting an NOI to the NPDES permitting authority that describes the storm water management plan, including best management practices (BMPs) and measurable goals. A Phase II permittee has the flexibility to develop an individualized storm water program that addresses the particular characteristics and needs of its system, provided the basic requirements of the general permit are satisfied.

- Permittees also can choose to share responsibilities for meeting the Phase II program requirements. Those entities choosing to do so may submit jointly with the other municipalities or governmental entities an NOI that identifies who will implement which minimum measures within the area served by the MS4.
- The permittee then follows the Phase II permit application requirements (see discussion in next question below).

Minimize Duplication of Effort

Two permitting options tailored to minimize duplication of effort can be incorporated into the general permit by the NPDES permitting authority. First, the permitting authority can recognize in the permit that another governmental entity is responsible under an NPDES permit for implementing any or all minimum measures. Responsibility for implementation of the measure(s) would rest with the other governmental entity, thereby relieving the permittee of its responsibility to implement that particular measure(s). For example, the NPDES permitting authority could recognize a county erosion and sediment control program for construction sites that was developed to comply with a Phase I permit. As long as the Phase II MS4s in the county comply with the county's construction program, they would not need to develop and implement their own construction programs because such activity would already be addressed by the county.

Second, the NPDES permitting authority can include conditions in a general permit that direct a permittee to follow the requirements of an existing qualifying local program rather than the requirements of a minimum measure. A qualifying local program is defined as a local, State or Tribal municipal storm water program that imposes requirements that are equivalent to those of the Phase II MS4 minimum measures. The permittee remains responsible for the implementation of the minimum measure through compliance with the qualifying local program.

☐ Individual Permits

- Individual permits are required for Phase I “medium” and “large” MS4s, but not recommended by EPA for Phase II program implementation.
- The permittee can either submit an individual application for coverage by the Phase II MS4 program (see §122.34) or the Phase I MS4 program (see §122.26(d)).
- For individual coverage under Phase II, the permittee must follow Phase II permit application requirements and provide an estimate of square mileage served by the system and any additional information requested by the NPDES permitting authority. A permittee electing to apply for coverage under the Phase I

program must follow the permit application requirements detailed at §122.26(d).

- The NPDES permitting authority may allow more than one regulated entity to jointly apply for an individual permit.
- The NPDES permitting authority could incorporate in the individual permit either of the two permitting options explained above in the *Minimize Duplication of Effort* section.

☐ Modification of a Phase I Individual Permit – A Co-Permittee Option

- The operator of a regulated small MS4 could participate as a limited co-permittee in a neighboring Phase I MS4's storm water management program by seeking a modification of the existing Phase I individual permit. A list of Phase I medium and large MS4s can be obtained from the EPA Office of Wastewater Management (OWM) or downloaded from the OWM web site.
- The permittee must follow Phase I permit application requirements (with some exclusions).
- The permittee must comply with the applicable terms of the Phase I individual permit rather than the minimum control measures in the Phase II Final Rule.

What Does the Permit Application Require?

Operators of regulated small MS4s are required to submit in their NOI or individual permit application the following information:

- ☐ Best management practices (BMPs) are required for each of the six minimum control measures:
 - ① Public education and outreach on storm water impacts
 - ② Public participation/involvement
 - ③ Illicit discharge detection and elimination
 - ④ Construction site storm water runoff control
 - ⑤ Post-construction storm water management in new development/redevelopment
 - ⑥ Pollution prevention/good housekeeping for municipal operations

(See Fact Sheets 2.3 through 2.8 for full descriptions of each measure, including examples of BMPs and measurable goals)

- ☐ Measurable goals for each minimum control measure (i.e., narrative or numeric standards used to gauge program effectiveness);

- Estimated months and years in which actions to implement each measure will be undertaken, including interim milestones and frequency; and
- The person or persons responsible for implementing or coordinating the storm water program.

Relying on Another Entity

The Phase II permittee has the option of relying on other entities already performing one or more of the minimum control measures, provided that the existing control measure, or component thereof, is at least as stringent as the Phase II rule requirements. For example, a county already may have an illicit discharge detection and elimination program in place and may allow an operator of a regulated small MS4 within the county's jurisdiction to rely on the county program instead of formulating and implementing a new program. In such a case, the permittee would not need to implement the particular measure, but would still be ultimately responsible for its effective implementation. For this reason, EPA recommends that the permittee enter into a legally binding agreement with the other entity. If the permittee chooses to rely on another entity, they must note this in their permit application and subsequent reports. A Phase II permittee may even rely on another governmental entity regulated under the NPDES storm water program to satisfy all of the permittee's permit obligations. Should this option be chosen, the permittee must note this in its NOI, but does not need to file periodic reports.

What Does the Permit Require?

The operator of a regulated small MS4 has the flexibility to determine the BMPs and measurable goals, for each minimum control measure, that are most appropriate for the system. The chosen BMPs and measurable goals, submitted in the permit application, become the required storm water management program; however, the NPDES permitting authority can require changes in the mix of chosen BMPs and measurable goals if all or some of them are found to be inconsistent with the provisions of the Phase II Final Rule. Likewise, the permittee can change its mix of BMPs if it determines that the program is not as effective as it could be. Fact Sheets 2.3 through 2.8 further describe each of the minimum control measures, while the permit requirements for evaluation/assessment and recordkeeping activities are described in separate sections below.

Menu of BMPs

The BMPs for minimum measures 3 through 6 (as listed in the permit application requirements section, above) are not enforceable until the NPDES permitting authority provides a list, or "menu," of BMPs to assist permittees in the design and

implementation of their storm water management programs. The NPDES permitting authority is required to provide this menu as an aid for those operators that are unsure of the most appropriate and effective BMPs to use. Since the menu is intended to serve as guidance only, the operators can either select from the menu or identify other BMPs to meet the permit requirements. EPA is scheduled to develop a menu of BMPs by October 27, 2000.

What Standards Apply?

A Phase II small MS4 operator is required to design its program so that it:

- Reduces the discharge of pollutants to the "maximum extent practicable" (MEP);
- Protects water quality; and
- Satisfies the appropriate water quality requirements of the Clean Water Act.

Compliance with the technical standard of MEP requires the successful implementation of approved BMPs. The Phase II Final Rule considers narrative effluent limitations that require the implementation of BMPs and the achievement of measurable goals as the most appropriate form of effluent limitations to achieve the protection of water quality, rather than requiring that storm water discharges meet numeric effluent limitations.

EPA intends to issue Phase II NPDES permits consistent with its August 1, 1996, Interim Permitting Approach policy, which calls for BMPs in first-round storm water permits and expanded or better tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards. In cases where information exists to develop more specific conditions or limitations to meet water quality standards, these conditions or limitations should be incorporated into the storm water permit. Monitoring is not required under the Phase II Rule, but the NPDES permitting authority has the discretion to require monitoring if deemed necessary.

What Evaluation/Reporting Efforts Are Required?

Frequency of Reports

Reports must be submitted annually during the first permit term. For subsequent permit terms, reports must be submitted in years 2 and 4 only, unless the NPDES permitting authority requests more frequent reports.

Required Report Content

The reports must include the following:

- ❑ The status of compliance with permit conditions, including an assessment of the appropriateness of the selected BMPs and progress toward achieving the selected measurable goals for each minimum measure;
- ❑ Results of any information collected and analyzed, including monitoring data, if any;
- ❑ A summary of the storm water activities planned for the next reporting cycle;
- ❑ A change in any identified best management practices or measurable goals for any minimum measure; and
- ❑ Notice of relying on another governmental entity to satisfy some of the permit obligations (if applicable).

A Change in Selected BMPs

If, upon evaluation of the program, improved controls are identified as necessary, permittees should revise their mix of BMPs to provide for a more effective program. Such a change, and an explanation of the change, must be noted in a report to the NPDES permitting authority.

What are the Recordkeeping Requirements?

Records required by the NPDES permitting authority must be kept for at least 3 years and made accessible to the public at reasonable times during regular business hours. Records need not be submitted to the NPDES permitting authority unless the permittee is requested to do so.

What Are the Deadlines for Compliance?

- ❑ The NPDES permitting authority issues general permits for regulated small MS4s by December 9, 2002.
- ❑ Operators of “automatically designated” regulated small MS4s in urbanized areas submit their permit applications within 90 days of permit issuance, no later than March 10, 2003.
- ❑ Operators of regulated small MS4s designated by the permitting authority submit their permit applications within 180 days of notice.
- ❑ Regulated small MS4 storm water management programs fully developed and implemented by the end of the first permit term, typically a 5-year period

What are the Penalties for Noncompliance?

The NPDES permit that the operator of a regulated small MS4 is required to obtain is federally enforceable, thus subjecting the permittee to potential enforcement actions and penalties by the NPDES permitting authority if the permittee does not fully comply with application or permit requirements. This federal enforceability also includes the right for interested parties to sue under the citizen suit provision (section 405) of the CWA.

Industrial "No Exposure"

4.0 – Conditional No Exposure
Exclusion for Industrial Activity

The 1972 amendments to the Federal Water Pollution Control Act, later referred to as the Clean Water Act (CWA), prohibit the discharge of any pollutant to navigable waters of the United States from a point source unless the discharge is authorized by a National Pollutant Discharge Elimination System (NPDES) permit. Efforts to improve water quality under the NPDES program traditionally have focused on reducing pollutants in industrial process wastewater and municipal sewage treatment plant discharges. Over time, it has become evident that more diffuse sources of water pollution, such as storm water runoff from construction sites, are also significant contributors to water quality problems.

Sediment runoff rates from construction sites are typically 10 to 20 times greater than those from agricultural lands, and 1,000 to 2,000 times greater than those of forest lands. During a short period of time, construction activity can contribute more sediment to streams than can be deposited over several decades, causing physical and biological harm to our Nation's waters.

In 1990, EPA promulgated rules establishing Phase I of the NPDES storm water program. Phase I addresses, among other discharges, discharges from large construction activities disturbing 5 acres or more of land. Phase II of the NPDES storm water program covers small construction activities disturbing between 1 and 5 acres. Phase II became final on December 8, 1999 with small construction permit applications due by March 10, 2003 (specific compliance dates will be set by the NPDES permitting authority in each State). This fact sheet outlines the construction activities covered by Phase I and Phase II, including possible waiver options from Phase II coverage, and the Phase II construction program requirements.

Who Is Covered Under the Phase I Rule?

Sites Five Acres and Greater

The Phase I NPDES storm water rule identifies eleven categories of industrial activity in the definition of "storm water discharges associated with industrial activity" that must obtain an NPDES permit. Category (x) of this definition is construction activity, commonly referred to as "large" construction activity. Under category (x), the Phase I rule requires all *operators* of construction activity *disturbing 5 acres or greater of land* to apply for an NPDES storm water permit. Operators of sites disturbing less than 5 acres are also required to obtain a permit if their activity is part of a "larger common plan of development or sale" with a planned disturbance of 5 acres or greater. "Disturbance" refers to exposed soil resulting from activities such as clearing, grading, and excavating. Construction activities can include road building, construction of residential houses, office buildings, industrial sites, or demolition.

What Is Meant by a "Larger Common Plan of Development or Sale"?

As defined in EPA's NPDES storm water general permit for large construction activity, a "larger common plan of development or sale" means a contiguous area where multiple separate and distinct construction activities are occurring under one plan (e.g., the operator is building on three half-acre lots in a 6-acre development). The "plan" in a common plan of development or sale is broadly defined as any announcement or piece of documentation

(including a sign, public notice or hearing, sales pitch, advertisement, drawing, permit application, zoning request, computer design, etc.) or physical demarcation (including boundary signs, lot stakes, surveyor markings, etc.) indicating that construction activities may occur on a specific plot.

What Is the Definition of an “Operator” of a Construction Site?

As defined in EPA’s storm water general permit for large construction activity, an “operator” is the party or parties that has:

- ❑ Operational control of construction project plans and specifications, including the ability to make modifications to those plans and specifications; *or*
- ❑ Day-to-day operational control of those activities that are necessary to ensure compliance with a storm water pollution prevention plan (SWPPP) for the site or other permit conditions (e.g., they are authorized to direct workers at a site to carry out activities required by the SWPPP or comply with other permit conditions).

There may be more than one party at a site performing the tasks related to “operational control” as defined above. Depending on the site and the relationship between the parties (e.g., owner, developer, contractor), there can either be a single party acting as site operator and consequently be responsible for obtaining permit coverage, or there can be two or more operators, all obligated to seek permit coverage. It is important to note that NPDES-authorized States may use a different definition of “operator” than the one above.

How Is the Phase II Construction Rule Related to the Phase I Construction Rule?

In 1992, the Ninth Circuit court remanded for further proceedings portions of EPA’s existing Phase I storm water regulation related to the category (x) discharges from large construction activity (NRDC v. EPA, 966 F.2d at 1292). EPA responded to the court’s decision by designating under Phase II storm water discharges from construction activity disturbing less than 5 acres as sources that should be regulated to protect water quality. The Phase II Rule designates these sources as “storm water discharges associated with *small construction* activity,” rather than as another category under “storm water associated with *industrial* activity.”

Who Is Covered Under the Phase II Construction Rule?

Sites Between One and Five Acres

The Storm Water Phase II Rule automatically designates, as small construction activity under the NPDES storm water permitting program, all operators of construction site activities that result in a *land disturbance of equal to or greater than 1 and less than 5 acres*.

Sites Less Than One Acre

Site activities disturbing less than 1 acre are also regulated as small construction activity if they are part of a larger common plan of development or sale with a planned disturbance of equal to or greater than 1 acre and less than 5 acres, or if they are designated by the NPDES permitting authority. The NPDES permitting authority or EPA Region may designate construction activities disturbing less than 1 acre based on the potential for contribution to a violation of a water quality standard or for significant contribution of pollutants to waters of the United States.

Are Waivers Available for Operators of Regulated Construction Activity?

Yes, but only for small, not large, construction activity. Under the Phase II Rule, NPDES permitting authorities have the option of providing a waiver from the requirements to operators of small construction activity who certify to either one of two conditions:

- ① Low predicted rainfall potential (i.e., activity occurs during a negligible rainfall period), where the rainfall erosivity factor (“R” in the Revised Universal Soil Loss Equation [RUSLE]) is less than 5 during the period of construction activity; *or*
- ② A determination that storm water controls are not necessary based on either:
 - (A) A “total maximum daily load” (TMDL) that address the pollutant(s) of concern for construction activities; **OR**
 - (B) An equivalent analysis that determines allocations are not needed to protect water quality based on consideration of instream concentrations, expected growth in pollutant concentrations from all sources, and a margin of safety.

Pollutants of concern include sediment or a parameter that addresses sediment (such as total suspended solids, turbidity, or siltation) and any other pollutant that has been identified as a cause of

The intent of the waiver provision is to waive only those sites that are highly unlikely to have a negative effect on water quality. Therefore, before applying for a waiver, operators of small construction activity are encouraged to consider the potential water quality impacts that may result from their project and to carefully examine such factors as proximity to water resources and sensitivity of receiving waters.

a. What is the Rainfall Erosivity Factor in Waiver ❶?

Waiver ❶ uses the Rainfall Erosivity Factor to determine whether the potential for polluted discharge is low enough to justify a waiver from the requirements. It is one of six variables used by the Revised Universal Soil Loss Equation (RUSLE)—a predictive tool originally used to measure soil loss from agricultural lands at various times of the year on a regional basis—to predict soil loss from construction sites. The Rainfall Erosivity Factor waiver is time-sensitive and is dependent on when during the year a construction activity takes place, how long it lasts, and the expected rainfall and intensity during that time. For information about the rainfall erosivity waiver, see Fact Sheet 3.1. Charts detailing the value of the Rainfall Erosivity Factor by particular regions can be found in Chapter 2 of the RUSLE user’s guide, which can be downloaded at: <http://www.epa.gov/owm/sw/phase2>.

b. What is a “TMDL” in Waiver ❷?

For impaired waters where technology-based controls required by NPDES permits are not achieving State water quality standards, the CWA requires implementation of the TMDL process. The TMDL process establishes the maximum amount of pollutants a waterbody can assimilate before water quality is impaired, then requires that this maximum level not be exceeded.

A TMDL is done for each pollutant that is found to be contributing to the impairment of a waterbody or a segment of a waterbody. To allow a waiver for construction activities, a TMDL would need to address sediment, or a parameter that addresses sediment such as total suspended solids, turbidity, or siltation. Additional TMDLs addressing common pollutants from construction sites such as nitrogen, phosphorus, and oil and grease also may be necessary to ensure water quality protection and allow a waiver from the NPDES storm water program.

A TMDL assessment determines the source or sources of a pollutant of concern, considers the maximum allowable level of that pollutant for the waterbody, then allocates to each source or category of sources a set level of the pollutant that it is allowed to discharge into the waterbody. Allocations to point sources are called wasteload allocations.

How Would an Operator Qualify for, and Certify to, Waiver ❷?

EPA expects that when TMDLs, or equivalent analyses are completed, there may be a determination that certain classes of sources, such as small construction activity, would not have to control their contribution of pollutants of concern to the waterbody in order for the waterbody to be in attainment with water quality standards (i.e., these sources were not assigned wasteload allocations). In such a case, to qualify for waiver ❷, the operator of the construction site would need to certify that its construction activity will take place, and the storm water discharges will occur, within the area covered either by the TMDLs or equivalent analysis. A certification form would likely be provided by the NPDES permitting authority for this purpose.

What Does the Phase II Construction Program Require?

The Phase II Final Rule requires operators of Phase II small construction sites, nationally, to obtain an NPDES permit and implement practices to minimize pollutant runoff. It is important to note that, locally, these same sites also may be covered by State, Tribal, or local construction runoff control programs (see Fact Sheets 2.6 and 2.7 for information on the Phase II small MS4’s construction program). For the Phase II small construction program, EPA has taken an approach similar to Phase I where the program requirements are not fully defined in the rule but rather in the NPDES permit issued by the NPDES permitting authority.

EPA recommends that the NPDES permitting authorities use their existing Phase I large construction general permits as a guide to developing their Phase II small construction permits. In doing so, the Phase II requirements would be similar to the three general Phase I requirements summarized below.

- ❑ Submission of a *Notice of Intent* (NOI) that includes general information and a certification that the activity will not impact endangered or threatened species. This certification is unique to EPA’s NOI and is not a requirement of most NPDES-delegated State’s NOIs;
- ❑ The development and implementation of a *Storm Water Pollution Prevention Plan* (SWPPP) with appropriate BMPs to minimize the discharge of pollutants from the site; and

- ❑ Submission of a *Notice of Termination* (NOT) when final stabilization of the site has been achieved as defined in the permit or when another operator has assumed control of the site.

Can the Permitting Authority Reference a Qualifying Erosion and Sediment Control Program in NPDES Construction Permits?

Yes. The Phase II Rule allows the NPDES permitting authority to include in its NPDES permits for large and for small construction activity conditions that incorporate by reference qualifying State, Tribal, or local erosion and sediment control program requirements. A qualifying program must include the following requirements:

- ❑ Requirements for construction site operators to implement appropriate erosion and sediment control best management practices;
- ❑ Requirements for construction site operators to control waste such as discarded building materials, concrete truck washout, chemicals, litter, and sanitary waste that may cause adverse impacts to water quality;
- ❑ Requirements for construction site operators to develop and implement a storm water pollution prevention plan; and
- ❑ Requirements to submit a site plan for review that incorporates consideration of potential water quality impacts.

In addition to the four elements above, a qualifying program for large construction activities must also include any additional requirements necessary to achieve the applicable technology-based standards of “Best Available Technology” (BAT) and “Best Conventional Technology” (BCT) based on the best professional judgment of the permit writer.

Should a State, Tribal, or local program include one or more, but not all, of the elements listed above, the permitting authority can reference the program in the permit, provided it also lists the missing element(s) as a condition in the permit.

What are Some Recommended BMPs for Small Construction Sites?

The approach and BMPs used for controlling pollutants in storm water discharges from small construction sites may vary from those used for large sites since their characteristics can differ in many ways. For example, operators of small sites may have more limited access to qualified design personnel and technical information. Also, small sites may have less space for installing and maintaining certain BMPs.

As is the case with all construction sites, erosion and sediment control at small construction sites is best accomplished with proper planning, installation, and maintenance of controls. The following practices have shown to be efficient, cost effective, and versatile for small construction site operators to implement. The practices are divided into two categories: non-structural and structural.

❑ Non-Structural BMPs

- Minimizing Disturbance
- Preserving Natural Vegetation
- Good Housekeeping

❑ Structural BMPs

Erosion Controls

- Mulch
- Grass
- Stockpile Covers

Sediment Controls

- Silt Fence
- Inlet Protection
- Check Dams
- Stabilized Construction Entrances
- Sediment Traps

Most erosion and sediment controls require regular maintenance to operate correctly. Accumulated sediments should be removed frequently and materials should be checked periodically for wear. Regular inspections by qualified personnel, which can allow problem areas to be addressed, should be performed after major rain events.

Operated MS4s: Program
Implementation

Construction Program

3.0 – Construction Program
Overview

3.1 – Construction Rainfall
Erosivity Waiver

Industrial "No Exposure"

4.0 – Conditional No Exposure
Exclusion for Industrial Activity

The 1972 amendments to the Federal Water Pollution Control Act, later referred to as the Clean Water Act (CWA), prohibit the discharge of any pollutant to navigable waters of the United States unless the discharge is authorized by a National Pollutant Discharge Elimination System (NPDES) permit. Because construction site storm water runoff can contribute significantly to water quality problems, the Phase I Storm Water Rule imposed a requirement that all construction sites with a planned land disturbance of 5 acres or more obtain an NPDES permit and implement storm water runoff control plans. Phase II extends the requirements of the storm water program to sites of between 1 and 5 acres. The Rainfall erosivity waiver, along with the water quality waiver, allows permitting authorities to waive those sites that do not have adverse water quality impacts.

What is Erosivity?

Erosivity is the term used to describe the potential for soil to wash off disturbed, devegetated earth into waterways during storms. The potential for erosion is in part determined by the soil type and geology of the site. For instance, dense, clay-like soils on a glacial plain will erode less readily when it rains than will sandy soils on the side of a hill. Another important factor is the amount and force of precipitation expected during the time the earth will be exposed. While it is impossible to predict the weather several months in advance of construction, for many areas of the country, there are definite optimal periods, such as a dry season when rain tends to fall less frequently and with less force. When feasible, this is the time to disturb the earth, so that the site is stabilized by the time the seasonal wet weather returns. There are many other important factors to consider in determining erosivity, such as freeze/thaw cycles and snow pack.

How Is Site Erosivity Determined?

The method for determining if a site qualifies for the erosivity waiver is based on the Universal Soil Loss Equation (USLE) developed by the U.S. Department of Agriculture (USDA) in the 1950s to help farmers conserve their valuable topsoil. The USLE has been updated to the Revised USLE (RUSLE). Using a computer model supported by decades worth of soil and rainfall data, USDA established estimates of annual erosivity values (R) for sites throughout the country. These R factors are used as surrogate measures of the impact that rainfall had on erosion from a particular site. They have been mapped using iseroindent contours, as shown in Figures 2 through 5.

USDA developed the Erosivity Index Table (EI Table, provided here in Table 1), to show how the annual erosivity factor is distributed throughout the year in two-week increments. Table 1 is based on 120 rainfall distribution zones for the continental U.S. Detailed instructions for calculating a project R Factor are provided later in this fact sheet.

The Storm Water Phase II rule allows permitting authorities to waive NPDES requirements for small construction sites if the value of the rainfall erosivity factor is less than 5 during the period of construction activity (see § 122.26(b)(15)(i)(A)). Note that the permitting authority has the option to not allow waivers for small construction activity. If the permitting authority in a State chooses to use the rainfall erosivity waiver, it will not become effective until permits are required from small construction activity.

If the R Factor for the period of construction calculates to 5 or lower, and the permitting authority allows the use of the waiver, the site owner may apply for a waiver under the low rainfall erosivity provision of the applicable NPDES Construction General Permit. When applying, owners are encouraged to consider other site-specific factors, such as proximity to water resources and the sensitivity of receiving waters to sedimentation impacts. The small construction operator must certify to the permitting authority that the construction activity will take place during a period when the rainfall erosivity factor is less than 5.

The start and end dates used for the construction activity will be the initial date of disturbance and the anticipated date when the site will have achieved final stabilization as defined by the permit. If the construction continues beyond this period, the operator will need to recalculate the EI for the site based on this new ending date (but keeping the old start date) and either resubmit the certification form or apply for NPDES permit coverage.

What Other Factors Can Affect Waiver Availability and Eligibility?

EPA has established the R Factor of 5 or lower as the criteria for determining waiver eligibility. However, since the intent is to waive only those construction activities that will not adversely impact water quality, State and Tribal permitting authorities have considerable discretion in determining where, when, and how to offer it. They can establish an R Factor threshold lower than 5, or they can suspend the waiver within an area where watersheds are known to be heavily impacted by, or sensitive to, sedimentation. They can also suspend the waiver during certain periods of the year. They may opt not to offer the waiver at all. NOTE: This waiver is not available to sites that will disturb more than 5 acres of land (large construction).

What if My Site Is Not Eligible?

If your site is not eligible for a waiver, you must submit a Notice of Intent under the NPDES General Permit, and comply with its requirements. These requirements are described in more detail in Storm Water Phase II Fact Sheet 3.0.

How Do I Compute the R Factor for My Project?

1. Estimate the construction start date. This is the day you expect to begin disturbing soils, including grubbing, stockpiling, excavating, and grading activities. Pick the 15-day period for your start date (e.g., June 1-15.)
2. Estimate the day you expect to have a permanent vegetative cover of at least 70%, or as defined by your permitting authority, over all previous disturbed areas. Round to the nearest 15-day period.

3. Refer to Figure 1 to find your Erosivity Index (EI) Zone based on your geographic location.
4. Refer to Table 1, the Erosivity Index (EI) Table. Find the number of your EI Zone in the left column. Locate the EI values for the 15-day periods that correspond to the project start and end periods you identified in Steps 1 and 2. Subtract the start value from the end value to find the % EI for your site. The maximum annual EI value for a project is 100%.
5. Refer to the appropriate Isoerodent Map (Figures 2 through 5). Interpolate the annual isoerodent value for your area. This is the annual R Factor for your site.
6. Multiply the percent value obtained in Step 4 by the annual isoerodent value obtained in Step 5. This is the R Factor for your scheduled project.

Examples

1. Construction started and completed in one calendar year.

Find the R value of a construction site in Denver, Colorado. Assume the site will be disturbed from March 1 to May 15.

The EI distribution zone is 84 (Figure 1). Referring to Table 1, the project period will span from March 1 to May 15. The difference in values between these two periods is 4.7 % ($4.9 - 0.2 = 4.7$). Since the annual erosion index for this location is about 45 (interpolated from Figure 2), the R Factor for the scheduled construction project is 4.7% of 45, or 2.1.

Because 2.1 is less than 5, the operator of this site would be able to seek a waiver under the low rainfall erosivity provision.

2. Construction spanning two calendar years.

Find the R value for a construction site in Pittsburgh, Pennsylvania. Assume the site will be disturbed from August 1 to April 15.

The EI distribution zone is 111 (Figure 1). Referring to Table 1, the project will span from August 1 to April 15. The difference in values between August 1 and December 30 is 35% ($100 - 65.0 = 35.0$). The difference between January 1 and April 15 is 8%. The total percentage EI for this project is 43% ($35 + 8$). Since the annual erosion index for this location is 112 (interpolated from Figure 2), the R Factor for the scheduled construction is 43% of 112, or 48.

Since 48 is greater than 5, the operator of this site would not be able to seek a waiver under the low rainfall erosivity provision.

Can I Use A Personal Computer to Calculate the R Factor?

The computer program used by USDA to develop the current R Factor maps and table is called the Revised Universal Soil Loss Equation, or RUSLE. The current version of RUSLE (v. 1.60) will calculate the R factor for the entire year for a limited number of cities in the U.S., but does not allow the R factor to be easily adjusted based on a shorter period of construction. If you are interested in using RUSLE; Version 1.06 for Mined Lands, Construction Sites, and Reclaimed Lands, is downloadable free of charge from the Internet at <http://www.sedlab.olemiss.edu/rusle>.

Where Can I Get Help?

- " A copy of "Chapter 2, Rainfall-Runoff Erosivity Factor (R)" from the *USDA Handbook 703 - Predicting Soil Erosion by Water: A Guide to Conservation Planning With the Revised Universal Soil Loss Equation (RUSLE)*, January 1997, is available on EPA's web site at <http://www.epa.gov/owm/sw/>.
- " Your local soil conservation district office can provide assistance with R Factors and other conservation-related issues. To find the office nearest you, look in the government section of the phone book under soil conservation district, conservation district, natural resource conservation district, etc.

Industrial "No Exposure"

4.0 – Conditional No Exposure Exclusion for Industrial Activity

Why Is the Phase I No Exposure Exclusion Addressed in the Phase II Final Rule?

The 1990 storm water regulations for Phase I of the federal storm water program identify eleven categories of industrial activities that must obtain a National Pollutant Discharge Elimination System (NPDES) permit. Operators of certain facilities within category eleven (xi), commonly referred to as "light industry," were exempted from the definition of "storm water discharge associated with industrial activity," and the subsequent requirement to obtain an NPDES permit, provided their industrial materials or activities were not "exposed" to storm water. This Phase I exemption from permitting was limited to those facilities identified in category (xi), and did not require category (xi) facility operators to submit any information supporting their no exposure claim.

In 1992, the Ninth Circuit court remanded to EPA for further rulemaking the no exposure exemption for light industry after making a determination that the exemption was arbitrary and capricious for two reasons. First, the court found that EPA had not established a record to support its assumption that light industrial activity that is not exposed to storm water (as opposed to all other regulated industrial activity not exposed) is not a "storm water discharge associated with industrial activity." Second, the court concluded that the exemption impermissibly relied on the unsubstantiated judgment of the light industrial facility operator to determine the applicability of the exemption. This fact sheet describes the revised conditional no exposure exclusion as presented in the Phase II Final Rule.

Who is Eligible to Claim No Exposure?

As revised in the Phase II Final Rule, the conditional no exposure exclusion applies to ALL industrial categories listed in the 1990 storm water regulations, except for construction activities disturbing 5 or more acres (category (x)).

What Is The Regulatory Definition of "No Exposure"?

The intent of the no exposure provision is to provide facilities with industrial materials and activities that are entirely sheltered from storm water a simplified way of complying with the storm water permitting provisions of the Clean Water Act (CWA). This includes facilities that are located within a larger office building, or facilities at which the only items permanently exposed to precipitation are roofs, parking lots, vegetated areas, and other non-industrial areas or activities. The Phase II regulatory definition of "no exposure" follows.

No exposure means all industrial materials and activities are protected by a storm resistant shelter to prevent exposure to rain, snow, snowmelt, and/or runoff. Industrial materials or activities include, but are not limited to, material handling equipment or activities, industrial machinery, raw materials, intermediate products, by-products, final products, or waste products.

A storm resistant shelter is not required for the following industrial materials and activities:

- Drums, barrels, tanks, and similar containers that are tightly sealed, provided those containers are not deteriorated and do not leak. “Sealed” means banded or otherwise secured and without operational taps or valves;
- Adequately maintained vehicles used in materials handling; and
- Final products, other than products that would be mobilized in storm water discharges (e.g., rock salt).

The term “storm-resistant shelter,” as used in the no exposure definition, includes completely roofed and walled buildings or structures, as well as structures with only a top cover but no side coverings, provided material under the structure is not otherwise subject to any run-on and subsequent runoff of storm water. While the intent of the no exposure provision is to promote a condition of permanent no exposure, EPA understands certain vehicles could become temporarily exposed to rain and snow while passing between buildings. Adequately maintained mobile equipment (e.g., trucks, automobiles, forklifts, trailers, or other such general purpose vehicles found at the industrial site that are not industrial machinery, and that are not leaking contaminants or are not otherwise a source of industrial pollutants) can be exposed to precipitation or runoff. Such activities alone would not prevent a facility from certifying to no exposure. Similarly, trucks or other vehicles awaiting maintenance at vehicle maintenance facilities that are not leaking contaminants or are not otherwise a source of industrial pollutants, are not considered “exposed.”

In addition, EPA recognizes that there are circumstances where permanent no exposure of industrial activities or materials is not possible and, therefore, under such conditions, materials and activities can be sheltered with temporary covers (e.g., tarps) between periods of permanent enclosure. The no exposure provision does not specify every such situation, but NPDES permitting authorities can address this issue on a case-by-case basis.

The Phase II Final Rule also addresses particulate matter emissions from roof stacks/vents that are regulated by, and in compliance with, other environmental protection programs (i.e., air quality control programs) and that do not cause storm water contamination are considered not exposed. Particulate matter or visible deposits of residuals from roof stacks and/or vents not otherwise regulated (i.e., under an air quality control program) and evident in storm water outflow are considered exposed. Likewise, visible “track out” (i.e., pollutants carried on the tires of vehicles) or windblown raw materials is considered exposed. Leaking pipes containing contaminants exposed to storm water are deemed exposed, as are past sources of storm water contamination that remain

onsite. General refuse and trash, not of an industrial nature, is not considered exposed as long as the container is completely covered and nothing can drain out holes in the bottom, or is lost in loading onto a garbage truck. Industrial refuse and trash that is left uncovered, however, is considered exposed.

What is Required Under the No Exposure Provision?

The Phase II Final Rule represents a significant expansion in the scope of the original no exposure provision in terms of eligibility (as noted above) and responsibilities for facilities claiming the exclusion. Under the original no exposure provision, a light industry operator was expected to make an independent determination of whether there was “exposure” of industrial materials and activities to storm water and, if not, simply not submit a permit application. An operator seeking to qualify for the revised conditional no exposure exclusion, including light industry operators (i.e., category (xi) facilities), must:

- Submit written certification that the facility meets the definition of “no exposure” to the NPDES permitting authority once every 5 years.
 - The Phase II Final Rule includes a four-page *No Exposure Certification* form that uses a series of yes/no questions to aid facility operators in determining whether they have a condition of no exposure. It also serves as the necessary certification of no exposure provided the operator is able to answer all the questions in the negative. EPA’s *Certification* is for use only by operators of industrial activity located in areas where EPA is the NPDES permitting authority.
 - A copy of the *Certification* can be obtained from the U.S. EPA Office of Wastewater Management (OWM) web site, the Storm Water Phase II Final Rule published in the *Federal Register* (Appendix 4), or by contacting OWM.
- Submit a copy, upon request, of the *Certification* to the municipality in which the facility is located.
- Allow the NPDES permitting authority or, if discharging into a municipal separate storm sewer system, the operator of the system, to: (1) inspect the facility; and (2) make such inspection reports publicly available upon request.

Regulated industrial operators need to either apply for a permit or submit a no exposure certification form in order to be in compliance with the NPDES storm water regulations. Any permit held becomes null and void once a certification form is submitted.

Even when an industrial operator certifies to no exposure, the NPDES permitting authority still retains the authority to require the operator to apply for an individual or general permit if the NPDES permitting authority has determined that the discharge is contributing to the violation of, or interfering with the attainment or maintenance of, water quality standards, including designated uses.

Are There Any Concerns Related to Water Quality Standards?

Yes. An operator certifying that its facility qualifies for the conditional no exposure exclusion may, nonetheless, be required by the NPDES permitting authority to obtain permit authorization. Such a requirement would follow the permitting authority's determination that the discharge causes, has a reasonable potential to cause, or contributes to a violation of an applicable water quality standard, including designated uses. Designated uses can include use as a drinking water supply or for recreational purposes.

Many efforts to achieve no exposure can employ simple good housekeeping and contaminant cleanup activities such as moving materials and activities indoors into existing buildings or structures. In limited cases, however, industrial operators may make major changes at a site to achieve no exposure. These efforts may include constructing a new building or cover to eliminate exposure or constructing structures to prevent run-on and storm water contact with industrial materials and activities. Major changes undertaken to achieve no exposure, however, can increase the impervious area of the site, such as when a building with a smooth roof is placed in a formerly vegetated area. Increased impervious area can lead to an increase in the volume and velocity of storm water runoff, which, in turn, can result in a higher concentration of pollutants in the discharge, since fewer pollutants are naturally filtered out.

The concern of increased impervious area is addressed in one of the questions on the *Certification* form, which asks, "Have you paved or roofed over a formerly exposed, pervious area in order to qualify for the no exposure exclusion? If yes, please indicate approximately how much area was paved or roofed over." This question has no affect on an operator's eligibility for the exclusion. It is intended only to aid the NPDES permitting authority in assessing the likelihood of such actions interfering with water quality standards. Where this is a concern, the facility operator and its NPDES permitting authority should take appropriate actions to ensure that water quality standards can be achieved.

What Happens if the Condition of No Exposure Is Not Maintained?

Under the Phase II Final Rule, the no exposure exclusion is conditional and not an outright exemption. Therefore, if there is a change in circumstances that causes exposure of industrial activities or materials to storm water, the operator is required to comply immediately with all the requirements of the NPDES Storm Water Program, including applying for and obtaining a permit.

Failure to maintain the condition of no exposure or obtain coverage under an NPDES storm water permit can lead to the unauthorized discharge of pollutants to waters of the United States, resulting in penalties under the CWA. Where a facility operator determines that exposure is likely to occur in the future due to some anticipated change at the facility, the operator should submit an application and acquire storm water permit coverage prior to the exposed discharge to avoid such penalties.

APPENDIX E – SAMPLE NATURAL RESOURCE PROTECTION ORDINANCES

INTRODUCTION

This appendix contains sample natural resource protection ordinances from various regional, county and municipal units of government in Illinois. The ordinances included represent examples and are not meant to be inclusive. Other regional, county, and municipal natural resource protection ordinances have been adopted elsewhere in Illinois and the nation that also may provide useful guidance.

With the advent of NPDES Phase II storm water permit program for small municipal separate storm sewer systems (MS4s), regulated operators of MS4s will be required to develop an ordinance or other regulatory mechanism for the Illicit Discharge Detection and Elimination, Construction Site Runoff Control, and Post-Construction Runoff Control minimum control measures.

The ordinances included in this appendix may be used to provide guidance for developing ordinances for the Construction Site Runoff Control and Post-Construction Runoff Control minimum control measures. In most cases, these ordinances were developed prior to the NPDES Phase II MS4 rules and permit being finalized. As a result, they should be reviewed and adapted to fit local conditions, current regulatory requirements and technology. The ordinances are in portable document file (pdf) format. Contact information is provided for anyone wanting to receive copies in other formats, such as MS Word for Windows or Word Perfect, which will allow for editing.

Additional information and examples of ordinances from other parts of the country can be obtained from the US Environmental Protection Agency “Model Ordinances to Protect Local Resources” website at www.epa.gov/owow/nps/ordinance/index.htm or from the Center for Watershed Protection’s website at www.stormwatercenter.net.

This section was updated in November 2002.

SAMPLE NATURAL RESOURCE PROTECTION ORDINANCES

REGIONAL MODELS

- 1) The Northeastern Illinois Planning Commission (NIPC) is the official comprehensive planning agency for the six-county Chicago metropolitan area. The natural resource ordinances listed were developed with input from numerous agencies and special interest groups and have served as models for ordinances throughout the state of Illinois. NIPC is currently considering updating their model ordinances. Additional information may be obtained by contacting NIPC's Natural Resources Department at 222 South Riverside Plaza, Suite 1800 Chicago, IL 60606, phone 312-454-0400 or at www.nipc.coq.il.us.
 - [Model Floodplain Ordinance for Communities Within Northeastern Illinois \(July 1996\)](#)
 - [Model Soil Erosion and Sediment Control Ordinance \(September 1991\)](#)
 - [Model Stormwater Drainage and Detention Ordinance \(June 2000\)](#)
 - [Model Stream and Wetland Protection Ordinance \(October 1988\)](#)

- 2) The South Suburban Mayor's and Managers Association (SSMMA) is an intergovernmental agency providing technical assistance and joint services to 43 municipalities in Cook and Will Counties. Their model ordinance was prepared for use in SSMMA's South Suburban Stormwater Strategy. Additional information may be obtained by contacting SSMMA at 1904 West 174th Street, East Hazel Crest, IL 60429, phone 708-206-1155 or at www.ssmma.org.
 - [Model Ordinance for Stormwater and Floodplain Ordinance \(August 2000\)](#)

- 3) The Southwestern Illinois Metropolitan and Regional Planning Commission (SWIMRPC) is the official planning agency for Madison, St. Clair, Monroe, Randolph, Bond, Clinton and Washington Counties. Additional information may be obtained by contacting SWIMRPC at 203 West Main Street, Collinsville, IL 62234, phone 618-344-4250.
 - [Model Ordinance Providing for the Control of Stormwater Drainage and Detention, Soil Erosion and Sediment Control \(June 1997\), as modified for the Village of Caseyville.](#)

- 4) The Tri-County Regional Planning Commission (TCRPC) is the official planning agency for Peoria, Tazewell and Woodford Counties. TCRPC assisted in coordinating a multi-county effort to produce a model Erosion, Sediment, and Storm Water Control Ordinance for each county and their municipalities. There are slight differences between the county ordinances. Individual county ordinances are listed below. Intergovernmental agreements have been executed between the counties and the local NRCS/SWCD office to assist in plan review and site inspections. Additional information may be obtained by contacting TCRPC's Environmental Services Planner at 411 Hamilton Boulevard, Suite 2001, Peoria, IL 61602, phone 309-673-9330, or at www.tricountyrpc.org.

- [Summary of Significant Differences Between the Peoria, Tazewell and Woodford County Erosion, Sediment, and Storm Water Control Ordinances](#)

COUNTY

- 1) Kane County's Stormwater Management Ordinance was prepared in accordance with the Kane County Comprehensive Countywide Stormwater Management Plan, as authorized in 55 ILCS 5/5-1062. This ordinance provides county-wide minimum standards and applies to all areas within the county, including municipalities. The ordinance was amended to provide protection of isolated wetlands that are no longer offered protection by the U.S. Army Corps of Engineers. A companion Technical Reference Manual (TRM) has been prepared to provide guidance in the implementation of the ordinance. Additional information may be obtained by contacting Kane County Environmental Management Department, 719 S. Batavia Avenue Bldg. A, Geneva, IL 60134, phone 630-208-5118 or at www.co.kane.il.us/Environment.
 - [Kane County Stormwater Management Ordinance \(October 2001\)](#)
 - [Amendment \(December 2001\)](#)
- 2) Kendall County's Stormwater Management Ordinance was prepared in accordance with police powers granted to the County by the Illinois Compiled Statutes and the Kendall County Land Resource Management Plan. It applies only to unincorporated areas within the county. Additional information may be obtained by contacting Strand Associates, Inc., 2400 Glenwood Avenue, Suite 226, Joliet, IL 60435, phone 815-744-4200.
 - [Kendall County Stormwater Management Ordinance \(October 2002\)](#)
- 3) Lake County's Watershed Development Ordinance (WDO) was prepared in accordance with the Lake County Comprehensive Stormwater Management Plan, as authorized in 55 ILCS 5/5-1062. The WDO provides county-wide minimum standards and applies to all areas within the county, including municipalities. The ordinance has been amended several times since initially adopted in 1992, most recently to provide protection of isolated wetlands that are no longer offered protection by the U.S. Army Corps of Engineers. A companion Technical Reference Manual (TRM) has been prepared to provide guidance in the implementation of the WDO. Additional information may be obtained by contacting Lake County Stormwater Management Commission (SMC), 333 Peterson Road, Libertyville, IL 60048, phone 847-918-5260 or at www.co.lake.il.us/smc.

Model Floodplain Ordinance

for Communities Within Northeastern Illinois

**Illinois Department of Natural Resources
Office of Water Resources
&
Northeastern Illinois Planning Commission
July 1996**

PREFACE

Floodplains and their associated stream, wetland and shoreline areas are among the State's greatest assets, because of multiple benefits related to environmental quality, natural resource management, and recreational opportunity. Floodplains are generally best able to provide these benefits if kept in a natural condition. Alterations of floodplains often have resulted in increased flood and stormwater hazards, reduced water quality, loss of habitat and recreational opportunities and poor aesthetics within communities. Wherever possible, the natural characteristics of floodplains and their associated water bodies should be preserved.

Unfortunately, unwise development practices and lack of planning have resulted in flooding for which mitigation has been sought through stream modifications such as channelization and reservoir construction. Such modifications may be costly to build and maintain and certainly do not provide for a full range of floodplain benefits, such as aquatic habitat, even though many millions of dollars have been spent to improve the water quality in the channels or watercourses within the floodplains. Often, the preservation of natural floodplains may have been more cost effective. In some situations, flood protection and other stream benefits can be achieved by remedial activities which restore natural characteristics of previously altered floodplain corridors.

In other instances, flood and stormwater problems simply cannot be addressed by natural floodplains and severe measures must be undertaken; similarly, intense demands for water-dependent recreational or commercial activities necessitate localized modifications within floodplains. Decisions to alter floodplains, and especially floodways and streams within floodplains should be the result of a careful planning process, which evaluates resource conditions and human needs. A well thought out and officially adopted plan is the best basis for land use regulations which affect the use and development of land.

Some citizens have verbally contested the legality and constitutionality of floodplain ordinances. And, in certain cases, the issues have been taken to the courts. Experience in various parts of the country, where such ordinances have been tested in the courts, reveals that when the purposes of such an ordinance have been clearly defined and the provisions judiciously enforced, the ordinances have been sustained. Restrictions, no matter how severe, are likely to be upheld if nuisances and threats to public health, safety and welfare are prevented. The purposes described here cover the broad range of circumstances for which protection of public interests is sought by enactment of this Ordinance. The rationale for this type of regulation is significantly strengthened if the regulation is an outgrowth of a planning process which establishes public policy and which has involved significant citizen participation and input.

This ordinance is intended for use in the following six counties of Northeastern Illinois: Cook, DuPage, Kane, Lake, McHenry, and Will. The adoption of this ordinance (or one that also satisfies the minimum federal and state requirements) is required of all communities which participate in the National Flood Insurance Program (NFIP).

Public Act 85-905, approved by the Illinois Legislature, and signed into law by the Governor on November 18, 1987, specified that the Illinois Department of Natural Resources, Office of Water Resources (IDNR/OWR) may delegate its permitting responsibilities to local units of government. Once your community has adopted this Ordinance, or an ordinance meeting the minimum federal and state requirements, and that Ordinance has been approved by IDNR/OWR; then your community may choose to be delegated the floodway permitting responsibilities.

P.A. 85-905 and P.A. 85-1266 provided additional authority to counties (55 Illinois Compiled Statutes, 5/5-10-62) to address floodplain and stormwater management issues under the provisions of the Stormwater Management Act. This legislation provides the authority and basis for many of the recommendations of the Northeastern Illinois Planning Commission (NIPC) that are contained within this model ordinance.

This ordinance is slightly longer than its predecessor. This increase in length is primarily a result of improved formatting to enhance the readability of the document. It is suggested that each community keep the Model Floodplain Ordinance on file because explanation and commentary on the regulations are provided in the right-hand margin. Copies of the ordinance can be obtained from:

IDNR/OWR
201 West Center Court
Schaumburg, Illinois 60196
(847) 705-4341

Copies can also be obtained from NIPC for a nominal charge:

NIPC
Publications Department
222 South Riverside Plaza, Suite 1800
Chicago, Illinois 60606
(312) 454-0400

Electronic copies of the ordinance can be obtained in IBM Microsoft Word or Word Perfect formats by sending a 3.5" disk to IDNR/OWR or for a nominal charge from NIPC.

For information and technical assistance on the "recommended" language in the ordinance, contact NIPC's Natural Resources Department.

HOW TO USE THIS ORDINANCE

The Model Floodplain Ordinance is drafted to reflect the minimum requirements of the Federal Emergency Management Agency (FEMA) for eligibility of units of government in the National Flood Insurance Program, and the minimum requirements of the Illinois Department of Natural Resources, Office of Water Resources (IDNR/OWR - formerly IDOT/DWR) concerning floodway construction and construction in designated and non-designated floodways that drain more than one square mile. Communities are encouraged to include more restrictive language. This Ordinance is intended to protect the hydrologic and hydraulic functions of floodplains and watercourses, and their related water quality and habitat functions as well as protect structures and their inhabitants. Presently, the vast majority of the waters of the State are designated as General Use waters and are to be protected for the uses of aquatic life, primary contact, agricultural and industrial water supply, and aesthetic quality. Waters of the State include natural and artificial, public and private stream channels, including headwaters. Experience in recent years in assessing the effects of development on both flooding and stream uses has led to a conclusion that a conservative, holistic floodplain management policy is essential to minimize public and private damages and to protect public benefits related to stream uses. The rationale for this type of regulation is significantly strengthened if the regulation is an outgrowth of a planning process which establishes public policy and which has involved significant citizen participation and input.

The minimum requirements established by FEMA and IDNR/OWR are included in the Model Ordinance in a normal type. The normal type also includes standard language used in floodplain ordinance statewide. Recommended requirements by IDNR/OWR and NIPC designed to preserve and enhance water quality, habitat, recreational opportunities, aesthetics, and/or provide an additional margin of safety are in ***bold italics***. Any commentary referring to these additional requirements is also in ***bold italics*** in the commentary column to the right of the corresponding Ordinance text.

THIS PAGE HAS BEEN LEFT INTENTIONALLY BLANK

MODEL FLOODPLAIN ORDINANCE FOR COMMUNITIES WITHIN NORTHEASTERN ILLINOIS (CITIES, VILLAGES)

ORDINANCE NO.

An Ordinance Regulating Development in Special Flood Hazard Areas

Be it ordained by the (Board of Trustees, City Council) of the (Village, City) of _____, Illinois, as follows:

Section 100.0 Index

Table with 2 columns: Section and Page. Lists sections 100.0 through 1700.0 with corresponding page numbers.

Section 200.0 Purpose

This Ordinance is enacted pursuant to the police powers granted to this (Village, City) by 65 ILCS 5/1-2-1, 5/11-12-12, 5/11-30-2, 5/11-30-8, and 5/11-31-2 (1994). The purpose of this Ordinance is to maintain this (Village's/City's) eligibility in the National Flood Insurance Program; to minimize potential losses due to periodic flooding including loss of life, loss of property, health and safety hazards, disruption of commerce and governmental services, extraordinary public expenditures for flood protection and relief, and impairment of the tax base, all of which adversely affect the public health, safety and general welfare; and to preserve and enhance the quality of surface waters, conserve economic and natural values and provide for the wise utilization of water and related land resources. This Ordinance is adopted in order to accomplish the following specific purposes:

200.1 To meet the requirements of 615 ILCS 5/18g Rivers, Lakes and Streams Act.

This section gives the reasons why this Ordinance is needed. In this case, it also explains why floodway development is unwise. The purpose and intent are broadly delineated in order to establish the public purpose and benefit (i.e. interest) on which the legality of this exercise of the police power is based.

If the adopting political body is a County, then the County or the County Board must be placed in all notations which now read (City, Village) or (City Council, Board of Trustees). In addition, Section 200.0 should read:

This Ordinance is enacted pursuant to the police powers granted to this County by the 55 ILCS 5/5-10-41, 5/5-10-42, 5/5-10-63. i

Although this ordinance requires that an applicant obtain a permit for a dam, where applicable, from IDNR/OWR, this ordinance is not meant to serve as a

200.2 To assure that new development does not increase the flood or drainage hazards to others, or creating unstable conditions susceptible to erosion;

200.3 To protect new buildings and major improvements to buildings from flood damage;

200.4 To protect human life and health from the hazards of flooding;

200.5 To lessen the burden on the taxpayer for flood control projects, repairs to flood-damaged public facilities and utilities, and flood rescue and relief operations; and

200.6 To make federally subsidized flood insurance available for property in the (City, Village) by fulfilling the requirements of the National Flood Insurance Program.

200.7 To comply with the rules and regulations of the National Flood Insurance Program codified as 44 CFR 59-79, as amended.

200.8 *To protect, conserve, and promote the orderly development of land and water resources;*

200.9 *To preserve the natural characteristics and functions of watercourses and floodplains in order to moderate flood and stormwater impacts, improve water quality, reduce soil erosion, protect aquatic and riparian habitat, provide recreational opportunities, provide aesthetic benefits and enhance community and economic development.*

Section 300.0 Definitions

For the purposes of this Ordinance, the following definitions are adopted:

300.1 "Act" "An act in relation to the regulation of the rivers, lakes and streams of the State of Illinois", 615 ILCS 5/5 et seq.

300.2 "Applicant" Any person, firm, corporation or agency which submits an application.

300.3 "Appropriate Use" Only uses of the designated floodway that are permissible and will be considered for permit issuance. The only uses that will be allowed are as specified in Section 802.0.

300.4 "Base Flood" The flood having a one-percent probability of being equaled or exceeded in any given year. The base flood is also known as the 100-year frequency flood event. Application of the base flood elevation at any location is as defined in Section 600.0 of this Ordinance.

Dam Safety ordinance, nor does it imply that this duty is delegated to the local government.

When interpreting this Ordinance, the definitions found in this section should be used. Any words not found in this section should take the standard definition found in the dictionary

NFIP definitions are in 44 CFR 59.1. IDNR/OWR definitions are in 92 Ill. Adm. Code 708

NIPC policy considers the following general categories as appropriate uses: public flood control projects, public recreation and open space uses, water dependent activities and crossing roads and bridges. A more specific definition of appropriate uses, and the distinctions between NIPC and IDNR/OWR appropriate uses, can be found in Section 802.0. In general, NIPC recognizes fewer activities as appropriate uses of the floodway.

300.5 "Building" A structure that is principally above ground and is enclosed by walls and a roof. The term includes a gas or liquid storage tank, a manufactured home, mobile home or a prefabricated building. This term also includes recreational vehicles and travel trailers to be installed on a site for more than 180 days, unless fully licensed and ready for highway use.

300.6 "Channel" *Any river, stream, creek, brook, branch, natural or artificial depression, ponded area, flowage, slough, ditch, conduit, culvert, gully, ravine, wash, or natural or man-made drainageway, which has a definite bed and banks or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.*

300.7 "Channel Modification" *Alteration of a channel by changing the physical dimensions or materials of its bed or banks. Channel modification includes damming, rip-rapping (or other armoring), widening, deepening, straightening, relocating, lining and significant removal of native vegetation from the bottom or banks. Channel modification does not include the clearing of dead or dying vegetation, debris, or trash from the channel. Channelization is a severe form of channel modification involving a significant change in the channel cross-section and typically involving relocation of the existing channel (e.g. straightening).*

300.8 "Compensatory Storage" An artificially excavated, hydraulically equivalent volume of storage within the SFHA used to balance the loss of natural flood storage capacity when artificial fill or structures are placed within the floodplain. The uncompensated loss of natural floodplain storage can increase off-site floodwater elevations and flows.

300.9 "Conditional Approval of a Designated Floodway Map Change" Preconstruction approval by IDNR/OWR and FEMA of a proposed change to the floodway map. This preconstruction approval, pursuant to this Part, gives assurances to the property owner that once an Appropriate Use is constructed according to permitted plans, the floodway map can be changed, as previously agreed, upon review and acceptance of as-built plans.

300.10 "Conditional Letter of Map Revision (CLOMR)" A letter which indicates that FEMA will revise base flood elevations, flood insurance rate zones, flood boundaries or floodway as shown on an effective Flood Hazard Boundary Map or Flood Insurance Rate Map, once the as-built plans are submitted and approved.

300.11 "Control Structure" *A structure designed to control the rate of flow that passes through the structure, given a specific upstream and downstream water surface elevation.*

300.12 "Dam" All obstructions, wall embankments or barriers, together with their abutments and appurtenant works, if any, constructed for the purpose of storing or diverting water or creating a pool. Underground water storage tanks are not included.

300.13 "Designated Floodway" The channel, including on-stream lakes, and that portion of the floodplain adjacent to a stream or watercourse as designated by IDNR/OWR, which is needed to store and convey the existing 100-year frequency flood discharge with no

A channel includes on-stream lakes and impoundments. For purposes of this Ordinance, a channel does not include very small headwater swales or ditches which generally would not be mapped on U.S.G.S. 7.5 minute quadrangle maps. The regulation of small headwater swales and ditches is more appropriately addressed in a stormwater management ordinance.

It is recommended that the maps which explicitly delineate regulated channels be adopted as part of this Ordinance.

Floodway modifications, except for the purpose of appropriate uses, as defined in Section 802.0, are contrary to NIPC policy.

Although a conditional approval of a regulatory map change is approved, the use of the site must still be an appropriate use as defined in 92 Ill. Adm. Code Part 708.

The floodway is a high risk area where zoning ordinances and other land use controls should be used to prevent development so as to avoid flood damages and to permit the free passage of floodwaters. The accurate

more than a 0.1 foot increase in stage due to the loss of flood conveyance or storage, and no more than a 10 percent increase in velocities.

(a) The floodways are designated for _____ (river, creek, stream) on the Flood Boundary and Floodway Map prepared by FEMA (or the Department of Housing and Urban Development) and dated _____ and for _____ (river, creek, stream) on the Regulatory Floodplain Map prepared by IDNR/OWR and dated _____. When two floodway maps exist for a waterway, the more restrictive floodway limit shall prevail.

(b) The floodways for those parts of unincorporated _____ County that are within the extraterritorial jurisdiction of the (City, Village) that may be annexed into the (City, Village) are designated for _____ (river, creek, stream) on the Flood Boundary and Floodway map prepared by FEMA (or Department of Housing and Urban Development) and dated _____ and for _____ (river, creek, stream) on the Regulatory Floodplain Map prepared by IDNR/OWR and dated _____.

(c) To locate the designated floodway boundary on any site, the designated floodway boundary should be scaled off the designated floodway map and located on a site plan, using reference marks common to both maps. Where interpretation is needed to determine the exact location of the designated floodway boundary, IDNR/OWR should be contacted for the interpretation.

300.14 "Development" Any man-made change to real estate, including:

(a) Construction, reconstruction, repair, or placement of a building or any addition to a building.

(b) Installing a manufactured home on a site, preparing a site for a manufactured home, or installing a travel trailer or recreational vehicle on a site for more than 180 days. If the travel trailer or recreational vehicle is on site for less than 180 days, it must be fully licensed and ready for highway use.

(c) Drilling, mining, installing utilities, construction of roads, bridges, or similar projects.

(d) Demolition of a structure or redevelopment of a site.

(e) Clearing of land as an adjunct of construction.

(f) Construction or erection of levees, walls, fences, dams, or culverts; channel modification; filling, dredging, grading, excavating, paving, or other non-agricultural alterations of the ground surface; storage of materials; deposit of solid or liquid waste;

(g) Any other activity of man that might change the direction,

determination of floodways and their limits is of critical importance. It is a complex procedure, requiring detailed engineering studies and the development of considerable hydraulic data.

The basic approach is to first assume the extent of the floodway along the length of the stream. In effect, this also assumes the alignment of the floodway encroachment lines. Then assume that the flood fringes will be completely filled without compensatory storage. New highwater elevations are then computed. If the resulting increase in height of the design flood is significant (greater than 0.1 foot), the encroachment lines are tested at locations further out from the channel center line. On the other hand, if the increase is less than 0.1 foot, the encroachment lines may be moved closer to the center line and the resultant water levels again computed.

IDNR/OWR's Designated Floodway List provides each community with a list of regulatory maps applicable to that community. That list should be placed into the Ordinance at this point. Contact IDNR/OWR regarding correct maps and definitions. For communities which have received the new Countywide Flood Insurance Rate Maps (FIRM) with floodways, the Flood Boundary and Floodway Maps should be replaced with FIRM.

Many communities may only have to adopt portions of definition 300.13, depending on their unique circumstances. For example, a land-locked community would not have to adopt (b).

The definition of development includes those activities which could significantly alter the hydraulics or hydrology of the floodplain, or otherwise interfere with its natural functions. Certain development activities are considered appropriate uses of the floodway, as indicated in Section 802.0, others are not.

height, or velocity of flood or surface water, including extensive vegetation removal;

Development does not include maintenance of existing buildings and facilities such as re-roofing or re-surfacing of roads when there is no increase in elevation, or gardening, plowing, and similar agricultural practices that do not involve filling, grading, or construction of levees.

300.15 "Elevation Certificates" A form published by FEMA that is used to certify the elevation to which a building has been elevated.

300.16 "Erosion" *The general process whereby soils are moved by flowing water or wave action.*

300.17 "Exempt Organizations" Organizations which are exempt from this Ordinance per Illinois Compiled Statutes (ILCS) including state, federal or local units of government.

300.18 "Existing Manufactured Home Park or Subdivision" A manufactured home park or subdivision for which the construction of facilities for servicing the lots on which the manufactured homes are to be affixed (including, at a minimum, the installation of utilities, the construction of streets, and either final site grading or the pouring of concrete pads) has been completed before April 1, 1990.

300.19 "Expansion to an Existing Manufactured Home Park or Subdivision" The preparation of additional sites by the construction of facilities for servicing the lots on which the manufactured homes are to be affixed (including the installation of utilities, the construction of streets, and either final site grading or the pouring of concrete pads).

300.20 "FEMA" Federal Emergency Management Agency and its regulations at 44 CFR 59-79 effective as of September 29, 1989. This incorporation does not include any later editions or amendments.

300.21 "Flood" A general and temporary condition of partial or complete inundation of normally dry land areas from overflow of inland or tidal waves, or the unusual and rapid accumulation or runoff of surface waters from any source.

300.22 "Flood Frequency" *A period of years, based on a statistical analysis, during which a flood of a stated magnitude may be expected to be equaled or exceeded.*

300.23 "Flood Fringe" That portion of the floodplain outside of the designated floodway.

300.24 "Flood Insurance Rate Maps (FIRM)" A map prepared by FEMA that depicts the Special Flood Hazard Area (SFHA) within a community. This map includes insurance rate zones and floodplains and may or may not depict floodways.

Cook County communities should add to the end of definitions "such as the Metropolitan Water Reclamation District."

The flood fringes are those portions of the floodplain outside of the floodway where floodwaters are usually shallow and slow-moving. They are low risk areas where development may be permitted provided reasonable precautions are taken, such as elevating, filling and non-residential structural floodproofing, and further provided that the capacity of the floodplain to store and convey floodwaters is preserved. The latter may be done by requiring compensatory storage for all volumes of such storage lost through construction and filling. See commentary on "floodway" above.

300.25 "Floodplain" That land typically adjacent to a body of water with ground surface elevations at or below the base flood or the 100-year frequency flood elevation. Floodplains may also include detached Special Flood Hazard Areas, ponding areas, etc. The floodplain is also known as the Special Flood Hazard Area (SFHA).

(a) The floodplains are those lands within the jurisdiction of the (City, Village) that are subject to inundation by the base flood or 100-year frequency flood. The SFHA's of the (City, Village) are generally identified as such on the Flood Insurance Rate Map of the (City, Village) prepared by the Federal Emergency Management Agency (or the U.S. Department of Housing and Urban Development) and dated _____.

(b) The SFHA's of those parts of unincorporated _____ County that are within the extraterritorial jurisdiction of the (City, Village) or that may be annexed into the (City, Village) are generally identified as such on the Flood Insurance Rate Map prepared for _____ County by the Federal Emergency Management Agency (or the U.S. Department of Housing and Urban Development) and dated _____.

300.26 "Floodproofing" Any combination of structural and non-structural additions, changes or adjustments to structures which reduce or eliminate flood damage to real estate or improved real property, water and sanitary facilities, structures and their contents.

300.27 "Floodproofing Certificate" A form published by FEMA that is used to certify that a building has been designed and constructed to be structurally dry floodproofed to the flood protection elevation.

300.28 "Flood Protection Elevation (FPE)" The elevation of the base flood or 100-year frequency flood *plus one foot of freeboard* at any given location in the SFHA.

300.29 "Freeboard" An increment of elevation added to the base flood elevation to provide a factor of safety for uncertainties in calculations, *future watershed development*, unknown localized conditions, wave actions and unpredictable effects such as those caused by ice or debris jams.

300.30 "Historic Structure" Any structure that is:

(a) Listed individually in the National Register of Historic Places or preliminary determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register;

(b) Certified or preliminary determined by the Secretary of the Interior as contributing to the historic district or a district preliminary determined by the Secretary to qualify as a registered historic district;

(c) Individually listed on the State inventory of historic places by the Illinois Historic Preservation Agency;

(d) Individually listed on a local inventory of historic places that has been certified by the Illinois Historic Preservation

Maps that indicate the location and extent of floodplains and are available from FEMA (1-800-358-9616) and NIPC (312-454-0400). Questions regarding floodways should be directed to IDNR/OWR, 201 West Center Court, Schaumburg, Illinois, 60196-1096.

If your community is one of those communities that is included under countywide mapping, then there will be no individual FIRM's for your community, and Section 300.25 should be reworded to recognize only countywide maps.

Any ground elevation which is lower than the Base Flood Elevation, and adjacent to the river or stream shall be considered to be in the floodplain.

Contact IDNR/OWR or FEMA for the date of your FIRM. Refer to your flood insurance study to determine which agency (FEMA or HUD) prepared the maps.

One foot is IDNR/OWR recommended minimum freeboard.

In appropriate parts of this Ordinance, a freeboard of one foot or more is recommended. Some local governments presently require a freeboard of two feet or more. The selection of a freeboard elevation for regulation should consider the degree of risk as well as the water body(s) to which it applies.

Agency.

300.31 "Hydrologic and Hydraulic Calculations"

Engineering analysis which determine expected flood flows and flood elevations based on land characteristics and rainfall events.

300.32 "IDNR/OWR" Illinois Department of Natural Resources, Office of Water Resources.

300.33 "Letter of Map Amendment (LOMA)" Official determination by FEMA that a specific structure is not in a 100-year flood zone; amends the effective Flood Hazard Boundary Map (FHBM) or FIRM.

300.34 "Letter of Map Revision (LOMR)" Letter that revises base flood or 100-year frequency flood elevations, flood insurance rate zones, flood boundaries or floodways as shown on an effective FHBM or FIRM.

300.35 "Manufactured Home" A structure, transportable in one or more sections, which is built on a permanent chassis and is designated for use with or without a permanent foundation when attached to the required utilities. The term manufactured homes also includes park trailers, travel trailers and other similar vehicles placed on site for more than 180 consecutive days. The term "manufactured home" does not include a "recreational vehicle".

300.36 "Manufactured Home Park or Subdivision" A parcel (or contiguous parcels) of land divided into two or more manufactured home lots for rent or sale.

300.37 "Mitigation" Mitigation includes those measures necessary to minimize the negative effects which floodplain development activities might have on the public health, safety and welfare. Examples of mitigation include compensatory storage, soil erosion and sedimentation control, and channel restoration. Mitigation may also include those activities taken to reduce a structure's susceptibility to flooding.

300.38 "New Manufactured Home Park or Subdivision" Manufactured home park or subdivision for which the construction of facilities for servicing the lots on which the manufactured homes are to be affixed (including at a minimum, the installation of utilities, the construction of streets, and either final site grading or the pouring of concrete pads) has been completed on or after April 1, 1990.

300.39 "NGVD" National Geodetic Vertical Datum of 1929. Reference surface set by the National Geodetic Survey deduced from a continental adjustment of all existing adjustments in 1929.

300.40 "Natural" *When used in reference to channels means those channels formed by the existing surface topography of the earth prior to changes made by man. A natural stream tends to follow a meandering path; its floodplain is not constrained by levees; the area near the bank has not been cleared, mowed or cultivated; the stream flows over soil and geologic materials typical of the area with no substantial alteration of the course or cross-section of the stream caused by filling or excavating. A modified channel may regain some natural characteristics over time as the channel meanders and vegetation is re-established. Similarly, a modified channel may be restored to more natural conditions by man through*

regrading and revegetation.

300.41 "Ordinary High Water Mark (OHWM)" *The point on the bank or shore up to which the presence and action of surface water is so continuous so as to leave a distinctive mark such as by erosion, destruction or prevention of terrestrial vegetation, predominance of aquatic vegetation or other easily recognized characteristics.*

300.42 "Public Flood Control Project" A flood control project which will be operated and maintained by a public agency to reduce flood damages to existing buildings and structures which includes a hydrologic and hydraulic study of the existing and proposed conditions of the watershed. Nothing in this definition shall preclude the design, engineering, construction or financing, in whole or in part, of a flood control project by persons or parties who are not public agencies.

300.43 "Public Bodies of Waters" All open public streams and lakes capable of being navigated by watercraft, in whole or in part, for commercial uses and purposes, and all lakes, rivers, and streams which in their natural condition were capable of being improved and made navigable, or that are connected with or discharge their waters into navigable lakes or rivers within, or upon the borders of the State of Illinois, together with all bayous, sloughs, backwaters, and submerged lands that are open to the main channel or body of water directly accessible thereto.

300.44 "Recreational Vehicle or Travel Trailer" A vehicle which is:

- (a) Built on a single chassis;
- (b) 400 square feet or less when measured at the largest horizontal projection;
- (c) Designed to be self-propelled or permanently towable by a light duty truck; and
- (d) Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational, camping, travel, or seasonal use.

300.45 "Registered Land Surveyor" A land surveyor registered in the State of Illinois, under The Illinois Land Surveyors Act. (225 ILCS 330/1, et seq.)

300.46 "Registered Professional Engineer" An engineer registered in the State of Illinois, under The Illinois Professional Engineering Practice Act. (225 ILCS 325/1 et seq.)

300.47 "Repair, Remodeling or Maintenance" Development activities which do not result in any increases in the outside dimensions of a building or any changes to the dimensions of a structure.

300.48 "Retention/Detention Facility" *A retention facility stores stormwater runoff without a gravity release. A detention facility provides for storage of stormwater runoff and controlled*

release of this runoff during and after a flood or storm.

300.49 "Riverine SFHA" Any SFHA subject to flooding from a river, creek, intermittent stream, ditch, on stream lake system or any other identified channel. This term does not include areas subject to flooding from lakes, ponding areas, areas of sheet flow, or other areas not subject to overbank flooding.

300.50 "Runoff" *The water derived from melting snow or rain falling on the land surface, flowing over the surface of the ground or collected in channels or conduits.*

300.51 "Sedimentation" *The processes that deposit soils, debris, and other materials either on other ground surfaces or in bodies of water or watercourses.*

300.52 "Special Flood Hazard Area (SFHA)" Any base flood area subject to flooding from a river, creek, intermittent stream, ditch, or any other identified channel or ponding and shown on a Flood Hazard Boundary Map or Flood Insurance Rate Map as Zone A, A0, A1-30, AE, A99, AH, VO, V30, VE, V, M, E, D, or X.

300.53 "Structure" The results of a man-made change to the land constructed on or below the ground, including the construction, reconstruction or placement of a building or any addition to a building; installing a manufactured home on a site; preparing a site for a manufactured home or installing a travel trailer on a site for more than 180 days unless they are fully licensed and ready for highway use.

300.54 "Substantial Damage" A building is considered substantially damaged when it sustains damage from any cause (fire, flood, earthquake, etc.), whereby the cost of fully restoring the structure would equal or exceed 50 percent of the pre-damage market value of the structure, regardless of the actual repair work performed.

300.55 "Substantial Improvement"

(a) Any repair, reconstruction or improvement of a structure, the cost of which equals or exceeds 50 percent of the market value of the structure either, (1) before the improvement or repair is started, or (2) if the structure has been damaged, and is being restored, before the damage occurred.

(b) For the purposes of this definition "substantial improvement" is considered to occur when the first alteration of any wall, ceiling, floor, or other structural part of the building commences, whether or not that alteration affects the external dimensions of the structure.

(c) The term does not, however, include either (1) any project for improvement of a structure to comply with existing state or local health, sanitary, or safety code specifications which are solely necessary to assure safe living conditions or (2) any alteration of a "historic structure", provided that the alteration will not preclude the structure's continued designation as a historic structure.

300.56 "Transition Section" Reaches of the stream or floodway where water flows from a narrow cross-section to a wide cross-section or vice versa.

The cost of repair must be calculated for full repair to "pre-damage" conditions, even if the owner elects to do less. The total cost of repair includes structural and finish materials, and labor. A substantially damaged building which is repaired must comply with the NFIP requirements for new construction.

Section 400.0 How to Use This Ordinance

401.0 The _____ shall be responsible for fulfilling all of the duties listed in Section 500.0.

402.0 To fulfill those duties, the _____ first should use the criteria listed in Section 600.0, Base Flood Elevations, to determine whether the development site is located within a floodplain.

403.0 Once it has been determined that a site is located within a floodplain, the _____ must determine whether the development site is within a flood fringe, a designated floodway, or within a SFHA or floodplain for which no floodway has been identified.

403.1 If the site is within a flood fringe, the _____ shall require that the minimum requirements of Section 700.0 be met.

403.2 If the site is within a floodway, the _____ shall require that the minimum requirements of Section 800.0 be met.

403.3 If the site is located within a SFHA or floodplain for which no detailed study has been completed and approved, the _____ shall require that the minimum requirements of Section 900.0 be met.

404.0 In addition, the general requirements of Section 1000.0 shall be met for all developments meeting the requirements of Section 700.0, 800.0, or 900.0.

405.0 The _____ shall assure that all subdivision proposals shall meet the requirements of Section 1100.0.

406.0 If a variance is to be granted for a proposal, the _____ shall review the requirements of Section 1200.0 to make sure they are met. In addition, the _____ shall complete all notification requirements.

407.0 In order to assure that property owners obtain permits as required in this Ordinance, the _____ may take any and all actions as outlined in Section 1400.0.

Section 500.0 Duties of the Enforcement Official(s)

The _____ shall be responsible for the general administration and enforcement of this Ordinance which shall include the following:

501.0 Determining the Floodplain Designation.

501.1 Check all new development sites to determine whether they are in a Special Flood Hazard Area (SFHA).

501.2 If they are in a SFHA, determine whether they are in a floodway, flood fringe or in a floodplain for which a detailed study has not been conducted and which drains more than one (1) square mile.

501.3 *Check whether the development is potentially within*

This section explains the procedure which the enforcement official is expected to follow when enforcing this Ordinance.

List the title of the official responsible for administering the floodplain Ordinance.

This Ordinance should be administered by a Professional Engineer (P.E.), or a combination of a P.E. and a Building Official. However, a Building Official, who is not a P.E. should not attempt to administer Section 800.0 or 900.0 of this Ordinance.

This section explains the duties of the enforcement official, in enforcing this Ordinance. It also explains what records the official is expected to maintain on file for public inspection.

Often, one square mile is the minimum regulated watershed size in urban areas. However, substantial local flooding can occur in headwater areas draining less than one square mile, and modifications and fills in these smaller watersheds can greatly exacerbate local and downstream flooding. Wherever possible, regulatory maps should be extended upstream of the one square mile cutoff as far as is practical. U.S.G.S. Hydrologic Atlas series maps provide a source of pre-1971 flood of record information in Northeastern Illinois, which may be useful in making preliminary

an extended SFHA (with a drainage area less than one square mile), indicating that the development would have adverse impacts regarding storage, conveyance, or inundation which would be the basis for the applicant being required to delineate the floodplain and floodway and be subject to the remaining Sections of this Ordinance.

502.0 Professional Engineer Review.

502.1 If the development site is within a floodway or in a floodplain for which a detailed study has not been conducted and which drains more than one square mile, the permit shall be referred to a registered professional engineer under the employ or contract of the (City, Village) for review to ensure that the development meets Sections 800.0 or 900.0.

502.2 In the case of an Appropriate Use, the P.E. shall state in writing that the development meets the requirements of Section 800.0.

503.0 Dam Safety Requirements.

503.1 Ensure that an IDNR/OWR permit has been issued or a letter indicating no permit is required, if the proposed development activity includes construction of a dam as defined in Section 300.12.

503.2 Regulated dams may include weirs, restrictive culverts or impoundment structures.

504.0 Other permit requirements.

Ensure that any and all required federal, state and local permits are received prior to the issuance of a floodplain development permit.

505.0 Plan Review and Permit Issuance.

505.1 Ensure that all development activities within the SFHAs of the jurisdiction of the (City, Village) meet the requirements of this Ordinance, and;

505.2 Issue a floodplain development permit in accordance with the provisions of this Ordinance and other regulations of this community when the development meets the conditions of this Ordinance.

506.0 Inspection Review.

Inspect all development projects before, during and after construction to assure proper elevation of the structure and to ensure compliance with the provisions of this Ordinance;

507.0 Elevation and Floodproofing Certificates.

Maintain permit files including:

507.1 An Elevation Certificate certifying the elevation of the lowest floor (including basement) of a residential or non-residential building subject to Section 1000.0 of this Ordinance, and/or;

507.2 The elevation to which a non-residential building has been floodproofed, using a Floodproofing Certificate, for all buildings

identifications of headwater and other unidentified floodplains. Increasingly, countywide stormwater management agencies, local governments, and landowners are becoming aware of the flood risks associated with unmapped floodplains, including isolated depressions.

If the adopting political body is a County, then in place of “more than one square mile” the following should be inserted:

“more than one (1) square mile in an urban or urbanizing area, or more than ten (10) square miles in a rural area”.

Some construction activities in the floodway involve fill in “waters of the United States” (i.e., wetlands and streams) and are subject to U.S. Army Corps of Engineers regulations under Section 404 and to stream and wetland protection requirements of some local communities. Necessary permits, or signoffs, from the Corps and/or the local community should be received prior to, or jointly with, issuance of a floodplain development permit.

Required by NFIP: 44 CFR 60.3(b)(4).

Copies to be provided for property owners or renters seeking Flood Insurance.

subject to Section 1000.0 of this Ordinance

508.0 Records for Public Inspection.

Maintain for public inspection and furnish upon request base flood data, SFHA and designated floodway maps, copies of federal or state permit documents, variance documentation, Conditional Letter of Map Revision, Letter of Map Revision, Letter of Map Amendment and "as-built" elevation and floodproofing and/or elevation certificates for all buildings constructed subject to this Ordinance.

509.0 State Permits.

Ensure that construction authorization has been granted by IDNR/OWR, for all development projects subject to Sections 800.0 and 900.0 of this Ordinance, unless enforcement responsibility has been delegated to the (City, Village). However, the following review approvals are not delegated to the (City, Village) and shall require review or permits from IDNR/OWR:

509.1 Organizations which are exempt from this Ordinance, as per the Illinois Compiled Statutes;

509.2 IDNR/OWR projects, dams or impoundment structures as defined in Section 300.12 and all other state, federal or local unit of government projects, including projects of the (City, Village) and County, except for those projects meeting the requirements of Section 802.7;

509.3 An engineer's determination that an existing bridge or culvert crossing is not a source of flood damage and the analysis indicating the proposed flood profile, per Section 802.3(e);

509.4 An engineer's analysis of the flood profile due to Section 802.3(d);

509.5 Alternative transition sections and hydraulically equivalent compensatory storage as indicated in Section 802.3(a, b, h);

509.6 Permit issuance of structures within, under, or over publicly navigable rivers, lakes and streams;

509.7 Any changes in the Base Flood Elevation or floodway locations; and,

509.8 Base Flood Elevation determinations where none now exist.

510.0 Cooperation with Other Agencies.

510.1 Cooperate with state and federal floodplain management agencies to improve base flood or 100-year frequency flood and floodway data and to improve the administration of this Ordinance;

510.2 Submit data to IDNR/OWR and FEMA for proposed revisions of a regulatory map;

IDNR/OWR can delegate state permitting authority in the floodway for certain minor projects. State delegation means your community will be responsible for issuing development permits for several types of minor floodway development activities, without first obtaining a State permit. This delegation will free up state staff to work on the detailed projects that involve a change to the base flood elevation or floodway location.

510.3 Submit reports as required for the National Flood Insurance Program; and

510.4 Notify FEMA of any proposed amendments to this Ordinance.

511.0 Promulgate Regulations.

Promulgate rules and regulations as necessary to administer and enforce the provisions of this Ordinance, subject however to the review and approval of IDNR/OWR and FEMA for any Ordinance changes.

Section 600.0 Base Flood Elevation

This Ordinance's protection standard is based on the Flood Insurance Study for the (City, Village).

600.1 If a base flood elevation or 100-year frequency flood elevation is not available for a particular site, then the protection standard shall be according to the best existing data available in the Illinois State Water Survey's Floodplain Information Repository that has been approved by IDNR/OWR and FEMA.

600.2 When a party disagrees with the best available data, he/she may finance the detailed engineering study needed to replace existing data with better data and submit it to IDNR/OWR and FEMA.

601.0 The base flood or 100-year frequency flood elevation for the SFHAs of ____ (river, creek, stream) shall be as delineated on the 100-year flood profiles in the Flood Insurance Study of the (City, Village) prepared by FEMA (or the Department of Housing and Urban Development) and dated____, and such amendments to such study and maps as may be prepared from time to time.

602.0 The base flood or 100-year frequency flood elevation for the SFHAs of those parts of unincorporated _____ County that are within the extraterritorial jurisdiction of the (City, Village) or that may be annexed into the (City, Village) shall be as delineated on the 100-year flood profiles in the Flood Insurance Study of____County prepared by FEMA (or Department of Housing and Urban Development) and dated _____, and such amendments or revisions to such study and maps as may be prepared from time to time.

603.0 The base flood or 100-year frequency flood elevation for each SFHA delineated as an "AH Zone" or "AO Zone" shall be that elevation (or depth) delineated on the Flood Insurance Rate Map of the (City, Village).

604.0 The base flood or 100-year frequency flood elevation for each of the remaining SFHAs delineated as an "A Zone" on the Flood Insurance Rate Map of the (City, Village) shall be according to the best existing data available in the Illinois State Water Survey Floodplain Information Repository.

604.1 When no base flood or 100-year frequency flood elevation exists, the base flood or 100-year frequency flood elevation for a riverine SFHA shall be determined from a backwater model, such as HEC-II, WSP-2, or a dynamic model such as HIP.

This section explains which maps are to be used or which procedures are to be followed in determining whether a parcel of land is in the floodplain.

NFIP requirement: 44 CFR 60.3(b)(4)

Contact IDNR/OWR or FEMA for the date of your FIS.

Contact IDNR/OWR to determine which Sections (601, 602, 603 or 604) are required for your community. Many communities may only have to adopt portions of this Section, depending on their unique circumstances. For example, a land-locked community would not have to adopt 602; a community with no AH or AO zones would not have to adopt 603.

The 100-year frequency flood event is that event which has a 1 percent statistical chance of occurring in any given year.

Flood flows should be based on anticipated future land use conditions in the watershed as determined from adopted local and regional land use plans. Anticipated future development will exacerbate existing flooding in many cases. In small to moderately sized watersheds, it has been shown that stringent stormwater detention requirements for new development can minimize or prevent increases in the flood peak. However, for larger watersheds (e.g., 100 square miles or larger), it is expected that future development will increase both flood peaks and durations, regardless of local

604.2 The flood flows used in the hydraulic models shall be obtained from a hydrologic model, such as HEC-I, TR-20, or HIP, or by techniques presented in various publications prepared by the United States Geological Survey for estimating peak flood discharges.

604.3 Along any watercourses draining more than one (1) square mile, the above analyses shall be submitted to IDNR/OWR for approval. Once approved it must be submitted to the Illinois State Water Survey Floodplain Information Repository for filing.

604.4 For a non-riverine SFHA, the Base Flood Elevation shall be the historic Flood of Record plus *three feet*, unless calculated by a detailed engineering study and approved by IDNR/OWR for drainage areas greater than one square mile.

604.5 For an unmapped extended SFHA (with a drainage area less than one square mile) which has been identified by the _____ pursuant to Section 501.3, the base flood elevation shall be determined by the applicant utilizing a method as approved in Section 604, with concurrence of the _____.

stormwater controls, due to increases in the total volume of runoff. In the situations where flood increases related to future development are expected, it is critical that flood flows and the resultant maps be based on anticipated future land use. In determining future flood flows, the influence of stormwater detention which is required and enforced by local government ordinances should be factored into the hydrologic model.

If the adopting political body is a County, then in place of “more than one square mile” the following should be inserted:

“more than one (1) square mile in an urban or urbanizing... area, or more than ten (10) square miles in a rural area”.

NIPC recommends that, at a minimum, floodplain mapping be performed for any watercourse draining more than one square mile, even if the political body is a county. Current development patterns and trends in northeastern Illinois indicate that urban development can occur anywhere, even in predominantly rural areas. Without floodplain mapping for many of the watercourses in these areas, it will be difficult to prevent new development from locating in floodprone zones.

The +3 foot requirement is recommended language from IDNR/OWR.

As described in the commentary opposite Section 501.0, it is important that significant floodplains be identified and be subject to the requirements of this Ordinance, even if the tributary drainage area is less than one square mile.

List the title of the official responsible for administering the floodplain ordinance.

Section 700.0 Occupation and Use of Flood Fringe Areas

Development in and/or filling of the flood fringe will be permitted if protection is provided against the base flood or 100-year frequency flood by proper elevation, and compensatory storage, and other applicable provisions of this Ordinance. No use will be permitted which adversely affects the capacity of drainage facilities or systems. Developments located within the flood fringe shall meet the requirements of this Section, along with the requirements of Section 1000.0.

701.0 Development Permit.

701.1 No person, firm, corporation, or governmental body not exempted by state law shall commence any development in the SFHA without first obtaining a development permit from the _____.

701.2 Application for a development permit shall be made on a form provided by the _____.

(a) The application shall be accompanied by drawings of the site, drawn to scale, showing property line dimensions and legal description for the property and sealed by a licensed engineer, architect or land surveyor; existing grade elevations in M.S.L., 1929 adj. datum or N.G.V.D. and all changes in grade resulting from excavation or filling; the location and dimensions of all buildings and additions to buildings.

(b) For all proposed buildings, the elevation of the lowest floor (including basement) and lowest adjacent grade shall be shown on the submitted plans and the development will be subject to the requirements of Section 1000.0 of this Ordinance.

701.3 Upon receipt of a development permit application, the _____ shall compare the elevation of the site to the base flood or 100-year frequency flood elevation.

(a) Any development located on land that can be shown to be higher than the base flood elevation of the current Flood Insurance Rate Map and which has not been filled after the date of the site's first Flood Insurance Rate Map without a permit as required by this ordinance is not in the SFHA and, therefore, not subject to the requirements of this Ordinance.

(b) The _____ shall maintain documentation of the existing ground elevation at the development site and certification that this ground elevation existed prior to the date of the site's first Flood Insurance Rate Map identification.

701.4 A soil erosion and sediment control plan for disturbed areas shall be submitted. This plan shall include a description of the sequence of grading activities and the temporary sediment and erosion control measures to be implemented to mitigate their effects. This plan shall also include a description of final stabilization and revegetation measures, and the identification of a responsible party to ensure post-construction maintenance.

701.5 The _____ shall be responsible for obtaining from the applicant copies of all other federal, state, and local permits, approvals or permit-not-required letters that may be required for this

This section explains the procedures which are to be followed in determining whether a parcel of land is in a flood fringe, and sets the minimum requirements for all developments within a flood fringe.

Developments in the flood fringe may include the construction of a dam as defined in Section 300.12. An IDNR/OWR permit for the dam or a letter indicating "no IDNR/OWR permit is required" is necessary for any such construction.

NFIP requirement: 44 CFR 60.3(b)(1). List the title of the official responsible for administering the floodplain ordinance.

List the title of the official responsible for administering the floodplain ordinance.

List the title of the official responsible for administering the floodplain ordinance.

Such a project will still be subject to the flood insurance purchase requirements unless the owner receives a Letter of Map Amendment from FEMA.

List the title of the official responsible for administering the floodplain ordinance.

Assistance in administration of soil erosion and sedimentation control requirements is provided in "Model Soil Erosion and Sediment Control Ordinance: A Guide for Local Officials" September, 1991.

List the title of the official responsible for administering the floodplain ordinance.

type of activity. The _____ shall not issue a permit unless all other federal, state, and local permits have been obtained.

702.0 Preventing Increased Damages.

No development in the flood fringe shall create a threat to public health and safety.

702.1 If fill is being used to elevate the site above the base flood or 100-year frequency flood elevation, the applicant shall submit sufficient data and obtain a letter of map revision (LOMR) from FEMA for the purpose of removing the site from the floodplain.

702.2 Compensatory Storage.

(a) Whenever any portion of a floodplain is authorized for use, the volume of space which will be occupied by the authorized fill or structure below the base flood or 100-year frequency flood elevation shall be compensated for and balanced by a hydraulically equivalent volume of excavation taken from below the base flood or 100-year frequency flood elevation.

(b) The excavation volume shall be at least equal to **1.5 times** the volume of storage lost due to the fill or structure.

(c) In the case of streams and watercourses, such excavation shall be made opposite or adjacent to the areas so filled or occupied.

(d) All floodplain storage lost below the existing 10-year flood elevation shall be replaced below the proposed 10-year flood elevation. All floodplain storage lost above the existing 10-year flood elevation shall be replaced above the proposed 10-year flood elevation.

(e) All such excavations shall be constructed to drain freely and openly to the watercourse.

NFIP requirement: 44 CFR 60.3(a)(2).

NFIP requirement: 44 CFR 60.3(a)(4)(i), 60.3(c)(10) and 60.3(d)(3).

NIPC policy supports the requirement for a safety factor for compensatory storage equal to at least 1.5 times the volume of storage lost due to fill or structures. This safety factor is intended to compensate for uncertainties in the estimation of the base flood elevation and in the determination of project impacts.

This section requires compensatory storage in the flood fringe and the floodway. Compensatory storage in the floodway is required by IDNR/OWR. ***Compensatory storage in the flood fringe is recommended by both NIPC and IDNR/OWR but is not required.*** If compensatory storage is not provided within the flood fringe, IDNR/OWR will require that all future mapping have storage floodways rather than the current conveyance floodways. Storage floodways are normally much wider than conveyance floodways and will result in the more stringent requirements of Section 800 being enforced in a larger area of the community.

If your community and other communities along a hydraulically significant portion of a stream desire to have the floodway defined on the basis of conveyance only and not storage, effective compensatory storage will be required for all construction in the floodplain for projects under the control of your community as well as any projects constructed that affects floodplain storage. If the municipality owns a regional flood control or stormwater storage facility, and has a plan for developing additional storage at the facility, the municipality may prefer to offer developers of isolated single lots, one quarter acre or smaller in size, the ability to provide hydraulically equivalent storage in the regional facility as an alternative to providing on-site compensatory storage. It would need to be shown through the use of hydrologic and hydraulic models, however, that the additional storage created in the regional facility is hydraulically equivalent to the storage lost at the development site.

Section 800.0 Occupation and Use of Designated Floodways

This section applies to proposed development, redevelopment, site modification or building modification within a designated floodway. The designated floodway for _____(river, creek, stream) shall be as delineated on the designated floodway maps designated by IDNR/OWR according to and referenced in Section 300.13. Only those uses and structures will be permitted which meet the criteria in this section. All floodway modifications shall be the minimum necessary to accomplish the purpose of the project. The development shall also meet the requirements of Section 1000.0.

801.0 Development Permit.

No person, firm, corporation or governmental body not exempted by state law shall commence any development in a floodway without first obtaining a development permit from the _____ and IDNR/OWR.

801.1 Application for a development permit shall be made on a form provided by the _____. The application shall include the following information:

- (a) Name and address of applicant;
 - (b) Site location (including legal description) of the property, drawn to scale, on the designated floodway map, indicating whether it is proposed to be in an incorporated or unincorporated area;
 - (c) Name of stream or body of water affected;
 - (d) Description of proposed activity;
 - (e) Statement of purpose of proposed activity;
 - (f) Anticipated dates of initiation and completion of activity;
 - (g) Name and mailing address of the owner of the subject property if different from the applicant;
 - (h) Signature of the applicant or the applicant's agent;
 - (i) If the applicant is a corporation, the president or other authorized officer shall sign the application form;
 - (j) If the applicant is a partnership, each partner shall sign the application form; and
 - (k) If the applicant is a land trust, the trust officer shall sign the name of the trustee by him (her) as trust officer. A disclosure affidavit shall be filed with the application, identifying each beneficiary of the trust by name and address and defining the respective interests therein.
- (l) Plans of the proposed activity shall be provided which

This section explains the procedures which are to be followed to determine if a site is within a floodway and sets the minimum requirements for all development within a floodway.

IDNR/OWR requirements. Section 800.0, in its entirety, meets the requirements of 92 Ill. Adm. Code Part 708.

NFIP requirement: 44 CFR 60.3(b)(1).

List the title of the official responsible for administering the floodplain Ordinance.

If IDNR/OWR has delegated its permitting authority in the floodway to the community, then only those development activities in Section 802.4 would still require permits from IDNR/OWR.

List the title of the official responsible for administering the floodplain Ordinance.

include as a minimum:

i. A vicinity map showing the site of the activity, name of the waterway, boundary lines, names of roads in the vicinity of the site, graphic or numerical scale, and north arrow;

ii. A plan view of the project and engineering study reach showing existing and proposed conditions including principal dimensions of the structure or work, elevations in mean sea level (1929 adjustment) datum or N.G.V.D. or North American Vertical Datum, adjacent property lines and ownership, drainage and flood control easements, **location of any channels and any existing or future access roads, distance between** proposed activity and navigation channel (when the proposed construction is near a commercially navigable body of water), designated floodway limit, floodplain limit, **specifications and dimensions of any proposed channel modifications**, location and orientation of cross-sections, north arrow, and a graphic or numerical scale;

iii. Cross-section views of the project and engineering study reach showing existing and proposed conditions including principal dimensions of the work as shown in plan view, existing and proposed elevations, normal water elevation, 10-year frequency flood elevation, 100-year frequency flood elevation, and graphic or numerical scales (horizontal and vertical);

iv. A soil erosion and sediment control plan for disturbed areas. This plan shall include a description of the sequence of grading activities and the temporary sediment and erosion control measures to be implemented to mitigate their effects. This plan shall also include a description of final stabilization and revegetation measures, and the identification of a responsible party to ensure post-construction maintenance.

v. A copy of the designated floodway map, marked to reflect any proposed change in the designated floodway location.

(m) Any and all other federal, state, and local permits or approval letters that may be required for this type of development.

(n) Engineering calculations and supporting data shall be submitted showing that the proposed work will meet the permit criteria of Section 802.0.

(o) If the designated floodway delineation, base flood or 100-year frequency flood elevation will change due to the proposed project, the application will not be considered complete until IDNR/OWR has indicated conditional approval of the designated floodway map change. No structures may be built until a Letter of Map Revision has been approved by FEMA.

prepared by the Northeastern Illinois Planning Commission requires the preparation and submittal of a series of plans which further document the conditions and provide for natural resources management. These include (1) a geologic and soil report, (2) a drainage control plan, (3) a site grading and excavation plan, and (4) a landscape plan. In some communities, the information included in these plans may be required through subdivision regulations or other existing ordinances. They were included in the Model Ordinance in order to insure a comprehensive approach to stream and wetland protection. Where communities have ordinance provisions which already require such information, it would not be necessary to require it through a stream and wetland protection ordinance. A stream and wetland protection ordinance, or a floodplain ordinance, may make reference to the other ordinances that deal with geology and soils, drainage, grading and excavation, and landscaping.

Assistance in administration of soil erosion and sedimentation control requirements is provided in "Model Soil Erosion and Sediment Control Ordinance: A Guide for Local Officials" September, 1991.

Floodway fill or channel modification activities often will require a permit from the U.S. Army Corps of Engineers if they constitute fill in "waters of the U.S."

(p) The application for a structure shall be accompanied by drawings of the site, drawn to scale showing property line dimensions and existing ground elevations and all changes in grade resulting from any proposed excavation or filling, and floodplain and floodway limits; sealed by a registered professional engineer, licensed architect or registered land surveyor; the location and dimensions of all buildings and additions to buildings; and the elevation of the lowest floor (including basement) of all proposed buildings subject to the requirements of Section 1000.0 of this Ordinance.

(q) If the proposed project involves a channel modification, the applicant shall submit the following information:

i. A discussion of the purpose of and need for the proposed work;

ii. A discussion of the feasibility of using alternative locations or methods (see 802.3(i).i.) to accomplish the purpose of the proposed work;

iii. An analysis of the extent and permanence of the impacts each feasible alternative identified in 802.3 (i).i. of this Section would have on the physical and biological conditions of the body of water affected; and

iv. An analysis of the impacts of the proposed project, considering cumulative effects on the physical and biological conditions of the body of water affected.

801.2 The _____ shall be responsible for obtaining from the applicant copies of all other federal, state, and local permits and approvals that may be required for this type of activity.

(a) The _____ shall not issue the development permit unless all required federal and state permits have been obtained.

(b) A Registered Professional Engineer, under the employ or contract of the (City, Village) shall review and approve applications reviewed under this Section.

802.0 Preventing Increased Damages and a List of Appropriate Uses.

802.1 The only development in a floodway which will be allowed are Appropriate Uses, which will not cause a rise in the base flood elevation, and which will not create a damaging or potentially damaging increase in flood heights or velocity or be a threat to public health and safety and ***welfare or impair the natural hydrologic and hydraulic functions of the floodway or channel, or permanently impair existing water quality or aquatic habitat. Construction impacts shall be minimized by appropriate mitigation methods as called for in this Ordinance.*** Only those Appropriate Uses listed in 92 Ill. Adm. Code Part 708 will be allowed. The approved Appropriate Uses are as follows:

(a) Flood control structures, dikes, dams and other public works or private improvements relating to the control of

Channel modifications are of particular concern because of their potential impacts on erosion, water quality and habitat, as well as flood height and velocity. Therefore, specific additional information is required to assess their impacts. The depth and extent of required impact analyses should be generally related to the severity of the proposed modification, the quality of the existing resource, and the length of channel affected. Certain activities involving fill in existing channels are also regulated by the U.S. Army Corps of Engineers, which requires its own assessment of environmental impacts. Review of such activities should be coordinated with the Corps.

List the title of the official responsible for administering the floodplain ordinance.

NFIP requirement: 44 CFR 60.3(a)(2).

NFIP requirement: 44 CFR 60.3(a)(4)(i), 60.3(c)(10) and 60.3(d)(3).

NIPC policy supports development in the floodway for only the following appropriate uses: public flood control projects, public recreation and open space uses, water dependent activities, and crossing roads and bridges. Recommended NIPC appropriate uses are listed in Alternative Section 802.1

Regrading or other modifications of the floodway for convenience of site design for private developments

drainage, flooding, erosion, or water quality or habitat for fish and wildlife.

(b) Structures or facilities relating to the use of, or requiring access to, the water or shoreline, such as pumping and treatment facilities, and facilities and improvements related to recreational boating, commercial shipping and other functionally water dependent uses;

(c) Storm and sanitary sewer relief outfalls;

(d) Underground and overhead utilities;

(e) Recreational facilities such as playing fields and trail systems, including any related fencing (at least 50 percent open when viewed from any one direction) built parallel to the direction of flood flows, and including open air pavilions and toilet facilities (4 stall maximum) that will not block flood flows nor reduce floodway storage

(f) Detached garages, storage sheds, or other non-habitable accessory structures that will not block flood flows nor reduce floodway storage;

(g) Bridges, culverts, roadways, sidewalks, railways, runways and taxiways and any modification thereto;

(h) Parking lots built at or below existing grade where either:

are not considered by NIPC to be appropriate uses of the floodway. Private flood control structures are considered appropriate uses if they are supported by the local government entity and if they reduce flood damages to existing structures both on and off site (i.e., if there are “regional” benefits).

NIPC policy does not consider the location of new treatment facilities and unnecessary pumping facilities in the floodway as appropriate unless such facility requires access to the water or shoreline. While wastewater treatment plants have traditionally been located along watercourses, often in the floodway, experience has indicated that such locations may be inappropriate. Facilities have been severely damaged by recent floods and disrupted plant operations have resulted in degraded water quality which, in turn, has resulted in increased flood damages. Floodproofing has been only partially successful in protecting facilities from severe floods. Other water dependent, treatment-related facilities, such as instream aeration, siphons, debris booms, etc., are considered appropriate uses as long as they are designed and operated so as to minimize negative impacts on the natural functions of the floodway and stream channels.

IDNR/OWR has determined that a small toilet facility for a park building would be appropriate because the use of floodways as parks or other open spaces should be encouraged.

NIPC policy discourages the inclusion of small toilet facilities as an appropriate use of the floodway. Such facilities could impede flood flows and/or contribute to water quality contamination. If such facilities are necessary, they should be located outside the floodplain, or at least in the flood fringe.

NIPC policy does not consider detached garages, storage sheds, or other accessory structures appropriate in the floodway. Although small, non-habitable structures may not be a large source of flood damages, they can impede flood flows and may impose a debris hazard in areas of high flow velocity.

Garages, storage sheds and other non-habitable accessory structures may be allowed if they are in the hydraulic shadow of an existing building and are designed to be wet floodproofed, or if the floodway has been excavated for conveyance and storage.

NIPC policy does not consider the placement of unnecessary impervious surfaces in the floodway as appropriate. Roadways, railways, and sidewalks necessary for conveyance over a channel, and associated bridges and culverts are considered

i. The depth of flooding at the 100-year frequency flood event will not exceed 1.0 foot; or

ii. The applicant of a short-term recreational use facility parking lot, formally agrees to restrict access during overbank flooding events and accepts liability for all damage caused by vehicular access during all overbank flooding events.

(i) Designated floodway regrading, without fill, to create a positive non-erosive slope toward a watercourse.

(j) Floodproofing activities to protect previously existing lawful structures including the construction of water tight window wells, elevating structures, or construction of floodwalls around residential, commercial or industrial principal structures where the outside toe of the floodwall shall be no more than ten (10) feet away from the exterior wall of the existing structure, and, which are not considered substantial improvements to the structure.

(k) The replacement, reconstruction, or repair of a damaged building, provided that the outside dimensions are not increased, and if the building was damaged to 50 percent or more of the market value before the damage occurred, the building will be protected from flooding to the flood protection elevation.

(l) Modifications to an existing building that would not increase the enclosed floor area of the building below the 100-year frequency flood elevation, and which will not block flood flows including but not limited to, fireplaces, bay windows, decks, patios, and second story additions. If the building improved to 50 percent or more of the market value before the modification occurred, the building will be protected from flooding to the flood protection elevation.

appropriate uses. Uses such as roadways parallel to a watercourse, taxiways and parking lots are not considered necessary or appropriate in the floodway. Impervious surfaces in the floodway may increase conveyance as well as reduce the absorption and recharge of storm and flood water. Such uses may increase the potential for vehicular flood damages and traffic disruptions.

NIPC further discourages short-term recreational use facility parking lots, particularly since this provision does not restrict the depth of flooding. In addition to the concerns previously stated regarding increased flood damage liability and impairment of natural functions, there is the concern that it will sometimes be impossible to accurately predict when flooding will occur and, correspondingly, it may be difficult to ensure that vehicles will be removed in a timely fashion.

NIPC policy does not consider the unnecessary regrading of a floodway to improve drainage as appropriate. Undrained, depressional areas in a floodway function to retain floodwaters after a flood has passed, discharging it slowly to the channel or recharging groundwater. Floodway regrading to improve drainage when necessary to achieve a valid public purpose, can be considered an appropriate use.

NIPC policy discourages the replacement, repair, or reconstruction of a substantially damaged (damages exceeding 50 percent of the market value) building in the floodway. Prohibiting repairs, etc. on substantially damaged buildings will result in long-term reductions in damage liability, reduced needs for emergency response, and increased incentives for buyouts of high-risk properties. To minimize financial hardships to existing property owners, it is recommended that federal, state, and/or local measures be implemented to compensate property owners for the dollar difference between the amount they are compensated for their property (i.e., insurance and/or buyouts) and its fair market value.

802.1 Alternative

(a) Public flood control structures, dikes, dams and other public works or private improvements relating to the control of drainage, flooding of existing structures, erosion, or water quality or habitat for fish and wildlife.

(b) Structures or facilities relating to the use of, or requiring access to, the water or shoreline, such as instream aeration and similar treatment facilities, facilities and improvements related to recreational boating, and commercial shipping and other functionally water dependent uses;

(c) Storm and sanitary sewer outfalls;

(d) Underground and overhead utilities;

(e) Public open space and recreational facilities such as playing fields and trail systems including any related fencing (at least 50 percent open when viewed from any one direction) built parallel to the direction of flood flows, and including open air pavilions;

(f) Bridges, culverts, and associated roadways, sidewalks, and railways, necessary for crossing over the floodway or for providing access to other appropriate uses in the floodway and any modification thereto;

(g) Flood proofing activities to protect previously existing lawful structures including the construction of water tight window wells, elevating structures, or construction of floodwalls around residential, commercial or industrial principal structures where the outside toe of the floodwall shall be no more than ten (10) feet away from the exterior wall of the existing structure, and, which are not considered substantial improvements to the structure.

(h) In the case of damaged or replacement buildings, reconstruction or repairs made to a building that are valued at less than 50 percent of the market value of the building before it was damaged or replaced, and which does not increase the outside dimensions of the building.

802.2 Appropriate uses do not include the construction or placement of any new structures, fill, building additions, buildings on stilts, *excavation or channel modifications done to accommodate otherwise non-appropriate uses in the floodway*, fencing (including landscaping or planting designed to act as a fence) and storage of materials except as specifically defined above as an Appropriate Use.

802.3 Within the designated floodway as identified on the floodway maps designated by IDNR/OWR, the construction of an Appropriate Use, will be considered permissible provided that the proposed project meets the following engineering and mitigation criteria and is so stated in writing with supporting plans, calculations and data by a registered professional engineer and provided that any structure meets the protection requirements of Section 1000.0 of this Ordinance:

This "Alternative" section lists NIPC recommended appropriate uses which are more restrictive than the appropriate uses allowed by State rules. In particular, uses such as pumping and treatment facilities, garages and sheds, roadways running longitudinally along a watercourse, and parking lots are not considered appropriate because of concerns that they will increase flood damages, interfere with natural functions of floodways, and/or impair water quality and habitat.

State law allows local regulations that are more restrictive than state requirements if they are reasonable. Local governments choosing to adopt the NIPC definition of appropriate uses are encouraged to back up their regulations with a planning process which supports and endorses the broad purposes of this Ordinance, and to document any problems which it has experienced with non-appropriate floodway development activities.

If the NIPC Alternative Section 802.1 is adopted, Section 802.1 should not be included.

(a) Preservation of Flood Conveyance, so as Not to Increase Flood Stages Upstream. For appropriate uses other than bridge or culvert crossings, on-stream structures or dams, all effective designated floodway conveyance lost due to the project will be replaced for all flood events up to and including the 100-year frequency flood. In calculating effective designated floodway conveyance, the following factors shall be taken into consideration:

i. Designated floodway conveyance,

$$"K" = (1.486/n)(AR^{2/3})$$

where "n" is Manning's roughness factor, "A" is the effective flow area of the cross-section, and "R" is the ratio of the area to the wetted perimeter. (See Open Channel Hydraulics, Ven Te Chow, 1959, McGraw-Hill Book Company, New York)

ii. The same Manning's "n" value shall be used for both existing and proposed conditions unless a recorded maintenance agreement with a federal, state, or local unit of government can assure the proposed conditions will be maintained or the land cover is changing from a vegetative to a non-vegetative land cover.

iii. Transition sections shall be provided and used in calculations of effective designated floodway conveyance. The following expansion and contraction ratios shall be used unless an applicant's engineer can prove to IDNR/OWR through engineering calculations or model tests that more abrupt transitions may be used with the same efficiency:

(1) When water is flowing from a narrow section to a wider section, the water should be assumed to expand no faster than at a rate of one foot horizontal for every four feet of the flooded stream's length.

(2) When water is flowing from a wide section to a narrow section, the water should be assumed to contract no faster than at a rate of one foot horizontal for every one foot of the flooded stream's length.

(3) When expanding or contracting flows in a vertical direction, a minimum of one foot vertical transition for every ten feet of stream length shall be used.

(4) Transition sections shall be provided between cross-sections with rapid expansions and contractions and when meeting the designated floodway delineation on adjacent properties.

(5) All cross-sections used in the calculations shall be located perpendicular to flood flows.

(b) Preservation of Floodway Storage so as Not to Increase

Any increase in stage associated with construction in the floodway is contrary to NIPC policy, unless the increase in stage is associated with a necessary public flood control project and there is no increase in off-site flood damages.

For communities without sophisticated word processing software, the formula can also be written as:

$$"K" = (1.486/n)*(A*(R^{0.667}))$$

For certain proposed activities, the floodway roughness may be increased by the activity. An example is a habitat restoration project. In these instances, the same Manning's "n" value should not be used for existing and proposed conditions. In general, floodway roughness should not be reduced by a proposed activity, unless the activity is a public flood control project designed to increase conveyance. Substantial reductions in roughness associated with, for example, changing from a vegetative to a non-vegetative land cover, are not supported by NIPC policy. Proposed activities which rely on continued future maintenance (e.g., mowing) to maintain a low roughness coefficient also are discouraged.

Floodway modification, particularly channel modification, should provide smooth transitions for flowing water to avoid unstable conditions or substantial head losses. It is recommended that neither contractions or expansions occur at a rate greater than one foot horizontal for every four feet of the flooded stream's length. Chow in "Open-Channel Hydraulics" states that the optimum maximum angle between the channel axis and a line connecting the channel sides is 12.5 degrees, which is approximately equal to 1 to 4.

Downstream Flooding.

i. Compensatory storage shall be provided for any designated floodway storage lost due to the proposed work from the volume of fill or structures placed and the impact of any related flood control projects.

ii. Compensatory storage for fill or structures shall be equal to at least **1.5 times** the volume of floodplain storage lost.

iii. Artificially created storage lost due to a reduction in head loss behind a bridge shall not be required to be replaced.

iv. The compensatory designated floodway storage shall be placed between the proposed normal water elevation and the proposed 100-year flood elevation. All designated floodway storage lost below the existing 10-year flood elevation shall be replaced below the proposed 10-year flood elevation. All designated floodway storage lost above the existing 10-year flood elevation shall be replaced above the proposed 10-year flood elevation. All such excavations shall be constructed to drain freely and openly to the watercourse.

v. If the compensatory storage will not be placed at the location of the proposed construction, the applicant's engineer shall demonstrate to IDNR/OWR through a determination of flood discharges and water surface elevations that the compensatory storage is hydraulically equivalent.

vi. There shall be no reduction in floodway surface area as a result of a floodway modification, unless such modification is necessary to reduce flooding at existing structure.

(c) Preservation of Floodway Velocities so as Not to Increase Stream Erosion or Flood Heights.

i. For all Appropriate Uses, except bridges or culverts or on stream structures, the proposed work will not result in an increase in the average channel or designated floodway velocities **or stage for all flood events up to and including the 100-year frequency event.**

ii. In the case of bridges or culverts or on stream structures built for the purpose of backing up water in the stream during normal or flood flows, velocities may be increased at the structure site if scour, erosion and sedimentation will be avoided by the use of rip-rap or other design measures.

(d) Construction of New Bridges or Culvert Crossings and Roadway Approaches.

i. The proposed structure shall not result in an increase

Compensatory Storage: NIPC policy supports the requirement for a safety factor for compensatory storage equal to at least 1.5 times the volume of storage lost due to fill or structures. This safety factor is intended to compensate for uncertainties in the estimate of the base flood elevation and in the determination of project impacts. NIPC policy also recommends that there be no reduction in existing floodway surface area. Any loss of upstream floodplain storage due to downstream conveyance improvements should be compensated with at least an equal volume of compensatory storage on the downstream site. As indicated in the commentary to 802.3(c), if reduced head loss is expected to increase downstream stages, downstream property owners should be notified of any changes to the Base Flood Elevation.

Artificially created storage is defined as that amount of water held or stored behind a bridge or culvert due to an opening which is too small to allow the passage of water without obstruction, during a base flood event.

Any increase in stage associated with construction in the floodway is contrary to NIPC policy, unless the increase in stage is associated with a necessary public flood control project and there is no increase in off-site flood damages.

Any increase in stage associated with construction in the floodway is contrary to NIPC policy, unless the increase in stage is associated with a necessary public flood control project and there is no increase in off-

of upstream flood stages greater than 0.1 foot when compared to the existing conditions for all flood events up to and including the 100-year frequency event; or the upstream flood stage increases will be contained within the channel banks (or within existing vertical extensions of the channel banks) such as within the design protection grade of existing levees or flood walls or within recorded flood easements.

ii. If the proposed construction will increase upstream flood stages greater than 0.1 feet, the developer must contact IDNR/OWR to obtain a permit for a dam or waiver.

(1) The engineering analysis of upstream flood stages must be calculated using the flood study flows, and corresponding flood elevations for tailwater conditions for the flood study specified in Section 600.0 of this Ordinance. Culverts must be analyzed using the U.S. DOT, FHWA Hydraulic Chart for the Selection of Highway Culverts. Bridges must be analyzed using the U.S. DOT/Federal Highway Administration Hydraulics of Bridge Waterways calculation procedures.

(2) Lost floodway storage must be compensated for per Section 802.3(b).

(3) Velocity increases must be mitigated per Section 802.3(c).

(4) If the crossing is proposed over a public water that is used for recreational or commercial navigation, an IDNR/OWR permit must be received.

(5) The hydraulic analysis for the backwater caused by the bridge showing the existing condition and proposed regulatory profile must be submitted to IDNR/OWR for concurrence that a CLOMR is not required by Section 802.0.

(6) All excavations for the construction of the crossing shall be designed per Section 802.3(h).

(e) Reconstruction or Modification of Existing Bridges, Culverts, and Approach Roads.

i. The bridge or culvert and roadway approach reconstruction or modification shall be constructed with no more than 0.1 foot increase in backwater over the existing flood profile for all flood frequencies up to and including the 100-year event, if the existing structure is not a source of flood damage.

ii. If the existing bridge or culvert and roadway approach is a source of flood damage to buildings or structures in the upstream floodplain, the applicant's engineer shall evaluate the feasibility of redesigning the structure to reduce the existing backwater, taking into consideration the effects on flood stages on upstream and downstream properties.

site flood damages.

If a bridge or culvert is modified to reduce existing backwater, it is likely that downstream flood stages will increase. While this section does not require mitigation for such an increase, downstream property owners should be notified of changes to the Base Flood Elevation, which might affect their flood prone status and their consideration of purchasing flood insurance.

iii. The determination as to whether or not the existing crossing is a source of flood damage and should be redesigned must be prepared in accordance with 92 Ill. Adm. Code Part 708 (Floodway Construction in Northeastern Illinois) and submitted to IDNR/OWR for review and concurrence before a permit is issued.

(f) On-Stream Structures Built for the Purpose of Backing Up Water.

i. Any increase in upstream flood stages greater than 0.0 foot when compared to the existing conditions, for all flood events up to and including the 100-year frequency event shall be contained within the channel banks (or within existing vertical extensions of the channel banks) such as within the design protection grade of existing levees or flood walls or within recorded flood easements.

ii. A permit or letter indicating a permit is not required must be obtained from IDNR/OWR for any structure built for the purpose of backing up water in the stream during normal or flood flow.

iii. All dams and impoundment structures as defined in Section 300.12 shall meet the permitting requirements of 92 Ill. Adm. Code Part 702 (Construction and Maintenance of Dams). *If the proposed activity involves a modification of the channel or floodway to accommodate an impoundment, it shall be demonstrated that:*

(1) The impoundment is determined to be in the public interest by providing flood control, public recreation, or regional stormwater detention;

(2) The impoundment will not prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, such as for spawning;

(3) The impoundment will not cause or contribute to degraded water quality or habitat conditions. Impoundment design should include gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin.

(4) A nonpoint source control plan has been implemented in the upstream watershed to control the effects of sediment runoff as well as minimize the input of nutrients, oil and grease, metals, and other pollutants. If there is more than one municipality in the upstream watershed, the municipality in which the impoundment is constructed should coordinate with upstream municipalities to ensure comprehensive watershed control;

(5) The project otherwise complies with the requirements of Section 800.0.

Impoundment of streams is often undesirable, for several reasons. Impoundments create quiescent conditions which may be conducive to depressed dissolved oxygen levels, the accumulation of polluted sediments and nutrient regeneration, and the proliferation of excessive plant and algae growth. Dams on streams may prevent the upstream migration of fish. In general, these concerns are most significant when permanent pools are constructed on larger streams (i.e. with watersheds larger than one or two square miles), or where nutrient-rich discharges, such as point sources are present. Use of on-stream impoundments for stormwater retention, without upstream nonpoint source pollutant controls, utilizes the stream for pollutant removal but may impair potential recreational and aquatic habitat uses of the impoundment. Impoundments without permanent low-flow pools are preferred except where a permanent pool is necessary to achieve the intended benefits of the impoundment (e.g. recreation or water quality mitigation). Design of such permanent pools should include criteria which will minimize the deleterious effects discussed above.

(g) Flood Proofing of Existing Habitable, Residential and Commercial Structures.

i. If construction is required beyond the outside dimensions of the existing building, the outside perimeter of the floodproofing construction shall be placed no further than 10 feet from the outside of the building.

ii. Compensation of lost storage and conveyance will not be required for floodproofing activities.

(h) Excavation in the Floodway.

i. When excavation is proposed in the design of bridges and culvert openings, including the modifications to and replacement of existing bridge and culvert structures, or to compensate for lost conveyance or other Appropriate Uses, transition sections shall be provided for the excavation.

ii. The following expansion and contraction ratios shall be used unless an applicant's engineer can prove to IDNR/OWR through engineering calculations or model tests that more abrupt transitions may be used with the same efficiency:

(1) When water is flowing from a narrow section to a wider section, the water should be assumed to expand no faster than at a rate of one foot horizontal for every four feet of the flooded stream's length;

(2) When water is flowing from a wide section to a narrow section, the water should be assumed to contract no faster than at a rate of one foot horizontal for every one foot of the flooded stream's length; and

(3) When expanding or contracting flows in a vertical direction, a minimum of one foot vertical transition for every ten feet of stream length shall be used.

(4) Erosion/scour protection shall be provided inland upstream and downstream of the transition sections.

(i) If the proposed activity involves a channel modification, it shall be demonstrated that:

i. There are no practicable alternatives to the activity which would accomplish its purpose with less impact to the natural conditions of the body of water affected. Possible alternatives include levees, bank stabilization, flood proofing of existing structures, removal of structures from the floodplain, clearing the channel, high flow channel, or the establishment of a stream side buffer strip or green belt. Channel modification is acceptable if the purpose is to restore natural conditions and improve water quality and fish and wildlife habitat;

Channel modifications are particularly sensitive activities because of their potential direct impacts on channel stability, conveyance, water quality, habitat, and aesthetics. In general, watercourse modifications should be avoided unless necessary to achieve the purposes of an appropriate use, such as habitat restoration or a public flood control project. Channel modifications should not be permitted if the purpose is to accommodate private development activities in the floodplain. Rigorous enforcement of mitigation requirements for necessary modifications can eliminate some of the temporary and most of the permanent impacts of modification. Some suggested references which discuss mitigation measures are: "Manual of Conservation Engineering Guidelines," Illinois Department of Conservation, 1983;

ii. *Water quality, habitat, and other natural functions would be significantly improved by the modification and no significant habitat area may be destroyed, or the impacts are offset by the replacement of an equivalent degree of natural resource values;*

iii. *The activity has been planned and designed and will be constructed in a way which will minimize its adverse impacts on the natural conditions of the body of water affected, consistent with the following criteria:*

(1) The physical characteristics of the modified channel shall match as closely as possible those of the existing channel in length, cross-section, slope and sinuosity. If the existing channel has been previously modified, restoration of more natural physical conditions should be incorporated into channel modification design, where practical.

(2) Hydraulically effective transitions shall be provided at both the upstream and downstream ends of the project, designed such that they will prevent erosion.

(3) One-sided construction of a channel shall be used when feasible. Removal of streamside (riparian) vegetation should be limited to one side of the channel, where possible, to preserve the shading and stabilization effects of the vegetation.

(4) Clearing of stabilizing vegetation shall be limited to that which is essential for construction of the channel.

(5) Channel banks shall be constructed with a side slope no steeper than 3:1 horizontal to vertical, wherever practicable. Native vegetation and gradual side slopes are the preferred methods for bank stabilization. Where high velocities or sharp bends necessitate the use of alternative stabilization measures, soil bioengineering techniques, natural rock or rip-rap are preferred approaches. Artificial materials such as concrete, gabions, or construction rubble should be avoided unless there are no practicable alternatives.

(6) All disturbed areas associated with the modification shall be seeded or otherwise stabilized as soon as possible upon completion of construction. Erosion blanket or an equivalent material shall be required to stabilize disturbed channel banks prior to establishment of the vegetative cover.

(7) If the existing channel contains considerable bottom diversity such as deep pools, riffles, and other similar features, such features shall be provided in the new channel. Spawning and nesting areas and flow characteristics compatible with fish habitat

“Mitigating the Impacts of Stream Alterations,” U.S. Army Corps of Engineers, Nashville (undated); and “Best Management Practices for Hydrologic Modification Projects,” Illinois Environmental Protection Agency (undated). Additional assistance is available from the Office of Resource Conservation, IDNR (Phone: (217) 785-8287).

For public flood control projects or water dependent activities, steeper side slopes may be unavoidable, due to limited land availability or conveyance factors. Where practicable, steep side slopes and artificial stabilization materials should be avoided.

Soil bioengineering techniques combine engineering principles and, in some cases, manufactured materials, with the use of native vegetation to accomplish effective, environmentally sensitive control of bank erosion. A number of bioengineering techniques, including lunger structures, A-jacks, coconut fiber rolls, and brush layering, have been successfully installed in northeastern Illinois channels in recent years. Advice on appropriate native vegetation can be found in the “Streambank Stabilization Program” report produced by the DuPage County Department of Environmental Concerns (DCDEC, 1995).

shall also be established, where appropriate.

(8) *A sediment basin shall be installed at the downstream end of the modification to reduce sedimentation and degradation of downstream water quality.*

(9) *New or relocated channels should be built in the dry and all items of construction, including vegetation, should be completed prior to diversion of water into the new channel.*

(10) *There shall be no increases in stage or velocity as the channel enters or leaves the project site for any frequency flood unless necessitated by a public flood control project or unless such an increase is justified as part of a habitat improvement or erosion control project.*

(11) *Unless the modification is for a public flood control project, there shall be no reduction in the volume of floodwater storage outside the floodway as a result of the modification; and*

iv. The project otherwise complies with the requirements of Section 800.0

(j) Seeding and Stabilization Plan.

For all activities located in a floodway, a seeding and stabilization plan shall be submitted by the applicant.

(k) *Soil Erosion and Sedimentation Measures.*
For all activities in the floodway, including grading, filling, and excavation, in which there is potential for erosion of exposed soil, soil erosion and sedimentation control measures shall be employed consistent with the following criteria:

i. The construction area shall be minimized to preserve the maximum vegetation possible. Construction shall be scheduled to minimize the time soil is exposed and unprotected. In no case shall the existing natural vegetation be destroyed, removed, or disturbed more than 15 days prior to the initiation of improvements.

ii. Temporary and/or permanent soil stabilization shall be applied to denuded areas as soon as possible. As a minimum, soil stabilization shall be provided within 15 days after final grade is reached on any portion of the site, and within 15 days to denuded areas which may not be at final grade but will remain undisturbed for longer than 60 days.

iii. Sedimentation control measures shall be installed before any significant grading or filling is initiated on the site to prevent the movement of eroded sediments off site or into the channel. Potential sediment control devices include filter fences, straw bale fences, check dams, diversion ditches, and sediment traps and basins.

Soil erosion and sedimentation control are critical mitigation requirements for floodway construction activities because of the proximity of these activities to channels and their potential for inundation. Lack of proper controls can lead to sediment runoff into channels and unstable soil conditions. These, in turn, can result in loss of downstream flood storage, impaired water quality and habitat, and increased demands on taxpayers to mitigate problems such as channel erosion. In addition to the indicated references, it is suggested that the following NIPC document be consulted: "Model Soil Erosion and Sediment Control Ordinance: A Guide for Local Officials" September, 1991.

iv. A vegetated buffer strip of at least 25 feet in width shall be preserved and/or re-established, where possible, along existing channels (See 802.3 (p)). Construction vehicle use of channels shall be minimized. Temporary stream crossings shall be constructed, where necessary, to minimize erosion. Necessary construction in or along channels shall be restabilized immediately.

v. Soil erosion and sedimentation control measures shall be designed and implemented consistent with "Procedures and Standards for Urban Soil Erosion and Sedimentation Control in Illinois" (1988) also known as the "Green Book" and "The Illinois Urban Manual" (NRCS, 1995).

(l) Public Flood Control Projects. For public flood control projects, the permitting requirements of this section will be considered met if the applicant can demonstrate to IDNR/OWR through hydraulic and hydrologic calculations that the proposed project will not singularly or cumulatively result in increased flood heights outside the project right-of-way or easements for all flood events up to and including the 100-year frequency event.

(m) General Criteria for Analysis of Flood Elevations.

i. The flood profiles, flows and floodway data in the designated floodway study, referenced in Section 600.0, must be used for analysis of the base conditions. If the study data appears to be in error or conditions have changed, IDNR/OWR shall be contacted for approval and concurrence on the appropriate base conditions data to use.

ii. If the 100-year designated floodway elevation at the site of the proposed construction is affected by backwater from a downstream receiving stream with a larger drainage area, the proposed construction shall be shown to meet:

(1) The requirements of this section for the 100-year frequency flood elevations of the designated floodway conditions; and,

(2) Conditions with the receiving stream at normal water elevations.

iii. If the applicant learns from IDNR/OWR, local governments, or a private owner that a downstream restrictive bridge or culvert is scheduled to be removed, reconstructed, modified, or a regional flood control project is scheduled to be built, removed, constructed or modified within the next five years, the proposed construction shall be analyzed and shown to meet the requirements of this section for both the existing conditions and the expected flood profile conditions when the bridge, culvert or flood control project is built.

(n) Conditional Letter of Map Revision.

i. If the Appropriate Use would result in a change in the

The "Green Book" is available through County Soil and Water Conservation District offices.

NIPC recommends that public flood control projects also meet the criteria of no offsite increase in velocities, unless such an increase is necessary to accomplish the purpose of the project. Any permitted increase in velocity shall not result in negative impacts offsite, such as erosive conditions. In addition, public flood control projects should be subject to the mitigation requirements of this section, including those dealing with sediment and erosion control, channel modifications and instream structures. In general, NIPC policy recommends the use of nonstructural methods for flood control wherever feasible. Modifications of the floodway for flood control should be the minimum necessary to accomplish the purpose of the project.

designated floodway location or the 100-year frequency flood elevation, the applicant shall submit to IDNR/OWR and FEMA all information, calculations and documents necessary to be issued a conditional designated floodway map revision and receive from IDNR/OWR a conditional concurrence of the designated floodway change before a permit is issued.

ii. The final designated floodway map will not be changed by FEMA until as-built plans or record drawings of initial filling, grading, dredging, or excavating activities are submitted and accepted by FEMA and IDNR/OWR.

iii. In the case of non-government projects, the municipality in incorporated areas and the county in unincorporated areas shall concur with the proposed conditional designated floodway map revision before IDNR/OWR approval can be given.

iv. No filling, grading, dredging or excavating shall take place until a conditional approval is issued.

v. After initial filling, grading, dredging or excavating, no activities shall take place until a final Letter of Map Revision (LOMR) is issued by FEMA with concurrence from IDNR/OWR.

(o) Professional Engineer's Supervision.

All engineering analyses shall be performed by or under the supervision of a registered professional engineer.

(p) For all activities in the floodway involving construction within 25 feet of the channel, the following criteria shall be met:

i. A natural vegetation buffer strip shall be preserved within at least 25 feet of the ordinary high water mark of the channel.

ii. Where it is impossible to protect this buffer strip during the construction of an Appropriate Use, a vegetated buffer strip shall be established upon completion of construction.

(q) After receipt of conditional approval of the designated floodway change and issuance of a permit and a Conditional Letter of Map Revision, construction as necessary to change the

The purpose of a vegetated buffer strip is to minimize erosion, stabilize the streambank, protect water quality, maintain water temperature at natural levels, preserve fish and wildlife habitat, to screen man-made structures, and also to preserve aesthetic values of the channel. While native riparian vegetation is preferred in the buffer strip, alternative vegetation is acceptable if it is consistent with these purposes. Urban areas present constraints which require consideration of local conditions including stream width, the potential need for public access, etc. Twenty-five feet is generally considered a minimum width for a buffer strip. On larger streams or in more natural settings, a wider buffer strip is recommended. The U.S. Department of Agriculture (USDA), through its Conservation Reserve Program, encourages farmers to create "water quality enhancement zones" along streams, wetlands and lakes. The USDA recommend that these "filter strips" extend 66 to 99 feet from stream banks. The Dane County (WI) Regional Planning Commission has made buffer strip recommendations based upon stream size and need for public access. Their recommended buffer widths range from 25 to 75 feet. Similarly, a number of northeastern Illinois communities and counties now require buffers ranging from 30 to 50 feet.

Modifications of the floodway are supported by NIPC policy only if the modification is for an appropriate use. A change in the regulatory floodway location or

floodway designation may proceed but no buildings or structures or other construction that is not an Appropriate Use may be placed in that area until the designated floodway map is changed and a final Letter of Map Revision is received. The designated floodway map will be revised upon acceptance and concurrence by IDNR/OWR and FEMA of the "as-built" plans.

802.4 Development Activities In Delegated Communities Requiring State Review.

For those projects listed below located in a designated floodway, the following criteria shall be submitted to IDNR/OWR for their review and concurrence prior to the issuance of a permit by a community or county delegated state permitting authority in the floodway.

- (a) An engineer's analysis of the flood profile due to a proposed bridge pursuant to Section 802.3(d).
- (b) An engineer's determination that an existing bridge or culvert crossing is not a source of flood damage and the analysis indicating the proposed flood profile, pursuant to Section 802.3(e).
- (c) Alternative transition sections and hydraulically equivalent storage pursuant to Section 802.3 (a, b, h).
- (d) The construction of any IDNR/OWR projects, dams (as defined in Section 300.12) and all other state, federal, or local units of government projects, including projects of the municipality or county.
- (e) An engineer's determination that a proposed bridge affected by backwater from a downstream receiving stream may be built with a smaller opening.
- (f) Projects which revise the floodway and/or flood profiles.
- (g) Projects in public bodies of water.

802.5 Other Permits.

- (a) In addition to the other requirements of this Ordinance, a development permit for a site located in a floodway shall not be issued unless the applicant first obtains a permit or written documentation that a permit is not required from IDNR/OWR, issued pursuant to 615 ILCS 5/5 et seq.
- (b) No permit from IDNR/OWR shall be required if IDNR/OWR has delegated this responsibility to the (City, Village).

802.6 Permits for Dams

the 100-year flood frequency elevation for any other use is not supported.

All construction activity in the floodway should be required to meet the construction and mitigation criteria outlined in this modification for other than appropriate uses. The minimum state requirements allow such modifications to facilitate development. If the adopted ordinance permits such modifications, they should be subject to the construction and mitigation requirements of this section.

This section may be deleted if a community has not been delegated state permitting authority in the designated floodway.

For information regarding delegation, contact the IDNR/OWR -Northeastern Illinois Regulatory Programs Section at (847) 705-4341.

Many activities in floodways will require a permit from the U.S. Army Corps of Engineers. In particular, the Corps regulates fill activities in "waters of the United States," which include most stream channels and wetlands. As a rule, a development permit should not be issued for a fill or related activity in the floodway until the applicant has received a permit or signoff from the Corps.

If IDNR/OWR has delegated its permitting authority in the floodway to the community, then only those development activities in Section 802.4 would still require permits from IDNR/OWR.

(a) Any work involving the construction, modification or removal of a dam as defined in Section 300.12 per 92 Ill. Adm. Code Part 702 (Rules for Construction of Dams) shall obtain an IDNR/OWR permit prior to the start of construction of a dam.

(b) If the _____ finds a dam that does not have an IDNR/OWR permit, the _____ shall immediately notify the IDNR/OWR Schaumburg office.

(c) If the _____ finds a dam which is believed to be in unsafe condition, the _____ shall immediately notify the owner of the dam, the IDNR/OWR Schaumburg office, and the Illinois Emergency Management Agency (IEMA).

802.7 Activities That Do Not Require a Registered Professional Engineer's Review.

The following activities may be permitted without a registered professional engineer's review. Such activities shall still meet the other requirements of this Ordinance, including the mitigation requirements.

(a) Underground and overhead utilities that:

i. Do not result in any increase in existing ground elevations, or

ii. Do not require the placement of above ground structures in the floodway, or

iii. In the case of underground stream crossings, the top of the pipe or encasement is buried a minimum of 3' below the existing streambed, and

iv. Overhead utility lines shall be constructed above the estimated 100-year frequency flood elevation or attached above the low chord of an existing bridge (with the permission of the bridge owner). No supporting towers shall be placed in the watercourse and shall be designed so as to not catch debris.

v. Disturbance of streamside vegetation shall be kept to minimum during construction to prevent erosion and sedimentation. All disturbed floodway areas, including the stream banks shall be restored to their original contours and seeded or otherwise stabilized upon completion of construction.

vi. A utility crossing carrying material which may cause water pollution as defined by the Environmental Protection Act 415 ILCS 5 (1992 State Bar Edition) shall be provided with shut-off valves on each side of the body of water to be crossed.

vii. All Illinois Commerce Commission, National Electric Safety Codes, and federal requirements for clearance must be met.

(b) Storm and sanitary sewer relief outfalls that:

i. Do not extend riverward or lakeward of the existing

List the title of the official responsible for administering the floodplain ordinance.

List the title of the official responsible for administering the floodplain ordinance.

Local governments are encouraged to evaluate these exemptions and delete any which, based on local experience, should be subject to a professional engineer's review.

adjacent natural bank slope, and

ii. Do not result in an increase in ground elevation,

iii. Are designed so as not to cause stream erosion at the outfall location.

(c) Construction of sidewalks, athletic fields (excluding fences), properly anchored playground equipment and patios at grade.

(d) Construction of shoreline and streambank protection that:

i. Does not exceed 1000 feet in length.

ii. Materials are not placed higher than the existing top of bank.

iii. Materials are placed so as not to reduce the cross-sectional area of the stream channel or bank of the lake.

iv. Stabilization utilizing native vegetation and gradual side slopes are the preferred mitigation methods for existing erosion problems. Where high channel velocities, sharp bends or wave action necessitate the use of alternative stabilization measures, soil bioengineering techniques, natural rock or rip-rap are preferred materials. Artificial materials such as concrete, construction rubble, and gabions should be avoided unless there are no practicable alternatives.

(e) Temporary stream crossings in which:

i. The approach roads will be 1/2 foot or less above natural grade.

ii. The crossing will allow stream flow to pass without backing up the water above the stream bank vegetation line or above any drainage tile or outfall invert.

iii. The top of the roadway fill in the channel will be at least 2' below the top of the lowest bank. ***Any fill in the channel shall be non-erosive material, such as rip-rap or gravel.***

iv. All disturbed stream banks will be seeded or otherwise stabilized as soon as possible upon installation and again upon removal of construction.

v. The access road and temporary crossings will be removed within one year after authorization.

Stabilization activities involving 1000 feet or less of shoreline or streambank, and which utilize vegetative or soil bioengineering techniques, need not be subject to the review of a registered professional engineer. However, "artificial" methods, such as concrete lining or gabions, which are likely to increase conveyance and potentially exacerbate erosion and/or flooding, downstream, should be subject to the review of a registered professional engineer

Section 900.0 Occupation and Use of SFHA Areas Where Floodways Are Not Identified.

In SFHA or floodplains, (including AE, AH, AO and Unnumbered A Zones) where no floodways have been identified and no base flood or 100-year frequency flood elevations have been established by FEMA, and draining more than a square mile, no development shall be permitted unless the cumulative effect of the proposals, when combined with all other existing and anticipated uses and structures, shall not significantly impede or increase the flow and passage of the floodwaters nor significantly increase the base flood or 100-year frequency flood elevation.

901.0 Development Permit.

901.1 No person, firm, corporation, or governmental body, not exempted by state law, shall commence any development in a SFHA or floodplain without first obtaining a development permit from the _____.

901.2 Application for a development permit shall be made on a form provided by the _____ .

(a) The application shall be accompanied by drawings of the site, drawn to scale showing property line dimensions; and existing grade elevations and all changes in grade resulting from excavation or filling, sealed by a licensed engineer, architect or surveyor; the location and dimensions of all buildings and additions to buildings; and the elevations of the lowest floor (including basement) of all proposed buildings subject to the requirements of Section 1000.0 of this Ordinance.

(b) The application for a development permit shall also include the following information:

- i. A detailed description of the proposed activity, its purpose, and intended use;
- ii. Site location (including legal description) of the property, drawn to scale, on the designated floodway maps, indicating whether it is proposed to be in an incorporated or unincorporated area;
- iii. Anticipated dates of initiation and completion of activity;
- iv. Plans of the proposed activity shall be provided which include as a minimum:

This section explains the procedures for determining whether a parcel is in a floodplain, where no detailed analysis has been completed; and how to determine whether development would be allowed. It also sets minimum development standards within the zone.

Floodways Not Identified: The floodways of a substantial number of urban channels in northeastern Illinois have not been identified on regulatory maps. It is recommended that these areas be regulated in a conservative manner by defining an interim floodway as part of the permit process for any proposed construction in this area. This section already requires that the applicant delineate the floodway under existing and proposed conditions. If this interim delineation indicates that the proposed activity is in the floodway, then the activity should be subject to the requirements of Section 800.0. In particular, only appropriate uses would be permitted and all activities would be subject to the construction and mitigation criteria. Activities in floodplain areas outside the delineated floodway would be subject to the flood fringe requirements of Section 700.0.

NFIP requirement: 44 CFR 60.3(b)(1).

List the title of the official responsible for administering the floodplain ordinance.

List the title of the official responsible for administering the floodplain ordinance.

Required plans should include a delineation of the floodway for both the existing and proposed

(1) A vicinity map showing the site of the activity, name of the waterway, boundary lines, names of roads in the vicinity of the site, graphic or numerical scale, and north arrow;

(2) A plan view of the project and engineering study reach showing existing and proposed conditions including principal dimensions of the structure or work, elevations in mean sea level (1929 adjustment) datum or N.G.V.D., adjacent property lines and ownership, drainage and flood control easements, distance between proposed activity and navigation channel (when the proposed construction is in or near a commercially navigable body of water), floodplain limit, location and orientation of cross-sections, north arrow, and a graphical or numerical scale;

(3) Cross-section views of the project perpendicular to the flow of floodwater and engineering study reach showing existing and proposed conditions including principal dimensions of the work as shown in plan view, existing and proposed elevations, normal water elevation, 10-year frequency flood elevation, 100-year frequency flood elevation, and graphical or numerical scales (horizontal and vertical); and

(4) A soil erosion and sedimentation control plan for disturbed areas. This plan shall include a description of the sequence of grading activities and the temporary sediment and erosion control measures to be implemented to mitigate their effects. This plan shall also include a description of final stabilization and revegetation measures, and the identification of a responsible party to ensure post-construction maintenance.

(c) Engineering calculations and supporting data shall be submitted showing that the proposed work will meet the criteria of Section 902.0.

(d) Any and all other federal, state, and local permits or approvals that may be required for this type of development.

901.3 Based on the best available existing data according to the Illinois State Water Survey's Floodplain Information Repository, the _____ shall compare the elevation of the site to the base flood or 100-year frequency flood elevation.

(a) Should no elevation information exist for the site, the developer's engineer shall calculate the elevation according to Section 604.0.

(b) Any development located on land that can be shown to have been higher than the base flood elevation of the current Flood Insurance Rate Map Identification is not in the SFHA and, therefore, not subject to the requirements of this Ordinance.

conditions. This floodway delineation, made by the applicant, should be consistent with the requirements of Section 600.0, Base Flood Elevation and Section 300.13, definition of the Designated Floodway. Floodplain and floodway delineations should be based on anticipated future watershed land use conditions (see Section 604.2). This delineation should be verified and approved by IDNR/OWR.

List the title of the official responsible for administering the floodplain ordinance.

Such a project will still be subject to the flood insurance purchase requirements unless the owner appeals to amend the FIRM.

(c) The Building Official shall maintain documentation of the existing ground elevation at the development site and certification that this ground elevation existed prior to the date of the site's first Flood Insurance Rate Map identification.

901.4 The _____ shall be responsible for obtaining from the applicant copies of all other federal, state, and local permits, approvals or permit-not-required letters that may be required for this type of activity. The _____ shall not issue the development permit unless all required federal, state, and local permits have been obtained.

902.0 Preventing Increased Damages.

902.1 No development in the SFHA, where a floodway has not been determined shall create a damaging or potentially damaging increase in flood heights or velocity or threat to public health, safety *and welfare or impair the natural hydrologic and hydraulic functions of the floodway or channel, or impair existing water quality or aquatic habitat. Construction impacts shall be minimized by appropriate mitigation methods as called for in this Ordinance.*

902.2 Within all riverine SFHA's where the floodway has not been determined, the following standards shall apply:

(a) The developer shall have a Registered Professional Engineer state in writing and show through supporting plans, calculations, and data that the project meets the engineering requirements of Section 802.3 (a) through (l) for the entire floodplain as calculated under the provisions of Section 604.0 of this Ordinance.

i. As an alternative, the developer should have an engineering study performed to determine a floodway and submit that engineering study to IDNR/OWR for acceptance as a designated floodway.

ii Upon acceptance of the floodway by IDNR/OWR, the developer shall then demonstrate that the project meets the requirements of Section 800.0 for the designated floodway. The floodway shall be defined according to the definition in Section 300.13 of this Ordinance.

(b) A development permit shall not be issued unless the applicant first obtains a permit from IDNR/OWR or written documentation that a permit is not required from IDNR/OWR.

(c) No permit from IDNR/OWR shall be required if IDNR/OWR has delegated permit responsibility to the (City, Village) per 92 Ill. Adm. Code Part, Part 708 for designated floodways.

(d) Permits for Dams

i. Any work involving the construction, modification or removal of a dam as defined in Section 300.12 per 92 Ill. Adm. Code Part 702 (Rules for Construction of Dams) shall obtain an IDNR/OWR permit prior to the start of construction of a dam.

ii. If the _____ finds a dam that does not have an

NFIP requirement: 44 CFR 60.3(a)(2).

List the title of the official responsible for administering the floodplain ordinance.

NFIP requirement: 44 CFR 60.3(a)(4)(i), 60.3(c)(10) and 60.3(d)(3).

Within all SFHA's where a regulatory floodway has not been defined, it is recommended that an interim floodway be defined by the applicant for purposes of this Ordinance. This interim floodway would be subject to the appropriate use, engineering and mitigation requirements of Section 800.0. A suggested interim floodway determination approach was discussed in the commentary to Section 900.0 above. As a minimum, all channels with the SFHA should be considered floodways for purposes of this Ordinance.

List the title of the official responsible for administering

IDNR/OWR permit, the _____ shall immediately notify the IDNR/OWR Schaumburg office.

iii. If the _____ finds a dam which is believed to be in unsafe condition, the _____ shall immediately notify the owner of the dam, the IDNR/OWR Schaumburg office, and the Illinois Emergency Management Agency (IEMA).

902.3 The following activities may be permitted without a Registered Professional Engineer's review or calculation of a base flood elevation and designated floodway. Such activities shall still meet the other requirements of this Ordinance:

(a) Underground and overhead utilities that:

i. Do not result in any increase in existing ground elevations, or

ii. Do not require the placement of above ground structures in the floodway, or

iii. In the case of underground stream crossings, the top of the pipe or encasement is buried a minimum of 3' below the existing streambed, and

iv. Overhead utility lines shall be constructed above the estimated 100-year frequency flood elevation or attached above the low chord of an existing bridge (with the permission of the bridge owner). No supporting towers shall be placed in the watercourse and shall be designed so as to not catch debris.

v. Disturbance of streamside vegetation shall be kept to minimum during construction to prevent erosion and sedimentation.

vi. A utility crossing carrying material which may cause water pollution as defined by the Environmental Protection Act 415 ILCS 5 (1992 State Bar Edition) shall be provided with shut-off valves on each side of the body of water to be crossed.

vii. All Illinois Commerce Commission, National Electric Safety Codes, and federal requirements for clearance must be met.

(b) Storm and sanitary sewer relief outfalls that:

i. Do not extend riverward or lakeward of the existing adjacent natural bank slope, and

ii. Do not result in an increase in ground elevation, and

iii. Are designed so as not to cause stream erosion at the outfall location.

(c) Construction of shoreline and streambank protection that:

i. Does not exceed 1000 feet in length.

the floodplain ordinance.

Use of artificial shoreline and streambank materials for the convenience of site design for private developments is not supported. Construction activities

- ii. Materials are not placed higher than the existing top of bank.
- iii. Materials are placed so as not to reduce the cross-sectional area of the stream channel by more than 10 percent.

iv. Stabilization utilizing native vegetation and gradual side slopes are the preferred mitigation methods for existing erosion problems. Where high channel velocities, sharp bends or wave action necessitate the use of alternative stabilization measures, soil bioengineering techniques, natural rock or rip-rap are preferred materials. Artificial materials such as concrete, construction rubble, and gabions should be avoided unless there are no practicable alternatives.

(d) Temporary stream crossings in which:

- i. The approach roads will be 1/2 foot or less above natural grade.
- ii. The crossing will allow stream flow to pass without backing up the water above the stream bank vegetation line or above any drainage tile or outfall invert.
- iii. The top of the roadway fill in the channel will be at least 2' below the top of the lowest bank. ***Any fill in the channel shall be non-erosive material, such as rip-rap or gravel.***
- iv. All disturbed stream banks will be seeded or otherwise stabilized as soon as possible upon installation and again upon removal of construction.
- v. The access road and temporary crossings will be removed within one year after authorization.

(e) The construction of light poles, sign posts and similar structures;

(f) The construction of sidewalks, driveways, athletic fields (excluding fences), patios and similar surfaces which are built at grade;

(g) The construction of properly anchored, unwalled, open structures such as playground equipment, pavilions, and carports built at or below existing grade that would not obstruct the flow of flood waters;

(h) The placement of properly anchored buildings not exceeding seventy (70) square feet in size, nor ten (10) feet in any one dimension (e.g., animal shelters and tool sheds);

(i) The construction of additions to existing buildings which do not increase the first floor area by more than twenty (20) percent, which are located on the upstream or downstream side of the existing building, and which do extend beyond the sides of the existing building that are parallel to the flow of flood waters;

involving 1000 feet of shoreline or streambank are not minor and should be subject to the review of a registered professional engineer. NIPC recommends there be no reduction in the cross-sectional area of the channel

NIPC policy discourages the building of any unnecessary private buildings in the floodway.

NIPC policy discourages the building of any unnecessary private buildings in the floodway.

(j) Minor maintenance dredging of a stream channel where:

- i The affected length of stream is less than 1000 feet.
- ii. The work is confined to reestablishing flows in natural stream channels, or
- iii. The cross-sectional area of the dredged channel conforms to that of the natural channel upstream and downstream of the site.

902.4 The flood carrying capacity within any altered or relocated watercourse shall be maintained.

902.5 Compensatory Storage.

(a) Whenever any portion of a floodplain is authorized for use, the volume of space which will be occupied by the authorized fill or structure below the base flood or 100-year frequency flood elevation shall be compensated for and balanced by a hydraulically equivalent volume of excavation taken from below the base flood or 100-year frequency flood elevation.

(b) The excavation volume shall be at least equal to **1.5 times** the volume of storage lost due to the fill or structure.

(c) In the case of streams and watercourses, such excavation shall be made opposite or adjacent to the areas so filled or occupied.

(d) All floodplain storage lost below the existing 10-year flood elevation shall be replaced below the proposed 10-year flood elevation. All floodplain storage lost above the existing 10-year flood elevation shall be replaced above the proposed 10-year flood elevation. All such excavations shall be constructed to drain freely and openly to the watercourse.

Section 1000.0 Permitting Requirements Applicable to All Floodplain Areas.

In addition to the requirements found in Sections 700.0, 800.0 and 900.0 for development in flood fringes, designated floodways, and SFHA or floodplains where no floodways have been identified (Zones A, AO, AH, AE, A1-A30, A99, VO, V1-30, VE, V, M, E, D, or X), the following requirements shall be met.

1001.0 Public Health Standards

1001.1 No developments in the SFHA shall include locating or storing chemicals, explosives, buoyant materials, animal wastes, fertilizers, flammable liquids, pollutants, or other hazardous or toxic materials below the flood protection elevation (FPE).

1001.2 New and replacement water supply systems, wells, sanitary sewer lines and on-site waste disposal systems may be permitted providing all manholes or other above ground openings located below the FPE are watertight.

Compensatory Storage. NIPC policy supports the requirement for a safety factor for compensatory storage equal to at least 1.5 times the volume of storage lost due to fill or structures. This safety factor is intended to compensate for uncertainties in the estimate of the base flood elevation and in the determination of project impacts.

If the municipality owns a regional flood control or stormwater storage facility, and has a plan for developing additional storage at the facility, the municipality may prefer to offer developers of isolated single lots, one quarter acre or smaller in size, the ability to provide hydraulically equivalent storage in the regional facility as an alternative to providing on-site compensatory storage. It would need to be shown through the use of hydrologic and hydraulic models, however, that the additional storage created in the regional facility is hydraulically equivalent to the storage lost at the development site.

This section sets minimum development standards within all floodplain zones.

NFIP requirement: 44 CFR 60.3(a)(6).

NIPC policy does not support wells, new sanitary sewer lines (except interceptor sewers) or on-site

1002.0 Carrying Capacity and Notification.

1002.1 For all projects involving channel modification, fill, or stream maintenance (including levees), the flood carrying capacity of the watercourse shall be maintained.

1002.2 In addition, the (City, Village) shall notify adjacent communities in writing 30 days prior to the issuance of a permit for the alteration or relocation of the watercourse.

1003.0 Protecting Buildings.

1003.1 All buildings located within a 100-year floodplain also known as a SFHA, **and all buildings located outside the 100-year floodplain but within the 500-year floodplain**, shall be protected from flood damage below the flood protection elevation. This building protection criteria applies to the following situations:

- (a) Construction or placement of a new building.
- (b) A structural alteration to an existing building that either increases the first floor area by more than 20 percent or the building's market value by more than 50 percent. ***This alteration shall be figured cumulatively beginning with any alteration which has taken place subsequent to April 1, 1990.***
- (c) Installing a manufactured home on a new site or a new manufactured home on an existing site. This building protection requirements does not apply to returning a mobile home to the same site it lawfully occupied before it was removed to avoid flood damage; and
- (d) Installing a travel trailer on a site for more than 180 days.

This building protection requirement may be met by one of the following methods.

1003.2 A residential or non-residential building, when allowed, may be constructed on permanent land fill in accordance with the following:

- (a) The lowest floor (including basement) shall be at or above the flood protection elevation.

waste disposal systems in the floodway.

NIPC policy supports such modifications or fills only for appropriate uses, where necessary.

For communities that would like to restrict the expansion or additions to existing buildings in the floodplain, it is suggested that the following language be substituted for Section 1003.1 (b):

Nonconforming structures may remain in use, but shall not be enlarged, replaced or structurally altered. A nonconforming structure damaged by flood, fire, wind or other man-made or natural disaster may be restored unless the damage exceeds fifty percent (50 percent) of its market value. In which case, it must, thereafter, conform to this Ordinance.

Community Rating System (CRS) points can be obtained by tracking cumulative substantial improvements.

All buildings proposed at locations which are at or below the flood protection elevation should be elevated. In situations where a community has identified a flood protection elevation which is higher than the 100-year, or base flood, elevation (i.e., it has a freeboard requirement), its elevation requirements should, by definition, extend beyond the 100-year floodplain, or SFHA. The recommended requirement to elevate all buildings within the 500-year floodplain is derived from DuPage County's Stormwater and Floodplain Ordinance. An alternative would be to require the applicant to identify all building locations which are outside the 100-year floodplain and below the flood protection elevation and require protection/elevation of the building. In situations where the freeboard requirement is one foot or greater, this alternative approach is recommended since the 500-year floodplain generally will not extend far enough.

NFIP requirement: 44 CFR 60.3(b)(5)(iii) and 59.22(a)(9)(iii).

NFIP requirement: 44 CFR 60.3(b)(4)(i) and 60.3(c)(2).

The minimum recommended flood protection elevation (FPE) is one foot above the Base Flood

(b) Fill Requirements.

i. The fill shall be placed in layers no greater than one (1) foot deep before compaction and should extend at least ten (10) feet beyond the foundation of the building before sloping below the flood protection elevation.

ii. The top of the fill shall be above the flood protection elevation. However, the ten (10) foot minimum may be waived if a structural engineer certifies an alternative method to protect the building from damages due to hydrostatic pressures.

iii. The fill shall be protected against erosion and scour.

iv. The fill shall not adversely affect the flow or surface drainage from or onto neighboring properties.

1003.3 A residential or non-residential building may be elevated in accordance with the following:

(a) The building or improvements shall be elevated on crawl space, stilts, piles, walls, or other foundation that is permanently open to flood waters and not subject to damage by hydrostatic pressures of the base flood or 100-year frequency flood. The permanent openings shall be no more than one foot above existing grade, and consists of a minimum of two openings. The openings must have a total net area of not less than one square inch for every one square foot of enclosed area subject to flooding below the Base Flood Elevation.

(b) The foundation and supporting members shall be anchored and aligned in relation to flood flows and adjoining structures so as to minimize exposure to known hydrodynamic forces such as current, waves, ice and floating debris.

(c) All areas below the flood protection elevation shall be constructed of materials resistant to flood damage.

i. The lowest floor (including basement) and all electrical, heating, ventilating, plumbing, and air conditioning equipment and utility meters shall be located at or above the flood protection elevation.

ii. Water and sewer pipes, electrical and telephone lines, submersible pumps, and other waterproofed service facilities may be located below the flood protection elevation.

(d) The areas below the flood protection elevation may only be used for the parking of vehicles, building access or storage in an area other than a basement.

Elevation. A number of communities in northeastern Illinois have more conservative requirements, such as 2 or 3 feet. It is recommended that a more conservative FPE be evaluated to provide a reasonable safety factor.

NFIP requirement: 44 CFR 60.3(a)(3) and 60.3(c)(5).

The following language is required for ordinances adopted by communities within the jurisdiction of MWRDGC:

When the building wall encloses open space that is below the Base Flood Elevation, gravity storm and sanitary sewer connections are specifically prohibited and overhead sewers are required for the sanitary connections and sumps for the storm sewer

(e) Manufactured homes, and travel trailers to be installed on a site for more than 180 days, shall be elevated to or above the flood protection elevation; and, shall be anchored to resist flotation, collapse, or lateral movement by being tied down in accordance with the Rules and Regulations for the Illinois Mobile Home Tie-Down Act issued pursuant to 77 Ill. Adm. Code Part 870. In addition, all manufactured homes shall meet the following elevation requirements:

i. In the case of manufactured homes placed or substantially improved (1) outside of a manufactured home park or subdivision, (2) in a new manufactured home park or subdivision, (3) in an expansion to an existing manufactured home park or subdivision, or (4) in an existing manufactured home park or subdivision on which a manufactured home has incurred substantial damage from a flood, the top of the lowest floor shall be elevated to or above the flood protection elevation.

ii. In the case of manufactured homes placed or substantially improved in an existing manufactured home park or subdivision, the manufactured home shall be elevated so that either the top of the lowest floor is above the base flood elevation or the chassis is at least 36 inches in height above grade and supported by reinforced piers or other foundations of equivalent strength, whichever is less.

(f) Recreational vehicles or travel trailers shall be required to meet the elevation and anchoring requirements of Subsection 1003.3(e) above unless:

i. They are on site for fewer than 180 consecutive days; and,

ii. They are fully licensed and ready for highway use. A recreational vehicle is ready for highway use if it is on its wheels or jacking system, is attached to the site only by quick disconnect type utility and service devices, and has no permanently attached additions.

1003.4 Only a non-residential building may be structurally dry floodproofed (in lieu of elevation) provided that:

(a) A registered professional engineer shall certify that the building has been structurally dry floodproofed below the flood protection elevation, the structure and attendant utility facilities are watertight and capable of resisting the effects of the base flood or 100-year frequency flood.

(b) The building design shall take into account flood velocities, duration, rate of rise, hydrostatic and hydrodynamic forces, the effects of buoyancy, and impacts from debris or ice.

(c) Floodproofing measures shall be operable without human intervention and without an outside source of electricity (levees, berms, floodwalls and similar works are not considered floodproofing for the purpose of this subsection).

1003.5 Tool sheds and detached garages on an existing

connections.

NFIP requirement: 44 CFR 60.3(b)(4)(ii) and 60.3(c)(3) and (4).

NFIP requirement: 44 CFR 60.3(b)(4) and 60.3(c)(4).

Tool sheds and detached garages can be constructed

single-family platted lot, may be constructed with the lowest floor below the flood protection elevation in accordance with the following:

- (a) The building is not used for human habitation.*
- (b) All areas below the base flood or 100-year frequency flood elevation shall be constructed with waterproof material. Structures located in a designated floodway shall be constructed and placed on a building site so as not to block the flow of flood waters and shall also meet the Appropriate Use criteria of Section 800.0. In addition, all other requirements of Section 700.0, 800.0 and 900.0 must be met.*
- (c) The structure shall be anchored to prevent flotation.*
- (d) Service facilities such as electrical and heating equipment shall be elevated or floodproofed to the flood protection elevation.*
- (e) The building shall be valued at less than \$7,500 and be less than 500 square feet in floor size.*
- (f) The building shall be used only for the storage of vehicles or tools and may not contain other rooms, workshops, greenhouses or similar uses.*
- (g) The building shall meet the permanent opening criteria of Section 1003.3(a)*

1003.6 Existing buildings located within a designated floodway shall also meet the more restrictive Appropriate Use standards included in Section 800.0. Non-conforming structures located in a designated floodway may remain in use and may only be enlarged, replaced or structurally altered in accordance with Section 802.0. A non-conforming structure damaged by flood, fire, wind or other natural or man-made disaster may be restored unless the damage exceeds fifty percent (50%) of its market value before it was damaged, in which case it shall conform to this Ordinance.

Section 1100.0 Other Development Requirements

The (City Council or Board of Trustees) shall take into account flood hazards, to the extent that they are known in all official actions related to land management, use and development.

1101.0 New subdivisions, manufactured home parks, annexation agreements, and Planned Unit Developments (PUDs) within the SFHA shall be reviewed to assure that the proposed developments are consistent with Sections 700.0, 800.0, 900.0 and 1000.0 of this Ordinance and the need to minimize flood damage. Plats or plans for new subdivisions, mobile home parks and Planned Unit Developments (PUDs) shall include a signed statement by a Registered Professional Engineer that the plat or plans account for changes in the drainage of surface waters in accordance with the Plat Act (765 ILCS 205/2).

below the flood protection elevation if Section 1003.5 is included in the community's ordinance. Communities desiring a more restrictive use of the floodplain, should omit this Section.

NIPC policy discourages locating sheds and garages below the flood protection elevation for the following reasons: such structures will increase the potential for flood damages to equipment, machinery, and vehicles; and materials stored in such facilities may contribute to water quality contamination during flood events.

This figure must be the minimum necessary to construct a two car garage or tool shed.

This section sets minimum subdivision design review, and recording standards, when the subdivisions are located within a floodplain.

NFIP requirement: 44 CFR 60.1(c).

NFIP requirement 44 CFR 60.3(b)(3) only requires this for subdivisions greater than 5 acres or 50 lots.

1102.0 Proposals for new subdivisions, manufactured home parks, travel trailer parks, planned unit developments (PUDs) and additions to manufactured home parks and additions to subdivisions shall include base flood or 100-year frequency flood elevation data and floodway delineations.

1102.1 Where this information is not available from an existing study filed with the Illinois State Water Survey, the applicant's engineer shall be responsible for calculating the base flood or 100-year frequency flood elevation per Section 604.0 and the floodway delineation per the definition in Section 300.13

1102.2 The applicant's engineer shall submit the data to IDNR/OWR for review and approval as best available regulatory data and then send it to the State Water Survey.

1103.0 Streets, blocks, lots, parks and other public grounds shall be located and laid out in such a manner as to preserve and utilize natural streams and channels. Wherever possible, the floodplains shall be included within parks or other public grounds.

1104.0 The (City Council, Board of Trustees, County Board) shall not approve any Planned Unit Development (PUD) or plat of subdivision located outside the corporate limits unless such agreement or plat is in accordance with the provisions of this Ordinance.

Section 1200.0 Variances

1201.0 No variances shall be granted to any development located in a designated floodway as defined in Section 300.13.

1201.1 Whenever the standards of this Ordinance place undue hardship on a specific development proposal, the applicant may apply to the _____ for a variance.

1201.2 The _____ shall review the applicant's request for a variance and shall submit its recommendation to the (City Council, Board of Trustees).

All new plats recorded must show the location of any SFHA which appears on the plat and must be signed, sealed, and certified by an Illinois Registered Land Surveyor as per the requirements of Public Act 85-267.

This section explains the criteria for a floodplain variance and explains the procedure which the community must follow when granting a variance.

NFIP guidelines: 44 CFR 60.6(a).

Communities in the NFIP are required to maintain a record of all variance actions, including justification for their issuance, and report them to FEMA in the Biennial Report. FEMA may review variances and may take compliance action against a community if the review "indicates a pattern inconsistent with the objectives of sound floodplain management...."

If a city/village adopts NIPC language which prohibits changing the regulatory floodway to facilitate development related to a non-appropriate use, it has precluded certain development activities in the existing floodway which are allowable under state rules. Such a floodway modification activity should be made eligible for the variance procedure described in this section if an exceptional hardship would otherwise result.

Similarly, if the city/village adopts NIPC language for mitigation (including soil erosion and sedimentation control, channel protection, vegetated buffer strips, etc.) which goes beyond the minimum state requirements, such requirements also should be eligible for the variance procedure described in this section if an exceptional hardship would otherwise result. All such variances must meet the minimum state requirements for appropriate uses and are otherwise subject to the requirements of Sections

1202.0 No variance shall be granted unless the applicant demonstrates that:

1202.1 The development activity cannot be located outside the SFHA;

1202.2 An exceptional hardship would result if the variance were not granted;

1202.3 The relief requested is the minimum necessary;

1202.4 There will be no additional threat to public health, safety, *beneficial stream uses and functions, especially aquatic habitat, or creation of a nuisance*;

1202.5 There will be no additional public expense for flood protection, *lost environmental stream uses and functions*, rescue or relief operations, policing, or repairs to *streambeds and banks*, roads, utilities, or other public facilities;

1202.6 The provisions of Sections 702.0 and 902.0 of this Ordinance shall still be met;

1202.7 The activity is not in a designated floodway;

1202.8 The applicant's circumstances are unique and do not represent a general problem, and;

1202.9 *The granting of the variance will not alter the essential character of the area involved including existing stream uses.*

1203.0 The _____ shall notify an applicant in writing that a variance from the requirements of Section 1000.0 that would lessen the degree of protection to a building will:

1203.1 Result in increased premium rates for flood insurance

700.0, 800.0 and 900.0. *In no case shall a variance from the minimum State requirements of Section 800.0 be considered for any development activity.*

A city/village which adopts requirements for floodway development which are more restrictive than state requirements, and which chooses to provide the opportunity for variances for such restrictions, should draft variance language which specifically references the more restrictive requirements. This language should be inserted into Section 1200.0 after the first sentence. Suggested language follows: "However, the following Ordinance requirements for floodway development, which are more restrictive than minimum state requirements shall be eligible for variance considerations: Sections _____, etc."

The blanks in Subsections 1201.1 and 1201.2 should be filled in with the title of the body reviewing requests for variances (e.g. the Plan Commission or the Zoning Board of Appeals).

As much as possible the variance procedure should be tied to existing zoning or building code variance procedure

The criteria for granting a variance should recognize and include the fact that there are legitimate stream uses and functions which may be adversely affected by the granting of the variance. These uses include aesthetics, aquatic habitat and recreation. Since these uses have a definite, though difficult to quantify, economic value, the applicant should demonstrate that these uses will not be impaired by the proposed activity as part of the application for a variance

These provisions still prohibit the placement of inappropriate uses in the floodway, meaning a variance for such placement cannot be obtained.

65 ILCS 5/11-13-4 and 5/11-13-5 *establishes specific municipal zoning variance criteria.*

1202.8 and 1202.9 *are based on those criteria which are an essential component of all municipal zoning ordinances.*

NFIP guidelines: 44 CFR 60.6(a)(5).

List the title of the official responsible for administering the floodplain ordinance.

up to amounts as high as \$25 for \$100 of insurance coverage;

1203.2 Increase the risks to life and property; and

1203.3 Require that the applicant proceed with knowledge of these risks and that he will acknowledge in writing that he assumes the risk and liability.

1204.0 Variances requested in connection with restoration of a historic site or historic structure as defined in 300.30 “Historic Structures”, may be granted using criteria more permissive than the requirements of Sections 1200.2 and 1200.3, subject to the conditions that:

1204.1 The repair or rehabilitation is the minimum necessary to preserve the historic character and design of the structure; and,

1204.2 The repair or rehabilitation will not result in the structure being removed as a certified historic structure.

Section 1300.0 Disclaimer of Liability

1301.0 The degree of flood protection required by this Ordinance is considered reasonable for regulatory purposes and is based on available information derived from engineering and scientific methods of study.

1302.0 Larger floods may occur or flood heights may be increased by man-made or natural causes.

1303.0 This Ordinance does not imply that development, either inside or outside of the SFHA, will be free from flooding or damage.

1304.0 This Ordinance does not create liability on the part of the (City, Village) or any officer or employee thereof for any flood damage that results from reliance on this Ordinance or any administrative decision made lawfully thereunder.

Section 1400.0 Penalty

Failure to comply with the requirements of a permit or conditions of a variance resolution shall be deemed to be a violation of this Ordinance. Upon due investigation, the _____ may determine that a violation of the minimum standards of this Ordinance exist. The _____ shall notify the owner in writing of such violation.

1401.0 If such owner fails after ten days notice to correct the violation:

1401.1 The (City, Village) may make application to the

An insurance agent can estimate the rate increase for specific projects (Example: for a new slab on grade home, with the top of the lowest floor four feet below the Base Flood Elevation, flood insurance could cost about \$50.00 per \$1000.00 of coverage).

The Standard Flood Insurance Policy permits an insurance adjuster to not pay for damage that was caused by something the owner did which increased the hazard to the property. Section 1316 of the National Flood Insurance Act authorizes local officials to request denial of flood insurance for buildings in violation of local floodplain codes.

Contact the Illinois Historic Preservation Agency at (217) 785-1153 for more information.

This section explains that this Ordinance does not guarantee that flood damage will not occur, and that the municipality, county, or enforcing official is not liable for decisions made lawfully under this Ordinance.

This section explains the penalty for not abiding by this Ordinance, and explains what actions the enforcement official may take in seeking compliance.

List the title of the official responsible for administering the floodplain ordinance.

A community may wish to treat a violation as a

Circuit Court for an injunction requiring conformance with this Ordinance or make such other order as the Court deems necessary to secure compliance with the Ordinance.

1401.2 Any person who violates this Ordinance shall, upon conviction thereof, be fined not less than fifty dollars (\$50.00) or more than one-thousand dollars (\$1,000.00) for each offense.

1401.3 A separate offense shall be deemed committed upon each day during or on which a violation occurs or continues.

1401.4 The (City, Village) may record a notice of violation on the title to the property.

1402.0 The _____ shall inform the owner that any such violation is considered a willful act to increase flood damages and, therefore, may cause coverage by a Standard Flood Insurance Policy to be suspended.

1402.1 The _____ is authorized to issue an order requiring the suspension of the subject development. The stop-work order shall be in writing, shall indicate the reason for the issuance, and shall order the action, if necessary, to resolve the circumstances requiring the stop-work order. The stop-work order constitutes a suspension of the permit

1402.2 No site development permit shall be permanently suspended or revoked until a hearing is held by the (Board of Appeals). Written notice of such hearing shall be served on the permittee and shall state: (1) the grounds for complaint or reasons for suspension or revocation; and (2) the time and place of the hearing. At such hearing, the permittee shall be given an opportunity to present evidence on his/her behalf. At the conclusion of the hearing, the (Board of Appeals) shall determine whether the permit shall be suspended or revoked.

1403.0 Nothing herein shall prevent the (City, Village) from taking such other lawful action to prevent or remedy any violations. All costs connected therewith shall accrue to the person or persons responsible.

Section 1500.0 Abrogation and Greater Restrictions

1501.0 This Ordinance is not intended to repeal, abrogate or impair any existing easements, covenants, or deed restrictions.

1502.0 Where this Ordinance and other ordinance, easements, covenants, or deed restrictions conflict or overlap, whichever imposes the more stringent restrictions shall prevail.

1503.0 This Ordinance is intended to repeal the original ordinance or resolution which was adopted to meet the National Flood Insurance Program regulations, but is not intended to repeal the resolution which the (City, Village) passed in order to establish initial eligibility for the program.

misdemeanor, in order to reinforce the necessity for compliance.

The fine amounts are the minimum recommended by IDNR/OWR.

Consideration should be given to increasing these suggested fine amounts. Certain violations can potentially lead to substantial off-site damages (e.g., increased flooding or sedimentation) and should be treated accordingly.

List the title of the official responsible for administering the floodplain ordinance.

A stop-work order should be issued if the development is proceeding in a manner which creates an imminent hazard of severe harm to persons or property (e.g., an unauthorized fill in the floodplain); or development has been accomplished in violation of the requirements of this Ordinance and a period of at least 15 days has elapsed since the permittee has received written notice of violation; or the development is proceeding without a permit.

This section explains which Ordinances are repealed when this Ordinance is adopted.

NFIP requirement: 44 CFR 60.1(b). This section should include a list of the specific ordinances that are repealed by this new Ordinance.

Section 1600.0 Separability

The provisions and sections of this Ordinance shall be deemed separable and the invalidity of any portion of this Ordinance shall not affect the validity of the remainder.

Section 1700.0 Effective Date

This Ordinance shall be in full force and effect from and after its passage and approval and publication, as required by law.

PASSED by the _____ of the _____ of _____, Illinois, this ____ day of _____, 19__.

Clerk

APPROVED by me this ____ day of _____, 19__.

Mayor

ATTESTED and FILED in my office this ____ day of _____, 19__.

Clerk

This section explains that if one part of this Ordinance is ruled to be invalid by the courts, the remainder of this ordinance is still in effect.

This section sets the date when this Ordinance goes into effect and contains sections which the authorized officials must sign to approve the passage of this Ordinance.

MODEL SOIL EROSION AND SEDIMENT CONTROL ORDINANCE

A GUIDE FOR LOCAL OFFICIALS

ANOTHER IN THE SERIES OF PLANNING AIDS FROM THE:
NORTHEASTERN ILLINOIS PLANNING COMMISSION

MODEL SOIL EROSION AND SEDIMENT CONTROL ORDINANCE

Northeastern Illinois Planning Commission
400 West Madison Street • Suite 200
Chicago, Illinois 60606

September 1991

This is another in a series of planning aids and manuals prepared by the Northeastern Illinois Planning Commission as a service to local governments under a section of its enabling act which authorizes the Commission to "prepare and make available to units of government standards for planning and regulatory ordinances, practices, and procedures." This ordinance has been prepared as a model to assist local units of government in developing their own regulations. This model ordinance is also available on computer diskettes at no charge to local governments.

Price: \$4.50

The preparation of revisions to this model ordinance was financed using federal Water Pollution Control Act Section 205(j) funds from the Illinois Environmental Protection Agency. The policies contained herein are not necessarily those of the Illinois Environmental Protection Agency.

Revision to NIPC's Model Soil Erosion and Sediment Control Ordinance

New Reference for Standards and Specifications

There are several references in the Ordinance to the Illinois Environmental Protection Agency's (EPA) *Standards and Specifications for Soil Erosion and Sediment Control* (sometimes called the Yellow Book). These references appear on pages 12 and 21.

This reference should be replaced with the *Illinois Urban Manual: A Technical Manual Designed for Urban Ecosystem Protection and Enhancement*, prepared by the Natural Resources Conservation Service for the Illinois EPA in 1995. The *Urban Manual* has revised many of the practices found in the Yellow Book and contains more in-depth information of construction specifications, material specifications, and standard drawings. The *Urban Manual* is available from county Soil and Water Conservation District offices throughout northeastern Illinois.

INTRODUCTION

Soil erosion and offsite sediment runoff are continuing serious environmental problems in northeastern Illinois. Each year, millions of tons of soil are eroded by water and wind from agricultural land, areas undergoing development, and developed areas which are improperly protected. The Illinois Water Quality Management Plan identifies sedimentation as a major water pollution problem in both rural and urbanized areas. Sediment reduces the carrying capacity of streams, transports pesticides and other pollutants, and degrades aquatic habitat. In addition, uncontrolled erosion and sedimentation lower the economic value of farmland, reduce the effectiveness of stormwater management facilities, and create hazards on streets and sidewalks.

The model ordinance which follows addresses one aspect of this problem: erosion and sedimentation from areas undergoing urbanization. The ordinance provides a means by which county and municipal governments can assure that site planning and development take potential erosion problems into account and include effective measures for their control. While the principal intent of the ordinance is preventive, it also includes provisions for enforcement action where this becomes necessary.

The Illinois Water Quality Management Plan recommends that erosion and sedimentation control ordinances be adopted by all counties and municipalities. More recently, the U.S. Environmental Protection Agency (USEPA) has promulgated regulations which will require stormwater permits for construction sites. All construction activities of 5 acres or greater will be required to implement erosion and sediment control measures and to perform routine maintenance and inspection of these measures.

The majority of local governments in northeastern Illinois have already adopted ordinances. Many of their ordinances are similar to the Commission model prepared in 1980. If effectively enforced, these ordinances satisfy basic erosion and sediment control objectives and need not be discarded. However, it is recommended that revisions contained in the new model be considered by local governments to enhance the achievement of ordinance objectives, particularly water quality protection, and to conform to USEPA guidelines.

The present model uses the 1980 model as a base and includes additions and revisions based on experience gained in this region and in other parts of the country. Many of the changes are based on ordinances previously adopted or currently under consideration by other agencies, including: the DuPage County Stormwater Committee; Kane County; Lake County Stormwater Commission; Dane County, Wisconsin; Loudoun County, Virginia; St. Charles, Missouri SWCD; and the states of Georgia, Maryland, Ohio, and Wisconsin.

This ordinance is similar to others in the series of planning aids prepared by the Commission. It is presented as a model for the guidance of local governments in adopting their own erosion and sediment control programs. It is understood that each local government may wish to modify the model

presented here to conform to its existing regulations and practices.

The Commission will provide technical assistance upon request in developing such modifications. However, it is important that each local government submit the model to careful review by administrative officials and legal counsel prior to adoption. Another potential source of technical assistance is the county Soil and Water Conservation District (SWCD) office. SWCD's in northeastern Illinois are becoming more attuned to urban issues, such as construction site erosion control, and can offer advice on ordinance implementation and site inspection.

The model ordinance contained herein is intended to stand by itself alongside other county or municipal development regulations. It provides for the issuance of a site development permit based on development plans and erosion control measures proposed by a developer and submitted to the local government with land use jurisdiction. Developments below a minimum size would not be required to secure a separate permit but would still be expected to include effective erosion control measures during construction.

This model may not be equally applicable to all communities. For example, a community which is largely built-up and experiencing relatively little new construction may require only amendment of its building code. Where large-scale development is going on, the development permit or subdivision approach may be more effective in regulating land-disturbing activities which take place prior to application for building permits. Some local governments will wish to adopt ordinances or amendments applicable to both small and large-scale developments.

The new model ordinance contains a section specifying minimum site design requirements. Beyond these requirements, though, the model ordinance must be supported by technical standards and specifications for the design of erosion control measures if they are to be effective. The ordinance identifies both "Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control" (the Green Book) and IEPA's "Standards and Specifications for Soil Erosion and Sediment Control" (the Yellow Book) as appropriate technical references. In its recent "Investigation of the Effectiveness of Urban Soil Erosion and Sediment Control Programs in Northeastern Illinois," NIPC noted that there are some deficiencies in both of these documents as stand-alone technical references. There also are some obvious inconsistencies between them. Until this situation is resolved, however, it is recommended in the model ordinance that these manuals be adopted by reference as guides to the design engineer in preparing, and the local government in reviewing, site plans and erosion control measures.

MODEL SOIL EROSION AND SEDIMENT CONTROL ORDINANCE

AN ORDINANCE PROVIDING FOR THE CONTROL
OF SOIL EROSION AND SEDIMENT RUNOFF FROM
AREAS UNDERGOING DEVELOPMENT

ORDINANCE

COMMENTARY

100.0 Findings and Purpose

100.0 Findings and Purpose

101.0 Findings

101.0 Findings

The (Board of Trustees) of the (village) hereby finds that:

This section identifies a range of circumstances which threaten the public health, safety, or welfare and from which protection is sought by the enactment of this ordinance.

At a number of points in the ordinance, the name of the unit of local government enacting it is to be entered. While the references in this model are to a village, the ordinance is also applicable to a city or county. The reference to the Board of Trustees may be changed to City Council or Board of Commissioners as appropriate.

101.1 Excessive quantities of soil may erode from areas undergoing development for certain non-agricultural uses including but not limited to the construction of dwelling units, commercial buildings and industrial plants, the building of roads and highways, the modification of stream channels and drainageways, and the creation of recreational facilities;

101.2 The washing, blowing, and falling of eroded soil across and upon roadways endangers the health and safety of users thereof, by decreasing vision and reducing traction of road vehicles;

101.3 Soil erosion necessitates the costly repairing of gulleys, washed-out fills, and embankments;

101.4 Sediment from soil erosion tends to clog sewers and ditches and to pollute and silt rivers, streams, lakes, wetlands, and reservoirs;

101.5 Sediment limits the use of water and waterways for most beneficial purposes, promotes the growth of undesirable aquatic weeds, destroys fish and other desirable aquatic life, and is costly and difficult to remove; and

101.6 Sediment reduces the channel capacity of waterways and the storage capacity of floodplains and natural depressions, resulting in increased chances of flooding at risk to public health and safety

102.0 Purpose

The (Board of Trustees) therefore declares that the purpose of this ordinance is to safeguard persons, protect property, prevent damage to the environment, and promote the public welfare by guiding, regulating and controlling the design, construction, use and maintenance of any development or other activity which disturbs or breaks the topsoil or otherwise results in the movement of earth on land situated in the (village). It is the intention of this ordinance that the delivery of sediment from sites affected by land disturbing activities be limited, as closely as practicable, to that which would have occurred if the land had been left in its natural undisturbed state.

200.0 Definitions

For the purposes of this Ordinance certain terms used herein are defined as set forth below:

200.1 BUILDING PERMIT: A permit issued by the (village) for the construction, erection or alteration of a structure or building.

200.2 CERTIFY OR CERTIFICATION: Formally attesting that the specific inspections and tests where required have been performed, and that such tests comply with the applicable requirements of this Ordinance.

200.3 CLEARING: Any activity which removes vegetative ground cover.

200.4 CUBIC YARDS: The amount of material in excavation and/or fill measured by the method of "average end areas."

200.5 EXCAVATION: Any act by which organic matter, earth, sand, gravel, rock or any other similar, material is cut into, dug, quarried, uncovered, removed, displaced, relocated or bulldozed and shall include the conditions resulting therefrom.

200.6 EXISTING GRADE: The vertical location of

200.0 Definitions

The local government adopting the ordinance may wish to expand or shorten the list of definitions provided here, depending on the terms already defined in other ordinances or regulations.

the existing ground surface prior to excavation or filling.

200.7 FILL: Any act by which, earth, sand, gravel, rock or any other material is deposited, placed, replaced, pushed, dumped, pulled, transported or moved by man to a new location and shall include the conditions resulting therefrom.

200.8 FINAL GRADE: The vertical location of the ground or pavement surface after the grading work is completed in accordance with the site development plan.

200.9 GRADING: Excavation or fill or any combination thereof and shall include the conditions resulting from any excavation or fill.

200.10 NATURAL DRAINAGE: Channels formed in the existing surface topography of the earth prior to changes made by unnatural causes.

200.11 PARCEL: All contiguous land in one ownership.

200.12 PERMITTEE: Any person to whom a site development permit is issued.

200.13 PERSON: Any individual, firm or corporation, public or private, the State of Illinois and its agencies or political subdivisions, and the United States, of America, its agencies and instrumentalities, and any agent, servant, officer or employee of any of the foregoing.

200.14 REMOVAL: Cutting vegetation to the ground or stumps, complete extraction, or killing by spraying.

200.15 SITE: A lot or parcel of land, or a contiguous combination thereof, where grading work is performed as a single unified operation.

200.16 SITE DEVELOPMENT: Altering terrain and/or vegetation and constructing improvements.

200.17 SITE DEVELOPMENT PERMIT: A permit issued by the (village) for the construction or alteration of ground improvements and structures for the control of erosion, runoff and grading.

ORDINANCE

COMMENTARY

200.18 STREAM: Any river, creek, brook, branch, flowage, ravine, or natural or man-made drainageway which has a definite bed and banks or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.

200.19 STRIPPING: Any activity which removes the vegetative surface cover including tree removal, clearing, and storage or removal of top soil.

200.20 VACANT: Land on which there are no structures or only structures which are secondary to the use or maintenance of the land itself.

200.21 VILLAGE: The Village of _____, _____ County, Illinois.

200.22 WETLANDS: Areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

200.18 STREAM: For purposes of this ordinance, a stream does not include very small headwater swales or ditches which generally would not be mapped on U.S.G.S. 7.5 minute quadrangle maps.

200.21 VILLAGE: Identification of the City or County should be substituted in the appropriate alphabetic position where one of these is the unit adopting the ordinance.

200.22 WETLANDS: In the context of this ordinance, wetlands are intended to refer to areas which are subject to regulations of the U.S. Army Corps of Engineers under Section 404 of the Clean Water Act. It is not intended that very small areas meeting the wetland definition (e.g., a roadside ditch) would be subject to the special provisions of this ordinance which require an erosion and sediment control permit for very minor disturbances.

300.0 General Principles

It is the objective of this ordinance to control soil erosion and sedimentation caused by development activities, including clearing, grading, stripping, excavating, and filling of land, in the (village). Measures taken to control soil erosion and offsite sediment runoff should be adequate to assure that sediment is not transported from the site by a storm event of ten-year frequency or less. The following principles shall apply to **all** development activities within the (village) and to the preparation of the submissions required under Section 400.0 of this ordinance:

300.0 General Principles

The approaches outlined here have been proven effective in minimizing soil erosion from development sites and in reducing the damaging effects of that erosion which does occur. They should serve as guidelines for the preparation of site development and erosion control plans required under Section 400.0, and in the conduct of development activities which are exempted from the permit requirements of this ordinance.

The erosion and sedimentation control practices discussed in this ordinance and the manual of

ORDINANCE

COMMENTARY

300.1 Development should be related to the topography and soils of the site so as to create the least potential for erosion. Areas of steep slopes where high cuts and fills may be required should be avoided wherever possible, and natural contours should be followed as closely as possible.

300.2 Natural vegetation should be retained and protected wherever possible. Areas immediately adjacent to natural watercourses, lakes, ponds, and wetlands should be left undisturbed wherever possible. Temporary crossings of watercourses, when permitted, must include appropriate stabilization measures.

300.3 Special precautions should be taken to prevent damages resultant from any necessary development activity within or adjacent to any stream, lake, pond, or wetland. Preventative measures should reflect the sensitivity of these areas to erosion and sedimentation.

300.4 The smallest practical area of land should be exposed for the shortest practical time during development.

300.5 Sediment basins or traps, filter barriers, diversions, and any other appropriate sediment or runoff control measures should be installed prior to site clearing and grading and maintained to remove sediment from run-off waters from land undergoing development.

300.6 The selection of erosion and sedimentation control measures should be based on assessment of the probable frequency of climatic and other events likely to contribute to erosion, and on evaluation of the risks, costs, and benefits involved.

300.7 In the design of erosion control facilities

"Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control" (prepared by the Northeastern Illinois Erosion & Sedimentation Control Steering Committee, in cooperation with area Soil and Water Conservation Districts and the U.S. Soil Conservation Service, and known as the Green Book) are designed to provide protection against sediment leaving the site during a ten-year storm.

300.2 In its floodplain and wetland protection model ordinances, NIPC recommends that a minimum 25 foot buffer strip be preserved along waterbodies and wetlands. It is recognized that mitigation wetlands will involve disturbance in their immediate proximity. In these situations, the time of disturbance should be kept to a minimum.

ORDINANCE

COMMENTARY

and practices, aesthetics and the requirements of continuing maintenance should be considered.

300.8 Provision should be made to accommodate the increased run-off caused by changed soil and surface conditions during and after development. Drainageways should be designed so that their final gradients and the resultant velocities and rates of discharge will not create additional erosion onsite or downstream.

300.9 Permanent vegetation and structures should be installed and functional as soon as practical during development.

300.10 Those areas being converted from agricultural purposes to other land uses should be vegetated with an appropriate protective cover prior to development.

300.11 All waste generated as a result of site development activity should be properly disposed of and should be prevented from being carried off the site by either wind or water.

300.12 All construction sites should provide measures to prevent sediment from being tracked onto public or private roadways.

ORDINANCE

COMMENTARY

400.0 Site Development Permit

400.0 Site Development Permit

401.0 Permit Required

401.0 Permit Required

Except as otherwise provided in this ordinance, no person shall commence or perform any clearing, grading, stripping, excavating, or filling of land which meets the following provisions without having first obtained a site development permit from the (permitting authority) of the (village).

The requirement of a site development permit is the means by which the local government can assure that adequate steps are taken before and during development to control erosion and its effects.

The adopted ordinance should specify the official or department (the "permitting authority") responsible for issuing permits, inspecting work in progress, and taking enforcement action if necessary. In most cases, this will be the administrative official responsible for other aspects of development regulation. Depending on practice in the particular local government, this may be the Building Officer, Zoning Officer, Plat Officer, Engineer, or other official with related responsibilities including enforcement authority. Identification of this authority should also be included among the definitions in Section 200.0.

401.1 Any land disturbing activity (i.e., clearing, grading, stripping, excavation, fill, or any combination thereof) that will affect an area in excess of 5000 square feet;

401.2 Any land disturbing activity that will affect an area in excess of 500 square feet if the activity is within 25 feet of a lake, pond, stream, or wetland; or

401.3 Excavation, fill, or any combination thereof that will exceed 100 cubic yards.

402.0 Exceptions

402.0 Exceptions

A permit shall not be required for any of the following provided that the person responsible for any such development shall implement necessary soil erosion and sediment control measures to satisfy the principles set forth in Section 300.0 of this Ordinance:

For certain soil-disturbing activities, it may be unnecessary or impractical to require application for and issuance of a permit. This is due to the type or scale of development activities involved. These exceptions should be clearly specified in the ordinance.

On development sites below a minimum size, it may be impractical to require the developer to prepare full site development and erosion control plans, given the relatively small area of soil disturbance. However, effective erosion and

ORDINANCE

COMMENTARY

sedimentation controls should still be required during development to avoid silting of streets and drainage channels and offsite water quality impacts. The local government may wish to include the requirement of basic erosion and sedimentation control measures as a condition for issuance of a building permit in such cases.

Some local governments may wish to establish a more restrictive minimum area for the issuance of permits than the 5000 square feet suggested here. This would be appropriate in areas of relatively steep slopes or erodible soils, in addition to areas involving streams, lakes, and wetlands referenced in the ordinance. An alternative approach is to base the need for a permit on the anticipated soil loss from the site during development. A model ordinance developed in Ohio limits erosion from development sites to an average annual soil loss of 15 tons/acre/year. Such a quantitative standard can take into account the existence of small but steep and highly erodible lots on which stringent erosion controls may be necessary, and larger but extremely pervious and flat areas, from which erosion may not be a serious problem. However, the most common soil-loss estimation techniques are not applicable to sites of much less than 50 acres, making the administration of such an ordinance impractical. The present model ordinance contains procedures for the granting of exceptions which may be applied to unique development sites.

402.1 Excavation below final grade for the basement and footings of a single-family residence and appurtenant structures on a site in excess of two acres for which a building permit has been issued by the (village);

402.1 This provision permits the construction of single residences in estate-zoned or agricultural areas where much potential sediment may be absorbed by the site itself. Again, the local government should include basic sediment control measures in its building permit requirements.

402.2 Agricultural use of land, including the implementation of conservation measures included in a farm conservation plan approved by the Soil and Water Conservation District, and including the construction of agricultural structures;

402.3 Installation, renovation, or replacement of a septic system to serve an existing dwelling or structure.

ORDINANCE

COMMENTARY

403.0 Application for Permit

Application for a site development permit shall be made by the owner of the property or his authorized agent to the (permitting authority) on a form furnished for that purpose. Each application shall bear the name(s) and address(es) of the owner or developer of the site and of any consulting firm retained by the applicant together with the name of the applicant's principal contact at such firm, and shall be accompanied by a filing fee of __. Each application shall include certification that any land clearing, construction, or development involving the movement of earth shall be in accordance with the plans approved upon issuance of the permit.

404.0 Submissions

Each application for a site development permit shall be accompanied by the following information:

404.1 A vicinity map in sufficient detail to enable easy location in the field of the site for which the permit is sought, and including the boundary line

403.0 Application for Permit

The application form for the permit can be relatively brief. It need contain only (1) identification of the applicant and of the person or firm responsible for development activity and for preparation of the required plans, (2) identification of the plans and other documents submitted with the application, and (3) certification that development will take place in accordance with the plans as approved upon issuance of the permit.

The local government may wish to require that each application be signed by a licensed professional engineer as an assurance of the technical validity of the submissions.

The filing fee is intended to defray the local government's cost of reviewing and acting upon the permit application. The amount of the fee should be consistent with existing practice of the local government, and may either be a flat amount or be based on a sliding fee scale related to the size and character of the proposed development. It may also be desired to provide for a separate supplemental fee where a hearing is required on an exception requested under Section 600.0.

404.0 Submissions

The application for a site development permit is to be accompanied by sufficient information to describe the erosion control measures which the developer proposes to take and to permit evaluation of the adequacy of those measures by local authorities. While these submissions are to be included as attachments to the permit application, the local government may wish to have them submitted informally for staff review in advance of the formal application. A local government may wish to expand or reduce the amount of detailed information to be submitted from that suggested here, taking into consideration the size of the area disturbed.

ORDINANCE

COMMENTARY

and approximate acreage of the site, existing zoning, and a legend and scale.

404.2 A development plan of the site showing:

- a. Existing topography of the site and adjacent land within approximately 100 feet of the boundaries, drawn at no greater than two-foot contour intervals and clearly portraying the conformation and drainage pattern of the area.
- b. The location of existing buildings, structures, utilities, streams, lakes, floodplains, wetlands and depressions, drainage facilities, vegetative cover, paved areas, and other significant natural or man-made features on the site and adjacent land within 100 feet of the boundary.
- c. A general description of the predominant soil types on the site, their location, and their limitations for the proposed use.
- d. Proposed use of the site, including present development and planned utilization; areas of clearing, stripping, grading, excavation, and filling; proposed contours, finished grades, and street profiles; provisions for storm drainage, including storm sewers, swales, detention basins and any other measures to control the rate of runoff, with a drainage area map, indications of flow directions, and computations; kinds and locations of utilities; and areas and acreages proposed to be paved, covered, sodded or seeded, vegetatively stabilized, or left undisturbed.

404.3 An erosion and sediment control plan showing all measures necessary to meet the objectives of this ordinance throughout all phases of construction and permanently after completion of development of the site, including:

- a. Location and description, including standard details, of all sediment control measures and design specifics of sediment basins and traps, including outlet details.

- a. In most of northeastern Illinois, two-foot contour intervals are adequate to portray the topography of the construction site. Local governments which anticipate development of exceptionally flat sites may wish to specify one-foot contour intervals instead of or in addition to the two-foot intervals suggested here. The local government may wish to specify that a boundary area greater or less than 100 feet be shown.

- d. The local government may wish to waive the requirement of proposed contours where finished grades are adequate to evaluate the plan.

ORDINANCE

COMMENTARY

-
- b. Location and description of all soil stabilization and erosion control measures, including seeding mixtures and rates, types of sod, method of seedbed preparation, expected seeding dates, type and rate of lime and fertilizer application, kind and quantity of mulching for both temporary and permanent vegetative control measures, and types of non-vegetative stabilization measures.
 - c. Location and description of all runoff control measures, including diversions, waterways, and outlets.
 - d. Location and description of methods to prevent tracking of sediment offsite, including construction entrance details, as appropriate.
 - e. Description of dust and traffic control measures.
 - f. Locations of stockpiles and description of stabilization methods.
 - g. Description of off-site fill or borrow volumes, locations, and methods of stabilization.
 - h. Provisions for maintenance of control measures, including type and frequency of maintenance, easements, and estimates of the cost of maintenance.
 - i. Identification (name, address, and telephone) of the person(s) or entity which will have legal responsibility for maintenance of erosion control structures and measures during development and after development is completed.
- i. Permanent maintenance of erosion control measures may be the responsibility of various entities, including the homeowner, the park district, and the village or county. These responsibilities should be identified as precisely as possible in the plan.

ORDINANCE

COMMENTARY

404.4 The proposed phasing of development of the site, including stripping and clearing, rough grading and construction, and final grading and landscaping. Phasing should identify the expected date on which clearing will begin, the estimated duration of exposure of cleared areas, and the sequence of installation of temporary sediment control measures (including perimeter controls), clearing and grading, installation of temporary soil stabilization measures, installation of storm drainage, paving streets and parking areas, final grading and the establishment of permanent vegetative cover, and the removal of temporary measures. It shall be the responsibility of the applicant to notify the (permitting authority) of any significant changes which occur in the site development schedule after the initial erosion and sediment control plan has been approved.

These submissions shall be prepared in accordance with the requirements of this ordinance and the standards and requirements contained in "Standards and Specifications for Soil Erosion and Sediment Control" (the Yellow Book) published by the Illinois Environmental Protection Agency and the "Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control" (the Green Book) prepared by the Northeastern Illinois Soil Erosion and Sedimentation Control Steering Committee and adopted by the (county) Soil and Water Conservation District, which standards and requirements are hereby incorporated into this ordinance by reference.

The (permitting authority) may waive specific requirements for the content of submissions upon finding that the information submitted is sufficient to show that the work will comply with the objectives and principles of this ordinance.

405.0 Bonds

The applicant is required to file with the (village) a faithful performance bond or bonds, letter of credit, or other improvement security satisfactory to the (municipal attorney) in an amount deemed sufficient by the (permitting authority) to cover all costs of improvements, landscaping, maintenance of improvements and landscaping, and soil

404.4 It is strongly recommended that a standard manual of practices and procedures for erosion control be adopted by reference to provide the technical basis for the development and review of erosion control plans. The Green Book provides valuable guidance on the development of an erosion and sediment control plan. The Yellow Book provides additional guidance on the selection and design of appropriate control measures. Presently, there are some inconsistencies between the two references. Also, in some cases this ordinance is more stringent than one or both references. In those cases, the ordinance shall govern.

405.0 Bonds

The filing of a performance bond by the developer may be made mandatory with respect to all developments or left at the discretion of the permitting authority. Some local governments in northeastern Illinois have specified the amount of the performance bond as a percentage of the cost of improvements and erosion controls on the site.

ORDINANCE

COMMENTARY

erosion and sediment control measures for such period as specified by the (village), and engineering and inspection costs to cover the cost of failure or repair of improvements installed on the site.

Bonds for development performance and maintenance may be separate. Where permanent maintenance will be assumed by an agency or entity other than the developer, the time period of the maintenance bond should be limited accordingly.

406.0 Review and Approval

Each application for a site development permit shall be reviewed and acted upon according to the following procedures:

406.1 The (permitting authority) will review each application for a site development permit to determine its conformance with the provisions of this ordinance. The (authority) may also refer any application to the (county) Soil and Water Conservation District and/or any other local government or public agency within whose jurisdiction the site is located for review and comment. Within thirty (30) days after receiving an application, the (permitting authority) shall in writing:

406.1 A reasonable time limit should be placed on local government action on permit applications in order to minimize the serious financial costs to the developer of delays. Informal review of the project prior to submittal of the final application can contribute to this objective.

The Soil and Water Conservation Districts have specialized expertise in soils analysis and erosion control techniques. The quality of local plan reviews may be improved by referring projects to the appropriate District for advisory technical review. Review of some projects (e.g., subdivision of agricultural lands) within the overlapping jurisdiction of the local government and a District may be required under 5 Ill. Rev. Stat. 127.2a. Communities which do not wish to retain specialized staff may choose to enter into a contract or intergovernmental agreement with the District for the conduct of all reviews and the preparation of recommended actions. Approval or disapproval of applications would remain the responsibility of the local government.

Where another public body (such as a park district) is to assume ownership and/or maintenance responsibility for part of a development, it should also be given an opportunity to review the development plans. This review should be completed within the 30-day period allowed the permitting authority, in order that the permitting authority may take action on the application within the time allowed.

- a. Approve the permit application if it is found to be in conformance with the provisions of this ordinance, and issue the permit;

ORDINANCE

COMMENTARY

-
- b. Approve the permit application subject to such reasonable conditions as may be necessary to secure substantially the objectives of this ordinance, and issue the permit subject to these conditions; or
 - c. Disapprove the permit application, indicating the deficiencies and the procedure for submitting a revised application and/or submission.

406.2 No site development permit shall be issued for an intended development site unless:

- a. the development, including but not limited to subdivisions and planned unit development, has been approved by the (village) where applicable, or
- b. such permit is accompanied by or combined with a valid building permit issued by the (village), or
- c. the proposed earth moving is coordinated with any overall development program previously approved by the (village) for the area in which the site is situated; and
- d. all relevant federal and state permits (i.e., for floodplains and wetlands) have been received for the portion of the site subject to soil disturbance.

406.2 Before earth movement begins, the local government will wish to be assured that the proposed development will comply with all applicable regulations. This can be done by mandating that the other required approvals or permits be secured prior to or concurrent with the site development permit, or by finding that the proposed earth moving is related to an annexation agreement, planned unit development, or other approved development program.

- d. This paragraph is not intended to address all federal and state permits, only those relevant to soil erosion and sediment control. For example, a site development permit could be issued while a developer awaits final IEPA approval regarding wastewater service.

ORDINANCE

COMMENTARY

406.3 Failure of the (permitting authority) to act on an original or revised application within thirty (30) days of receipt shall authorize the applicant to proceed in accordance with the plans as filed unless such time is extended by agreement between the (permitting authority) and the applicant. Pending preparation and approval of a revised plan, development activities shall be allowed to proceed in accordance with conditions established by the (permitting authority).

406.3 This provision is directed at reducing development costs by avoiding delays in government action. When some aspects of a proposed plan require modification, it may be reasonable to permit other parts of development to proceed as long as they do not render the modifications nugatory.

407.0 Expiration of Permit

Every site development permit shall expire and become null and void if the work authorized by such permit has not been commenced within one hundred and eighty (180) days, or is not completed by a date which shall be specified in the permit; except that the (permitting authority) may, if the permittee presents satisfactory evidence that unusual difficulties have prevented work being commenced or completed within the specified time limits, grant a reasonable extension of time if written application is made before the expiration date of the permit. The (permitting authority) may require modification of the erosion control plan to prevent any increase in erosion or offsite sediment runoff resulting from any extension.

407.0 Expiration of Permit

Because the erosion control measures required on a site are related to seasonal variations and other factors, changes may be required if the development does not proceed on the anticipated schedule. Some communities in northeastern Illinois have established 90 days (rather than 180) as the period within which development should begin. It is suggested that any fixed completion date be omitted from the ordinance and that this date be specified in the permit itself, relating the date to the developer's proposed schedule.

408.0 Appeals

The applicant, or any person or agency which received notice of the filing of the application, may appeal the decision of the (permitting authority) as provided in Section 406.0, to the (board of appeals). Upon receipt of an appeal, the (board of appeals) shall schedule and hold a public hearing, after giving 15 days notice thereof. The (board) shall render a decision within thirty (30) days after the hearing. Factors to be considered on review shall include, but need not be limited to, the effects of the proposed development activities on the surface water flow to tributary and downstream lands, any comprehensive watershed management plans, or the use of any retention facilities; possible saturation of fill and unsupported cuts by water, both natural and domestic; runoff surface waters that produce erosion and silting of drainageways; nature and type of soil or

408.0 Appeals

Provision should be made for the appeal of administrative decisions to a policy body of the local government. Appeal should be available to the applicant or to any body (e.g., the local Planning Commission or Soil and Water Conservation District) which has received the permit application for review. The ordinance should specify the body responsible for hearing and acting upon appeals, and for granting exceptions to the ordinance under Section 600.0. Depending on local practice, this may be the Zoning Board of Appeals, the Council or Trustees or Commissioners or its Planning or Development Committee, or the Planning Commission. The body should be identified among the definitions in Section 200.0. It may be desired to provide that this body seek a recommendation from those bodies which themselves have the right of appeal

ORDINANCE

COMMENTARY

rock which when disturbed by the proposed development activities may create earth movement and produce slopes that cannot be landscaped; and excessive and unnecessary scarring of the natural landscape through grading or removal of vegetation.

before it acts.

409.0 Retention of Plans

Plans, specifications, and reports for all site developments shall be retained in original form or on microfilm by the (permitting authority).

500.0 Design and Operation Standards and Requirements

500.0 Design and Operation Standards and Requirements

501.0 Applicability

501.0 Applicability

All clearing, grading, stripping, excavating, and filling which is subject to the permit requirements of this ordinance shall be subject to the applicable standards and requirements set forth in this Section 500.0.

It is reiterated that developments which are exempted from the permit requirements of this ordinance are still required to take actions to control erosion and sedimentation leaving the development site, and that those actions shall be generally consistent with this Section 500.0.

502.0 Responsibility

The permittee shall not be relieved of responsibility for damage to persons or property otherwise imposed by law, and the (village) or its officers or agents will not be made liable for such damage, by (1) the issuance of a permit under this ordinance, (2) compliance with the provisions of that permit or with conditions attached to it by the (permitting authority), (3) failure of (village) officials to observe or recognize hazardous or unsightly conditions, (4) failure of (village) officials to recommend denial of or to deny a permit, or (5) exemptions from the permit requirements of this ordinance.

503.0 Site Design Requirements

503.1 On-site sediment control measures, as

ORDINANCE

COMMENTARY

specified by the following criteria, shall be constructed and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

- a. For disturbed areas draining less than 1 acre, filter barriers (including filter fences, straw bales, or equivalent control measures) shall be constructed to control all offsite runoff as specified in referenced handbooks. Vegetated filter strips, with a minimum width of 25 feet, may be used as an alternative only where runoff in sheet flow is expected.

- b. For disturbed areas draining more than 1 but less than 5 acres, a sediment trap or equivalent control measure shall be constructed at the downslope point of the disturbed area.

- c. For disturbed areas draining more than 5 acres, a sediment basin or equivalent control measure shall be constructed at the downslope point of the disturbed area.

- d. Sediment basins and sediment traps designs shall provide for both detention storage and sediment storage. The detention storage shall be composed of equal volumes of "wet"

- a. Filter barriers are appropriate sediment control measures for small drainage areas where concentrated flow is not present. Existing references specify a range of appropriate drainage areas for their application. The Green Book recommends that filter barrier usage be limited to 1/2 acre drainage areas, except for individual lots where the drainage area may be increased to 1 acre. Draft USEPA guidance allows filter barriers for drainage areas up to 10 acres.

The Green Book recommends a minimum vegetative filter width of 15 feet to protect adjacent property or streams. While there is no clearly recognized standard for this width, NIPC recommends 25 feet for consistency with its stream and wetland protection ordinance and floodplain ordinance.

- b. Sediment traps or basins are required to control sediment runoff in situations where concentrated or channelized flow is likely to be present. Generally speaking, sediment barriers such as silt fences are ineffective and unreliable in such situations. In particular, they are subject to undercutting and blowout due to high water velocities.

It is recommended that the construction of sediment traps or basins be coordinated with the needs for stormwater detention. If properly designed, located, and maintained, sediment basins can be readily converted to permanent detention basins after the site is fully stabilized.

- d. Capacity must be provided in sediment basins for both sediment storage and detention storage. The detention storage detains the water for a sufficient period of time to

ORDINANCE

COMMENTARY

detention storage and "dry" detention storage and each shall be sized for the 2-year, 24-hour runoff from the site under maximum runoff conditions during construction. The release rate of the basin shall be that rate required to achieve minimum detention times of at least 10 hours. The elevation of the outlet structure shall be placed such that it only drains the dry detention storage.

settle out the eroded sediment. The sediment storage stores the settled sediment so that there is no loss of detention storage during the life of the sediment basin.

Both "wet" detention storage and "dry" detention storage are needed to maximize the effectiveness of the sediment basin. The total detention storage equal to twice the volume needed to detain the 2-year, 24-hour runoff for ten hours is approximately equal to the 10-year detention storage recommended by the Green Book and also recommended in draft USEPA guidance. For a typical site, this combined wet/dry storage is equivalent to 2.0 inches of runoff from the site.

The wet portion of the detention storage contains a permanent pool which drains by evaporation and infiltration only. The permanent pool prevents resuspension of previously deposited sediment and creates better settling conditions than a basin with no wet detention storage by reducing the energy of the incoming runoff. If the wet detention storage dries between events, it will detain with no release, the majority of runoff generated by the site for most events. The sediment basin should be equally effective if the wet detention storage dries between events or remains a permanent pool.

The dry portion of the detention storage is drained by an outlet structure and temporarily stores runoff for a sufficient period of time to allow settling of the settleable solids. The Green Book has examples and figures for calculating the required storage to achieve the design detention times and also has illustrations of outlet control devices. For most applications a release rate of 0.06 cfs/acre-inch of runoff should achieve the required detention time of ten hours. The Greenbook recommends using a Curve Number of 90 for sites under construction.

- e. The sediment storage shall be sized to store the estimated sediment load generated from the site over the duration of the construction period with a minimum storage equivalent to the volume of sediment generated in one

- e. The required sediment storage volume may be calculated using the Universal Soil Loss Equation or from Figure 6-20 in the Green Book.

ORDINANCE

COMMENTARY

year. For construction periods exceeding 1 year, the 1-year sediment load and a sediment removal schedule may be substituted.

503.2 Stormwater conveyance channels, including ditches, swales, and diversions, and the outlets of all channels and pipes shall be designed and constructed to withstand the expected flow velocity from the 10-year frequency storm without erosion. All constructed or modified channels shall be stabilized within 48 hours, consistent with the following standards:

- a. For grades up to 4 percent, seeding in combination with mulch, erosion blanket, or an equivalent control measure shall be applied. Sod or erosion blanket or mat shall be applied to the bottom of the channel.
- b. For grades of 4 to 8 percent, sod or an equivalent control measure shall be applied in the channel.
- c. For grades greater than 8 percent, rock, riprap, or an equivalent control measure shall be applied, or the grade shall be effectively reduced using drop structures.

503.3 Disturbed areas shall be stabilized with temporary or permanent measures within 7 calendar days following the end of active disturbance, or redisturbance, consistent with the following criteria:

- a. Appropriate temporary or permanent stabilization measures shall include seeding, mulching, sodding, and/or non-vegetative measures.
- b. Areas having slopes greater than 12 percent shall be stabilized with sod, mat or blanket in combination with seeding, or equivalent.

503.2 Conveyance channels, because of the presence of concentrated flows typically having high velocities, warrant special consideration. The slope categories and recommended control measures presented here are derived from language in the Kane County, Illinois draft ordinance.

Diversion channels, which are intended to route off-site flows away from disturbed areas, should be constructed as soon as possible in the construction process.

503.3 Early stabilization of disturbed areas is essential. USEPA guidance for the permitting of construction activities requires vegetative stabilization within 7 days. The Green Book recommends stabilization within 15 days.

- b. This provision recognizes the fact that steep slopes generally cannot be effectively stabilized with seeding and mulching alone. Slope instability and high runoff velocities necessitate the use of more substantial measures. The reference to a maximum slope of 12 percent, based on a Kane County

ORDINANCE

COMMENTARY

critterion, is subject to local discretion and soil conditions. Other ordinances refer to slopes as steep as 33 percent as needing special measures.

503.4 Land disturbance activities in stream channels shall be avoided, where possible. If disturbance activities are unavoidable, the following requirements shall be met:

- a. Construction vehicles shall be kept out of the stream channel to the maximum extent practicable. Where construction crossings are necessary, temporary crossings shall be constructed of non-erosive material, such as riprap or gravel.
- b. The time and area of disturbance of stream channels shall be kept to a minimum. The stream channel, including bed and banks, shall be restabilized within 48 hours after channel disturbance is completed, interrupted, or stopped.
- c. Whenever channel relocation is necessary, the new channel shall be constructed in the dry and fully stabilized before flow is diverted.

503.5 Storm sewer inlets and culverts shall be protected by sediment traps or filter barriers meeting accepted design standards and specifications.

503.5 Protection of storm sewer inlets should be implemented in a manner which will avoid unacceptable flooding of public streets.

503.6 Soil storage piles containing more than 10 cubic yards of material shall not be located with a downslope drainage length of less than 25 feet to a roadway or drainage channel. Filter barriers, including straw bales, filter fence, or equivalent, shall be installed immediately on the downslope side of the piles.

503.7 If dewatering devices are used, discharge locations shall be protected from erosion. All pumped discharges shall be routed through appropriately designed sediment traps or basins, or equivalent.

503.8 Each site shall have graveled (or equivalent) entrance roads, access drives, and parking areas of sufficient length and width to

ORDINANCE

COMMENTARY

prevent sediment from being tracked onto public or private roadways. Any sediment reaching a public or private road shall be removed by shoveling or street cleaning (not flushing) before the end of each workday and transported to a controlled sediment disposal area.

503.9 All temporary and permanent erosion and sediment control practices must be maintained and repaired as needed to assure effective performance of their intended function.

503.10 All temporary erosion and sediment control measures shall be disposed of within 30 days after final site stabilization is achieved with permanent soil stabilization measures. Trapped sediment and other disturbed soils resulting from the disposition of temporary measures should be permanently stabilized to prevent further erosion and sedimentation.

504.0 Handbooks Adopted by Reference

The standards and specifications contained in "Standards and Specifications for Soil Erosion and Sediment Control" (the Yellow Book) and the "Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control" (the Green Book) cited in Section 400.0, are hereby incorporated into this Section 500.0 and made a part hereof by reference for the purpose of delineating procedures and methods of operation under site development and erosion and sedimentation control plans approved under Section 400.0. In the event of conflict between provisions of said manuals and of this ordinance, the ordinance shall govern.

504.0 Handbooks Adopted by Reference

As previously indicated, there are certain inconsistencies between this ordinance and the manuals adopted by reference. For example, Paragraph 503.1 specifies design criteria for the sizing of sediment traps and basins. These criteria are similar to, but more explicit than, the Green Book. However, the Yellow Book specifies radically different criteria for the sizing of sediment traps and basins. In these cases, this ordinance governs.

Nonetheless, the two references can be valuable in the development of the erosion and sediment control plan and in the design and implementation of erosion and sediment control measures. In particular, the Yellow Book provides design specifications not provided by either the Ordinance or the Green Book.

ORDINANCE

COMMENTARY

505.0 Maintenance of Control Measures

All soil erosion and sediment control measures necessary to meet the requirements of this ordinance shall be maintained periodically by the applicant or subsequent land owner during the period of land disturbance and development of the site in a satisfactory manner to ensure adequate performance.

506.0 Inspection

The (permitting authority) shall make inspections as hereinafter required and shall either approve that portion of the work completed or shall notify the permittee wherein the work fails to comply with the site development or erosion and sedimentation control plan as approved. Plans for grading, stripping, excavating, and filling work bearing the stamp of approval of the (permitting authority) shall be maintained at the site during progress of the work. In order to obtain inspections and to ensure compliance with the approved erosion and sediment control plan, the grading or building permit, and this Ordinance, the permittee shall notify the (permitting authority) within two (2) working days of the completion of the construction stages specified below:

1. Upon completion of installation of sediment and runoff control measures (including perimeter controls and diversions), prior to proceeding with any

505.0 Maintenance of Control Measures

Effective maintenance of control measures is critical to their success and should be budgeted into the erosion and sediment control plan. Particular emphasis should be placed on the following types of maintenance needs: repair and replacement of sediment barriers, such as straw bales; removal of excess accumulated sediment from traps, basins, and channels; irrigation, fertilization, or reseeded of vegetatively stabilized areas; repair of scour or gully development on slopes and in channels; removal of sediment from roadways; and control of dust.

506.0 Inspection

On-site inspections are provided at critical junctures in the development process to assure that development practices and erosion control measures are effective in securing the objectives of the ordinance. Local governments will wish to coordinate this inspection schedule with those required under other permits. In general, inspection should be provided at least monthly, or more frequently in the event of major rainfall events. In some instances (e.g., very small sites), fewer inspections than the six suggested here may be sufficient. Provision is made for development to proceed in the event the local government cannot provide timely inspection, and for inspection at the stage of partial completion in the case of large, phased developments. The phases or areas for which separate inspections will be requested should be identified in the plan.

The "Illinois Field Manual for Implementation and Inspection of Erosion and Sediment Control Plans" is an excellent reference for conducting inspections. This manual includes a detailed checklist of inspection criteria and recommends that inspection be performed by a designated site inspector after every storm. USEPA recommends inspection by onsite personnel at least once every 7 days.

ORDINANCE

COMMENTARY

-
- other earth disturbance or grading,
 2. After stripping and clearing,
 3. After rough grading,
 4. After final grading,
 5. After seeding and landscaping deadlines,
and
 6. After final stabilization and landscaping,
prior to removal of sediment controls.

If stripping, clearing, grading and/or landscaping are to be done in phases or areas, the permittee shall give notice and request inspection at the completion of each of the above work stages in each phase or area. If an inspection is not made and notification of the results given within five working days after notice is received by the (village) from the permittee, the permittee may continue work at his/her own risk, without presuming acceptance by the (village). Notification of the results of the inspection shall be given in writing at the site.

507.0 Special Precautions

507.1 If at any stage of the grading of any development site the (permitting authority) determines by inspection that the nature of the site is such that further work authorized by an existing permit is likely to imperil any property, public way, stream, lake, wetland, or drainage structure, the (permitting authority) may require, as a condition of allowing the work to be done, that such reasonable special precautions to be taken as is considered advisable to avoid the likelihood of such peril. "Special precautions" may include, but shall not be limited to, a more level exposed slope, construction of additional drainage facilities, berms, terracing, compaction, or cribbing, installation of plant materials for erosion control, and recommendations of a registered soils engineer and/or engineering geologist which may be made requirements for further work.

507.2 Where it appears that storm damage may result because the grading on any development site is not complete, work may be stopped and the permittee required to install temporary structures or take such other measures as may be required to protect adjoining property or the public safety. On large developments or where unusual site conditions prevail, the (permitting authority) may

507.0 Special Precautions

507.1 Unanticipated (1) site conditions or (2) storm events may require that erosion control measures beyond those provided for in the approved plan be instituted. These should be reasonable in terms of the additional costs or delays they impose on the developer in relationship to the risks incurred by the failure to undertake such measures.

ORDINANCE

COMMENTARY

specify the time of starting grading and time of completion or may require that the operations be conducted in specific stages so as to insure completion of protective measures or devices prior to the advent of seasonal rains.

508.0 Amendment of Plans

Major amendments of the site development or erosion and sedimentation control plans shall be submitted to the (permitting authority) and shall be processed and approved or disapproved in the same manner as the original plans. Field modifications of a minor nature may be authorized by the (permitting authority) by written authorization to the permittee.

600.0 Enforcement

601.0 Exceptions

The (board of appeals) may, in accordance with the following procedures, authorize exceptions to any of the requirements and regulations set forth in this ordinance:

601.1 Application for any exception shall be made by a verified petition of the applicant for a site development permit, stating fully the grounds of the petition and the facts relied upon by the applicant. Such petition shall be filed with the site development permit application. In order for the petition to be granted, it shall be necessary that the (board of appeals) find all of the following facts with respect to the land referred to in the petition:

- a. That the land is of such shape or size or is affected by such physical conditions or is subject to such title limitations of record,that it

508.0 Amendment of Plans

Particularly on large or phased developments, changed conditions during development may require changes in the plans on which the permit was based. Whether these are of such magnitude as to require a complete review of the project and the adequacy of erosion control measures is a matter of administrative judgment as to potential costs to the developer and the public.

600.0 Enforcement

601.0 Exceptions

Exceptions to the requirements of the ordinance may be granted where such exception would not be contrary to the public welfare and where enforcement of the requirements would work undue hardship on the landowner. The required findings and procedures (including public hearing) are intended to assure that exceptions are granted only after full assessment of their benefits and costs, including any adverse environmental impacts. If it is the local government's practice to permit decisions by the board of appeals to be referred to the principal policy body (county or municipal board or council), provisions for this second appeal should be added to this Section.

ORDINANCE

COMMENTARY

is impossible or impractical for the applicant to comply with all of the requirements of this ordinance;

- b. That the exception is necessary for the preservation and enjoyment of a substantial property right of the applicant; and
- c. That the granting of the exception will not be detrimental to the public welfare or injurious to other property in the vicinity of the subject property.

601.2 Each application for an exception shall be referred to the (permitting authority) for review. The (authority) shall transmit its recommendations to the (board of appeals), which shall review such recommendations prior to granting or denying the exception.

601.3 The (board of appeals) shall hold a public hearing on each application for exception, within thirty (30) days after receiving application, in the manner provided with respect to appeals. After public hearing, the (board) may approve the site development permit application with the exceptions and conditions it deems necessary or it may disapprove such site development permit application and exception application or it may take such other action as appropriate.

602.0 Stop-Work Order; Revocation of Permit

In the event any person holding a site development permit pursuant to this ordinance violates the terms of the permit, or carries on site development in such a manner as to materially adversely affect the health, welfare, or safety of persons residing or working in the neighborhood of the development site or so as to be materially detrimental to the public welfare or injurious to property or improvements in the neighborhood, the (permitting authority) may suspend or revoke the site development permit.

602.1 Suspension of a permit shall be by a written stop-work order issued by the (permitting authority) and delivered to the permittee or his agent or the person performing the work. The stop-work order shall be effective immediately,

601.3 If local practice includes the use of a hearing officer who makes a report and recommendation to the board of appeals, this provision may be added here.

602.0 Stop-Work Order; Revocation of Permit

A stop-work order may be issued in the event the requirements of the ordinance are violated. This order is temporary unless confirmed by the body responsible for hearing appeals and exceptions. A local government may wish to specify a maximum term for such a temporary permit (e.g., 30 days), after which action by the appeal body will be necessary for the order to remain in force, rather than referring to the board of appeals' next regular meeting.

ORDINANCE

COMMENTARY

shall state the specific violations cited, and shall state the conditions under which work may be resumed. A stop-work order shall remain in effect until the next regularly scheduled meeting of the (board of appeals) at which the conditions of sub-paragraph 602.2 below can be met.

602.2 No site development permit shall be permanently suspended or revoked until a hearing is held by the (board of appeals). Written notice of such hearing shall be served on the permittee, either personally or by registered mail, and shall state:

1. the grounds for complaint or reasons for suspension or revocation, in clear and concise language; and
2. the time when and place where such hearing will be held.

Such notice shall be served on the permittee at least five (5) days prior to the date set for the hearing. At such hearing, the permittee shall be given an opportunity to be heard and may call witnesses and present evidence on his behalf. At the conclusion of the hearing the (board of appeals) shall determine whether the permit shall be suspended or revoked.

603.0 Violations and Penalties

No person shall construct, enlarge, alter, repair, or maintain any grading, excavation or fill, or cause the same to be done, contrary to or in violation of any terms of this ordinance. Any person violating any of the provisions of this ordinance shall be deemed guilty of a misdemeanor, and each day during which any violation of any of the provisions of this ordinance is committed, continued, or permitted shall constitute a separate offense. Upon conviction of any such violation, such person, partnership, or corporation shall be punished by a fine of not more than (\$500) for each offense. In addition to any other penalty authorized by this section, any person, partnership, or corporation convicted of violating any of the provisions of this ordinance shall be required to restore the site to the condition existing prior to commission of the violation, or to bear the expense of such restoration.

603.0 Violations and Penalties

Financial penalties are provided for conviction of violation of the ordinance. Several referenced ordinances also allow for imprisonment. Depending on local practice, it may be desired to identify in the ordinance the official by whom action against alleged violations will be brought and the procedure to be followed. The amount of the penalty should be related to the local government's overall fine schedule.

604.0 Separability

The provisions and sections of this ordinance shall be deemed to be separable, and the invalidity of any portion of this ordinance shall not affect the validity of the remainder.

June 2000 revised draft
Northeastern Illinois Planning Commission

**MODEL
STORMWATER
DRAINAGE AND
DETENTION ORDINANCE**

100.0 Authority and Purpose

This ordinance is enacted pursuant to the police powers granted to (County, City, Village) by the Illinois Revised Statutes (Chapter __, Sections ____).

The purpose of this ordinance is to diminish threats to public health, safety and welfare caused by runoff of excessive stormwater from new development and redevelopment. This excessive stormwater could result in the inundation of damageable properties, the erosion and destabilization of downstream channels, and the pollution of valuable stream and lake resources. The cause of increases in stormwater runoff quantity and rate and impairment of quality is the development and improvement of land and as such this ordinance regulates these activities to prevent adverse impacts.

This ordinance is adopted to accomplish the following objectives:

100.1 To assure that new development does not increase the drainage or flood hazards to others, or create unstable conditions susceptible to erosion;

100.2 To protect new buildings and major improvements to buildings from flood damage due to increased stormwater runoff;

100.3 To protect human life and health from the hazards of increased flooding on a watershed basis;

100.4 To lessen the burden on the taxpayer for flood control projects, repairs to flood-damaged public facilities and utilities, correction of channel erosion problems, and flood rescue and relief operations caused by increased stormwater runoff quantities from new development;

100.5 To protect, conserve, and promote the orderly development of land and water resources;

100.6 To preserve the natural hydrologic and hydraulic functions of watercourses and floodplains and to protect water quality and aquatic habitats;

100.7 To preserve the natural characteristics of stream corridors in order to moderate flood and stormwater impacts, improve water quality, reduce soil erosion, protect aquatic and riparian habitat, provide recreational opportunities, provide aesthetic benefits and enhance

100.0 Authority and Purpose

In order to stand the tests of legality and constitutionality, ordinances should clearly define the purposes for which they are enacted. The purposes described here cover the full range of beneficial water resources uses for which protection of public interests is sought by enactment of this ordinance.

County authority to regulate drainage derives from Chapter 34 Sections 414 (subdivision control), 422 (building codes), and 3151 (zoning). Municipal authority derives from Chapter 24, Sections 11-12-5,6, and 12 (subdivision regulations), 11-13-1 (zoning), 11-14-1 (set-back lines), 11-30-2 and 8 (building codes), 11-105-1 (public lands), 11-109-1 (culverts, drains), 11-110-11 (drainage, flood control), and Chapter 85, Section 1711 (on-site detention). Additionally, the Water Quality Act of 1987 and proposed federal regulations 40CFR Parts 122, 123, 124, and 504 will require new construction discharging to the waters of the United States to provide on-site management of stormwater pollutants. Finally, P.A.s 85-905 and 1266 add comprehensive stormwater management authority to northeastern Illinois counties (excluding Cook) which choose to exercise them.

community and economic development.

200.0 Definitions

200.1 Adverse Impacts: Any deleterious impact on water resources or wetlands affecting their beneficial uses including recreation, aesthetics, aquatic habitat, quality, and quantity.

200.2 Applicant: Any person, firm, or governmental agency who executes the necessary forms to procure official approval of a development or permit to carry out construction of a development from the (County, City, Village of _____).

200.3 Base Flood Elevation: The elevation at all locations delineating the level of flooding resulting from the 100-year frequency flood event.

200.4 Best Management Practice (BMP): A measure used to control the adverse stormwater-related effects of development. BMPs include site design approaches (e.g., cluster development) and structural devices (e.g., swales, filter strips, infiltration trenches, and detention basins) designed to reduce pollutant runoff, reduce runoff rates and volumes, and protect aquatic habitats. BMPs also include non-structural approaches, such as public education efforts to prevent the dumping of household chemicals into storm drains.

200.5 Bypass Flows: Stormwater runoff from upstream properties tributary to a property's drainage system but not under its control.

200.6 Channel: Any river, stream, creek, brook, branch, natural or artificial depression, ponded area, flowage, slough, ditch, conduit, culvert, gully, ravine, wash, or natural or manmade drainageway, which has a definite bed and bank or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.

200.7 Channel Modification: Alteration of a channel by changing the physical dimensions or materials of its bed or banks. Channel modification includes damming, riprapping (or other armoring), widening, deepening, straightening, relocating, lining, and significant removal of bottom or woody rooted vegetation. Channel

200.0 Definitions

Local governments may choose to shorten or expand this list of definitions dependent on information contained in other ordinances. It is important to note that a number of definitions are directly applicable to floodplain ordinances. They are included because of the interaction between stormwater drainage and flood control facilities.

200.6 Channel: Channels include on-stream lakes and impoundments.

200.7 Channel Modification: NIPC policy expressly opposes unnecessary channel modifications because of the extreme damage they can cause to aquatic habitat and because of the uncertainty that modified systems can provide the same beneficial uses and functions as natural systems.

modification does not include the clearing of debris or removal of trash.

200.8 Compensatory Storage: An artificially excavated, hydraulically equivalent volume of storage within the floodplain used to balance the loss of natural flood storage capacity when fill or structures are placed within the floodplain.

200.9 Conduit: Any channel, pipe, sewer or culvert used for the conveyance or movement of water, whether open or closed.

200.10 Detention Basin: A facility constructed or modified to provide for the temporary storage of stormwater runoff and the controlled release by gravity of this runoff at a prescribed rate during and after a flood or storm.

200.11 Detention Time: The mean residence time of stormwater in a detention basin.

200.12 Development: Any man-made change to real estate, including:

- a) Preparation of a plot of subdivision;
- b) Construction, reconstruction or placement of a building or any addition to a building;
- c) Installation of a manufactured home on a site, preparing a site for a manufactured home, or installing a travel trailer on a site for more than 180 days;
- d) Construction of roads, bridges, or similar projects;
- e) Redevelopment of a site;
- f) Filling, dredging, grading, clearing, excavating, paving, or other non-agricultural alterations of the ground surface;
- g) Storage of materials or deposit of solid or liquid waste;
- h) Any other activity that might alter the magnitude, frequency, deviation, direction, or velocity of stormwater flows from a property.

200.13 Drainage Plan: A plan, including engineering drawings and supporting calculations, which describes the existing stormwater drainage system and environmental features, as well as the drainage system and environmental features which are proposed after development of a property.

200.14 Dry Basin: A detention basin designed to drain completely after temporary storage of stormwater flows and to normally be dry over the majority of its bottom area between runoff events.

200.15 Erosion: The general process whereby earth is removed by flowing water or wave action.

200.16 Excess Stormwater Runoff: The volume and rate of flow of stormwater discharged from an urbanized drainage area which is or will be in excess of that volume and rate which occurred before urbanization.

200.17 Floodplain: That land, generally adjacent to a body of water, with ground surface elevations at or below the base flood or the 100-year frequency flood elevation. The floodplain is also known as the Special Flood Hazard Area (SFHA).

200.18 Flood Fringe: That portion of the floodplain outside of the regulatory floodway.

200.19 Floodway: The channel and that portion of the flood-plain adjacent to a stream or watercourse which is needed to store and convey the anticipated existing and future 100-year frequency flood discharge with no more than a 0.1 foot increase in stage due to any loss of flood conveyance or storage and no more than a ten percent increase in velocities.

200.20 Hydrograph: A graph showing for a given location on a stream or conduit, the flow rate with respect to time.

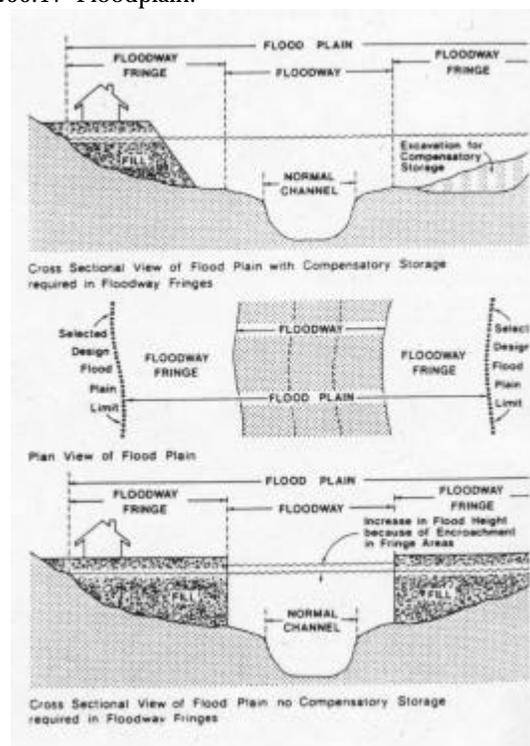

200.21 Infiltration: The passage or movement of water into the soil surfaces.

200.22 Major Drainage System: That portion of a drainage system needed to store and convey flows

200.14 Dry Basin: Conventional dry bottom detention designs are not recommended, for several reasons. 1) Dry basins are relatively ineffective in removing runoff pollutants and 2) it will be difficult to maintain conventional turf vegetation in dry basin bottoms due to the restrictive release rates of this ordinance that are intended to promote extended detention times.

200.15 Erosion: For the purposes of this ordinance, only erosion by water is considered.

200.17 Floodplain:

beyond the capacity of the minor drainage system.

200.23 Minor Drainage System: That portion of a drainage system designed for the convenience of the public. It consists of street gutters, storm sewers, small open channels, and swales and, where manmade, is usually designed to handle the 10-year runoff event or less.

200.24 Mitigation: Mitigation includes those measures necessary to minimize the negative effects which stormwater drainage and development activities might have on the public health, safety and welfare. Examples of mitigation include compensatory storage, soil erosion and sedimentation control, and channel restoration.

200.25 Natural: Conditions resulting from physical, chemical, and biological processes without intervention by man.

200.26 One Hundred-Year Event: A rainfall, runoff, or flood event having a one percent chance of occurring in any given year.

200.27 Positive Drainage: Provision for overland paths for all areas of a property including depressional areas that may also be drained by storm sewer.

200.25 Natural: There are few truly natural stream reaches in northeastern Illinois or the entire state for that matter. Channel modification, treatment plant discharges, and urban runoff all have reduced the naturalness of Illinois streams. NIPC has placed high priority on the protection of natural features that remain on northeastern Illinois streams because of the beneficial uses they provide, including recreation, aquatic habitat, flood control and groundwater recharge.

200.26 One-hundred Year Event: It is important to note that the term "one-hundred year event" does not mean that only one such event will occur every one hundred years. The more correct way of thinking about such an event is that it will have a one percent chance of occurring in any given year. For example there is an 18 percent chance that two 100-year events will occur within any given 100 year period.

Another important point is that the magnitude of such an event is a statistical estimate whose reliability depends on the size of the sample which is available for analysis and the variability of the data in that sample. In short, factors of safety are strongly encouraged when utilizing these estimates in drainage system design.

Finally, it is important to reiterate that the 100-year rainfall event does not equate to the 100-year runoff event. Antecedent soil moisture, temperature, and streamflow conditions can combine to turn the 25-year rainfall event into the 100-year flood event as in the 1986 flooding in northeastern Illinois.

200.28 Peak Flow: The maximum rate of flow of water at a given point in a channel or conduit.

200.29 Property: A parcel of real estate.

200.30 Regulatory Floodway: The channel, including on-stream lakes, and that portion of the flood plain adjacent to a stream or watercourse as designated by the IDNR/OWR, which is needed to store and convey the existing and anticipated future 100-year frequency flood discharge with no more than a 0.1 foot increase in stage due to the loss of flood conveyance or storage, and no more than a 10% increase in velocities. The regulatory floodways are designated for ____ (stream) on the Flood Boundary and Floodway Map prepared by FEMA (or Department of Housing and Urban Development) and dated ____ and for ____ (stream) on the Regulatory Flood Plain Map prepared by the IDNR/OWR and dated _____. The regulatory floodways or those parts of unincorporated County that are within the extraterritorial jurisdiction of the (City, Village) that may be annexed into the (City, Village) are designated for ____ (stream) on the Flood Boundary and floodway map prepared by the FEMA (or Department of Housing and Urban Development) and dated _____. To locate the regulatory floodway boundary on any site, the regulatory floodway boundary should be scaled off the regulatory floodway map and located on a site plan, using reference marks common to both maps. Where interpretation is needed to determine the exact location of the regulatory floodway boundary, the Division should be contacted for the interpretation.

200.31 Retention Basin: A facility designed to completely retain a specified amount of stormwater runoff without release except by means of evaporation, infiltration, emergency bypass or pumping.

200.32 Sedimentation: The process that deposits soils, debris, and other materials either on other ground surfaces or in bodies of water or stormwater drainage systems.

200.33 Stormwater Drainage System: All means, natural or man-made, used for conducting stormwater to, through or from a drainage area to the point of final outlet from a property. The stormwater drainage system includes but is not limited to any of the following: conduits and appurtenance features, canals, channels,

200.30 Regulatory Floodway: This definition is only applicable to Cook, DuPage, Kane, Lake, McHenry, and Will counties and is the result of Public Act 85-905.

200.31 Retention Basin: This term is sometimes used by others to describe a wet bottom basin. That usage is different from that intended in this ordinance.

ditches, streams, culverts, streets, storm sewers, detention basins, swales and pumping stations.

200.34 Stormwater Runoff: The waters derived from melting snow or rain falling within a tributary drainage basin which are in excess of the infiltration capacity of the soils of that basin, which flow over the surface of the ground or are collected in channels or conduits.

200.35 Storm Sewer: A closed conduit for conveying collected stormwater.

200.36 Time of Concentration: The elapsed time for stormwater to flow from the most hydraulically remote point in a drainage basin to a particular point of interest in that watershed.

200.37 Tributary Watershed: all of the land surface area that contributes runoff to a given point.

200.38 Two-year Event: A runoff, rainfall, or flood event having a fifty percent chance of occurring in any given year.

200.39 Urban Runoff Pollutants: Contaminants commonly found in urban runoff which have been shown to adversely affect uses in receiving waterbodies. Pollutants of concern include sediment, heavy metals, petroleum-based organic compounds, nutrients, oxygen-demanding organics (BOD), pesticides, salt, and pathogens.

200.40 Wet Basin: A detention basin designed to maintain a permanent pool of water below the active storage zone for stormwater runoff.

200.41 Wetland Basin: A detention basin designed with all or a portion of its bottom area as a wetland.

200.34 Stormwater Runoff: The volume and rate of stormwater runoff produced by any rainfall event is a variable dependent on land cover capability to intercept and infiltrate the precipitation. As a result the probability of stormwater runoff volumes and rates are not the same as the probability of rainfall but rather are a function of the probability of antecedent soil moisture conditions and rainfall, as well as temperature (frozen ground) and land cover conditions.

200.39 Urban Runoff Pollutants: Adverse effects of runoff pollutants include toxicity to fish and aquatic life, sediment contamination, excessive growth of aquatic plants (eutrophication), impairment of water supplies, beach closings, and destruction of sensitive wetland plant communities.

200.41 Wetland Basin: While some of the bottom area of a wetland basin can be used for recreational purposes (similar to a dry basin), a substantial portion will be vegetated as a wetland and/or excavated as a stilling basin.

300.0 Applicability

This ordinance shall apply to all development in the (County, City, Village) of _____.

400.0 Drainage Plan Submittal Requirements

Each applicant shall submit the following information, depending on development size, to ensure that the provisions of this ordinance are met. The submittal shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts of the development on water resources both on-site and downstream, and the effectiveness of the proposed drainage plan in managing stormwater runoff. The applicant shall certify on the drawings that all clearing, grading, drainage, and construction shall be accomplished in strict conformance with the drainage plan. The following information shall be submitted for both existing and proposed property conditions.

Properties smaller than 10 acres shall submit only the

300.0 Applicability

It is important that all properties within the local government's jurisdiction be treated equitably which suggests the need for uniform applicability of regulations.

However, special considerations may be necessary for smaller development sites where very small detention basins would result from the requirements of this ordinance. The necessarily small outlets of these basins could result in a greater likelihood of operational and maintenance problems.

Communities are encouraged to establish a master drainage plan which provides for regional detention sites and facilities at strategic points in the community's watersheds so that properties not providing on-site detention are still controlled at regional sites. This would require the establishment of a fee-in-lieu of detention system for properties not building on-site detention and a means for collecting and spending these fees, purchasing land for regional basins, constructing regional detention basins and participating in up-sizing detention basins to regionalize their function ("opportunity regionalization," see Section 800).

Communities should remain cognizant of their legal responsibilities to ensure that new development will not damage downstream properties. It is likely that even a one-acre commercial site will cause downstream drainage problems if not adequately mitigated. The ordinance therefore recommends that a community review small site exceptions on a case by case basis.

400.0 Drainage Plan Submittal Requirements

The drainage plan is the essence of the application for a permit to construct. The intent is for the drainage plan to depict existing drainage and environmental (wetlands, watercourses, floodplains, floodways) features on the property and then to define how the applicant intends to modify and/or utilize those features to accommodate the drainage needs for the development. Requirements are divided between small developments whose individual impacts are not likely to be major and larger properties where more detailed analysis of onsite and offsite impacts is warranted.

Properties smaller than one acre should be evaluated for

Basic Drainage Plan called for in Section 401.0. Properties larger than 10 acres shall comply with the submittal requirements of both the Basic Drainage Plan and the Advanced Drainage Plan of Section 402.0.

drainage plan submittal requirements by the zoning administrator. If it is determined that the impact of the proposed development is insignificant, detailed submittals may be waived.

401.0 Basic Drainage Plan

401.1 Topographic Map: A topographic survey of the property at one-foot contours under existing and proposed conditions, and areas upstream and downstream, necessary to determine off-site impacts of the proposed drainage plan. The map shall be keyed to a consistent datum specified by the (County, City, Village).

401.1 Topographic Map: Local governments should substitute whatever contour interval they would normally require in reviewing plats. However, intervals greater than two feet may lead to the inability to accurately judge drainage plan effectiveness particularly for smaller sites.

401.2 Drainage System: Mapping and descriptions, where relevant, of existing and proposed drainage system features of the property and immediate vicinity including:

- a) the banks and centerline of streams and channels;
- b) shoreline of lakes, ponds, and detention basins;
- c) farm drains and tiles;
- d) sub-watershed boundaries within the property;
- e) watershed soils classifications;
- f) the property's location within the larger watershed;
- g) location, size and slope of stormwater conduits and drainage swales;
- h) sanitary or combined sewers;
- i) depressional storage areas;
- j) delineation of upstream and downstream drainage features and watersheds which might be affected by the development;
- k) detention facilities;
- l) roads and streets and associated stormwater inlets;
- m) base flood elevation, and regulatory floodway where identified for the property; and
- n) basis of design for the final drainage network components.
- o)

401.3 Environmental Features: A depiction of environmental features of the property and immediate vicinity including the following:

- a) the limits of wetland areas;
- b) any designated natural areas; and
- c) any proposed environmental mitigation features.

401.3 Environmental Features: Consistent with the comprehensive stormwater management intent of this ordinance, a full depiction of existing and proposed environmental features is required as part of the drainage plan. Proposed measures to mitigate impacts of development on these features is also required.

402.0 Advanced Drainage Plan

402.0 Advanced Drainage Plan

The same information as required in Section 401.0 is required for properties larger than 10 acres along with the following additional information for the minor drainage system's design runoff event and the 100-year runoff event of critical duration:

- a) elevations and maps of 100-year flooding;
- b) cross-section data for open channel flow paths and designated overland flow paths;
- c) direction of storm flows;
- d) flow rates and velocities at representative points in the drainage system; and
- e) a statement by the design engineer of the drainage system's provisions for handling events greater than the 100-year's runoff.

500.0 Minimization of Increases in Runoff Volumes and Rates

In the preparation of a site design and drainage plan for a development, the applicant shall evaluate and implement, where practicable, site design features which minimize the increase in runoff volumes and rates from the site. The applicant's drainage plan submittal shall include evaluations of site design features which are consistent with the following hierarchy:

- 1) Preserve natural resource features of the development site (e.g., native woodlands, prairie remnants, wetlands, and floodplains);
- 2) Preserve existing natural swales, drainageways, streams, and depressions;
- 3) Minimize impervious surfaces on the property, consistent with the needs of the project (e.g., reduce road widths, minimize driveway length and width, share driveways, cluster houses);
- 4) Preserve the natural infiltration characteristics of the site and incorporate designed infiltration devices (e.g., trenches and basins), where feasible;
- 5) Attenuate surface runoff flows by use of open vegetated swales and natural depressions and preserve existing natural stream channels;
- 6) Provide stormwater retention structures;
- 6) Provide wet bottom or wetland detention structures

The intent of this section of the drainage plan is to demonstrate that the applicant's design takes into account the extent of flooding on the property for a full range of conditions, that velocities within the drainage system will not be dangerous or erosive, and that flow patterns to any detention facility are identified. The referenced critical duration is the duration of the design event which results in the greatest peak flows at a given point in the drainage system. Local governments should substitute the design event they require for the minor drainage system (storm sewers, etc.) into the ordinance language.

500.0 Minimization of Increases in Runoff Volumes and Rates

Conventional site designs incorporate features that seek to rapidly drain surface stormwater runoff from the site as a waste product. The approach recommended in this ordinance seeks to maximize the natural infiltration of precipitation and minimize the generation of surface stormwater runoff, mimicking as closely as practicable the natural drainage characteristics of the site prior to development.

Local governments should carefully evaluate the hierarchy recommended in the model ordinance for applicability to their situations. Some communities may find certain alternative site design and natural drainage approaches volume control and swale drainage difficult to implement on some sites due to topographical, soil, and building density constraints. However, many all communities, particularly those experiencing development in previously rural watersheds, may should be able to apply adapt this hierarchy to achieve better control of both stormwater quantity and quality. Land developers may also benefit from the lower costs of drainage systems which rely less on storm sewers and large detention basins.

It is important to recognize that certain infiltration practices such as dry wells will require a Class V injection well permit from IEPA. The Illinois Groundwater Protection Act also has resulted in the establishment of setback zones around community wells which need to be observed when siting certain infiltration practices (e.g., for industrial facilities) which could be considered

to slow the rate of runoff and reduce runoff pollutants leaving the site; and

- 7) Construct storm sewers.

600.0 Water Quality and Multiple Uses

The drainage system should be designed to minimize adverse water quality impacts downstream and on the property itself. Detention basins shall incorporate design features to capture stormwater runoff pollutants. In particular, designers shall utilize wet bottom and wetland detention designs and all flows from the development shall be routed through the basin (i.e., low flows shall not be bypassed). Retention and infiltration of stormwater shall be promoted throughout the property's drainage system to reduce the volume of stormwater runoff and to reduce the quantity of runoff pollutants.

The drainage system should incorporate multiple uses, where practicable. Uses considered compatible with stormwater management include open space, aesthetics, aquatic habitat, recreation (boating, trails, playing fields), wetlands and water quality mitigation.

potential pollution sources.

600.0 Water Quality and Multiple Uses

~~Local governments should add language to this section to note that federal National Pollutant Discharge Elimination System (NPDES) permit requirements may apply to construction activities on the property. Final regulations are expected to be available in mid-1990 and would mandate implementation of stormwater quality management practices for land development activities.~~

Stormwater system designs should be in conformance with Illinois EPA stormwater permitting requirements. In particular, a state National Pollutant Discharge Elimination System (NPDES) Permit for Construction Site Activities is required for land disturbances of five or more acres. (Soon, the requirement will apply to sites of one or more acres, as part on NPDES Phase 2.) Permit requirements for a "stormwater pollution prevention plan" specifically reference the need for stormwater detention, vegetated swales and natural depressions, infiltration measures, and velocity dissipation devices to control runoff pollutants and to maintain pre-development hydrologic conditions.

Good drainage system design strives to develop a drainage plan which accomplishes the safe conveyance and storage of stormwater from a property while also achieving the multiple objectives of water quality, recreation, open space, and aesthetics. While recreation is encouraged, particularly for residential sites, water contact activities (e.g., swimming) generally should be discouraged in detention basins due to the occurrence of potential human pathogens (i.e., fecal coliform bacteria) in stormwater runoff.

The design philosophy of this ordinance recognizes a tradeoff. By isolating runoff pollutants in facilities like sediment basins, and preventing them from impairing uses in downstream waterbodies, the use of certain stormwater facilities may be constrained. However, pollutant control is greatly facilitated and the burden for mitigating development impacts is placed on developers and new residents rather than on society as a whole. Local use constraints can be minimized by certain non-structural BMPs, such as source control programs for

residents.

700.0 Design Criteria, Standards, and Methods

701.0 Release Rates - The drainage system for a property shall be designed to control the peak rate of discharge from the property for the two-year, 24-hour and 100-year, 24-hour events to levels which will not cause an increase in flooding or channel instability downstream when considered in aggregate with other developed properties and downstream drainage capacities. The peak discharge from events less than or equal to the two-year event shall not be greater than 0.04 cfs per acre of property drained. The peak 100-year discharge shall not be greater than 0.15 cfs per acre of property drained.

700.0 Design Criteria, Standards, and Methods

Local governments may wish to modify or add language to this section depending on their local conditions or needs. For example, if local governments wish to adopt a design recurrence other than the 10-year event for storm sewer design, it should be substituted wherever the 10-year event requirement appears.

701.0 Release Rates - In the absence of a detailed watershed-specific planning study, it is felt that these release rates, in combination with the ordinance storage requirements, will be effective in 1) limiting 100-year flooding to existing conditions and 2) controlling flooding to existing conditions for events less than the 100-year event. The recommended release rates are based in part on the results of a study of detention effectiveness in a 30-square mile watershed. The study results indicate that the recommended release rates likely will be effective for larger watersheds, but larger watersheds have not been explicitly evaluated.

The recommended 100-year release rate of 0.15 cfs/acre is the same as that recommended in NIPC's previous detention ordinance (dated March 1980) which was based on observed maximum recorded streamflows in northeastern Illinois.

The two-year release rate criteria is intended to control the magnitude, frequency, and duration of bankfull streamflows downstream of the property. Urbanization without detention control of the two-year event results in dramatic increases (200 percent) in the magnitude of the 2-year event and frequency of bankfull conditions resulting in stream destabilization. This leads to streambed and bank erosion and damages, both economic and environmental.

The two-year, 24-hour event release rate requirement also will provide additional settling time to remove suspended stormwater pollutants. About 80 percent of the long term runoff volume from a watershed results from events less than or equal to this two-year event. Small events (0.1 to 0.2 inches of runoff) will likely be detained for at least 5 to 10 hours and larger runoffs (1 inch or more) will receive detention times exceeding 24 hours.

701.1 Detention Basin Outlet Design: Backwater on the outlet structure from the downstream drainage system shall be evaluated when designing the outlet.

702.0 Detention Storage Requirements - The design maximum storage to be provided in a detention basin shall be based on the runoff from the 100-year, 24-hour event and reservoir (also called modified puls or level pool) routing or equal. Detention storage shall be computed using hydrograph methods as described in this section.

703.0 Drainage System Design and Evaluation - The following criteria should be used in evaluating and designing the drainage system. The underlying objective is to provide capacity to pass the 10-year peak flow in the minor drainage system and an overload flow path for flows in excess of the design capacity.

703.1 Design Methodologies: Major and minor conveyance systems for areas up to 10 acres may be designed using the rational formula. The rational formula may also be used in sizing the minor drainage system for larger sites. Runoff hydrograph methods as described in Section 704.0 must be used for major drainage system design for all systems with greater than 10 acres of drainage area and for the design of all detention basins.

703.2 Positive Drainage: Whenever practicable, all areas of the property must be provided an overland flow path that will pass the 100-year flow at a stage at least 1

Control of the two-year release rate to 0.04 cfs/acre likely will result in longer detention times than most existing ordinances. As a result, special design features should be considered to avoid maintenance and operational problems.

701.1 Detention Basin Outlet Design: If downstream conditions are not considered when determining the capacity of the outlet structure, the detention basin may fill quicker and release a higher peak discharge through the overflow structure than required by the ordinance.

702.0 Detention Storage Requirements - The requirements of this ordinance will result in substantially larger storage volumes than typically required by most existing ordinances. NIPC's study of detention effectiveness indicated that detention basins designed using traditional assumptions of rainfall (i.e. T.P.40) and the simple runoff relationships of the modified rational formula will have too little storage and will likely overflow for events much smaller than the 100-year event.

If use of the modified rational formula is to be allowed (which is extremely discouraged), the 100-year event of critical duration should be specified when the modified rational formula is used, durations of less than 24 hours are often critical.

703.0 Drainage System Design and Evaluation - The local government should substitute the design event they require for minor drainage systems (storm sewers, swales, etc.).

703.1 Design Methodologies: The rational formula is an adequate design tool for small conveyance systems but is not appropriate for larger sites or for the design of detention basins. More sophisticated hydrograph methods are widely available and are relatively easy to apply using personal computers.

703.2 Positive drainage is provided to prevent flooding when the design capacity of the minor conveyance system is exceeded. Positive drainage also makes

foot below the lowest foundation grade in the vicinity of the flow path. Overland flow paths designed to handle flows in excess of the minor drainage system capacity shall be provided drainage easements. Street ponding and flow depths shall not exceed curb heights by more than one inch.

704.0 Methods for Generating Runoff Hydrographs - Runoff hydrographs shall be developed incorporating the following assumptions of rainfall amounts and antecedent moisture.

704.1 Rainfall: Unless a continuous simulation approach to drainage system hydrology is used, all design rainfall events shall be based on the Illinois State Water Survey's Bulletin 70. The first quartile point rainfall distribution shall be used for the design and analysis of conveyance systems with critical durations less than or equal to 12 hours. The third quartile point rainfall distribution shall be used for the design and analysis of detention basins and conveyance system with critical durations greater than 12 and less than or equal to 24 hours. The fourth quartile distribution shall be used in the design and analysis of systems with durations greater than 24 hours. The first, third, and fourth quartile distributions described by Huff are presented in Table 37 of Bulletin 70. The SCS Type II distribution may be used as an alternate to the Huff distributions.

accurate calculation of peak flows for conveyance system sizing less critical.

704.0 Methods for Generating Runoff Hydrographs - The following hydrologic design procedures are considered acceptable for generation of hydrographs: Corps of Engineers HEC-1, Soil Conservation Service TR-20 (and TR-55, subject to rainfall distribution modifications), Illinois State Water Survey ILLUDAS, U.S. EPA's SWMM, and continuous simulation (e.g., HSPF).

A community may wish to select one of these models as the preferred approach to provide consistency in plan submittals and to ease the burden of permit review.

704.1 Rainfall: Recent research by the Illinois State Water Survey on rainfall statistics for northeastern Illinois has led to the publication of Bulletin 70. This is the most accurate and up-to-date information available and should be the design standard. NIPC's study of detention effectiveness has indicated that detention designs relying on 100-year rainfall amounts from the U.S. Weather Bureau's Technical Paper No. 40 will overflow for runoff events substantially smaller than the 100-year event.

Bulletin 70 reports a 100-year, 24-hour rainfall amount of 7.6 inches as the regional average for northeastern Illinois, but also indicates greater and lesser amounts on regional isohyetal maps. It is recommended that the ordinance specify design rainfall amounts which are the larger of the Bulletin 70 regional average and the local isohyetal amount to provide a conservative design.

The Huff rainfall distribution is particularly applicable to northeastern Illinois storms but is also an integral part of ILLUDAS. It is important to note that TR-55 assumes SCS Type II rainfall distribution.

704.2 Antecedent Moisture: Computations of runoff hydrographs which do not rely on a continuous accounting of antecedent moisture conditions shall assume a conservative wet antecedent moisture condition as a minimum.

704.2 Antecedent Moisture: It is important that local governments stipulate what design assumptions they will allow concerning antecedent moisture conditions and the ability of pervious areas to abstract rainfall. The ordinance should specify minimum antecedent moisture conditions for approved models. (Eg., SCS TR-20 and TR-55 - antecedent moisture condition two; ILLUDAS - ILLUDAS number 3, "rather wet").

705.0 Wet Detention Basin Design - Wet detention basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing, and as much as feasible to be available for recreational use.

705.1 Wet Basin Depths: Wet basins shall be at least three feet deep, excluding nearshore ~~banks zones~~ and safety ledges. If fish habitat is to be provided, basins shall be at least ten feet deep over twenty-five percent of the bottom area to prevent winter freeze-out.

705.1 Wet Detention Basin Depths: Wet basins need to be deep enough to discourage emergent aquatic plant growth in interior areas intended to be open water, unless wetland creation is envisioned by the local government. Local governments wishing to encourage wetland recreation should change this section to allow shallower depths in the interior of the basin as needed for the establishment of wetland vegetation. The fish habitat recommendations were developed by the Illinois Department of Conservation.

To facilitate future maintenance needs of wet basins, stilling/sedimentation basins (similar to section 706.4) may be required to isolate large sediment particles in a manageable area for dredging.

705.2 Wet Basin Shoreline Slopes: The side slopes of wet basins ~~at the normal pool elevation~~ shall not be steeper than ~~5 to 1~~ 10 to 1 (horizontal to vertical) from one foot above the normal pool stage to at least one foot below the normal pool stage.

705.2 Wet Basin Shoreline Slopes: Flat side slopes are important in preventing shoreline erosion due to wave action and fluctuating water levels. The recommended 10:1 shoreline slope will provide for a relatively flat underwater safety shelf with a minimum width of at least 10-feet around the periphery of the basin. The shelf will have an average depth of six inches and a maximum depth of 12 inches below the normal pool stage to facilitate the growth of emergent wetland vegetation.

Appropriate soil conditions shall be provided in this shoreline zone. First, compaction of both subsoil and topsoil shall be minimized (i.e., to less than 275 psi). Where subsoil compaction cannot be avoided, it should be disced to a depth of 6 - 8 inches with a chisel plow before spreading topsoil. Second, a suitable uncompacted topsoil, at a minimum thickness of one foot, shall be spread to provide a suitable growing medium for aquatic plants. Coarse soils with minimal clay content and a high organic content are recommended.

A critical consideration in site preparation is the provision of an adequate growing medium for new plants. Because construction of stormwater facilities typically requires extensive grading, resultant soils become highly disturbed and unsuitable for planting. *The Native Plant Guide for Streams and Stormwater Facilities in Northeastern Illinois* provides additional recommended guidance on soil preparation.

Upper slopes of detention basins (higher than one foot above normal stage) should be no steeper than 4:1.

(Flatter slopes (i.e., 5:1) are preferred to enhance plant establishment and to facilitate long-term maintenance.)

705.3 Shoreline Vegetation: Water tolerant native vegetation shall be used to landscape the shorelines of wet detention facilities. The selected plants and planting methods shall conform to the soils, hydrology, and water quality conditions present in such facilities, with plants being tolerant of highly variable hydrologic conditions and degraded water quality (e.g., high turbidity and salinity content). Plant selection should conform to the guidance in the *Native Plant Guide for Streams and Stormwater Facilities in Northeastern Illinois* (NRCS et al, 1998), which is hereby adopted by reference.

Native vegetation is recommended, but not required, for side slopes (higher than one foot above normal stage) of all detention facilities.

705.4 Permanent Pool Volume: The permanent pool volume in a wet basin at normal depth shall be equal to the runoff volume from its watershed for the two-year event.

705.5 Inlet and Outlet Orientation: To the extent feasible, the distance between detention inlets and outlets shall be maximized. If possible, they should be at opposite ends of the basin. There should be no low flow bypass between the inlet and outlet.

706.0 ~~Dry Wetland~~ Detention Basin Design - In addition to the other requirements of this ordinance, ~~dry wetland~~ basins shall be designed to remove stormwater

705.3 Shoreline Vegetation: Native vegetation is recommended in shoreline zones for several reasons. 1) It provides soil stability in a zone where conventional turf is prone to failure. 2) It aids in pollutant removal/transformation. 3) It can significantly limit nuisance goose populations, and associated water quality and nuisance problems. 4) It provides aquatic and wildlife habitat. 5) It is relatively inexpensive to maintain.

The *Native Plant Guide* provides recommended plantings for three detention basin zones (emergent, saturated, and upland). Guidance on plant and seed installation, including optimal time of year, also is provided. Planting can be done with live plants and/or seeds. Use of live plants, tubers, or root stock is preferred in shoreline zones and shallow ponded areas of detention basins, and in other areas prone to frequent inundation, because it results in rapid establishment of stabilizing vegetative cover. It is desirable to install most live plants, tubers and root stock in the spring or early summer (i.e., before summer dry periods) to allow for effective root establishment before the following winter.

Finally, areas newly planted with live plants or seeds generally need to be protected from predation, particularly by Canada geese. Protection in the form of "goose cages," or similar devices that fence out plant predators, is particularly important in emergent wetland zones and areas adjacent to significant open water.

705.4 Permanent Pool Volume: The pool volume needs to be sufficient so that incoming stormwater will generally just displace resident pool water resulting in longer detention times and better settling of suspended stormwater pollutants.

705.5 Inlet and Outlet Orientation: Maximizing the distance between inlets and outlets will prevent the short-circuiting of flows through a basin. Short-circuiting is counter productive to the removal of stormwater pollutants. Short-circuiting can also be avoided by the use of baffles or berms in the basin bottom.

706.0 ~~Dry Wetland~~ Detention Basin Design - The use of conventional dry basins ~~will be complicated~~ is generally not consistent with the nonpoint source

pollutants, to be safe, to be aesthetically pleasing and, where feasible, to be available for multiple uses.

pollution control objectives of this ordinance. Wetland basins have been shown to be much more effective at removing nonpoint source pollutants. Further, by the more restrictive low flow release rates this model ordinance requires will result in extended detention times and longer durations of standing water that will preclude the establishment of turf grass in much of the basin bottom. Detention times will increase relative to most existing ordinance requirements and a larger percentage of storms will be detained resulting in standing water for longer periods of time.

Dry Wetland basin designs should recognize this fact and address it by planning to minimize the amount of basin area which has standing water by creating "wet" and "dry" zones within the basin are intended to maximize the opportunity to remove/transform nonpoint source pollutants while providing for aesthetics, wildlife habitat, and, where feasible, recreational uses. Larger wetland basins can be designed to include zones that will normally be dry and that can be used for recreational purposes (e.g., ball fields).

706.1 Wetland Basin Grading: The side slopes of wet basins (from one foot above the normal pool stage to at least one foot below the normal pool stage) and the basin bottom shall not be steeper than 10 to 1 (horizontal to vertical). Steeper slopes are permitted in settling basins and open water zones near the basin outlet.

706.1 Wetland Basin Grading: As for wet basins, flat side slopes are important in preventing shoreline erosion due to wave action and fluctuating water levels, and in establishing wetland vegetation. Depths in wetland basins should be no greater than one foot in zones where emergent wetland vegetation is desired. Depths greater than approximately one foot generally will result in open water zones.

Appropriate soil conditions shall be provided in the shoreline zone and basin bottom. First, compaction of both subsoil and topsoil shall be minimized (i.e., to less than 275 psi). Where subsoil compaction cannot be avoided, it should be disced to a depth of 6 - 8 inches with a chisel plow before spreading topsoil. Second, a suitable uncompacted topsoil, at a minimum thickness of one foot, shall be spread to provide a suitable growing medium for aquatic plants. Coarse soils with minimal clay content and a high organic content are recommended.

As indicated in the guidance for wet basins, soil preparation is critical in shoreline and shallow water zones. Useful guidance is found in the *Native Plant Guide for Streams and Stormwater Facilities in Northeastern Illinois*.

Upper slopes of detention basins (higher than one foot above normal stage) should be no steeper than 4:1. (Flatter slopes (i.e., 5:1) are preferred to enhance plant establishment and to facilitate long-term maintenance.)

706.2 Wetland Vegetation: Water tolerant native vegetation shall be used to landscape the shorelines and bottoms (non-open water areas) of wetland detention

706.2 Wetland Vegetation: Native wetland vegetation is intend to be the dominant landscaping material in the bottom and shoreline zones of wetland basins, for similar

facilities. The selected plants and planting methods shall conform to the soils, hydrology, and water quality conditions present in such facilities, with plants being tolerant of highly variable hydrologic conditions and degraded water quality (e.g., high turbidity and salinity content). Plant selection should conform to the guidance in the *Native Plant Guide for Streams and Stormwater Facilities in Northeastern Illinois* (NRCS et al, 1998), which is hereby adopted by reference.

Native vegetation is recommended, but not required, for side slopes (higher than one foot above normal stage) of all detention facilities.

706.1 Dry Basin Drainage: Dry basins shall be designed so that eighty percent of their bottom area shall have standing water no longer than seventy-two hours for any runoff event less than the 100-year event. Underdrains directed to the outlet control shall be used if necessary to accomplish this requirement.

706.3 Velocity Dissipation Stilling/Sedimentation Basins: Wetland detention basins should be constructed with sediment basins or forebays at all major inlets to the basins. The volume of the basins should be at least 500 cubic feet per acre of impervious surface in the drainage area. Side slopes below one foot of depth should be no steeper than 3 to 1 (horizontal to vertical) and basin depth should be at least 3 feet and designed to allow access for sediment removal equipment. Velocity dissipation measures shall be incorporated into dry basin designs to minimize erosion at inlets and outlets and to minimize the resuspension of pollutants.

706.4 Inlet and Outlet Orientation: To the extent feasible, the distance between detention inlets and outlets shall be maximized. If possible, they should be at opposite ends of the basin. There should be no low flow bypass between the inlet and outlet and paved low flow channels shall not be used.

reasons described for wet basin shorelines. The *Native Plant Guide* provides extensive guidance on plant selection, installation, and protection from predation.

706.1 Dry Basin Drainage: It is very important that dry basins not have standing water unintentionally as a result of poor drainage because of aesthetic and maintenance considerations. The maximum inundation time of 72 hours was chosen to ensure the viability of grass based on recommendations received from NIPC's Stormwater Management Technical Advisory Committee. Two-level designs for dry basins should be considered. The lower wetter portion may be managed as a wetland and should be maintained over time to remove accumulated sediment.

706.3 Stilling/Sedimentation Basins: These basins are intended to both dissipate the erosive energy of stormwater inlets and settle out large sediment particles in an isolated area to facilitate future maintenance. The recommended design volume is based on the objective of removing 50 percent of the annual suspended solids load. While most fine sediment particles will pass through this basin, most of the larger solids will settle. Sediment removal will be required infrequently. Sediment quality will be similar to street sweeping debris and disposal should be handled accordingly.

706.4 Inlet and Outlet Orientation: Maximizing the distance between inlets and outlets will prevent the short-circuiting of flows through a basin. short-circuiting is counter productive to the removal of stormwater pollutants. Short-circuiting can be avoided by designing elongated basins (ideal length:width ratio of at least 3:1), or by the use of baffles or berms in the basin bottom. Because low flows and the "first flush" of storm runoff often contain the most concentrated pollutants, it is critical that all flows be routed through the basin to provide opportunities for effective pollutant removal.

707.0 Minimum Detention Outlet Size - Where a single pipe outlet or orifice plate is to be used to control discharge, it shall have a minimum diameter of 4 inches.

If this minimum orifice size permits release rates greater than those specified in this section, and regional detention is not a practical alternative, alternative outlet designs shall be utilized which incorporate self cleaning flow restrictors.

708.0 Detention in Floodplains -The placement of detention basins within the floodplain is strongly discouraged because of questions about their reliable operation during flood events. However, the stormwater detention requirements of this ordinance may be fulfilled by providing detention storage within flood fringe areas on the project site provided the following provisions are met.

708.1 Detention in Flood Fringe Areas: The placement of a detention basin in a flood fringe area shall require compensatory storage for 1.5 times the volume below the base flood elevation occupied by the detention basin including any berms. The release from the detention storage provided shall still be controlled consistent with the requirements of this section. The applicant shall demonstrate its operation for all streamflow and floodplain backwater conditions. Excavations for compensatory storage along watercourses shall be opposite or adjacent to the area occupied by detention.

All floodplain storage lost below the ten-year flood elevation shall be replaced below the ten-year flood elevation. All floodplain storage lost above the existing ten-year flood elevation shall be replaced above the proposed ten-year flood elevation. All compensatory storage excavations shall be constructed to drain freely and openly to the watercourse.

708.2 Detention in Floodways: Detention basins shall be placed in the floodway only in accordance with 708.3.

707.0 Minimum Detention Outlet Size - Use of single orifices smaller than 4 inches may result in operating difficulties due to obstructions. If design release rates call for outlets smaller than this, self cleaning flow restrictors such as perforated risers should be utilized. This situation likely will occur for small sites, particularly those less than 5 acres in drainage area.

708.0 Detention in Floodplains -Detention in floodplains requires additional design criteria if the environmental and flood storage and conveyance functions of the floodplain are to be preserved.

708.1 Detention in Flood Fringe Areas: Detention in flood fringe areas can present great design difficulties in preventing streamflows from backing up into the basin and in being able to discharge a property's runoff during flood stages on the stream. Allowing detention in the flood fringe requires careful review of final design and a community may find it better to not allow it at all. It is important to note that merely adding additional flood fringe storage equivalent to the stormwater detention volume needed for the property is not acceptable unless the rate at which it enters the flood fringe is also controlled consistent with this section.

708.2 Detention in Floodways: Detention basins are not an appropriate use for floodway construction as defined by 92 Illinois Administrative Code, Part 708. NIPC policy also recommends against location of detention facilities in the floodway because of serious questions about their ability to meet this ordinance's requirements over the full range of flood stages which will occur in such a location. For example if the outlet of a basin is submerged during a flood event, release from the basin will be controlled by the backwater condition. If the flood stage is high enough no discharge may occur from the basin until overflow from the basin spillway occurs, at a rate considerably higher than that

specified by this ordinance.

NIPC also has serious concerns about the impact of placing basins in the floodway in light of the fact that current floodway boundaries are likely underestimated by steady state modeling techniques which may not adequately consider the effects of lost storage. Placement of any structure in the floodway, even if existing cross-sectional area and storage are maintained, may cause unexpected problems.

Finally, it is very difficult to successfully prevent short term environmental impacts associated with any construction in the floodway. For this reason NIPC recommends against any avoidable construction in floodway areas.

708.3 On-stream Detention: On-stream detention basins are discouraged but allowable if they provide regional public benefits and if they meet the other provisions of this ordinance with respect to water quality and control of the two-year and 100-year, 24-hour events from the property. Further criteria are presented in Section 800.0 of this ordinance.

If on-stream detention is used for watersheds larger than one square mile, it is recommended that the applicant use dynamic modeling to demonstrate that the design will not increase stage for any properties upstream or downstream of the property. Also, impoundment of the stream as part of on-stream detention:

- a. shall not prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, such as for spawning,
- b. shall not cause or contribute to the degradation of water quality or stream aquatic habitat,

708.3 On-stream Detention: NIPC policy discourages the modification of streams to construct on-stream detention basins unless they are designed to provide regional public benefits and their adverse environmental impacts are mitigated. On-stream detention basins may have a very difficult time meeting the release rate requirements of this section unless they are in the headwaters of a stream. This is because the time of concentration of an individual property is dramatically less than the time of concentration for an entire upstream watershed. As a result peak discharges from an individual property will pass through on-stream facilities relatively undetained well before upstream flood peaks arrive. This can result in downstream flood peaks being larger than if off-stream detention were applied.

The environmental criteria are provided in an effort to mitigate the impacts of on-stream detention on beneficial stream uses. The interruption of free-flowing stream reaches, by weirs and dams designed to produce on-stream detention, affects stream water quality in several ways.

The recommendation that dynamic modeling be performed for watersheds larger than one square mile is based on the concern that on-stream detention perform as effectively as off-stream detention as discussed above. The one-square mile cutoff was selected because watersheds larger than this will fall under IDNR/OWR permitting requirements and so the need to furnish additional data on potential impacts will be anticipated by developers.

Dynamic modeling, incorporating continuous simulation hydrologic modeling, can assess a full range of storm types, temporal and spatial distributions and antecedent moisture conditions. Gradually varied, unsteady flow hydraulics are needed to accurately assess the complex interactions of storage and conveyance which on-stream structures frequently present.

- a. The change from a free-flowing reach to a reservoir can adversely impact existing fish life and habitat.
- b. The slowing of in-stream flow velocities can reduce reaeration and the ability of the stream to assimilate organic pollutant loads. Sediment and pollutant deposition also is encouraged behind impoundments, leading to a potential in-stream water quality problem.

- c. shall include a design calling for gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin,
- d. shall not involve any stream channelization or the filling of wetlands,
- e. shall require the implementation of an effective nonpoint source management program throughout the upstream watershed which shall include at a minimum: runoff reduction BMPs consistent with Section 500.0 of this ordinance; 2-year detention/sedimentation basins for all development consistent with Section 709.4; and a program to control nonpoint sources at the source for prior developments constructed without appropriate stormwater BMPs,
- f. shall not occur downstream of a wastewater discharge, and
- g. shall comply with 92 Illinois Administrative Code Parts 702 and 708 and the floodplain ordinance of (County, City, Village of _____).

709.0 Drainage into Protection of Wetlands and Depressional Storage Areas: Wetlands and other depressional storage areas shall be protected from damaging modifications and adverse changes in runoff quality and quantity associated with land developments. In addition to the other requirements of this ordinance, the following requirements shall be met for all developments whose drainage flows into wetlands and other depressional storage areas:

Channel modification is frequently a part of on-stream detention projects and this results in direct destruction of stream habitat.

e. Streams, wetlands, and other waters of the U.S. are not intended to be modified to become sinks or depositional zones for controllable nonpoint source pollution. Where regional, on-stream detention is determined to be in the public interest, nonpoint source BMPs must be implemented in the upstream watershed to minimize adverse water quality impacts. In addition to structural BMPs, watershed residents should be educated about the need to manage nonpoint impacts at the source through effective controls on discharges of household chemicals, used motor oil, and pesticides.

709.0 Drainage into Protection of Wetlands and Depressional Storage Areas: Wetlands provide valuable habitat, water quality, and hydrologic functions which may be adversely affected by development activities. Adverse impacts can result from direct modifications, the introduction of urban runoff pollutants, as well as changes in runoff rates. Changes in hydrology, in particular, can affect the delicate balance which exists in sensitive wetlands and result in loss of habitat diversity. For these reasons, wetlands should be protected from urban runoff changes by the measures specified in this ordinance and moderate to high quality wetlands should not be modified to accommodate stormwater detention.

Non-wetland depressional storage areas are areas in the pre-development landscape (e.g., in farm fields) which are undrained or very poorly drained. While not providing important habitat values, these depressions often store considerable volumes of runoff for extended time periods (e.g., weeks) and provide important pollutant removal benefits.

709.1 Detention in Wetlands and Depressional Storage Areas: Existing wetlands shall not be modified for the purposes of stormwater detention unless it is demonstrated that the existing wetland is low in quality and the proposed modifications will maintain or improve its habitat and ability to perform beneficial functions. Existing depressional storage and release rate characteristics of in wetlands and other depressional storage areas shall be maintained and the volume of detention storage provided to meet the requirements of this section shall be in addition to this existing storage.

709.2 Sediment Control: The existing wetland shall be protected during construction by appropriate soil erosion and sediment control measures and shall not be filled.

709.3 Alteration of Drainage Patterns: Site drainage patterns shall not be altered to substantially decrease or increase the existing area tributary to the wetland.

709.4 Detention/Sedimentation: All runoff from the development shall be routed through a preliminary detention/sedimentation basin designed to capture the two-year, 24-hour event and hold it for at least 24 hours, before being discharged to the wetland. Basin design shall conform to the criteria for wet bottom or wetland basins contained in Sections 705 or 706. This basin shall be constructed before property grading begins. In addition, the drainage hierarchy defined in section 500.0 should be followed to minimize runoff volumes and rates being discharged to the wetland.

709.5 Vegetated Buffer Strip: A buffer strip of at least 25 feet in width, ~~preferably~~ vegetated with native plant species, shall be maintained or restored around the periphery of the wetland.

710.0 Street, Parking Lot, and Culvert Drainage

710.1 Streets: If streets are to be used as part of the minor or major drainage system, ponding depths shall not exceed curb heights by more than one inch and shall not remain flooded for more than eight (8) hours for any event less than or equal to the 100-year event.

709.1 Detention in Wetlands and Depressional Storage Areas: Low quality wetlands, with adequate protection and mitigation, can be beneficially utilized for detention, consistent with the mitigation requirements of this section. Low quality wetlands are those which have been substantially disturbed. This disturbance is usually reflected in a low diversity of habitat and the presence of only insensitive plant species (e.g., a monoculture of cattails). Certain modifications of low quality wetlands, such as the limited excavation of open water areas, may actually enhance their value. It is important, however, that the storage functions of wetlands and depressional storage areas be preserved, in addition to meeting the detention requirements of this ordinance.

709.2 Sediment Control: This provision is consistent with "Greenbook" recommendations for controlling soil erosion from disturbed sites.

710.1 Streets: Local governments should substitute whatever depth and duration of ponding their citizens are willing to tolerate. Since there are a variety of curb types in use with varying heights it is important that each local government tailor this section to its design stan-

710.2 Parking Lots: The maximum stormwater ponding depth in any parking area shall not exceed six (6) inches for more than four (4) hours.

710.3 Culvert Road and Driveway Crossings: Sizing of culvert crossings shall consider entrance and exit losses as well as tailwater conditions on the culvert.

711.0 Infiltration Practices - To effectively reduce runoff volumes, infiltration practices including basins, trenches, and porous pavement should be located on soils in hydrologic soil groups "A" or "B" as designated by the U.S. Soil Conservation Service. Infiltration basins and trenches designed to recharge groundwater shall not be located within seventy-five feet of a water supply well or a building foundation. A sediment settling basin shall be provided to remove coarse sediment from stormwater flows before they reach infiltration basins or trenches. Stormwater shall not be allowed to stand more than seventy-two hours over eighty percent of a dry basin's bottom area for the maximum design event to be ex-filtrated. The bottom of infiltration facilities shall be a minimum of four feet above seasonally high groundwater and bedrock.

711.a Vegetated Filter Strips and Swales: To effectively filter stormwater pollutants and promote infiltration of runoff, sites should be designed to maximize the use of vegetated filter strips and swales. Wherever practicable,

dards. It is also very important that local governments take into consideration curb cuts leading to garages below grade. Where street storage of runoff is considered, below grade parking should be prohibited.

710.2 Parking Lots: The use of parking lots to provide stormwater detention will be limited by the storage volume and detention time requirements of this ordinance. In addition, parking lot detention will provide little or no water quality benefits and is therefore discouraged as a primary source of detention. However, parking lot storage may be useful in providing supplementary storage for a traditional detention basin. In such an application, the parking lot may be located at a higher elevation than the detention basin bottom and would only store water for more extreme events (e.g., greater than 5 or 10-year recurrence interval).

710.3 Culvert Road and Driveway Crossings: Use of Mannings equation to size culverts does not account for the significant entrance and exit head losses. Federal Highway Administration culvert nomographs or more sophisticated backwater models are recommended, as appropriate.

711.0 Infiltration Practices - There is considerable potential for the use of infiltration practices in northeastern Illinois but their application must be carefully analyzed before they are implemented. Soil acceptability and the potential for groundwater contamination must be carefully assessed. Infiltration practices are also very sensitive to maintenance concerns, especially clogging by sediment. As a result pre-sedimentation basins to remove the bulk of any sediment load are recommended. Local governments should refer to publications from the state of Maryland and the Metropolitan Washington Council of Governments listed in this document's references for further information.

Local governments also need to be aware of IEPA Class V injection well permit requirements and setback zones from community wells established by the Illinois Groundwater Protection Act.

711.a Vegetated Filter Strips and Swales: Existing subdivision codes often discourage filter strips and swales by mandating curbs and gutters and direct discharge of runoff into storm sewers. A more effective, often lower-

runoff from impervious surfaces should be directed onto filter strips and swales before being routed to a storm sewer or detention basin. Native vegetation is recommended, but not required, for landscaping of filter strips and swales.

712.0 Safety Considerations - The drainage system components, especially all detention basins, shall be designed to protect the safety of any children or adults coming in contact with the system during runoff events.

712.1 Side Slopes: The side slopes of all detention basins at one-hundred year capacity shall be as level as practicable to prevent accidental falls into the basin and for stability and ease of maintenance. Side slopes of detention basins and open channels shall not be steeper than ~~three~~ four to one (horizontal to vertical).

712.2 Safety Ledge: All wet detention basins shall have a level safety ledge at least (four) feet in width (2.5 to three) feet below the normal water depth.

712.3 Velocity: Velocities throughout the surface drainage system shall be controlled to safe levels taking into consideration rates and depths of flow.

712.4 Overflow Structures: All stormwater detention basins shall be provided with an overflow structure capable of safely passing excess flows at a stage at least 1 foot below the lowest foundation grade in the vicinity of the detention basin. The design flow rate of the overflow

cost alternative is to route runoff through slotted curbs (or curb stops) onto vegetated strips. In this preferred design, many landscaped areas would occupy the lower portions of the site (e.g., rather than raised islands) and effectively filter and infiltrate stormwater from impervious surfaces. A simple application of a filter strip in a residential setting is a lawn which receives runoff from rooftops, driveways, and (ideally) streets. Swales are cost effective options to storm sewers in many settings, such as office campuses, industrial parks, low density single-family developments, and multifamily uses.

Both swales and filter strips are most effective when well vegetated, preferably with native vegetation, and when slopes are relatively flat.

712.0 Safety Considerations - Safety of stormwater drainage system components is always a principal design criteria. The local government should avoid the use of fencing around detention basins by designing safe facilities. However, certain extreme cases may require the use of fences to protect the public.

712.1 Side Slopes: The Illinois Department of Transportation Standards and Specifications for Highway Construction call for maximum embankment slopes of 3 to 1 for safe mowing. Based on actual experience with basins in northeastern Illinois, 4 to 1 is recommended for reasons of soil stability, ease of establishing vegetation, and access for maintenance and recreational use.

712.2 Safety Ledge: The recommended requirements for safety ledge design are based on a review of a number of sources whose design criteria vary. A community may wish to revise these requirements based on its local experience. It may be concluded that a safety ledge is unnecessary in light of the requirement for a 10:1 shoreline shelf at the edge of all basins.

712.3 Velocity: One common rule of thumb for safe velocities calls for the product of velocity (feet/second) times depth (feet) not to exceed 4 for human safety.

712.4 Overflow Structures: Recent NIPC inspections of stormwater detention basins revealed that few had a stable and clearly defined overflow spillway to safely pass flows exceeding the 100-year design event, or to pass flows if an outlet becomes obstructed. This is a very

structure shall be equivalent to the 100-year inflow rate.

713.0 Maintenance Considerations: The stormwater drainage system shall be designed to minimize and facilitate maintenance. Detention basins shall be provided with alternate outflows which can be used to completely drain the pool for sediment removal. (Pumping may be considered if drainage by gravity is not feasible.) Pre-sedimentation basins shall be included, where feasible, for localizing sediment deposition and removal. Access for heavy equipment shall be provided.

Long term maintenance also shall include the routine removal of excessive trash or debris and the removal of obstructions from the basin outlet structure. Periodic removal of accumulated sediment (e.g., from swales, forebays, and settling basins) also shall be done to maintain the function and aesthetics of stormwater facilities. At a minimum, sediment shall be removed from forebays and sediment basins whenever one foot or more of sediment has accumulated in the basin bottom. Naturally landscaped areas of detention and drainage facilities shall be maintained via controlled burning every one to three years, as needed to control invasive weeds. Where controlled burning is not feasible, mowing shall be performed as needed. Mowing should be performed on naturally landscaped areas not suitable for burning on an annual basis and on all turfing areas on a regular basis to maintain grass height below 6 inches. Turfed side slopes shall be designed to allow lawn mowing equipment to easily negotiate them.

important design consideration as the invert for the spillway will control the depth of storage and potential flood stages on properties tributary to the detention basin. Spillway velocity and rate considerations should be addressed in the drainage plan. The probable maximum storm has been recommended as a design event by ASCE, but may be excessively conservative for most applications. More conservative overflow designs may be necessary for large detention basins if their size makes them subject to IDNR/OWR's Dam Safety Rules.

713.0 Maintenance Considerations: Local governments should tailor this section to meet their maintenance concerns. The ability to completely drain wet basins for sediment removal is an important maintenance option, as is the ability for heavy equipment to access a basin.

Experience from around the country indicates that maintenance to remove accumulated sediment will be needed on an infrequent basis (i.e., every 10-20 years). Sediment, similar to street sweeping debris, should be disposed appropriately.

Continued maintenance shall be provided to maintain a diverse native plant community, minimize the proliferation of weeds and undesired woody vegetation, and minimize erosion of slopes and shorelines.

800.0 Accommodating Flows From Upstream Tributary Areas

Stormwater runoff from areas tributary to the property shall be considered in the design of the property's drainage system. Whenever practicable, flows from upstream areas that are not to be detained should be routed around the basin being provided for the site being developed.

801.0 Upstream Areas Not Meeting Ordinance Requirements - When there are areas not meeting the storage and release rates of this ordinance, tributary to the applicant's property, regionalized detention on the applicant's property shall be explored by the applicant. The following steps shall be followed.

- a. The applicant shall compute the storage volume needed for his property using the release rates of Section 600.0, the applicant's property area, and the procedures described in Section 700.0.
- b. Areas tributary to the applicant's property, not meeting the storage and release rate requirements of this ordinance, shall be identified.
- c. Using the areas determined in 801.b. above plus the applicant's property area, total storage needed for the combined properties shall be computed.

Allowable release rates shall be computed using the combined property areas. Storage shall be computed as described in Section 700.0. If tributary areas are not developed, a reasonable fully developed land cover,

800.0 Accommodating Flows From Upstream Tributary Areas

The model ordinance is designed to provide flexibility in managing tributary area flows while retaining the degree of control needed to protect downstream property owners.

It is strongly recommended that local governments look for opportunities to participate with applicants to build regional detention facilities in advance of upstream property development. The costs for the local government share could be paid by the downstream property and then recaptured when upstream properties develop; or the local government could use special assessments on the upstream properties to pay the costs immediately. Finally, costs could be paid from any fee in lieu of detention programs for the areas in question.

Where bypassing of flows from upstream areas is the selected approach, it is recommended that these flows be routed around the detention basin for the same reason that online storage is discouraged. (I.e., the peak flows from the individual site may pass virtually undetained before the upstream peaks arrive).

based on local zoning, shall be assumed for the purposes of computing storage.

Once the necessary combined storage is computed the (County, City, Village) may choose to pay for over-sizing the applicant's detention basin to accommodate the regional flows. The applicant's responsibility will be limited to the storage for his property as computed in "a" above. If regional storage is selected by the (County, City, Village), then the design produced in "c" above shall be implemented. If regional storage is rejected by the (County, City, Village), the applicant shall bypass all tributary area flows around the applicant's basin whenever practicable. If the applicant must route upstream flows through his basin and the upstream areas exceed one-square mile in size, the applicant must meet the provisions of Section 708.30 for on-stream basins.

802.0 Upstream Areas Meeting Ordinance Requirements - When there are areas which meet the storage and release rate requirements of this ordinance, tributary to the applicant's property, the upstream flows shall be bypassed around the applicant's detention basin, or be routed through the applicant's detention basin if this is the only practicable alternative. Storage needed for the applicant's property shall still be computed as described in Section 801.0, a. However, if the (County, City, Village) decides to route tributary area flows through an applicant's basin, the final design stormwater releases shall be based on the combined total of the applicant's property plus tributary areas. It must be shown that at no time will the runoff rate from the applicant's property exceed the allowable release rate for his/her property alone.

900.0 Early Completion of Detention Facilities

Where detention, retention, or depressional storage areas are to be used as part of the drainage system for a property, they shall be constructed as the first element of the initial earthwork program. Any eroded sediment captured in these facilities shall be removed by the applicant before project completion in order to maintain the design volume of the facilities.

900.0 Early Completion of Detention Facilities

Completion of detention facilities first on a property provides a vital element of a runoff management and soil erosion and sediment control strategy for a property. It also places the burden for cleanup of soil eroded from a construction site on the applicant before the drainage system can receive a final permit. These recommendations are consistent with the Northeastern Illinois Soil Erosion and Sediment Control Steering Committee's Green Book.

1000.0 Fee In Lieu of Detention

All single-family residential developments under 5 acres in size and all other development under 1 acre in size shall pay a fee of \$_____ for each acre-foot of detention which would be required under this ordinance rather than installing detention facilities on the property, unless specifically directed to do otherwise by the (insert appropriate local official's title). The (County, City, Village of _____) also shall have the option for larger properties of requiring a fee of \$_____ for each acre-foot of detention needed in lieu of the applicant building a basin on-site provided the property will discharge stormwater to the (County's, City's, Village's) storm sewer system.

In instances where regional benefits and economies of scale can be achieved, it will be permissible for adjacent properties to utilize a common regional detention basin. Applicants shall have the option of paying a fee of \$_____ for each-acre foot of detention required so that the (County, City, Village of _____) can build regional facilities or they can jointly build the necessary facilities themselves.

1000.0 Fee In Lieu of Detention

The intent of this ordinance is to minimize the number of small detention basins which may have greater maintenance and operational problems. At the same time, there may be a need for small, onsite basins in situations where in-fill development occurs, potentially resulting in local drainage problems on adjacent properties. This situation always should be evaluated by the local government.

Local governments should not implement this section of the ordinance unless they have a completed master drainage plan for their watersheds, an administrative mechanism for collecting fees, and financial reserves to participate in the purchase of land and construction of regional detention basins. Obviously, a local government must be certain that properties which pay a fee will have their stormwater runoff adequately managed. The responsibility for this management will fall either to the local governments directly or to joint efforts between downstream developers and the local government. Failure to expeditiously invest fees could lead to the municipality being charged with not meeting the "reasonable use" rules of Illinois drainage law.

The model ordinance might recommend a higher minimum lot size if it were not for the distinct possibility that the U.S. Environmental Protection Agency will soon be requiring NPDES permits and the implementation of best management practices from all land development activities over 5 acres (1 acre for non-residential development). It would appear that if a local government builds a regional facility which accepts flows from such activities the NPDES permit responsibility and some of the best management practice implementation responsibility will fall to the local government.

Each unit of local government should determine an equitable basis for assessing an adequate fee in lieu of detention. Typical methods include fees based on percent impervious area on the property, fees based on acre feet of detention required, and fees based on the actual cost to construct facilities.

1100.0 Maintenance Responsibility

Maintenance of stormwater drainage facilities located on private property shall be the responsibility of the owner of that property. Before a (insert appropriate permit) is obtained from the (County, City, Village of _____) the applicant shall execute a maintenance agreement with the (County, City, Village of _____) guaranteeing that the applicant and all future owners of the property will maintain its stormwater drainage system. The maintenance agreement shall also specifically authorize representatives of the (County, City, Village) to enter onto the property for the purpose of inspections and maintenance of the drainage system. Such agreement shall be recorded with the Recorder of Deeds of(_____ County). The maintenance agreement shall include a schedule for regular maintenance of each aspect of the property's stormwater drainage system and shall provide for access to the system for inspection by authorized personnel of the (County, City, Village of _____). The maintenance agreement shall also stipulate that if the (appropriate authorized personnel of the County, City, Village of _____) notify the property owner in writing of maintenance problems which require correction, the property owner shall make such corrections within 30 (thirty) calendar days of such notification. If the corrections are not made within this time period the (County, City, Village) may have the necessary work completed and assess the cost to the property owner.

The (County, City, Village of _____) has the option of requiring a bond to be filed by the property owner for maintenance of the stormwater drainage system.

1100.0 Maintenance Responsibility

It is critical if maintenance contracts are used by a local government that the maintenance organizations have the ability to assess and collect fees. Local governments may also wish to investigate the requirement that covenants be added to property recordings to reflect maintenance responsibilities.

Some local governments, ~~particularly at the county level,~~ may wish to undertake all maintenance activities themselves. In this instance impact fees or some other means of regularly collecting the cost of such activities needs to be investigated.

Property owners may include individuals, corporations, or homeowners associations.

Local governments also should require maintenance easement from property owners in the event they must enter property to correct deficiencies.

1200.0 Administration

1201.0 Inspections

1201.10 Inspections During Construction: General site grading shall not begin until the (appropriate official of the County, City, Village) has certified in writing to the applicant that any necessary detention facilities are in place and operational. The (appropriate official of the County, City, Village) or his representative will also conduct periodic inspections of the work in progress to be certain that the drainage system is being built as designed. If any violations of the provisions or requirements of this ordinance are noted during such inspections, the () shall notify the property owner in writing of the items needing correction. The property owner shall have ten (10) calendar days to make such corrections unless given a specific extension of time in writing by the ().

Failure to complete such corrections within the specified time period shall constitute a violation of this ordinance.

1201.20 Final Inspection: Upon notification by the applicant that the drainage system is completed, the (appropriate official of the County, City, Village) or his representative shall conduct a final inspection. If the drainage system is found to contain deficiencies which require correction the () or his representative shall notify the property owner of the necessary corrections. The property owner shall correct such deficiencies within ten (10) calendar days unless given a specific extension of time in writing by the (). Failure to make necessary corrections within the specified time period shall constitute a violation of this ordinance. Upon finding that the drainage system meets the provisions and requirements of this ordinance the () shall issue in writing a notice of drainage system completion to the property owner.

1201.30 Routine Inspections: All privately owned drainage systems shall be inspected by representatives of the (County, City, Village) not less often than once per year. A written report shall be filed of the results of any inspection and a copy sent to the property owner detailing any problems which need correction.

1202.0 Enforcement - The administration and enforcement of this ordinance shall be the responsibility of the () Department of the (County, City, Village) of () or his representatives.

1203.0 Appeals - All appeals to the Director of (_____) Department's decisions regarding the interpretation of this ordinance shall be heard by the (_____) Board of the (County, City, Village of _____).

1300.0 Severability

If any section, clause, provision or portion of this ordinance is judged unconstitutional or invalid by a court of competent jurisdiction, the remainder of this ordinance shall remain in force and not be affected by such judgement.

1400.0 Penalties

Any person convicted of violating any of the provisions or requirements of this ordinance shall be guilty of a misdemeanor and shall be subject to a fine of not more than One Thousand Dollars (\$1,000.00) or be imprisoned for not more than (____). Each day the violation continues shall be considered a separate offense.

1500.0 Effective Date

This ordinance shall be in full force and effect from and after its passage and approval and publication, as required by law.

MODEL STREAM AND WETLAND PROTECTION ORDINANCE
for the creation of a
Lowland Conservancy Overlay District

Northeastern Illinois Planning Commission
222 South Riverside Plaza Suite 1800
Chicago, Illinois 60606 October 1988

\$3.00

The preparation of this document has been financed, in part, by the Federal Highway Administration, the Urban Mass Transportation Administration, the Illinois Department of Transportation, and through local funds. Additional support was provided to the NIPC stream and wetland protection program by the Illinois Environmental Protection Agency using federal Water Pollution Control Act Section 205j funds and by the Environmental Research Program of the Illinois Department of Energy and Natural Resources. The opinions, findings and conclusions expressed herein are not necessarily those of the funding agencies.

INTRODUCTION

This is one of a series of planning aids and manuals prepared by the Northeastern Illinois Planning Commission (NIPC) as a service to local governments.

The streams, wetlands and other surface water resources of northeastern Illinois compose one of the region's greatest assets. In their natural state these areas provide water quality, flood and stormwater, habitat, recreational and aesthetic benefits. Modification of streams, floodplains, and wetlands has altered or destroyed the natural conditions of over half the streams and the vast majority of the wetlands in northeastern Illinois. This has an adverse impact on the region's environment and negatively affects the region's economic development potential as well.

Since state and federal regulations are not adequate currently to protect these resources, local regulation is all the more important. Such regulation is within the police power authority granted to local government. It is also at the local level that effective day-to-day decisions can be made in support of a high quality growth management process.

With these factors in mind, the Northeastern Illinois Planning Commission has developed a Model Stream and Wetland Protection Ordinance. This ordinance creates a "Lowland Conservancy Overlay District" as a complement to a jurisdiction's (municipal or county) zoning ordinance. Within a designated overlay district, special criteria and procedures are applied so that the development process results in protection and conservation of streams, wetlands and related resource areas. The model will need to be modified to satisfy the particular needs of each jurisdiction.

This document is divided into two main sections. The first is a question and answer section which provides background for the model ordinance in terms of certain technical aspects of stream and wetland management as well as the legal framework for such regulations.

The second part is the text of the model ordinance with a side-by-side "commentary" which explains the reasons for certain provisions, the ways in which provisions can be tailored to local conditions, and sources of additional information.

This model may be used in conjunction with other suggested ordinances and planning aids prepared by NIPC: Suggested Soil Erosion and Sedimentation Control Ordinance, Suggested Flood Damage Prevention Ordinance, Suggested On-Site Stormwater Detention Ordinance, and Stormwater Detention for Water Quality Benefits.

Part I: Questions and Answers Regarding Streams and Wetland Protection

1. Q. What is a wetland?

A. A wetland is defined in this ordinance as an area where water is at or near or above the land surface long enough to support aquatic or hydrophytic vegetation and which has soils indicative of wet conditions. What this means in simple terms is that a wetland is an area so influenced by water that only plants and animals that are specifically adapted to a wet environment survive there. Places that are wet only for short periods of time, for example, after a hard rain, or in the spring, but which do not contain aquatic plants and animals or characteristic wetland soils, are not wetlands and are not covered by this ordinance.

2. Q. Why are wetlands important?

A. Historically, wetlands have been thought of as wasteland that should be converted to better uses. And, historically, wetlands were converted about one-half of the original American wetlands (and more than 90 percent of Illinois') are now gone. Unfortunately, we have discovered that the conversion was not to a necessarily better use.

Wetlands are highly complex natural systems; no two wetland areas provide the same levels or rates of function in the maintenance of the environment. Wetlands represent the edge between the land and the water and are generally highly productive in terms of supporting plants and animals. Some wetlands provide places for the breeding, nesting, and rearing of young wildlife species of birds, mammals, fish and reptiles. Recreational activities, such as hiking, fishing, hunting, etc. are enjoyed in wetlands.

Wetlands are particularly important in protecting water resources, drainage and hydrologic functions. Wetlands are of ten groundwater recharge areas that provide protection against contamination of groundwater supplies. Wetlands provide temporary detention and storage of floodwaters and runoff, which reduces flood damage and maintains a hydrologic balance between ground and surface waters. Wetlands serve to filter pollutants and allow sediment in stormwater runoff to settle before the pollutants and sediments reach the state's water bodies, resolving pollution problems at a nominal cost to the state's citizens. Wetlands also enhance scenic beauty and provide logical barriers to urban development as well as buffers between incompatible land uses.

3. Q. What effect does unregulated development in a stream watershed have upon water quantity?
- A. Unregulated development, with an increase of impervious surfaces and the destruction of vegetation and wetlands, results in an absolute increase in water runoff. Soils, vegetation and wetlands normally absorb runoff which prevents flooding and allows the runoff to filter slowly into groundwater reservoirs. An increased flow of runoff causes irregular groundwater levels and increases the chances of stream flooding. To maintain a stable surface and groundwater supply, protective soils, vegetation and wetlands must be maintained.
4. Q. What effect does unregulated development in a stream watershed have upon water quality?
- A. Increased runoff results in erosion of stream banks and increased sedimentation of stream beds. An increase in sediments can cause water turbidity, an increase in suspended particles, that reduces the light necessary for keeping stream plants and animals alive. An increase in organic sediments entering the stream can cause oxygen depletion affecting plants and animals, and the destruction of shading vegetation increases water temperature, also to the detriment of plants and animals. Impervious surfaces not only increase the quick flow of runoff into streams but that runoff carries pollutants such as de-icing salts, nutrients, heavy metals, and petroleum products. As sediment or pollution-laden runoff is carried quickly to streams, the natural filtering capacity of soils and vegetation is lost, and the streams become polluted.
5. Q. Are there economic costs associated with the degradation of stream and wetland areas?
- A. Many private landowners and communities learn about stream and wetland degradation the hard way, after the land is eroded or the water polluted. The direct economic costs at that point can be very high indeed. Private landowners will pay dearly with a reduction of property value or the actual destruction of their property. The public may incur high costs in finding alternative water sources or in having to construct expensive storm sewers, flood control projects, or water purification systems.
6. Q. What are the benefits of local stream and wetland protection zoning?
- A. Stream and wetland zoning ensures that the valuable functions of streams and wetlands will be protected. This includes protection of the areas' ability to hold flood waters, to provide habitats for fish and wildlife, to maintain water of high quality, to protect the areas for recreational values and uses, and to protect the areas' aesthetic character for the adjacent property owners and the general public. Adjacent landowners are ensured of a reasonable use of their property without the fear that future development will spoil the character and quality of water areas.

Local governments have an important opportunity in adopting zoning regulations for the protection of these natural resources. The long tradition of local zoning authority means that residents are accustomed to turning to their local government, rather than the state, for approval of development. Local zoning in stream and wetland areas helps ensure that fragmentation of development controls does not occur. Various local controls, such as planning, subdivision, zoning, building codes, soil erosion and floodplain management, can be coordinated locally in an effective manner.

7. Q. Don't existing state and federal regulations adequately protect streams and wetlands?

A. No. The U.S. Army Corps of Engineers, under Section 10 of the Rivers and Harbors Act, regulates construction in, and other work affecting, "navigable waters" which include only Lake Michigan and the major waterways. Under Section 404 of the Clean Water Act, the Corps issues permits for deposition of dredged and fill materials in the water of the cited States. This program is of limited effectiveness because of discretion used in evaluating practicable alternatives and in regulating activities in small streams and wetlands. Also, activities that may have adverse impact but do not involve deposition of dredged or fill material are beyond the scope of the regulatory program.

The Division of Water Resources in the Illinois Department of Transportation (IDOT) issues permits for activities such as channel modification, bridge and level construction, utility crossings, sewer outfalls, and construction in the floodway. Under current policy, IDOT does not consider environmental impacts in its review of projects involving non-public water bodies (about 90% of the stream miles in northeastern Illinois). Though Illinois law authorizes IDOT to require permits for construction activities on smaller streams, they are regulated only for hydrologic and hydraulic considerations, and not for impacts on habitat, water quality or aesthetic impacts. There is no state regulation of wetlands unless they are adjacent to public water bodies.

8. Q. Why is an overlay district along streams and wetlands important?

A. Within the overlay district, there are natural vegetation buffer strips along streams and around wetlands or ponds which protect water resources. These buffer strips provide pollution control by allowing natural vegetation in the buffer strips to filter sediments and contaminants from surface runoff which enters water bodies. These buffer strips also allow vegetation to stabilize erosion of the natural drainageway and streambank.

In many instances, stream buffer strips provide a significant amount of open space and recreational opportunities for neighborhoods or subdivisions. These strips also provide a continuous wildlife habitat which is especially important in urban or urbanizing areas. The buffer strips enhance scenic beauty and provide logical barriers to urban development as well as buffers between incompatible land uses.

9. Q. Why is the Lowland Conservancy District created as an overlay district as compared to alternative zoning techniques?

A. There are three principal methods for creating a stream and wetland protection ordinance. For those jurisdictions that do not have a zoning ordinance, a partial zoning ordinance could be structured affecting land activities in the stream and wetland areas, leaving the rest of the jurisdiction unzoned.

For those jurisdictions that have zoning, the current ordinance can be amended to create a separate stream and wetland district or zone. The third method is to amend a current zoning ordinance to create an overlay zone that covers the stream and wetland areas, and impose regulations in addition to those regulations in the underlying district.

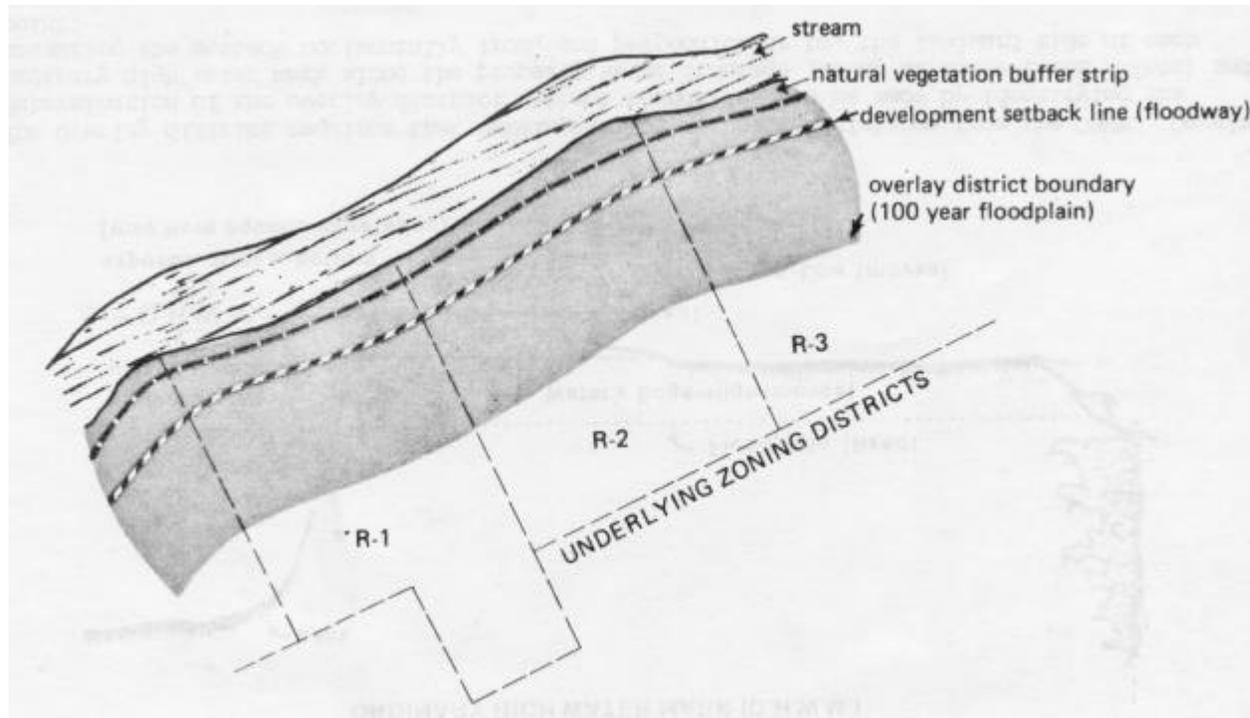

We have assumed in adopting the Lowland Conservancy Overlay District that the communities we are addressing have an existing comprehensive zoning ordinance. However, for those communities that do not have a zoning ordinance, the stream and wetland overlay district ordinance can be amended to become a partial zoning ordinance. A partial zoning ordinance (containing only those provisions necessary to effectively protect the stream and wetland areas) would have to be adopted in accordance with all the procedures of the state's zoning enabling act, just as would a comprehensive zoning ordinance.

The creation of a separate natural stream and wetland district, with permitted activities and site development requirements specific to the district, has the advantage of focusing attention on regulations designed to achieve very specific public objectives and wetland management. An overlay district, however, is probably the most acceptable to communities because the district does not greatly disturb the communities' underlying zoning, in order to achieve appropriate stream and wetland management objectives.

As long as the uses permitted in the underlying district are compatible with the objectives of the stream and wetland protection ordinance, an overlay district is more effective.

An overlay district is a mapped zone that imposes an additional set of requirements upon those of the underlying zoned district. The land must then be used under the conditions and requirements of both zones. The most restrictive requirements prevail in cases of conflict. Provisions of the zone are administered through the usual zoning processes.

A LOWLAND CONSERVANCY OVERLAY DISTRICT

The adoption of stream and wetland overlay districts easily withstands judicial attack. The restrictions do not constitute an uncompensated taking of property, because the property can be improved provided the appropriate special use permit conditions are met. Furthermore, the Illinois Constitution specifically recognizes the importance of the environment:

Section 1. Public Policy-Legislative Responsibility

The public policy of the State and the duty of each person is to provide and maintain a healthful environment for the benefit of this and future generations. The General Assembly shall provide by law for the implementation and enforcement of this public policy.

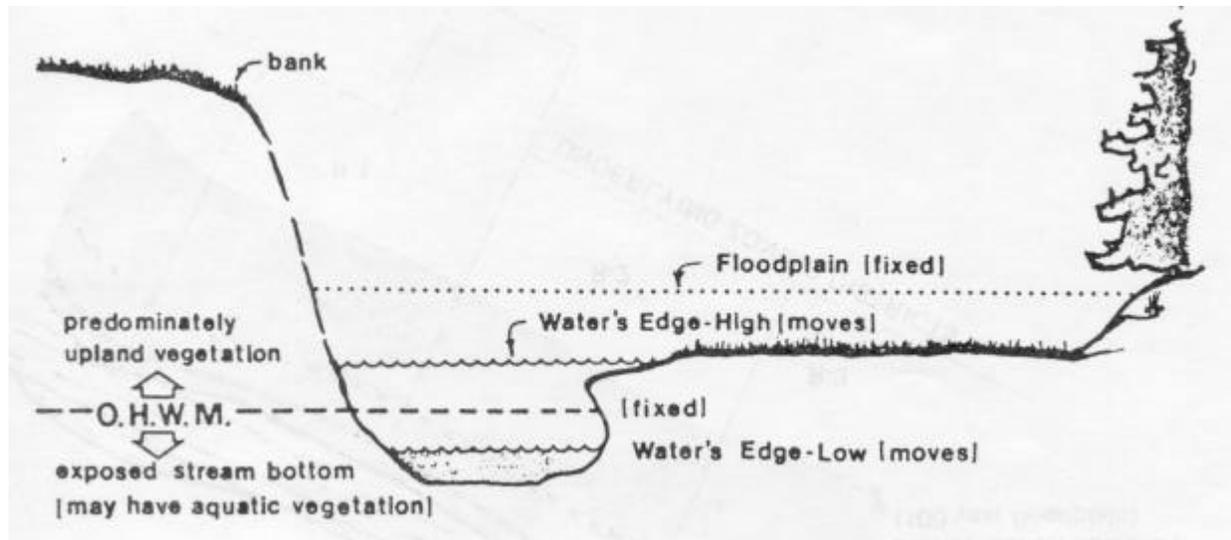

The stream and wetland overlay district zoning technique is merely a means toward achieving this end.

10. Q. What is a stream's "ordinary high water mark (OHWM)?"

A. Streams pose unusual problems with regard to measuring the distance from the stream across the land and determining the area which is to be included in the Lowland Conservancy Overlay District. Streams move (that is, change their location) over time and also rise and fall with the seasons, rainfall, and drought. To administer this ordinance uniformly, the edge of the stream should be measured from the ordinary high water mark for the stream. The ordinary high water mark is fairly easily delineated in the field. As defined by the ordinance:

Ordinary high water mark means the point on the bank or shore up to which the presence and action of surface water is so continuous so as to leave a distinctive mark such as by erosion, destruction or prevention of terrestrial vegetation, predominance of aquatic vegetation, or other easily recognized characteristics.

ORDINARY HIGH WATER MARK (OHWM)

The overlay district requires that development be set back a distance from the OHWM. On-site determination of the overlay district setback boundaries can be made by identifying the ordinary high water mark along the property water frontage (using at least three points) and measuring the setback horizontally from, and perpendicular to, the landward side of each point.

11. Q. Where does a municipality obtain the authority to impose stream and wetland setbacks?

A. The power to impose setback restrictions has been delegated to municipalities and counties by Illinois' basic zoning enabling legislation. Communities usually employ this zoning technique in a roadway context; that is, the technique usually relates building location to the street or right-of-way line.

Setback regulations are, however, also a powerful tool for managing the vital stream and wetland resources in northeastern Illinois.

12. Q. Why utilize a special use permit procedure?

A. Development activities which require a special use permit have a strong potential for damaging the environment or conflicting with surrounding uses. Through the special use permit process, these activities may be allowed in a given district as long as they can meet standards and conditions specified in the zoning ordinance. A special use permit is ideal in a stream and wetland protection overlay district because it assumes that any development can impair the values of the district if there is not proper attention given to the conditions under which the development proceeds. A special use permit procedure provides local zoning bodies with the flexibility that may not otherwise be available in the zoning ordinance to deal with difficult situations.

The standards for approval of special uses must be specified in the zoning ordinance. If a request is made for a special use that complies with all the requirements, the use, after thorough review, must be approved. Every special use permit should contain: 1) procedures for application for a special use permit; 2) the criteria or standards which must be met; 3) an identification of the decision-making body; 4) the requirements for a hearing, presentation of evidence, documentation of the findings and the decision, and 5) the procedures for appeal. Of course, many of these items need not be contained in the Lowland Conservancy Overlay District Ordinance but rather in the underlying zoning ordinance.

13. Q. Must the special use permit provisions be very specific?

A. Yes. Because each instance of development occurring in the overlay district is approved by testing whether it meets the special use permit criteria, there is a heavy burden on the administrative process. This burden can easily become time-consuming and costly for both administrators and property owners, yet can be alleviated by defining the conditions and application procedures as precisely as possible.

14. Q. Why doesn't the model ordinance contain a list of permitted and prohibited uses in the overlay district?

A. The uses permissible in the overlay district are those listed in the underlying zoning district. For example, if the underlying district is a residential district such as an R-1 district, those uses permitted and prohibited in the district are allowed to stand in the overlay district. However, these uses must meet the special use requirements specified for the overlay district as well as the requirements of the underlying district.

15. Q. Will the stream and wetland overlay protection ordinance create nonconforming uses?

A. At the time that the ordinance becomes effective, it is likely that certain existing uses in the stream and wetland areas will not meet the requirements of the ordinance. Specific provisions covering nonconforming uses are not contained in the model ordinance. Further, reference is made to the underlying zoning ordinance.

The abatement of nonconforming uses is a traditional land use management technique that has been upheld by the courts when supported by consistent public interest justifications. Amortization provisions can be incorporated into the ordinance by a community that so desires.

16. Q. Is the protection of aesthetics appropriate in the stream and wetland ordinance?

A. The acceptance of aesthetic criteria as a lawful land use management technique has been slow. However, today the Illinois courts readily uphold the reasonable aesthetic concerns of communities as enunciated in the communities' zoning ordinance.

Typically, Illinois' shoreline communities have been in the vanguard of those municipalities with aesthetic regulations. The basic thrust of the model stream and wetland ordinance is to protect a fragile resource, yet this protection surely can be accomplished in an aesthetically pleasing manner.

For some communities adopting the model ordinance, aesthetics will be a very important concern.

17. Q. Should the ordinance contain more elaborate references to procedures and processes?

A. Illinois zoning enabling legislation sets forth the broad parameters for legislative/administrative processes that protect the constitutional rights of due process and equal protection of the law. Furthermore, Illinois courts require strict adherence to the formalities of notice and hearing contained in a community's comprehensive zoning ordinance. Because the overlay district must also comply with a municipality's zoning ordinance, the procedures and processes contained in that ordinance apply to the overlay district.

18. Q. Should the community adopting the stream and wetland protection ordinance amend their zoning map?
- A. Yes. Although the community will probably rely on the mapping of streams and wetlands as carried out by the U.S. Geological Survey and the U.S. Fish and Wildlife Service, the local community may have to adjust these maps for specific site inaccuracies or to provide greater detail. Furthermore, citizens who live in the area or plan to develop in the area should be aware of the boundaries of the overlay district.
19. Q. Could limitations on development within the overlay district be viewed as an uncompensated, hence unconstitutional taking of property?
- A. Those opposing restrictions on development in general have traditionally advanced the argument that such regulations result in the confiscation of private property without providing just compensation. Proponents of the regulations counter these claims by stating that it is the responsibility of government to protect the public from unwise land use that may cause physical harm and property damage. If the ordinance prohibits development that constitutes neither a hazard to its occupants nor a nuisance to the public, and further, reduces the value of the property towards zero, its invalidation in the courts as a taking of property would be likely. The fact that the stream and wetland protection ordinance allows administrative discretion to grant variances in case of extreme hardship will insulate the ordinance from constitutional attack as an uncompensated taking.
20. Q. How is the stream and wetland protection ordinance different from floodplain regulations?
- A. Floodplain ordinances serve as overlay districts and are, in form, very similar to the stream and wetland overlay district regulations. The purpose of floodplain regulations is to reduce risk of human injury and damage to property due to flooding. Those regulations restrict the construction of buildings in flood prone areas and require "flood proofing" of structures.
- The stream and wetland protection ordinance has more comprehensive objectives, dealing also with water quality and resource management. The areas affected by these ordinances will be the same or similar, but each has its own requirements. Administration of the ordinance is simplified where the stream protection district and the regulated floodplain are made to coincide.
21. Q. Do the communities of northeastern Illinois already have zoning provisions for the protection of the environment?
- A. Several communities throughout northeastern Illinois have ordinances complementary to the stream and wetland protection ordinance. For example,, many communities have soil erosion and sedimentation ordinances that govern and regulate the clearing, grading, excavating and

transporting of soil to reduce the hazards of erosion. These ordinances do not set forth regulations regarding the permissible types of development, but do establish construction procedures. Also of specific concern to many communities is the regulation of septic systems where communities rely exclusively on individual wastewater treatment systems. Used in conjunction with the stream and wetland overlay ordinances, existing septic system ordinances help ensure that septic effluent is not released directly into any of an area's drainage systems.

22. Q. Will local zoning regulation along streams and wetlands become ineffective because streams and wetlands tend to cut across jurisdictions?

A. Ideally, uniform regulations would cover development near streams and wetlands throughout northeastern Illinois. While it may be difficult to achieve uniform regulations, it is important that some form of control be established to prevent the degradation of streams and wetlands.

Jurisdictions in a drainage basin are encouraged to cooperate in the development of uniform regulations for development affecting streams and wetlands. In Illinois, P.A. 85-905 enables five northeastern Illinois counties (excluding Cook) to prepare and implement countywide watershed stormwater plans. This legislation provides an excellent opportunity for northeastern Illinois jurisdictions to incorporate stream and wetland protection into the stormwater management planning process.

23. Q. Is the Lowland Conservancy Overlay District sufficient to protect water resources in a community?

A. This ordinance, although important, is just one tool in an array of potential water resources protection measures. The effectiveness of this ordinance will be enhanced by the adoption of a sediment and erosion control ordinance, a stormwater drainage and detention ordinance, and a floodplain protection ordinance. Stream maintenance programs are important for keeping streams clear of debris. In addition, where public access is desired (e.g. for fishing, hiking or bicycling), a program of stream corridor (greenway) open space acquisition is necessary. In situations where public recreational access is not desirable, the dedication of conservation easements to a public jurisdiction or an appropriate open space/conservation organization can help ensure the protection of the stream corridor resources.

Part II: MODEL STREAM AND WETLAND
PROTECTION ORDINANCE
Lowland Conservancy Overlay District

Sec. 15.00	Retroactivity
Sec. 16.00	Enforcement
16.01	Stop Work Order; Revocation of Permit
16.02	Violations and Penalties
Sec. 17.00	Effective Date

Sec. 1.00 Authority

The Lowland Conservancy Overlay District is adopted by the (legislative body) of _____, Illinois, under the authority of (village/ city/county's) Home Rule Powers as set forth in Article VII, Section 6, of the 1970 Illinois Constitution (home rule city or county); of the Illinois Revised Statutes, Chapter 34, Paragraphs 3151 et seq. (non-home rule county); of the Illinois Revised Statutes, Chapter 24, Paragraphs 11-13-1 et seq. (non-home rule village or city).

Sec. 2.00 Short Title

This ordinance shall be known and may be cited as the (local government name) Lowland Conservancy Overlay District Ordinance.

Sec. 3.00 Purpose and Intent

It is the purpose and intent of this ordinance to promote the health, safety and general welfare of the present and future residents of (local government name) and downstream drainage areas by providing for the protection, preservation, proper maintenance, and use of (local government name) watercourses, lakes, ponds, floodplain and wetland areas. The ordinance is more specifically adopted:

- a. to prevent flood damage by preserving storm and flood water storage capacity;
- b. to maintain the normal hydrologic balance of streams, floodplains, ponds, lakes, wetlands, and groundwater by storing and providing for infiltration of wet-period runoff in floodplains and wetlands, and releasing it slowly to the stream to maintain in-stream flow;

Sec. 1.00 Authority

State legal authority for local government regulations such as the Lowland Conservancy Overlay District, is granted in one of three ways. The Illinois Constitution provides the authority to home rule governments as provided within the parentheses to the left. State statutes provide the authority for non-home rule counties (Illinois Revised Statutes, Chapter 34, Paragraphs 3151 et. seq.) and non-home rule villages and cities (Illinois Revised Statutes, Chapter 24, Paragraphs 11-13-1 et seq.). The information within the parentheses should be replaced as appropriate for the municipality adopting this ordinance.

Sec. 3.00 Purpose and Intent

The purpose and intent is broadly delineated in order to establish the public purpose and benefit (i.e. interest) on which the legality of this exercise of the police power is based.

The rationale for this type of regulation is significantly strengthened if the regulation is an outgrowth of a planning process which establishes public policy for stream protection and which has involved significant citizen participation and input.

Ordinance Text

Commentary

c. to manage stormwater runoff and maintain natural runoff conveyance systems, and minimize the need for major storm sewer construction and drainageway modification;

d. to improve water quality, both by filtering and storing sediments and attached pollutants, nutrients, and organic compounds before they drain into streams or wetlands, and by maintaining the natural pollutant-assimilating capabilities of streams, floodplains and wetlands;

e. to protect shorelines and stream banks from soil erosion, using natural means and materials wherever possible;

f. to protect fish spawning, breeding, nursery and feeding grounds;

g. to protect wildlife habitat;

h. to preserve areas of special recreational, scenic, or scientific interest, including natural areas and habitats of endangered species;

i. to maintain and enhance the aesthetic qualities of developing areas; and

j. to encourage the continued economic growth and high quality of life of the (local government name) which depends in part on an adequate quality of water, a pleasing natural environment, and recreational opportunities in proximity to the (local government name).

In order to achieve the purpose and intent of this ordinance, (local government name) hereby designates the Lowland Conservancy Overlay District which shall be considered as an overlay

to the zoning districts created by (local government name) zoning ordinances as amended. (See Section 1.00) Any proposed development activity within the District must obtain a Special Use Permit as approved by the governing body of (local government name). See Section 5.00.

Sec. 4.00 Definitions

a. "Armoring" is a form of channel modification which involves the placement of materials (concrete, riprap, bulkheads, etc.) within a stream channel or along a shore line to protect property above streams, lakes and ponds from erosion and wave damage caused by wave action and stream flow.

b. "Bulkhead" means a retaining wall that protects property along water.

c. "Channel" means a natural or artificial watercourse of perceptible extent that periodically or continuously contains moving water, or which forms a connecting link between two bodies of water. It has a definite bed and banks that serve to contain the water.

d. "Channel modification" or "channelization" means to alter a watercourse by changing the physical dimension or materials of the channel. Channel modification includes damming, riprapping (or other armoring), widening, deepening, straightening, relocating, lining and significant removal of bottom or woody vegetation. Channel modification does not include the clearing of debris or trash from the watercourse. Channelization is a severe form of channel modification involving a significant change in the channel cross-section and typically involving relocation of the existing channel (e.g. straightening).

e. "Control structure" means a structure designed to control the rate of stormwater runoff that passes through the structure, given a specific upstream and downstream water surface elevation.

f. "Culvert" means a structure designed to carry drainage water or small streams below barriers such as roads, driveways, or railway embankments.

g. "Depression 1 area" means any area which is lower in elevation on all sides than surrounding properties (i.e. does not drain freely), or whose drainage is severely limited such as by a restrictive culvert. A depression area will fill with water on occasion when runoff into it exceeds the rate of infiltration into underlying soil or exceeds the discharge through its controlled outlet. Large depression areas may provide significant stormwater or floodplain storage.

h. "Development" means the carrying out of any building, agricultural, or mining operation, or the making of any change in the use or appearance of land, and the dividing of land into two or more parcels. The following activities or uses shall be taken, for the purposes of this ordinance, to involve development as defined herein:

1. any construction, reconstruction, or alteration of a structure to occupy more or less ground area, or the on-site preparation for same;
2. any change in the intensity of use of land, such as an increase in the number of dwelling units on land, or a material increase in the site coverage of businesses, manufacturing establishments, offices, and dwelling units, including mobile homes, campers, and recreational vehicles, on land;

Ordinance Text

3. any agricultural use of land including, but not limited to, the use of land in horticulture, floriculture, forestry, dairy, livestock, poultry, beekeeping, pisciculture, and all forms of farm products and farm production;
4. the commencement of drilling, except to obtain soil samples, or the commencement of mining, filling, excavation, dredging, grading or other alterations of the topography;
5. demolition of a structure or redevelopment of a site;
6. clearing of land as an adjunct of construction for agricultural, private residential, commercial or industrial use;
7. deposit of refuse, solid or liquid waste, or fill on a parcel of land, or the storage of materials;
8. construction, excavation, or fill operations relating to the creation or modification of any road, street, parking facility or any drainage canal, or to the installation of utilities or any other grading activity that alters the existing topography;
9. construction or erection of dams, levees, walls, fences, bridges or culverts; and
10. any other activity that might change the direction, height, or velocity of flood or surface waters.

i. "District" means the Lowland Conservancy Overlay District as defined in Section 6.02 of this ordinance.

Commentary

3. This ordinance is primarily intended for use in developing urban and suburban areas. The unit of government should consider whether, or to what extent, it wishes to apply the ordinance to agricultural areas and agricultural activities, recognizing that row crop production and livestock grazing can have significant non-point pollution impacts. At a minimum there may be a need in agricultural areas to provide for the natural vegetation buffer strip. It would also be recommended that live stock be removed from the buffer strip area as well. Note that Section 5.05, Permit Exceptions, removes farm drainage ditches from regulation, but a vegetated buffer strip is recommended.

Ordinance Text

Commentary

j. "Erosion" means the general process whereby soils are moved by flowing water or wave action.

k. "Filtered view" means the maintenance or establishment of woody vegetation of sufficient density to screen developments from a stream or wet land, to provide for streambank stabilization and erosion control, to serve as an aid to infiltration of surface runoff, and to provide cover to shade the water. The vegetation need not be so dense as to completely block the view. Filtered view means no clear cutting.

l. "Floodplain" means that land adjacent to a body of water with ground surface elevations at or below the 100-year frequency flood elevation.

m. "Floodway" means that portion of the floodplain (sometimes referred to as the base floodplain or Special Flood Hazard Area) required to store and convey the base flood. The floodway is the 100 year floodway as designated and regulated by the Illinois Department of Transportation /Division of Water Resources. The remainder of the floodplain which is outside the regulatory floodway is referred to as the flood fringe or floodway fringe.

n. "Hydraulic characteristics" means the features of a watercourse which determine its water conveyance capacity. These features include but are not limited to: size and configuration of the cross-section of the watercourse and floodway; texture and roughness of materials along the watercourse; alignment of watercourse; gradient of watercourse; amount and type of vegetation within the watercourse; and size, configuration, and other characteristics of structures within the watercourse. In low-lying area the characteristics of the overbank area also determine water conveyance capacity.

l. The report, "Floodplain Regulations" (Local Assistance Series 2C), January 1987, published by the Illinois Department of Transportation/Division of Water Resources, provides an excellent overview of state and federal floodplain regulations as well as explanations and definitions of technical flood management terminology. Maps published by the Federal Emergency Management Agency (FEMA) indicate the location and extent of floodplains (Special Flood Hazard Area, SFHA) and are available from the Northeastern Illinois Planning Commission. Questions regarding floodways should be directed to FEMA, 175 West Jackson Boulevard, Chicago, Illinois 60604, and the Illinois Department of Transportation/Division of Water Resources, 201 West Center Court, Schaumburg, Illinois 60196-1096.

Ordinance Text

o. "Lot" means an area of land, with defined boundaries, that is designated in official assessor's records as being one parcel.

p. "Lake or pond" means any inland waterbody, fed by spring or surface water flow.

q. "Natural" in reference to watercourses means those stream channels, grassed waterways and swales formed by the existing surface topography of the earth prior to changes made by unnatural causes. A natural stream tends to follow a meandering path; its floodplain is not constrained by levees; the area near the bank has not been cleared, mowed or cultivated; the stream flows over soil and geologic materials typical of the area with no alteration of the course or cross-section of the stream caused by filling or excavating.

r. "Ordinary high water mark" (OHWM) means the point on the bank or shore up to which the presence and action of surface water is so continuous so as to leave a distinctive mark such as by erosion, destruction or prevention of terrestrial vegetation, predominance of aquatic vegetation, or other easily recognized characteristics.

s. "Qualified professional" means a person trained in one or more of the disciplines of biology, geology, soil science, engineering, or hydrology whose training and experience ensure a competent analysis and assessment of stream, lake, pond and wetland conditions and impacts.

t. "Registered professional engineer" means a professional engineer registered under the provisions of "The Illinois Professional Engineering Act" and any act amendatory thereof.

Commentary

p. Local jurisdictions, after studying the water bodies within their boundaries, may wish to adopt criteria in order to bring certain lakes or ponds under the ordinance regulations. Generally speaking, smaller ponds and especially retention facilities are more difficult to manage and maintain as "natural" water bodies because they are less resilient to the impacts of adjacent development and inflow as well as the natural aging processes.

s. and t. Persons trained as environmental engineers have training in the environmental sciences as well as engineering, and are therefore generally qualified to work with the requirements of this ordinance. Geoscientists and biologists have training that allows assessment of environmental impacts. Not all engineers are familiar with non-structural management approaches that are encouraged by this ordinance.

Ordinance Text

u. "Retention/detention facility" means a facility that provides for storage of storm water runoff and controlled release of this runoff during and after a flood or storm.

v. "Runoff" means the portion of precipitation on the land that is not absorbed by the soil or plant material and which runs off the land.

w. "Sedimentation" means the processes that deposit soils, debris, and other materials either on other ground surfaces or in water bodies or watercourses.

x. "Setback" means the horizontal distance between any portion of a structure or any development activity and the ordinary high water mark of a perennial or intermittent stream, the ordinary high water mark of a lake or pond, or the edge of a wetland, measured from the structure's or development's closest point to the ordinary high water mark, or edge.

y. "Stream" means a body of running water flowing continuously or intermittently in a channel on or below the surface of the ground. 7.5 minute topographic maps of the U.S. Geological Survey are one reference for identifying perennial and intermittent streams. For purposes of this ordinance, the term "stream" does not include storm sewers.

z. "Structure" means anything that is constructed, erected or moved to or from any premise which is located above, on, or below the ground including, but not limited to roads, signs, billboards, and mobile homes. Temporary recreational facilities including, but not limited to, tents, camper trailers, and recreation vehicles are not considered structures when used less than 180 days per year and located landward of the minimum setback provided as a natural vegetation strip.

Commentary

u. A retention facility maintains a permanent pool of water. A detention facility does not.

Ordinance Text

aa. "Vegetation" means all plant growth, especially trees, shrubs, mosses, and grasses.

bb. "Watercourse" means any river, stream, creek, brook, branch, natural or artificial depression, ponded area, slough, gulch, draw, ditch, channel, conduit, culvert, swale, grass waterway, gully, ravine, wash, or natural or man-made drainageway, which has a definite channel, bed and banks, in or into which stormwater runoff and floodwater flow either regularly or intermittently.

cc. "Wetland" means those transitional lands between terrestrial and aquatic system where the water table is usually at or near the surface or the land is covered by shallow water. Classification of areas as wetlands shall follow the "Classification of Wetlands and Deepwater Habitats of the United States" as published by the U.S. Fish and Wildlife Service (FWS/OBS-79/31).

Sec. 5.00 Special Use Permit

To ensure that proposed development activity can be carried out in a manner which is compatible and harmonious with the natural amenities of the Lowland Conservancy Overlay District and with surrounding land uses, a request for a Special Use Permit for such development activity must be submitted for approval by the governing body of (local government name).

No special use permit shall be issued unless the (local government name) finds that:

a. the development will not detrimentally affect or destroy natural features such as ponds, streams, wetlands, and forested areas, nor impair their natural functions, but will preserve and incorporate such features into the development's site;

Commentary

aa. Wherever possible, native species should be preserved or introduced as necessary. "Naturalized" species should be utilized if proven that there will be no negative impacts such as rapid takeover and "choking" of other beneficial species. The Illinois Department of Conservation may be consulted regarding appropriate stream and wetland vegetation.

cc. NIPC is a distributor of the U.S. Fish and Wildlife Service/Illinois Department of Conservation National Wetlands Inventory maps, as is Northern Illinois University. Additional references include Wetland Plants of the State of Illinois, 1986, Hydric Soils of the State of Illinois, 1985, and A Field Guide to the Wetlands of Illinois, Illinois Department of Conservation, 1988.

b. the location of natural features and the site's topography have been considered in the designing and siting of all physical improvements;

c. adequate assurances have been received that the clearing of the site of topsoil, trees, and other natural features will not occur before the commencement of building operations; only those areas approved for the placement of physical improvements may be cleared;

d. the development will not reduce the natural retention storage capacity of any watercourse, nor increase the magnitude and volume of flooding at other locations; and that in addition, the development will not increase stream velocities; and

e. the soil and subsoil conditions are suitable for excavation and site preparation, and the drainage is designed to prevent erosion and environmentally deleterious surface runoff.

There shall be no development, including the immediate or future clearing or removal of natural ground cover and/or trees, within the Lowland Conservancy Overlay District for any purpose, unless a special use permit is granted subject to the provisions of this ordinance or the provisions of the (local government name) zoning ordinance.

Dumping, filling, mining, excavating, dredging, or transferring of any earth material within the district is prohibited unless a special use permit is granted. No ponds or impoundments shall be created nor other alterations or improvements shall be allowed in the district for recreational uses, storm water management, flood control, agricultural uses or as scenic features unless a special use permit is granted.

The ordinance is not intended to preclude removal of vegetation (for example, removal of exotic species or selective thinning in order to increase sunlight penetration) as part of a management program for maintenance and restoration of natural areas. Jurisdictions may wish to add specific language to this effect.

Sec. 5.01 Application for Permit

Application for a special use permit, shall be made by the owner of the property, or his/her authorized agent, to the (local government name) on a form furnished for that purpose. Each application shall bear the name(s) and address(es) of the owner or developer of the site and of any consulting firm retained by the applicant together with the name of the applicant's principal contact at such firm, and shall be accompanied by a filing fee of _____. Each application shall include certification that any land clearing, construction, or development involving the movement of earth shall be in accordance with the plans approved upon issuance of the permit.

Sec. 5.02 Submissions

Each application for a special use permit shall be accompanied by the following information as specified in the ordinance sections cited:

General Provisions:

Site Development Plan	Sec. 6.04
Geologic and Soil Report	Sec. 6.05
Drainage Control Plan	Sec. 6.06
Site Grading & Excavation Plan	Sec. 6.07
Landscape Plan	Sec. 6.08

Justification for Watercourse
Relocation and Minor Modifications:

Stream "Modification/Relocation Plan	Sec. 7.02
Channel and Bank Armoring	Sec. 7.03
Culverts	Sec. 7.04
On-Stream Impoundments	Sec. 7.05
Impact Assessment (at option of (local government name))	Sec. 8.00

Sec. 5.02 Submissions

Large development projects require submittal of extensive documentation. In order that the regulation does not become unreasonable and onerous for very small development projects, the local jurisdiction should have the flexibility of waiving or simplifying submission requirements.

Where ordinance requirements are considered to be burdensome due to unusual lot configurations, for example, a very small lot area covered by the District, the special use permit applicant may petition for a variance under the provisions of Section 11.01.

The submissions called for in Sections 6.04 through 6.08 may be required by existing ordinances. If so, they may be deleted from this ordinance with a cross-reference to the other ordinance or ordinances.

In some instances, a jurisdiction may wish to amend existing ordinances with provisions from this ordinance rather than, or in addition to, adopting a new ordinance.

Where a proposed development activity is less than 2 1/2 acres in area the (permit issuing agency), upon approval of the (local government name) engineer, may waive or simplify any or all of the submission requirements (Sec. 6.04-6.08) provided that the person responsible for any such development shall implement necessary protection measures to satisfy the purpose and intent set forth in Section 3.00 of this ordinance. (See Sec. 11.01, Variances)

Sec. 5.03 Bonds

The applicant may be required to file with the (local government name) a faithful performance bond or bonds, letter of credit, or other improvement security satisfactory to the (municipal attorney), in an amount deemed sufficient by the (local government name) to cover all costs of improvements, landscaping, or maintenance of improvements and landscaping, for such period as specified by the (local government name), and engineering and inspection costs to cover the cost of failure or repair of improvements installed on the site.

Sec. 5.04 Review and Approval

Each application for a special use permit shall be reviewed and acted upon according to the following procedures:

1. The (local government name) will review each application for a special use permit to determine its conformance with the provisions of this ordinance. The (local government name) may also refer any application to the (county) Soil and Water Conservation District and/or any other local government or public agency within whose jurisdiction the site is located for review and comments. Within thirty (30) days after receiving an application, the (local government name) shall in writing, (a) approve the permit application, if it is found to be in conformance with the

provisions of this ordinance, and issue the permit;
(b) approve the Permit application subject to such reasonable conditions as may be necessary to secure substantially the objectives of this ordinance, and issue the permit subject to these conditions; or (c) disapprove the permit application, indicating the deficiencies and the procedure for submitting a revised application and/or submission.

2. No special use permit shall be issued for an intended development site unless:

a. the development, including but not limited to subdivisions and planned unit developments, has been approved by the (local government name) where applicable; or

b. such Permit is accompanied by or combined with a valid building permit issued by the (local government name); or

c. the proposed development is coordinated with any overall development program previously approved by the (local government name) for the area in which the site is situated.

3. Failure of the (local government name) to act on an original or revised application within thirty days' of receipt shall authorize the applicant to proceed in accordance with the plans as filed, unless such time is extended by agreement between the (local government name) and the applicant. Pending preparation and approval of a revised plan, development activities shall be allowed to proceed in accordance with conditions established by the (local government name).

Sec. 5.05 Permit Exceptions

The provisions of this ordinance shall not apply to:

a. emergency work necessary to preserve life or property; when emergency work is performed under this section, the person performing it shall report the pertinent facts relating to the work to the (permit issuing agency) within ten (10) days after commencement of the work and shall thereafter obtain a special use permit and shall perform such work as may be determined by the agency to be reasonably necessary to correct any impairment to the watercourse, lake, pond, floodplain or wetland (in terms of the purposes of this ordinance Section 3.00 a-j);

b. work consisting of the operation, repair, or maintenance of any lawful use of land existing on the date of adoption of this ordinance;

c. lands adjacent to farm ditches if:

1. such lands are not adjacent to a natural stream or river; or
2. those parts of such drainage ditches adjacent to such lands were not streams before ditching; or
3. such lands are maintained in agricultural uses without buildings and structures.

Where farm ditches are found to contribute to adverse environmental impacts or hazards to persons or property, the (local government name) may include designated farm ditches in the District. The (local government name) may also require that linings, bulkheads, dikes and culverts be removed to mitigate hazards, or that other mitigative measures be taken, such as the maintenance of a natural vegetation buffer strip.

c. Many drainageways in the region were created as agricultural drainage ditches, or drainage ditches were created by channelizing streams or swales. The primary purpose of this ordinance is not to regulate agricultural activities and farm ditches specifically. Therefore this language is provided. Where streams flowing through agricultural areas have a reasonable degree of natural amenity, the jurisdiction is justified in regulating them, particularly if a planning process has specifically identified such streams and if protection of those streams in agricultural areas is necessary for managing water resources in downstream areas that are urbanizing or are already urbanized. It is recommended that a vegetation buffer strip be maintained on both sides of agricultural drainage ditches.

Sec. 5.06 Effect on Other Permits

The granting of a special use permit under the provisions herein shall in no way affect the owner's responsibility to obtain the approval required by any other statute, ordinance, or regulation of any state agency or subdivision thereof, or to meet other (local government name) ordinances and regulations. Where state and/or federal permits are required, a special use permit will not be issued until they are obtained.

Sec. 6.00 General Provisions: Area Affected

This ordinance applies to development in or near streams, lakes, ponds and wetlands within (local government name). Streams, lakes, and ponds (including intermittent streams) are those which are shown on the United States Department of the Interior Geological Survey (USGS) 7.5 minute quadrangle maps and those additional streams, lakes, and ponds delineated on maps adopted as part of this ordinance. Those maps are hereby made a part of this ordinance, and two copies thereof shall remain on file in the office of the (local government name) administrator for Public inspection. Within the jurisdiction of (local government name), those waterbodies and watercourses that are named and are subject to the provisions of this ordinance are (list of water bodies and water courses). Wetlands are those designated in the U.S. Fish and Wildlife Service/ Illinois Department of Conservation wetland inventory and those additional wetlands delineated on maps adopted as part of this ordinance.

If new drainage courses, lakes, ponds or wetlands are created as part of a development, the requirements for setbacks and uses within setbacks, and the criteria for watercourse relocation and minor modification shall apply. The District shall be amended as appropriate to include these areas.

Sec. 5.06 Effect on Other Permits

The U.S. Army Corps of Engineers, U.S. Environmental Protection Agency, and the Illinois Department of Transportation/Division of Water Resources all have water resource management and regulatory authority which is independent of, and in addition to, any requirements of this ordinance. Their regulations may or may not apply to the streams covered by this ordinance.

Sec. 6.00 General Provisions: Area Affected

USGS quadrangle maps may not be up to date in all areas, and they may not be of sufficient detail except to serve as a general location reference. It is recommended that the ordinance contain more detailed maps which show the location of drainageways, wetlands and ponds to be regulated, with careful attention to the end Points of stream reaches affected. The width of the District can also be mapped in addition to width specifications in the ordinance text.

The width of the District may need to vary in order to reflect stream conditions, need for nonpoint source pollution control, and planned land use considerations (e.g. need for public access in certain areas). A rationale should exist for variations in District width, and all areas with similar characteristics should be treated uniformly. The ordinance would have to identify the locations of the various District widths.

The U.S. Fish and Wildlife Service/Illinois Department of Conservation Wetland Inventory, although very detailed, may not include all wetlands within a given jurisdiction. The local jurisdiction may want to review wetlands in their area with technical personnel of the Illinois Department of Conservation or local experts before deciding which wetlands to regulate with this ordinance.

Sec. 6.01 The Lowland Conservancy Overlay District

The Lowland Conservancy Overlay District shall be considered as an overlay to the zoning districts created by the (local government name) zoning ordinance as amended in addition to the requirements of this ordinance, applicants for a special use permit within the District shall meet all requirements of the underlying zoning districts. In the event of a conflict between the overlay district requirements and the underlying zoning district requirements, the most restrictive requirements prevail.

Sec. 6.02 District Boundary

The procedures, standards and requirements contained in this ordinance shall apply to all lots within wetlands and streams, and all lots lying wholly or in part:

- a. within the Special Flood Hazard Area (SFHA) designated by the Federal Emergency Management Agency (FEMA); or
- b. within 100 feet of the ordinary high water mark (OHWM) of a perennial stream or intermittent stream, the ordinary high water mark of a lake or pond, or the edge of a wetland; or
- c. within depressional areas serving as floodplain or stormwater storage areas, as designated on the Lowland Conservancy District Map.

The District is designated on a map labeled "Lowland Conservancy Overlay District Map", which is made to be part of this ordinance and which has the same force and effect as if all the notations, references, and descriptions shown thereon were set forth or described herein. Designated areas are attached as Exhibits _____ and additional areas may be approved from time to time and be made exhibits hereto.

Sec. 6.02 District Boundary

An overlay district can be defined by fixed or floating boundaries. A fixed boundary is set at a certain number of feet from the ordinary high water mark of a stream, lake or pond, or the edge of a wetland. A floating boundary varies in width according to the location of sensitive areas along the stream or wetland.

The value and the problems associated with either type of boundary are obvious. Fixed boundaries, although easy to set and administer, may be rigid and potentially arbitrary. A review of ordinances from around the country indicates that fixed boundaries can be anywhere from 25 to 300 feet wide. Floating boundaries are more sensitive to critical areas along streams and adjacent to wetlands, yet defining a floating boundary takes both investigation and evaluation of environmental data (a relatively difficult task when staff and other resources are limited). The criteria included in the model ordinance use a combination approach. The boundary is defined by the floodplain (SFHA) which has been delineated for most streams in the region, or by a fixed distance which is a minimum. Not all floodplain areas have been mapped by FEMA.

Sec. 6.03 Minimum Setback of Development Activity from Streams, lakes, Ponds, and Wetlands

Absolutely no development activity (except as provided below) may occur within the minimum setback which is defined as 75 feet from the ordinary high water mark of streams, lakes and ponds, or the edge of wetlands, or within a designated depressional areas. In no case shall the setback be less than the boundary of the 100-year floodway as defined by FEMA. These setback requirements do not apply to a stream in a culvert unless the stream is taken out of the culvert as part of development activity. If a culvert functions as a low-flow culvert, where water is intended to periodically flow over it, the setback requirements apply.

The following development activities may be permitted, subject to issuance of a special use permit, within the minimum setback areas only if, as a practical matter, they cannot be located outside the setback area. Such development activities will only be approved based upon a report, prepared by a qualified professional, which demonstrates that they will not adversely affect water quality; destroy, damage or disrupt significant habitat area; adversely affect drainage and/or stormwater retention capabilities; adversely affect flood conveyance and storage; lead to unstable earth conditions, create erosion hazards, or be materially detrimental to any other property in the area of the subject property or to the (local government name) as a whole, including the loss of open space or scenic vistas:

- a. minor improvements such as walkways, benches, comfort stations, informational displays, directional signs, foot bridges, observation decks, and docks;
- b. the maintenance, repair, replacement, and reconstruction of existing highways and bridges, electrical transmission and telecommunication lines, poles, and towers; and

The publication, "Manual of Conservation Engineering Guidelines" (Illinois Department of Conservation, 1983), is an excellent resource. It contains a chapter on streambank erosion control with discussion of vegetative stabilization.

c. the establishment and development of public and private parks and recreation areas, outdoor education areas, historic natural and scientific areas, game refuges, fish and wildlife improvement projects, game bird and animal farms, wildlife preserves and public boat launching ramps.

Review of the proposed development activity within the minimum setback area will consider the following:

a. Only limited filling and excavating necessary for the development of public boat launching ramps, swimming beaches, or the development of park shelters or similar structures is allowed. The development and maintenance of roads, parking lots and other impervious surfaces necessary for permitted uses are allowed only on a very limited basis, and where no alternate location outside of the setback area is available.

b. Land surface modification within the minimum setback shall be permitted for the development of stormwater drainage swales between the developed area of the site (including a stormwater detention facility on the site) and a stream, lake or pond, or wetland. Detention basins within the setback are generally discouraged, unless it can be shown that resultant modifications will not impair water quality, habitat, or flood storage functions.

c. No filling or excavating within wetlands is permitted except to install piers for the limited development of walkways and observation decks. Walkways and observation decks should avoid high quality wetland areas, and should not adversely affect natural areas designated in the Illinois Natural Areas Inventory or the habitat of rare or endangered species.

d. Wetland area occupied by the development of decks and walkways must be mitigated by an equal area of wetland habitat improvement.

e. Modification of degraded wetlands for purposes of stormwater management is permitted where the quality of the wetland is improved and total wetland acreage is preserved. Where such modification is permitted, wetlands shall be protected from the effects of increased stormwater runoff by measures such as detention or sedimentation basins, vegetated swales and buffer strips, and sediment and erosion control measures on adjacent developments. The direct entry of storm sewers into wetlands shall be avoided. Environmental impact analysis of wetland modification may be required in accordance with Section 8.00 of this ordinance.

An applicant for a special use permit (See Section 5.00) must stabilize areas left exposed after land surface modification with vegetation normally associated with that stream or wetland. The planting of native riparian vegetation is recommended as the preferred stabilization measure. Other techniques should be used only when and where vegetation fails to control erosion. The preferred alternative is riprap, using natural rock materials where practicable, installed on eroding bank areas in a manner that provides interstitial space for vegetative growth and habitat for macroinvertebrates and other stream organisms. Lining of the stream channel bottom is not permitted.

The applicant shall minimize access to the applicant's proposed development activity within all or part of the Lowland Conservancy Overlay District where such access could adversely affect the stream, lake, pond, wetland, or related environmentally sensitive areas.

Sec. 6.04 Site Development Plan

A site development plan must be prepared for any proposed development within, or Partly within, the Lowland Conservancy Overlay District and must indicate:

- a. dimension and area of parcel, showing also the vicinity of the site in sufficient detail to enable easy location, in the field, of the site for which the special use permit is sought, and including the boundary line, underlying zoning, a legend, a scale, and a north arrow. (This requirement may be satisfied by the submission of a separate vicinity map.);
- b. location of any existing and proposed structures;
- c. location of existing or proposed on-site sewage systems or private water supply systems;
- d. location of any perennial or intermittent stream, lake or pond, and its ordinary high water mark;
- e. location and landward limit of all wetlands;
- f. location of setback lines as defined in this ordinance;
- g. location of the 100-year floodway;
- h. location of existing or future access roads;
- i. specifications and dimensions of stream, wetland or other water areas proposed for alterations;
- j. cross-sections and calculations indicating any changes in flood storage volumes; and

k. such other information as reasonably requested by (local government name).

The applicant shall present evidence, prepared by a qualified professional, that demonstrates that the proposed development activity will not endanger health and safety, including danger from the obstruction or diversion of flood flow. The developer shall also show, by submitting appropriate calculations and resource inventories, that the proposed development activity will not substantially reduce natural floodwater storage capacity, destroy valuable habitat for aquatic or other flora and fauna, adversely affect water quality or ground water resources, increase stormwater runoff velocity so that water levels on other lands are substantially raised or the danger from flooding increased, or adversely impact any other natural stream, floodplain, or wetland functions, and is otherwise consistent with the intent of this ordinance.

**Sec. 6.05 Geologic and Soil
Characteristics/Geologic and Soil Report**

The site proposed for development shall be investigated to determine the soil and geologic characteristics, including soil erosion potential. A report, prepared by a licensed professional engineer, geoscientist, or soil scientist experienced in the practice of geologic and soil mechanics, shall be submitted with every application for land development within the Lowland Conservancy Overlay District. This report shall include a description of soil type and stability of surface and subsurface conditions. Any area which the investigation indicates as being subject to geologic or soil hazards shall not be subjected to development, unless the engineer or soil scientist can demonstrate conclusively that these hazards can be overcome.

Sec. 6.06 Hydrologic Controls/Drainage Control Plan

A drainage control plan that describes the hydraulic characteristics of on-site and nearby watercourses as well as the proposed drainage plan, prepared by a registered Professional engineer experienced in hydrology and hydraulics, shall be submitted with each application for land development within the Lowland Conservancy Overlay District. Unless otherwise noted, the following restrictions, requirements and standards shall apply to all development within the Lowland Conservancy Overlay District:

a. natural open-channel drainageways shall be preserved; and

b. runoff from areas of concentrated impervious cover (e.g., roofs, driveways, streets, patios, etc.) shall be collected and transported to a drainageway (preferably a natural drainageway) with sufficient capacity to accept the discharge without undue erosion or detrimental impact. Vegetated drainage swales are preferred over conveyances constructed of concrete or other manufactured materials.

The drainage control Plan shall identify appropriate measures, such as recharge basins and detention/retention basins, which will limit the quantitative and qualitative effects of stormwater runoff to pre-development conditions.

Section 6.07 Site Grading and Excavation Plan

Section 6.07 applies to the extent that grading and excavation and erosion control plans, which satisfy the following requirements, are not already required by a jurisdiction.

Sec. 6.06 Hydrologic Controls/Drainage Control Plan

It is desirable to have the drainage control plan reviewed by a qualified professional from the environmental field.

Sec. 6.07 Site Grading and Excavation Plan

Reference: NIPC Planning Aid No. 11, Suggested Soil Erosion and Sedimentation Control Ordinance: A Guide for Local Officials, January 1980.

A site grading and excavation Plan, prepared by a registered professional engineer, trained and experienced in civil engineering, shall be submitted with each application for a special use permit and shall include the following:

- a. details of the existing terrain and drainage pattern with one-foot contours;
- b. proposed site contours at one-foot intervals;
- c. dimensions, elevation and contours of grading, excavation and fill;
- d. a description of methods to be employed in disposing of soil and other material that is removed from allowable grading and excavation sites, including location of the disposal site if on the property;
- e. a schedule showing when each stage of the project will be completed, including the total area of soil surface to be disturbed during each stage, and estimated starting and completion dates. The schedule shall be prepared so as to limit, to the shortest possible period, the time soil is exposed and unprotected. In no case shall the existing natural vegetation be destroyed, removed or disturbed more than fifteen (15) days prior to initiation of the improvements; and
- f. a detailed description of the revegetation and stabilization methods to be employed, to be prepared in conjunction with the landscape plan per Section 6.08. This description should include locations of erosion control measures such as sedimentation basins, straw bales, diversion swales, etc.

Ordinance Text

Commentary

The grading and excavation plan must be consistent with all the provisions of this ordinance.

Unless otherwise provided in this ordinance, the following restrictions, requirements and standards shall apply to all development within the District:

a. every effort shall be made to develop the site in such a manner so as to minimize the alteration of the natural topography;

b. no grading, filling, cleaning, clearing, terracing or excavation of any kind shall be initiated until final engineering plans are approved and the special use permit is granted by the (local government name); and

c. the depositing of any excavation, grading or clearing material within a stream, lake, pond or wetland area (i.e. within the District) shall be prohibited.

In addition to locating all site improvements on the subject property to minimize adverse impacts on the stream, lake, pond, or wetland, the applicant shall install a berm, curb, or other physical barrier during construction, and following completion of the project, where necessary, to prevent direct runoff and erosion from any modified land surface into a stream, lake, pond, or wetland. All parking and vehicle circulation areas should be located as far as possible from a stream, lake, pond, or wetland.

(Local government name) may limit development activity in or near a stream, lake, pond, or wetland to specific months, and to a maximum number of continuous days or hours, in order to minimize adverse impacts.

Also, the (local government name) may require that equipment be operated from only one side of a stream, lake, or pond in order to minimize bank disruption.

Other development techniques, conditions, and restrictions may be required in order to minimize adverse impacts on streams, lakes, ponds or wetlands, and on any related areas not subject to development activity.

Sec. 6.08 Natural Vegetation Buffer Strip Required: Vegetation and Revegetation/Landscape Plan

To minimize erosion, stabilize the streambank, protect water quality, maintain water temperature at natural levels, preserve fish and wildlife habitat, to screen man-made structures, and also to preserve aesthetic values of the natural water course and wetland areas, a natural vegetation strip shall be maintained along the edge of the stream, lake, pond or wetland. The natural vegetation strip shall extend landward a minimum of 25 feet from the ordinary high water mark of a perennial or intermittent stream, lake or pond and the edge of wetland.

Within the natural vegetation strip, trees and shrubs may be selectively pruned or removed for harvest of merchantable timber, to achieve a filtered view of the waterbody from the principal structure and for reasonable private access to the stream, lake, pond, or wetland. Said pruning and removal activities shall ensure that a live root system stays intact to provide for streambank stabilization and erosion control.

A landscape plan, prepared by a professional landscape architect, shall be submitted with each special use permit application for development activity within the Lowland Conservancy Overlay District and contain the following:

a. a plan describing the existing vegetative cover of the property and showing those areas where the vegetation will be removed as part of the proposed construction; and

Sec. 6.08 Natural Vegetation Buffer Strip Required: Vegetation and Revegetation/Landscape Plan

One purpose of this ordinance is to provide for the protection of a natural vegetation buffer strip. It is desirable to provide for maximum width of natural vegetation as a buffer area. Urban areas present constraints which require consideration of local conditions including stream width, the potential need for public access etc. The U.S. Department of Agriculture (USDA) through its Conservation Reserve Program, encourages farmers to create "water quality enhancement zones" along streams, wetlands and lakes.

The USDA recommend that these "filter strips" extend 66 to 99 feet from stream banks. The Dane County (WI) Regional Planning Commission has made buffer strip recommendations based upon stream size and need for public access. (See following page.)

Ordinance Text

b. a plan describing the proposed revegetation of disturbed areas specifying the materials to be used.

The vegetation must be planned in such a way that access for stream maintenance purposes shall not be prevented.

Sec. 7.00 Watercourse Relocation and Minor Modifications (including Channelization and Relocation)

Watercourse relocation or modification is generally not permitted because these activities are not usually consistent with the purposes of this ordinance. Under certain circumstances, relocation and minor modification may be permitted through a special use permit where certain problems can be mitigated by relocation and/or minor modification, specifically when:

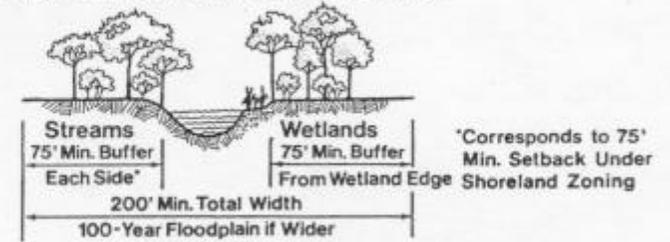

- a. off-site hydrologic conditions are causing erosion, flooding and related problems; or
- b. on-site soil and geologic conditions are resulting in unstable conditions that pose hazards to life, health, and existing structures or property; or
- c. the quality of previously modified or relocated streams can be improved through restoration; or
- d. officially adopted stormwater management plans call for placement of detention or retention facilities in a stream; or
- e. public utilities, including sanitary sewers, pipelines, and roadways require stream crossing or relocation where there are not practical alternatives.

Modification of watercourses as a convenience for site design purposes is not permitted.

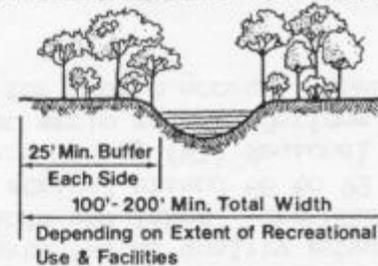

Commentary

BUFFER STRIP EXAMPLES*

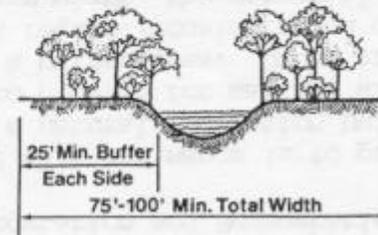

NAVIGABLE STREAMS & WETLANDS

INTERMITTENT STREAMS & DRAINAGEWAYS WITH PUBLIC ACCESS FOR RECREATION

INTERMITTENT STREAMS & DRAINAGEWAYS NO RECREATIONAL ACCESS

*Recommendations of the Dane County (WI) Regional Planning Commission

Sec. 7.01 Conditions and Restrictions for Permitting Stream Modification

Stream modification, when permitted, is subject to the following conditions and restrictions:

- a. water quality, habitat and other natural functions must be significantly improved by the modification; no significant habitat area may be destroyed;
- b. the amount of flow and velocity of a stream is not to be increased or decreased as the stream enters or leaves a subject property, unless this reflects an improvement over previous conditions in terms of reduced flooding, reduced erosion, or enhanced lowflow conditions;
- c. prior to diverting water into a new channel, a qualified professional approved by the (local government name) shall inspect the stream modification, and issue a written report to the (local government name) that the modified stream complies with the requirements in Section 7.02; and
- d. stream channel enlargement, or other modifications that would increase conveyance, shall not be permitted if the intended purpose is to accommodate development activities in the floodplain.

Sec. 7.02 Required Content of Stream Modification, Relocation Plan

Stream relocation may be permitted in accordance with a stream relocation plan which provides for:

- a. the creation of a natural meander pattern, pools, riffles, and substrate;

Sec. 7.02 Required Content of Stream Modification/Relocation Plan

Also see, Manual of Conservation Engineering Guidelines, p. IV-17

- b. the formation of gentle side slopes (at least three feet horizontally per one foot vertically), including installation of erosion control features;
- c. the utilization of natural materials wherever possible;
- d. the planting of vegetation normally associated with streams, including primarily native riparian vegetation;
- e. the creation of spawning and nesting areas wherever appropriate;
- f. the re-establishment of the fish population wherever appropriate;
- g. the restoration of water flow characteristics compatible with fish habitat areas, wherever appropriate;
- h. the filling and revegetation of the prior channel;
- i. a proposed phasing plan, specifying time of year for all project phases;
- j. plans for sediment and erosion control; and
- k. establishment of a low-flow channel which reflects the conditions of a natural stream.

Sec. 7.03 Criteria for Permitting Armoring of Channels and Banks

Armoring in the form of bulkheads, riprap or other materials or devices is not permitted except in accordance with the following:

- h. In some instances it may be desirable to retain the prior channel as a backwater lake for habitat management purposes.

Sec. 7.03 Criteria for Permitting Armoring of Channels and Banks

See also Manual of Conservation Engineering Guidelines, p.IV-21 - IV-26.

- a. significant erosion cannot be prevented in any other way and the use of vegetation and gradual bank slopes has not sufficiently stabilized the shoreline or bank;
- b. the bulkhead or other device is not placed within a wetland, or between a wetland and a lake or pond;
- c. the bulkhead, riprap or other device will minimize the transmittal of wave energy or currents to other properties; and
- d. the change in the horizontal or vertical, configuration of the land must be kept to a minimum where permission to install bulkheads or other armoring devices is requested as part of the special use permit application documentation and certification pertaining to the items above' must be submitted.

Sec. 7.04 Criteria for Permitting the Use of Culverts

Culverts are not permitted in streams except in accordance with the following:

- a. where a culvert is necessary for creating access to a property; use of culverts as a convenience, in order to facilitate general site design, is not to be considered;
- b. the culvert must allow passage of fish inhabiting the stream, and accommodate the 100-year flood event without increasing upstream flooding, except where a restricting culvert is desirable as part of an overall storm and floodwater management plan;
- c. the culvert must be maintained free of debris and sediment to allow free passage of water, and if applicable, fish; and

Sec. 7.04 Criteria for Permitting the Use of Culverts

See also Manual of Conservation Engineering Guidelines, p.III-17.

d. the stream bottom should not be significantly widened for the placement of a culvert as this increases siltation; if multiple culverts must be installed, one culvert should be at the level of the bottom of the stream and the others at or above normal water elevation.

Sec. 7.05 Criteria for Permitting On-Stream Impoundments

Impoundment of streams is not permitted except in accordance with the following:

a. the impoundment is determined to be in the public interest by providing regional stormwater detention, flood control, or public recreation;

b. the impoundment will not prevent the upstream migration of indigenous fish species;

c. a non-point source control plan has been implemented in the upstream watershed to control the effects of sediment runoff as well as minimize the input of nutrients, oil and grease, metals, and other pollutants;

d. impoundments without permanent low-flow pools are preferred except where a permanent pool is necessary to achieve the intended benefits of the impoundment (e.g. recreation or water quality mitigation); and

e. impoundment design shall include gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin.

Sec. 8.00 Impact Assessment

(Local government name) may ask an applicant to submit a report prepared by a qualified professional, and approved by the (local government name), in order to

Sec. 7.05 Criteria for permitting On-Stream Impoundments

Impoundment of urban streams is often undesirable, for several reasons. Impoundments create conditions conducive to the accumulation of polluted sediments and the proliferation of excessive plant and algae growth. Dams on streams may prevent the upstream migration of fish. In general, these concerns are most significant when permanent pools are constructed on larger streams (i.e. with watersheds larger than two or three square miles), or where nutrient-rich point source discharges are present. Use of on-stream impoundments for stormwater retention, without upstream non-point source pollutant controls, utilizes the stream for pollutant removal but may impair potential recreational and aquatic habitat uses of the impoundment.

assess the potential impact of proposed development on a lake, stream or wetland and associated environmentally sensitive areas, including loss of flood storage potential, loss of habitat, changes in species diversity and quantity, impacts on water quality, increases in human intrusion, and impacts on associated streams, lakes, ponds, wetlands or downstream areas.

Sec. 9.00 Stream Maintenance Easement

The applicant shall grant an access easement for stream maintenance purposes to the (local government name), over twenty-five feet parallel to the stream bank.

Sec. 10.00 Nonconforming Uses

(To conform with the appropriate section of the (local government name) zoning ordinance.)

Sec. 11.00 Board of Appeals

(To conform with the appropriate section of the (local government name) zoning ordinance.)

Sec. 11.01 Variances

(To conform with the appropriate section of the (local government name) zoning ordinance.)

Sec. 11.02 Appeals

(To conform with the appropriate section of the (local government name) zoning ordinance.)

Sec. 9.00 Stream Maintenance Easement

In one sample out-of-state ordinance, the dedication of a conservation easement was required. Such an easement could be granted to a county or municipality, or to a private organization such as CorLands or the Nature Conservancy. Such easements are not for purposes of allowing general public access across private property. Where communities require dedication of open space for public access, the dedication can be encouraged or required to occur along streams or adjacent to wetlands or lakes.

Sec. 11.01 Variances

While special uses are permitted in the Overlay District as long as they meet certain conditions, variances are allowed only to relieve a unique hardship created by the application of the Overlay District which is borne by an individual property owner. A variance can be granted to permit the reasonable use of property which, often due to unusual natural conditions on the site, would not otherwise permit development in accordance with this ordinance's requirements. However, variances can be improperly approved to grant a special favor to one property owner that is not granted to others, and variances too liberally approved can undermine the objectives of the stream and wetland protection ordinance. To prevent this occurrence, the stream and wetland protection ordinance and/or the underlying zoning ordinance should provide the standards concerning the proper situations in which a zoning variance may be approved.

Sec. 12.00 Bonds

(Local government name) may require the posting of a bond or surety to ensure compliance with any aspect of this ordinance.

Sec. 13.00 Liability

Prior to issuance of a construction permit, the applicant shall enter into an agreement with the (local government name) which runs with the property, in a form acceptable to the (local government name) attorney, indemnifying the (local government name) for any damage resulting from development activity on the subject property which is related to the physical condition of the stream or wetland.

Sec. 14.00 Separability

Every section, provision, or part of this ordinance is declared separable from every other section, provision, or part; and if any section, provision, or part thereof shall be held invalid, it shall not affect any other section, provision, or part.

Sec. 15.00 Retroactivity

The requirements of this ordinance apply to all platted and unplatted lands within the jurisdiction of (local government name.)

Sec. 16.00 Enforcement

Authority for administration of this ordinance resides with the Zoning Administrator. (To conform with appropriate section of the (local government name) zoning ordinance.) Appeals regarding decisions of the Zoning Administrator in granting special permits shall be made according to the provisions of Section 11.02.

Sec. 16.01 Stop-Work Order; Revocation of Permit

In the event any person holding a special use permit pursuant to this ordinance violates the terms of the permit, or carries on site development in such a manner so as to materially and adversely affect the health, welfare, or safety of persons residing or working in the neighborhood of the development site, or so as to be materially detrimental to the public welfare or injurious to property or improvements in the neighborhood, the (local government name) may suspend or revoke the special, use permit.

1. Suspension of a permit shall be by a written stop-work order issued by the (local government name) and delivered to the permittee or his agent or the person performing the work. The stop-work order shall be effective immediately, shall state the specific violations cited, and shall state the conditions under which work may be resumed. A stop-work order shall remain in effect until the next regularly scheduled meeting of the Board of Appeals, at which the conditions of sub-paragraph 2 below can be met.

2. No special use permit shall be permanently suspended or revoked until a hearing is held by the Board of Appeals. Written notice of such hearing shall be served on the permittee, either personally or by registered mail, and shall state:

a. the grounds for complaint or reasons for suspension or revocation, in clear and concise language; and

b. the time when and place where such hearing will be held.

Such notice shall be served on the permittee at least five (5) days prior to the date set for the hearing. At such hearing, the permittee shall be given an opportunity to be heard and may call witnesses and present evidence on his/her behalf. At the conclusion of the hearing the Board of Appeals shall determine whether the permit shall be suspended or revoked.

Sec. 16.02 Violations and Penalties

No person shall undertake or continue any development activity contrary to or in violation of any terms of this ordinance. Any person violating any of the provisions of this ordinance shall be deemed guilty of a misdemeanor, and each day during which any violation of any of the provisions of this ordinance is committed, continued, or permitted shall constitute a separate offense. Upon conviction of any such violation, such person, partnership, or corporation shall be punished by a fine of not more than _____ for each offense. In addition to any other penalty authorized by this section, any person, partnership, or corporation convicted of violating any of the provisions of this ordinance shall be required to restore the site to the condition existing prior to commission of the violation, or to bear the expense of such restoration.

Sec. 17.00 Effective Date

This ordinance shall be in full force and effect from and after its passage and publication. The effective date is _____, 19 ____.

Stormwater and Floodplain Management Ordinance

Executive Summary

This ordinance has been prepared to best serve the stormwater management needs and flooding conditions in the south suburbs of Cook County. It meets all stormwater and floodplain management requirements of the Metropolitan Water Reclamation District, the Illinois Department of Natural Resources, and the National Flood Insurance Program. It includes most of the recommendations of the Northeastern Illinois Planning Commission. It is organized in three parts:

Part 1. General and Administrative Procedures. The first part of the ordinance covers administrative requirements for all development. It includes definitions of technical terms that are used and legal provisions, such as statutory authority, disclaimers and penalties.

All developments are subject to this ordinance. “Development” is defined as any man-made change to the land. Three levels of development are identified:

- Level 1 – multi-family, non-residential and larger single-family projects
- Level 2 – one or more single-family homes
- Level 3 – smaller projects (e.g., detached garages and regrading back yards)

The ordinance sets the most requirements for level 1 developments. Sections 4 and 5 specify the permit procedures and materials that must be included with an application for a permit.

Part 2. Site Development Requirements. This part lists the requirements that all new developments must meet to minimize problems caused by stormwater runoff. Sections 8 and 9 relate to managing the quantity of runoff to prevent increased flooding and drainage problems downstream of the development.

The primary approach to doing this is to require level 1 and level 2 development projects to provide on-site storage. The most common approach is a storage basin which must be designed with a permanent pool and/or wetland features to improve the quality of the water that leaves the development. Storage can be provided by other or additional means, including preserving existing depressional areas and using streets and parking lots.

Section 10 addresses erosion and sediment control measures that level 1 and level 2 development projects must incorporate during construction to reduce the amount of soil that runs off into receiving streams. Section 11 established buffer areas to protect stream banks and to provide a vegetative filter for runoff.

Part 3. Floodplain Development Requirements. The third part of the ordinance addresses projects located in floodplains. The requirements are in addition to the Part 2 site development requirements. All new buildings must be built to a flood protection level of at least one foot above the base (100-year) flood. Section 13 includes higher standards for critical facilities and lesser requirements for accessory buildings and smaller, temporary structures.

Section 14 states the rules for development in floodways. Certain small projects can be readily permitted, but larger projects will need a separate permit from the Illinois Department of Natural Resources to ensure that they will not adversely affect other properties.

ORDINANCE NO. _____.

**An Ordinance to Protect Development
From Flooding and Stormwater**

Be it ordained by the (Board of Trustees/City Council) of the (Village/City)
of _____, Illinois, as follows:

Part 1. General and Administrative Procedures	2
Section 1. Authority and Purpose	2
Section 2. Organization.....	3
Section 3. Definitions.....	4
Section 4. Permit Procedures	14
Section 5. Permit Materials.....	19
Section 6. General Provisions.....	25
Part 2. Site Development Requirements	31
Section 7. General Requirements.....	31
Section 8. Stormwater Storage.....	35
Section 9. Stormwater Conveyance	43
Section 10. Erosion and Sediment Control	47
Section 11. Stream and Wetland Protection	53
Part 3. Floodplain Development Requirements	58
Section 12. Regulatory Floodplain Data	58
Section 13. Requirements in all Special Flood Hazard Areas	61
Section 14. Requirements in Floodways.....	72
Section 15. Areas Without Regulatory Floodplain Data.....	81
Section 16. Enactment	83

Part 1. General and Administrative Procedures.

Section 1. Authority and Purpose

1.1. Authority. This Ordinance is enacted pursuant to the police powers granted to this (Village, City) by 65 ILCS 5/1-2-1, 5/11-12-12, 5/11-30-2, 5/11-30-8, and 5/11-31-2 .

1.2. Purpose. The purpose of this Ordinance is to:

- 1.2.1. Protect buildings and other property from damage due to flooding,
- 1.2.2. Protect the life, health and safety of the residents of this (Village/City),
- 1.2.3. Minimize disruption of commerce and governmental services and the impairment of the tax base caused by flooding,
- 1.2.4. Prevent new development from increasing the flood or drainage hazard to others,
- 1.2.5. Prevent future public expenditures for repairs and recovery activities following a flood and for drainage improvements and flood protection projects,
- 1.2.6. Preserve and enhance the quality of surface water,
- 1.2.7. Preserve the natural characteristics and functions of watercourses and floodplains to moderate flood and stormwater impacts, improve water quality, and preserve aquatic/riparian habitat,
- 1.2.8. Reduce the sedimentation in the watercourses of the (Village/City),
- 1.2.9. Meet the requirements of 615 ILCS 5/18g Rivers, Lakes and Streams Act.
- 1.2.10. Make federally subsidized flood insurance available for property in the (Village/City) by fulfilling the requirements of the National Flood Insurance Program.

Home rule communities can include their home rule authority under the Illinois Constitution.

This section gives the reasons why this Ordinance is needed. This helps if the specific regulatory standards are later challenged.

Section 2. Organization.

To protect people and property from flooding, development of land must be managed both in the watershed (where the water comes from) and in the floodplain (where it accumulates). Therefore, this ordinance has three parts.

2.1. General and Administrative Procedures. Part 1 of this ordinance includes the definitions, permit procedures and similar administrative matters that apply to all development projects

2.2. Site Development Requirements. Part 2 of this ordinance contains the land development requirements that manage the runoff of stormwater that leaves the development site. It includes criteria for the amount of water that can leave a site and measures that must be taken to improve the quality of the water.

2.3. Floodplain Development Requirements. Part 3 of this ordinance contains requirements for developments that will be located in the floodplain. It includes criteria to protect the new development, to minimize the impact of the development on flooding to other properties, and to protect the flood conveyance channel.

2.4. Overlapping Requirements.

2.4.1. Floodplains are part of the watershed. All floodplain developments must also meet the site development requirements of Part 2, where applicable.

2.4.2. The definitions in Section 3 and the administrative procedures in Sections 4 - 6 apply to both Parts 2 and 3.

2.5. “Development.” This ordinance regulates all development as defined in Section 3. Definitions.

2.5.1. The regulatory criteria are different for three different sizes of development: Level 1, Level 2 and Level 3, which are also defined in Section 3.

2.5.2. When the term “development” is used alone, it includes all three levels.

Section 3. Definitions

For the purposes of this Ordinance, the following definitions are adopted:

3.1. “Base Flood” The flood having a one-percent probability of being equaled or exceeded in any given year. The base flood is also known as the 100-year frequency flood event. Application of the base flood elevation at any location is as defined in Section 12 of this Ordinance.

3.2. “Best Management Practice (BMP)” A measure used to control the adverse impacts of a stormwater discharge on water quality downstream. BMPs include structural devices (e.g. grassed swales, filter strips and detention basins) designed to remove pollutants and reduce runoff volumes and non-structural measures such as public information on proper disposal and use of pesticides and herbicides.

3.3. “Building” A building that is principally above ground and is enclosed by walls and a roof. The term includes a gas or liquid storage tank, a manufactured home, mobile home or a prefabricated building. This term also includes recreational vehicles and travel trailers to be installed on a site for more than 180 days, unless fully licensed and ready for highway use.

3.4. “Buffer” An area of natural vegetation adjacent to channels, wetlands, lakes, ponds or other surface waters to be left open for the purpose of eliminating or minimizing adverse impacts to such areas.

3.5. “By-pass flow” An approach that routes tributary drainage area runoff around and not through a stormwater control structure.

3.6. “Channel” Any river, stream, creek, brook, branch, natural or artificial depression, ponded area, flowage, slough, ditch, culvert, gully, ravine, wash, or natural or open man-made drainageway, which has a definite bed and banks or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.

3.7. “Channel Modification” Alteration of a channel

A channel includes on-stream lakes and impoundments.

by changing the physical dimensions or materials of its bed or banks. Channel modification includes damming, rip-rapping (or other armoring), widening, deepening, straightening, relocating, lining and significant removal of native vegetation from the bottom or banks. Channel modification does not include the clearing of dead or dying vegetation, debris, or trash from the channel.

3.8. “CLOMR” “Conditional Letter of Map Revision.”

3.9. “Compensatory Storage” An artificially excavated, hydraulically equivalent volume of storage within the SFHA used to balance the loss of natural flood storage capacity when artificial fill or buildings are placed within the floodplain. The uncompensated loss of natural floodplain storage can increase off-site floodwater elevations and flows.

3.10. “Conditional Letter of Map Revision” A letter which indicates that FEMA will revise base flood elevations, flood boundaries or floodways once the as-built plans are submitted and approved.

3.11. Designated Floodway. The channel and that portion of the riverine floodplain adjacent to a stream or watercourse as designated by IDNR/OWR, which is needed to store and convey the existing base flood discharge with no more than a 0.1 foot increase in stage due to the loss of flood conveyance or storage, and no more than a 10 percent increase in velocities.

3.12. “Detention Basin” A man-made structure for the temporary storage of stormwater runoff with controlled release during and immediately following a storm.

3.13. “Development”

3.13.1. “Development” means any man-made change to real estate, including:

- (a) Construction, reconstruction, repair, or placement of a building or any addition to a building.

The designated floodway is shown on the community’s Flood Boundary and Floodway Map or Flood Insurance Rate Map.

The State mandated 0.1 floodway standard receives up to 150 points under Section 411.c.2 and 15 points under Section 431.ℓ in the *CRS Coordinator’s Manual*.

The definition of development includes those activities which could significantly alter the hydraulics or hydrology of the floodplain, or otherwise interfere with its natural functions.

This ordinance defines three levels of development: Level 1, Level 2 and Level 3 which are defined later in this section.

- (b) Installing a manufactured home on a site, preparing a site for a manufactured home, or installing a travel trailer or recreational vehicle on a site for more than 180 days. Parking a travel trailer or recreational vehicle on site for less than 180 days is not considered “development” provided it is fully licensed, not connected to any utilities, and ready for highway use.
- (c) Drilling, mining, installing utilities, construction of roads, bridges, or similar projects.
- (d) Demolition of a building or redevelopment of a site.
- (e) Clearing of land as an adjunct of construction.
- (f) Construction or erection of levees, walls, fences, dams, or culverts; channel modification; filling, dredging, grading, excavating, paving, or other non-agricultural alterations of the ground surface; storage of materials; deposit of solid or liquid waste;
- (g) Subdivision of land, annexation agreements, and finalization of a plat, replat, planned unit development or manufactured home park; and
- (h) Any other human development project that might change the direction, height, or velocity of flood or surface water, including extensive vegetation removal.

3.13.2. “Development” does *not* include:

- (a) Maintenance of existing buildings and facilities such as re-roofing or re-surfacing of roads when there is no increase in the ground or road surface elevation;

Small projects that do not alter the hydraulics or hydrology of the floodplain, or otherwise interfere with its natural functions, may be explicitly excluded. If the community wants to list additional types of projects that are not subject to these regulations, it must get the list approved by IDNR/OWR.

Ordinance	Commentary
<p>(b) Gardening, plowing, and similar agricultural practices that do not involve filling, grading, or construction of levees;</p> <p>(c) Erection of a storage shed, accessory building, fence and playground equipment, that:</p> <p>(1) Has a footprint of less than 50 square feet,</p> <p>(2) Is not located in a floodway or within 10 feet of a property line, and</p> <p>(3) Is properly anchored to withstand surface water flows.</p> <p>3.14. “Elevation Certificate” A form published by FEMA that is used to certify the elevation to which a building has been elevated.</p> <p>3.15. “Emergency Overflow” The structure in a detention or retention basin designed to protect the basin in the event of a malfunction of the primary outlet or a storm event greater than the basin design storm.</p> <p>3.16. “Excavation” Any act by which organic matter, earth, sand, gravel rock or any other similar material is cut into, dug, quarried, uncovered, removed, displaced, relocated or bulldozed. The term shall include the conditions resulting therefrom.</p> <p>3.17. “Exceptional Functional Value Wetland” Any wetland that either (1) meets the Illinois Natural Area Inventory’s definition for determining exceptional functional value or (2) is located in an Illinois Natural Area Inventory site.</p> <p>3.18. “Existing Grade” The vertical location of the existing ground surface prior to excavation or filling.</p> <p>3.19. “FEMA” The Federal Emergency Management Agency, the agency responsible for administering the National Flood Insurance Program.</p> <p>3.20. “FIRM” or “Flood Insurance Rate Map. A map prepared by the Federal Emergency Management</p>	<p>Projects within 10 feet of the property line may alter local drainage. Such projects, no matter how small, need a permit review to make sure they do not cause a problem on neighboring properties.</p> <p>The current Elevation Certificate is FEMA Form 81-31, dated August 1999.</p> <p>FEMA’s office is located at:</p> <p>FEMA Region V 536 South Clark Chicago, Illinois 60605 312/408-5500</p>

Agency that delineates the Special Flood Hazard Area of the (Village/City). The FIRM includes flood insurance rate zones and may or may not include floodways.

3.21. “Flood” A general and temporary condition of partial or complete inundation of normally dry land areas from overflow of inland or tidal waves, or the unusual and rapid accumulation or runoff of surface waters from any source.

3.22. “Flood Fringe” That portion of riverine floodplains outside of the designated floodway.

3.23. “Floodplain” Any land area susceptible to being inundated by flood waters from any source.

3.24. “Floodproofing” Any combination of structural and non-structural adjustments to a building which reduces or eliminates flood damage to that building, its contents and supporting utilities. “Dry floodproofing” techniques prevent flood waters from entering a building.

3.25. “Floodproofing Certificate” A form published by FEMA that is used to certify that a building has been designed and constructed to be structurally dry floodproofed.

3.26. FPE or Flood Protection Elevation. The elevation above sea level (NGVD) to which new buildings must be protected from flood damage.

3.27. “Historic Building” Any building that is:

- (a) Listed individually in the National Register of Historic Places (a listing maintained by the Department of Interior) or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register;
- (b) Certified or preliminarily determined by the Secretary of the Interior as contributing to the historical significance of a registered

The term includes those areas mapped as Special Flood Hazard Areas and other land areas that can be flooded.

The current Floodproofing Certificate is FEMA Form 81-65, dated My 1993.

See section 6.4.5

Ordinance	Commentary
<p>historic district or a district preliminarily determined by the Secretary to qualify as a registered historic district;</p> <p>(c) Individually listed on the State inventory of historic places by the Illinois Historic Preservation Agency;</p> <p>(d) Individually listed on a local inventory of historic places that has been certified by the Illinois Historic Preservation Agency.</p> <p>3.28. “IDNR/OWR” The Illinois Department of Natural Resources, Office of Water Resources, the agency responsible for administering 615 ILCS 5/18g, the Rivers, Lakes and Streams Act.</p> <p>3.29. “Level 1 Development” A development project that meets <i>any</i> of the following criteria:</p> <p>(a) Is a single family residential development on 10 acres or more,</p> <p>(b) Is a multi-family or non-residential development on 3 acres or more, or</p> <p>(c) Disturbs more than 20,000 square feet of land area</p> <p>3.30. “Level 2 Development” A development project which does not qualify as a Level 1 development but meets any of the following criteria:</p> <p>(a) Has one or more new dwelling units,</p> <p>(b) Has more than one existing dwelling unit,</p> <p>(c) Has more than one platted lot,</p> <p>(d) Will be used for other than residential, agricultural or public purpose, or</p> <p>(e) Disturbs more than 10,000 square feet of land area or adds an additional 1,000 square feet of new impervious area.</p>	<p>The IDNR/OWR office is at:</p> <p>201 West Center Court Schaumburg, IL 60196 847/705-4341</p> <p>See also the definition for “development” and what is not considered “development.”</p> <p>Applicants for permits for Level 1 development projects must produce more accurate floodplain data and meet more restrictive requirements.</p> <p>Examples of Level 2 developments include construction of a new single family homes, altering or repairing a multi-family building or business, lot splits, and disturbing 10,000 square feet of land area.</p>

3.31. “Level 3 Development” A development project that does not meet the criteria for the definition of Level 2 development.

See also the definition for “development.” Level 3 development projects include altering or repairing a single family home, constructing a detached residential garage, and disturbing less than 500 square feet, regardless of the size of the lot.

3.32. Licensed Professional Engineer: An engineer registered in the State of Illinois, under the Professional Engineer Practice Act of 1989, 225 ILCS 325/1-49.

3.33. “Major Drainage System” That portion of a drainage system needed to store and convey flows beyond the capacity of the minor drainage system.

3.34. “Manufactured Home” A building, transportable in one or more sections, which is built on a permanent chassis and is designated for use with or without a permanent foundation when attached to the required utilities. The term manufactured homes also includes park trailers, travel trailers and other similar vehicles placed on site for more than 180 consecutive days. The term “manufactured home” does not include a “recreational vehicle.”

3.35. “Minor Drainage System” That portion of a drainage system designed to safely convey the 10-year runoff event or less. It includes street gutters, storm sewers, small open channels and swales.

3.36. “NGVD” National Geodetic Vertical Datum of 1929. Reference surface set by the National Geodetic Survey deduced from a continental adjustment of all existing adjustments in 1929.

3.37. “Natural” When used in reference to channels, means those channels formed by the existing surface topography of the earth prior to changes made by humans.

3.38. “Ordinary Highwater Mark” The point on the bank or shore at which the presence and movement of surface water are continuous so as to leave a distinctive mark, such as by erosion, destruction or prevention of terrestrial vegetation, predominance of aquatic vegetation or other such recognized characteristics.

3.39. “Overland Flow Path” An area of land which conveys stormwater for all events up to and including the base flood event. The overland flow path can be determined using topographic information and shall take into account all on-site and off-site tributary areas.

3.40. “Public Bodies of Water” All open public streams and lakes capable of being navigated by watercraft, in whole or in part, for commercial uses and purposes, and all lakes, rivers, and streams which in their natural condition were capable of being improved and made navigable, or that are connected with or discharge their waters into navigable lakes or rivers within, or upon the borders of the State of Illinois, together with all bayous, sloughs, backwaters, and submerged lands that are open to the main channel or body of water directly accessible thereto.

3.41. “Recreational Vehicle or Travel Trailer” A vehicle which is:

- (a) Built on a single chassis;
- (b) 400 square feet or less when measured at the largest horizontal projection;
- (c) Designed to be self-propelled or permanently towable by a light duty vehicle; and
- (d) Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational, camping, travel, or seasonal use.

3.42. “Retention Basin” A facility designed to completely retain a specified amount of stormwater runoff without release except by means of evaporation, infiltration or pumping.

3.43. “Riverine” Related to a river, creek, intermittent stream, ditch, or any other identified channel. This term does not include areas subject to flooding from lakes, ponding areas, or areas of sheet flow.

3.44. “SFHA” or “Special Flood Hazard Area” The area subject to flooding by the base flood and shown on the November 6, 2000, Cook County county-wide Flood Insurance Rate Map as Zone A, A1-30, AE, A0, AH and/or A99.

The list of the types of “A” zones can be shortened to reflect those zone designations in the (Village/City) and adjacent unincorporated areas. See also section 12.1.

3.45. “Substantially Damaged”

- (a) A building that has been damaged by any cause (fire, flood, earthquake, etc.) whereby the cost of restoring the building to its before damaged condition would equal or exceed 50% of the market value of the building before the damage occurred.
- (b) *A building that has been damaged by a flood on two separate occasions during a 10-year period for which the cost of repairs at the time of each such flood event, on the average, equals or exceeds 25% of the market value of the building before the damage occurred.*

The cost of repair must be calculated for full repair to “pre-damage” conditions, even if the owner elects to do less. The total cost of repair includes structural and finish materials, and labor. A substantially damaged building which is repaired must comply with the requirements for new construction.

The second part of the definition (b) provides the legal language for a repetitively damaged building to qualify for “Increased Cost of Compliance.” This is an additional flood insurance claim payment that helps finance bringing a damaged building into compliance with the ordinance.

3.46. “Substantially Improved”

- (a) A building that has been remodeled, repaired added to, or otherwise improved whereby the cost of the project equals or exceeds 50 percent of the market value of the building before the improvement is started. The cost of the project is based on the prevailing costs of labor, equipment and supplies, even if some of these are donated or obtained at reduced rates.
- (b) For the purposes of this definition a substantial improvement is considered to occur when the first alteration of any wall, ceiling, floor, or other structural part of the building commences, whether or not that alteration affects the external dimensions of the building regardless of the actual work performed.
- (c) The term does not include either (1) any project for improvement of a building to comply with existing state or local health, sanitary, or safety code specifications which are solely necessary to assure safe living

conditions or (2) any alteration of a “historic building,” provided that the alteration will not preclude the building’s continued designation as a historic building.

3.47. “Watershed” The land area above a given point on a channel that contributes stormwater to that point.

3.48. “Waters of the United States” Those waters under the authority of the Corps of Engineers under the Clean Water Act and defined in 33 CFR Part 328, as amended. This includes most lakes, rivers, streams ponds and wetlands.

3.49. “Wetland” A subset of the Waters of the United States. A wetland is land that is inundated or saturated by surface or ground water at a frequency and duration sufficient to support, under normal conditions, a prevalence of vegetation adapted for life in saturated soil conditions (known as hydrophytic vegetation). A wetland is identified based upon three attributes: 1) hydrology, 2) soils and 3) vegetation as mandated by the Federal wetland determination methodology.

3.50. “Wetland Impact” Any development activity within the boundary of a delineated wetland. Final determination of wetland impact is performed by the US Environmental Protection Agency and the US Corps of Engineers based on 33 CFR Part 230 - Section 404(b)(1) and 33 CFR Parts 320 through 330, as amended.

3.51. “Zone S” *The area subject to flooding by the base flood and shown on the [name] Map prepared by the [name of preparing organization] and dated [date of map].*

The “S” in “Zone S” stands for small drainage area that does not show as SFHA on the community’s FIRM. NIPC has guidelines on how to prepare maps showing these areas. This section is optional, but communities are encouraged to regulate floodplains in drainage areas smaller than FEMA’s and IDNR’s mapping standard.

Section 4. Permit Procedures.**4.1. Site Development Permit Required.**

- 4.1.1. No person, firm, corporation or governmental agency shall commence any development regulated by this Ordinance on any lot or parcel of land without first obtaining a Site Development Permit from [title of permit official].
- 4.1.2. A permit shall be issued if the proposed development meets the requirements of this Ordinance.
- 4.1.3. No development site shall be occupied, no certificate of occupancy shall be issued, and no subdivision or other development shall be accepted by the (City Council/Village Board of Trustees) unless and until all provisions of this Ordinance are met, including the issuance of a final Letter of Map Revision, where appropriate.

4.2. Grandfathering.

- 4.2.1. Development projects that have been approved or permitted prior to the effective date of this ordinance are exempt from this ordinance providing the stormwater management facilities and flood protection measures are installed, functioning and in compliance with all applicable stormwater and floodplain regulations in effect at the time of approval or permit.
- 4.2.2. If a previously developed site is redeveloped or modified so that the amount of impervious surface or the amount of stormwater runoff will increase, then the redevelopment or modification project shall comply with the provisions of this ordinance.
- 4.2.3. Improvements, modifications, additions and repairs to an existing building in the Special Flood Hazard Area shall meet the requirements of this Ordinance.

See Section 13.5 in Part 3.

Ordinance	Commentary
<p>4.3. Contiguous Property.</p> <p>4.3.1. In order to preclude inappropriate phasing of developments to circumvent the intent of this Ordinance, when a proposed development activity will occur on a lot or parcel of land that has contiguous lots or parcels of lands owned by the same property owner, then the criteria as defined in this section will be applied to the total land area compiled from aggregate ownership parcels.</p> <p>4.3.2. The determination of Level 1, 2 or 3 development will be based on the total area of all of the contiguous parcels under the same ownership.</p>	<p>See the definitions for “development” and “Level 1, 2 and 3 development.”</p>
<p>4.4. Other Permits.</p> <p>4.4.1. The permit applicant shall be responsible for:</p> <ul style="list-style-type: none"> (a) Obtaining all other federal, state, and local permits, approvals or permit-not-required letters that may be required for this type of activity, and (b) Providing copies of the permits, approvals and letters to [title of permit official]. <p>4.4.2. The [title of permit official] shall not issue a Site Development Permit unless all other federal, state, and local permits have been obtained.</p>	<p>It is strongly recommended that the community develop a list of locations and conditions where other agencies, such as the Corps of Engineers and IDNR, will require permits. A complete list of other required permits should be prepared. It should include:</p> <p>IDNR/OWR permits for floodway development (see section 14.6).</p> <p>IDNR/OWR dam safety permits for construction, modification or removal of a dam or on-stream structure to impound water.</p> <p>US Army Corps of Engineers Section 404 permits for development in wetlands.</p> <p>Written opinion and natural resource information from the Soil and Water Conservation District</p> <p>Approval from sanitary district</p> <p>Local zoning permit</p> <p>Local building code permit</p> <p>Fire Marshall approval</p> <p>Health department approval</p> <p>NPDES Notice of Intent</p> <p>While Section 4.4.1 notes that the permit applicant must provide copies of other federal, state and local permits, the local permit official is still responsible for obtaining</p>

Ordinance	Commentary
<p>4.4.3. The [title of permit official] is responsible for obtaining and maintaining copies of all other required federal, state, and local permits</p>	<p>copies of those permits. The permit official should discuss them with the issuing agency to verify how inspections will be made. Because this ordinance depends on IDNR/OWR permits to assure compliance with the community's NFIP requirements, the community is responsible for ensuring that the project is constructed in conformance with IDNR/OWR permits.</p>
<p>4.5. Conditional Approval.</p>	
<p>4.5.1. The [title of permit official] may issue a letter of conditional approval of</p> <ul style="list-style-type: none"> (a) the regulatory floodplain and regulatory floodway delineation, overland flow path, wetland delineation, runoff volume reduction hierarchy, and/or detention and bypass computations for a development and/or (b) parts of the development project that comply with local requirements. A letter of conditional approval shall not be issued for those parts of the project that are awaiting state or federal approval. 	<p>An example of a conditional approval would be to allow regrading of the flood fringe portion of the site pending IDNR approval of the floodway portion.</p>
<p>4.5.2. A conditional approval to alter the floodway delineation shall not be granted until a CLOMR has been issued by FEMA.</p>	<p>"CLOMR" is defined in Sections 3.8 and 3.10. IDNR does not permit fill in a floodway without a CLOMR or its equivalent in order to assure that the final project will result in an approveable floodway change.</p>
<p>4.5.3. A conditional approval will be based on conformance with the performance standards, and the submittal of the appropriate application requirements.</p>	
<p>4.5.4. The letter of conditional approval will state the conditions placed on the permit applicant. Variation from these conditions is considered a violation of the provisions of this ordinance.</p>	

Ordinance	Commentary
<p>4.5.5. Before the issuance of a letter of conditional approval, the permit applicant shall sign a statement that he or she understands that:</p> <ul style="list-style-type: none"> (a) the project has not been granted a final site development permit, (b) the final site development permit may require changes to the plans, and (c) the applicant proceeds at his or her own risk pending issuance of the final permit. 	
<p>4.6. Timing of Work</p>	
<p>4.6.1. Stormwater management facilities shall be functional before building permits are issued.</p>	
<p>4.6.2. Foundation only permits may be issued for non-residential developments prior to completion of the stormwater systems.</p>	
<p>4.6.3. Soil erosion and sediment control measures shall be functional before general construction begins.</p>	
<p>4.6.4. Where development of a site is to proceed in phases, the timing requirements shall apply to each phase.</p>	
<p>4.7. Fees. An application for a site development permit shall be accompanied by the appropriate fee:</p>	
<p>4.7.1. For a level 1 development: \$[amount]</p>	
<p>4.7.2. For a level 2 development: \$[amount]</p>	
<p>4.7.3. For a level 3 development: \$[amount]</p>	
<p>4.7.4. Additional fee for projects located in the Special Flood Hazard Area: \$[amount]</p>	
<p>4.7.5. Fee in lieu of providing an on-site stormwater management facility in accordance with Section 7.10: \$[amount]</p>	<p>Fees should be set based on the time and cost needed to review the application and conduct all the needed inspections during construction. A level 1 development permit should cost more than a level 3 development permit. A project in the SFHA has additional requirements which take additional time to review and inspect.</p>

4.8. Application Review.

- 4.8.1. The [title of permit official] shall approve, deny or identify what needs to be changed in an application within 60 days.
- 4.8.2. If an application is incomplete or otherwise needs to be revised, the amended permit applications shall be reviewed within 60 days of receipt.

4.9. Permit Termination. A permit shall be terminated for any of the following causes:

- 4.9.1. Noncompliance with any condition of the permit;
- 4.9.2. The permittee's failure to disclose fully all relevant facts in the application process or the permittee's misrepresentation of any relevant facts at any time; or
- 4.9.3. If the authorized work is not commenced within 180 days after issuance of the permit or, if the authorized work is suspended or abandoned, for a period of 180 days after the time of commencing the work, unless an extension has been granted in writing by the [title of permit official]. The extension should be requested of the [title of permit official], in writing no sooner than 90 days prior to the termination of the permit.

The 180 day expiration time period is the same as for a standard building permit. The community can extend the expiration date if the applicant is delayed because of waiting for permits from other agencies.

Section 5. Permit Materials

5.1. All Development. Application for a development permit shall be made on a form provided by the [title of permit official]. All applications for a Site Development Permit shall include the following:

- 5.1.1. Name and address of applicant;
- 5.1.2. Address and legal description of the property
- 5.1.3. Site location of the property, drawn to scale, showing
 - (a) If the project is in the SFHA and
 - (b) If the project is in an incorporated or unincorporated area;
- 5.1.4. Description of the proposed activity;
- 5.1.5. Statement of purpose of the proposed activity;
- 5.1.6. Anticipated dates of initiation and completion of activity;
- 5.1.7. Name and mailing address of the owner of the subject property if different from the applicant;
- 5.1.8. Plans of the proposed activity, drawn to scale, showing:
 - (a) Graphic or numerical scale,
 - (b) North arrow,
 - (c) Property lines and dimensions,
 - (d) Location and dimensions of easements,
 - (e) Location and names of roads in the vicinity,
 - (f) Location and names of waterways in the vicinity, and
 - (g) Location and dimensions of all buildings.

5.1.9. Acknowledgment by the applicant that representatives of any federal, state or local unit of government with regulatory authority over the project are authorized to enter upon the property to inspect the development.

5.1.10. Signature of the applicant or the applicant's agent;

- (a) If the applicant is a corporation, the president or other authorized officer shall sign the application form;
- (b) If the applicant is a partnership, each partner shall sign the application form; and
- (c) If the applicant is a land trust, the trust officer shall sign the name of the trustee by him (her) as trust officer. A disclosure affidavit shall be filed with the application, identifying each beneficiary of the trust by name and address and defining the respective interests therein.

5.2. Level 2 Development Application Materials. In addition to the materials required under Section 5.1, an application for a Level 2 development project shall also include:

5.2.1. A topographic survey of the property at one foot contour intervals keyed to the National Geodetic Vertical Datum 1929, adjusted. The survey shall show:

- (a) Existing terrain;
- (b) Proposed conditions; and
- (c) Adjacent areas necessary to determine off-site impacts to the proposed drainage plan.
- (d) If the development project does not involve regrading the site, then the elevations of the top of foundation, the corners of the lot and representative spots on the lot lines and within the lot may be submitted in lieu of a topographic survey.

Level 2 developments must submit these materials that are, in essence, a "basic" drainage plan.

- 5.2.2. A narrative describing the existing and proposed stormwater management system, including all discharge points, collection, conveyance and stormwater storage facilities.
- 5.2.3. A drainage system map including, but not limited to the following:
- (a) Sub-watershed boundaries and the property's location within the larger watershed;
 - (b) Location of all existing drainage features, such as streams, lakes, wetlands and field tiles;
 - (c) Proposed drainage system including but not limited to storm sewers, overland flow paths, detention facilities and roads;
 - (d) Proposed post-development terrain at one foot contour intervals;
 - (e) Soil classifications; and
 - (f) Proposed buffer areas.
- 5.2.4. Copy of all stormwater calculations, sealed by a Licensed Professional Engineer, including but not limited to, detention basin sizing, storm sewer sizing and overland flow path design.
- 5.2.5. Copy of the proposed plat or deed restrictions for all stormwater management features.
- 5.2.6. Copy of the draft operation and maintenance procedures for all stormwater management features.
- 5.2.7. Copy of any wetland submittal to the US Army Corps of Engineers, a letter from the Corps stating a permit is not required, or a letter from a qualified person stating no Corps of Engineers permits are required.

50 points are provided in Section 451.c.3 of the *CRS Coordinator's Manual*.

Up to 110 points are provided in Section 451.a.3 of the *CRS Coordinator's Manual* if the community accepts responsibility to ensure that all new storage basins will be maintained.

Ordinance	Commentary
<p>5.2.8. Subdivisions, annexation agreements, plats, replats, manufactured home parks and PUDs shall include a signed statement by a Licensed Professional Engineer that accounts for changes in the drainage of surface waters in accordance with the Plat Act (765 ILCS 205/2)</p> <p>5.2.9. Copy of the erosion and sediment control plan (see Section 10).</p>	
<p>5.3. Level 1 Development Application Materials. In addition to the materials required under Sections 5.1 and 5.2 for Level 2 development applications, an application for a Level 1 development project shall also include:</p> <p>5.3.1. Calculations and a plan defining the flood levels and flow areas through the development for the runoff from the 100-year storm;</p> <p>5.3.2. Cross-section data for open channel flow paths and designated overland flow paths;</p> <p>5.3.3. Flow rates and velocities at representative points in the drainage system;</p> <p>5.3.4. A statement by the design engineer of the drainage system’s provisions for handling events greater than the 100-year runoff.</p>	<p>Level 1 developments must submit these materials that are, in essence, an “advanced” drainage plan.</p> <p>This requirement should not be confused with the requirement to show the 100-year floodplain on a plat.</p>
<p>5.4. Level 3 Development Application Materials. An application for a Level 3 development project shall include a plan of the parcel showing pre-development and post-development surface drainage flows.</p>	<p>The plan can be a drawing. The objective is to ensure that both the applicant and the community check how the project will affect flows on the lot and from and onto adjoining properties.</p>
<p>5.5. Floodplain Development Application Materials. In addition to the site development application materials of Sections 5.1 – 5.3, a permit application for a development project in the SFHA shall include:</p> <p>5.5.1. A copy of the designated floodway map, showing:</p> <p>(a) The location of the project and property lines in relation to the floodplain and floodway boundaries;</p> <p>(b) Any proposed change in the designated</p>	

floodway location.

5.5.2. For all proposed buildings, the elevation of the lowest floor (including basement) and lowest adjacent grade shall be shown on the submitted plans.

5.5.3. Additional base flood elevation and floodway calculations and data that may be needed as identified in other sections of this Ordinance.

5.6. Plats. Plats or plans for new subdivisions, mobile home parks and Planned Unit Developments (PUDs) shall include:

5.6.1. A signed statement by a Licensed Professional Engineer that the plat or plans account for changes in the drainage of surface waters in accordance with 765 ILCS 205/2.

5.6.2. The delineation of all SFHAs which appear on the plat, signed and sealed by an Illinois Registered Land Surveyor as per the requirements of Public Act 85-267.

5.7. Records

5.7.1. The [title of permit official] shall maintain all permit and inspection records, including copies of elevation and floodproofing certificates. Such records shall be made readily available for a period of up to three years after the project is completed.

5.7.2. All stormwater management facilities shall be located and described within a deed or a plat restriction.

5.7.3. All stormwater management facilities shall be

See also the additional requirements for subdivisions and other large developments in the floodplain in Section 13.13.

Even though these provisions are required by State law, 10 points are provided under Section 341.b in the *CRS Coordinator's Manual*.

Records should be kept forever, but may be archived after three years. It is the community's responsibility to make records available for a Community Assistance Visit or CRS verification visit. Such visits may be as long as five years apart.

Communities in the Community Rating System must keep all Elevation and Floodproofing Certificates readily available forever. CRS communities should keep all other pertinent records until their ISO/CRS Specialist advises them that the credits have been verified and the records are no longer needed.

located within easements or rights-of-way that explicitly provide for public access for maintenance of such facilities.

- 5.7.4. Perpetual operation and maintenance responsibility and emergency access shall be designated on the plat or deed. Stormwater management facilities that service a single parcel (or two parcels) of property may be excused from this requirement upon approval of the [title of permit official].

Up to 110 points are provided in Section 451.a.3 of the *CRS Coordinator's Manual* z if the community accepts responsibility to ensure that all new storage basins will be maintained.

Section 6. General Provisions

6.1. Duties of the Enforcement Official(s)

The [title of permit official] be responsible for the general administration and enforcement of this Ordinance which shall include the following:

- 6.1.1. Ensure that any and all required federal, state and local permits are received prior to the issuance of a watershed development permit.
- 6.1.2. Ensure that all development activities within the SFHAs of the jurisdiction of the (Village/City) meet the requirements of this Ordinance.
- 6.1.3. Inspect all development projects before, during and after construction to assure proper elevation of the structure and to ensure compliance with the provisions of this Ordinance;
- 6.1.4. Require and obtain copies of all necessary federal, state and local permits and ensure that development projects are constructed in accordance with those permits;
- 6.1.5. Maintain permit files including Elevation and Floodproofing Certificates;
- 6.1.6. Maintain for public inspection and furnish upon request base flood data, SFHA and designated floodway maps, copies of federal or state permit documents, variance documentation, Conditional Letter of Map Revision, Letter of Map Revision, Letter of Map Amendment and elevation or floodproofing certificates for all buildings constructed subject to this Ordinance.
- 6.1.7. Cooperate with state and federal floodplain management agencies to improve base flood or 100-year frequency flood and floodway data and to improve the administration of this Ordinance;
- 6.1.8. Submit reports as required for the National Flood Insurance Program; and

See Section 4.4 and its commentary on other permits that may be required. Because this ordinance depends on IDNR/OWR permits to assure compliance with the community's NFIP requirements, the community is responsible for ensuring that the project is constructed in conformance with IDNR/OWR permits.

- 6.1.9. Notify FEMA of any proposed amendments to this ordinance.
- 6.1.10. Submit data to IDNR and FEMA to support proposed revisions to the regulatory maps.
- 6.1.11. Ensure that development projects authorized by state and federal authorities are constructed in accordance with the related state and federal permits.

6.2. Disclaimer of Liability

- 6.2.1. The degree of flood protection required by this Ordinance is considered reasonable for regulatory purposes and is based on available information derived from engineering and scientific methods of study.
- 6.2.2. Larger floods may occur or flood heights may be increased by man-made or natural causes. This Ordinance does not imply that development, either inside or outside of the SFHA, will be free from flooding or damage.
- 6.2.3. This Ordinance does not create liability on the part of the (Village/City) or any officer or employee thereof for any flood damage that results from reliance on this Ordinance or any administrative decision made lawfully thereunder.

6.3. Penalty

- 6.3.1. Failure to comply with the requirements of a permit or conditions of a variance resolution shall be deemed to be a violation of this Ordinance.
- 6.3.2. Upon due investigation, the [title of permit official] may determine that a violation of the minimum standards of this Ordinance exist. The [title of permit official] shall notify the owner in writing of such violation.
- 6.3.3. If such owner fails after ten days notice to correct the violation,

This section explains that this Ordinance does not guarantee that flood damage will not occur, and that the municipality, county, or enforcing official is not liable for decisions made lawfully under this Ordinance.

Ordinance	Commentary
<p>(a) The (Village/City) may make application to the Circuit Court for an injunction requiring conformance with this Ordinance or make such other order as the Court deems necessary to secure compliance.</p> <p>(b) Any person who violates this Ordinance shall, upon conviction thereof, be fined not less than fifty dollars (\$50.00) or more than one-thousand dollars (\$1,000.00) for each offense.</p> <p>(c) A separate offense shall be deemed committed upon each day during or on which a violation occurs or continues.</p> <p>(d) The (Village/City) may record a notice of violation on the title to the property.</p>	
<p>6.3.4. The [title of permit official] shall inform the owner that any such violation is considered a willful act to increase flood damages and, therefore, may cause coverage by a Standard Flood Insurance Policy to be suspended.</p>	<p>Section 1316 of the National Flood Insurance Act authorizes local officials to request denial of flood insurance for buildings in violation of the local floodplain ordinance.</p>
<p>6.3.5. The [title of permit official] is authorized to issue an order requiring the suspension of the subject development. The stop-work order shall be in writing, shall indicate the reason for the issuance, and shall order the action, if necessary, to resolve the circumstances requiring the stop-work order. The stop-work order constitutes a suspension of the permit.</p>	<p>A stop-work order should be issued if the development is proceeding in a manner which creates an imminent hazard of severe harm to persons or property (e.g., an unauthorized fill in the floodplain); or development has been accomplished in violation of the requirements of this Ordinance and a period of at least 15 days has elapsed since the permittee has received written notice of violation; or the development is proceeding without a permit.</p>
<p>6.3.6. No Site Development Permit shall be permanently suspended or revoked until a hearing is held by the (Board of Appeals). Written notice of such hearing shall be served on the permittee and shall state: (1) the grounds for compliant or reasons for suspension or revocation; and (2) the time and place of the hearing. At such hearing, the permittee shall be given an opportunity to present evidence on his/her behalf. At the conclusion of the hearing, the (Board of Appeals) shall determine whether the permit shall be suspended or revoked.</p>	

6.3.7. Nothing herein shall prevent the (Village/City) from taking such other lawful action to prevent or remedy any violations. All costs connected therewith shall accrue to the person or persons responsible.

6.4. Variances. Whenever the standards of this Ordinance place undue hardship on a specific development proposal, the applicant may apply to the [title of the board or commission responsible for issuing variances] for a variance.

6.4.1. The [title of the board or commission responsible for issuing variances] shall review the applicant's request for a variance and shall submit its recommendation to the (Board of Trustees/City Council).

6.4.2. No variance shall be granted to the requirements of this ordinance unless the applicant demonstrates that:

- (a) An exceptional hardship would result if the variance were not granted;
- (b) The relief requested is the minimum necessary;
- (c) There will be no additional threat to public health, safety, *beneficial stream uses and functions, especially aquatic habitat*, or creation of a nuisance;
- (d) There will be no additional public expense for flood protection, *lost environmental stream uses and functions*, rescue or relief operations, policing, or repairs to streambeds and banks, roads, utilities, or other public facilities;
- (e) The applicant's circumstances are unique and do not represent a general problem, and;
- (f) *The granting of the variance will not alter the essential character of the area involved including existing stream uses.*

6.4.3. No variance shall be granted to the floodplain

As much as possible the variance procedure should be tied to existing zoning or building code variance procedure.

These criteria are mandated by the NFIP, except the phrases in italics.

This last subsection is optional, but recommended.

Communities in the NFIP are required to

Ordinance	Commentary
<p>development requirements of this ordinance unless the applicant demonstrates that:</p>	<p>maintain a record of all variance actions, including justification for their issuance, and report them to FEMA in the Biennial Report.</p>
<ul style="list-style-type: none"> (a) The development project cannot be located outside the SFHA; (b) All floodway construction requirements, if any, will still be met; and (c) All requirements of other permitting agencies will still be met. 	<p>The community does not have the authority to grant a variance to the IDNR floodway requirements or the requirements of other regulatory agencies.</p>
<p>6.4.4. The [title of the board or commission responsible for issuing variances] shall notify an applicant in writing that a variance from the requirements of Section 13 that would lessen the degree of protection to a building will:</p>	<p>This subsection on floodplain variances are minimum NFIP requirements.</p>
<ul style="list-style-type: none"> (a) Result in increased premium rates for flood insurance up to amounts as high as \$25 for \$100 of insurance coverage; (b) Increase the risks to life and property; and (c) Require that the applicant proceed with knowledge of these risks and that he will acknowledge in writing that he assumes the risk and liability. 	<p>An insurance agent can estimate the rate increase for specific projects.</p> <p>The Standard Flood Insurance Policy permits an insurance adjuster to not pay for damage that was caused by something the owner did which increased the hazard to the property.</p>
<p>6.4.5. Variances requested in connection with restoration of a historic site, building or structure, may be granted using criteria more permissive than the above requirements, subject to the conditions that:</p>	<p>This subsection on floodplain variances are minimum NFIP requirements.</p>
<ul style="list-style-type: none"> (a) The repair or rehabilitation is the minimum necessary to preserve the historic character and design of the building or structure; and, (b) The repair or rehabilitation will not result in the building or structure being removed as a certified historic building or structure. 	<p>Contact the Illinois Historic Preservation Agency at 217/785-1153 for more information.</p>
<p>6.4.6. A variance to Section 13's prohibition of critical facilities in the SFHA may be issued, providing:</p>	<p>Just because the applicant owns land in the floodplain, it is not sufficient grounds for</p>
<ul style="list-style-type: none"> (a) The applicant demonstrates that the facility 	

Ordinance	Commentary
<p>cannot be located in a flood-free location,</p> <p>(b) The facility shall be protected from flood damage to the 500-year flood elevation, and</p> <p>(c) The facility shall be provided with at least one all-weather access road that connects the facility to areas outside the SFHA. The surface of the access road shall be at or above the base flood elevation.</p>	<p>granting a variance. There must be no alternative sites for the project.</p>
<p>6.5. Abrogation and Greater Restrictions</p> <p>6.5.1. This Ordinance is not intended to repeal, abrogate or impair any existing easements, covenants, or deed restrictions.</p> <p>6.5.2. Where this Ordinance and other ordinance, easements, covenants, or deed restrictions conflict or overlap, whichever imposes the more stringent restrictions shall prevail.</p> <p>6.5.3. This Ordinance is intended to repeal the original ordinance or resolution which was adopted to meet the National Flood Insurance Program regulations, but is not intended to repeal the resolution which the (Village/City) passed in order to establish initial eligibility for the program.</p>	<p>Required by the NFIP.</p>
<p>6.6. Separability</p> <p>The provisions and sections of this Ordinance shall be deemed separable and the invalidity of any portion of this Ordinance shall not affect the validity of the remainder.</p>	

Part 2. Site Development Requirements

Section 7. General Requirements

7.1. General Requirement. No development shall adversely affect the flow of surface waters to or from neighboring properties.

7.2. Existing Systems

7.2.1. Stormwater systems shall properly incorporate and be compatible with existing subsurface and surface drainage systems including agricultural systems.

7.2.2. All existing drain tiles shall be incorporated into the new storm sewer system.

7.3. Drainage Easements

7.3.1. No obstructions shall be placed in any drainage easement that may block or divert the flow of surface drainage.

7.3.2. All fences built in or across a drainage easement shall be either:

(a) Open to allow the flow of surface water, or

(b) Have the bottom of the fence at least 6 inches above grade to allow the unobstructed flow of surface water.

7.4. Stormwater Depths

7.4.1. The maximum depth of stormwater or floodwaters on new streets, parking lots, and other paved areas shall be eight inches measured at the gutter.

7.4.2. The maximum depth of stormwater in other areas that are not designated drainageways or water bodies, shall be one foot.

7.5. Diversions. Transfers of waters between watersheds shall be prohibited except when such transfers will not violate the provisions of this ordinance

Ordinance	Commentary
<p>7.6. Best Management Practices. Developments shall incorporate all best management practices as may be required pursuant to the United States Clean Water Act, as amended.</p> <p>7.7. Runoff Volume Reduction Hierarchy.</p> <p>7.7.1. An applicant shall choose a strategy to meet the release rate requirements that minimizes the increase in runoff volumes and rates from the development and improves water quality.</p> <p>7.7.2. The applicant shall use appropriate best management practices and the following hierarchy in preparing a drainage plan:</p> <ul style="list-style-type: none"> (a) Preservation of natural resource features of the development site (e.g. floodplains, wetlands, prairies and woodlands); (b) Preservation of the existing natural streams, channels and drainage ways; (c) Minimizing impervious surfaces created at the site (e.g., narrowing road width, minimizing driveway length and width, clustering homes and shared driveways); (d) Design of open vegetated channels to convey stormwater runoff; (e) Preservation of the natural infiltration and storage characteristics of the site (e.g., interspersing grass filter strips in areas with impervious cover and installing on-lot bioretention facilities); (f) Implementation of structural measures that provide water quality and quantity control, such as constructing wet bottom versus dry bottom basins; (g) Implementation of structural measures that provide only quantity control and conveyance. 	<p>The relevant provisions of the Clean Water Act are spelled out in Phase II of the U.S. Environmental Protection Agency's National Pollution Discharge Elimination System (NPDES).</p> <p>NPDES will require South Suburban communities to obtain a permit for their separate storm sewer systems. By requiring all new developments to begin reducing stormwater runoff from their sites through the use of best management practices, communities will also reduce the discharge of pollutants.</p> <p>The Phase II NPDES Rule outlines the following six minimum control measures for small community programs:</p> <ol style="list-style-type: none"> 1. Public Education and Outreach 2. Public Participation/Involvement 3. Illicit Discharge Detection and Elimination 4. Construction Site Runoff Control 5. Post-construction Runoff Control 6. Pollution Prevention/Good Housekeeping <p>Implementation of the runoff volume hierarchy and construction of best management practices spelled out in this model ordinance should help communities meet the requirements for measures 4 and 5.</p> <p>Additional information regarding the NPDES program is available from the USEPA at its website: www.epa.gov/owm/sw</p>

7.8. Design Rainfall

- 7.8.1. Unless a continuous simulation approach to drainage system hydrology is used, all design rainfall events shall be based on Illinois State Water Survey's *Bulletin 70*.
- 7.8.2. The first quartile point rainfall events shall be used for the design and analysis of conveyance systems with a duration of less than twelve hours.
- 7.8.3. The third quartile point rainfall distributions shall be used for the design and analysis of detention basins and conveyance systems with a duration greater than 12 and less than or equal to 24 hours.
- 7.8.4. The fourth quartile distribution shall be used in the design and analysis of systems with durations greater than 24 hours.
- 7.8.5. The SCS Type II distribution may be used as an alternative.

The first, third and fourth quartile distributions described by Huff are presented in Table 37 of *Bulletin 70*.

7.9. Design Methods

- 7.9.1. Major conveyance systems for tributary areas up to ten (10) acres may be designed using the rational method. All minor conveyance systems may be designed using the rational method.
- 7.9.2. Event hydrograph methods shall be used to calculate design runoff volumes for stormwater storage basins and major conveyance systems with greater than 10 acres of drainage area.
- 7.9.3. The following hydrologic design procedures are considered acceptable for generation of hydrographs: Corps of Engineers HEC-1, TR-20, TR-55 subject to rainfall distribution modifications, and continuous simulation models.
- 7.9.4. Event methods must use antecedent moisture condition 2.

7.9.5. *The hydrologic model used shall assume that the watershed is either fully urbanized or fully developed according to current zoning ordinances that have jurisdiction over the area. The model may assume that detention will be construction for new development as required by current ordinances that have jurisdiction over the area.*

7.10. Fee in Lieu. Where a regional drainage plan has been adopted and is being implemented, the applicant may pay a fee in lieu of meeting the requirements of this Part.

7.10.1. The fee shall be as set in Section 4.7.

7.10.2. Fees so paid shall be dedicated to implementing the drainage plan and shall not be used for other purposes.

7.10.3. Payment of the fee does not relieve the development from meeting all pertinent floodplain development requirements of Part 3 of this Ordinance.

Note that the fee in lieu approach can only be used if the community has adopted a regional drainage plan that shows how the fees will be spent.

Section 8. Stormwater Storage

8.1. Release Rates

- 8.1.1. No level 1 or 2 development shall allow the stormwater runoff to leave the development site at a rate greater than the peak runoff from the site under the conditions that exist when the permit is applied for.
- 8.1.2. The drainage system for a property shall be designed to control the peak rate of discharge from the property for the two-year, 24-hour and 100-year, 24-hour events.
- 8.1.3. The peak discharge for events less than or equal to the two-year event shall not be greater than 0.04 cfs per acre of property drained. The peak 100-year discharge shall not be greater than 0.15 cfs per acre of property drained.
- 8.1.4. Upon approval of the [title of permit official], storage volume calculations for Level 2 developments may be based on the development's percentage of impervious area, using the calculations in *Detention Volume versus Impervious Area*, (South Suburban Mayors and Managers Association, May, 2000)

8.2. Emergency Overflow

- 8.2.1. All stormwater infiltration, retention and detention facilities shall be provided with an emergency overflow structure capable of passing the 100-year peak flow inflow rate without damage to buildings or property.
- 8.2.2. The overflow shall be established at the 100-year highwater elevation.
- 8.2.3. The remainder of the basin shall have at least one foot of freeboard.

8.3. Outlet Design.

- 8.3.1. Single pipe outlets shall have a minimum inside diameter on 12 inches.
- 8.3.2. If design release rates call for a smaller outlet, a

This is a general performance standard: the development must not allow an increase in peak runoff from before-development conditions.

80 points are provided in Sections 451.a.1 and 2 of the *CRS Coordinator's Manual*.

This standard is more restrictive than the Metropolitan Water Reclamation District's criteria, which dates back to the early 1970's.

Using this figure leads to a conservative storage volume. The figure should not be used for sites with any off site flow being routed through the storage basin, on-stream detention or detention within a floodplain.

design that minimizes the possibility of clogging, such as a perforated riser, shall be used.

- 8.3.3. The minimum outlet restrictor size shall be four (4) inches in diameter provided there is adequate downstream capacity.
- 8.3.4. All outlets shall be “gravity only” unless otherwise approved by the [title of permit official].
- 8.3.5. Backwater on the outlet structure from the downstream drainage system shall be evaluated when designing the outlet.

8.4. Dam Construction. If the construction of a storage basin involves the construction, modification or removal of a dam or in-stream impoundment structure, as defined in 17 IL Adm. Code 3702 (Rules for Construction of Dams), the applicant shall obtain an Illinois Division of Water Resources Dam Safety Permit or letter stating no permit is required prior to the start of work.

8.5. Off-site Flow. Stormwater infiltration, retention and detention facilities required to meet a development’s discharge requirements shall be designed to bypass off-site tributary flow from streams and channels unless approved by the [title of permit official].

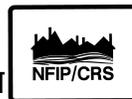

8.6. Depressional Storage

- 8.6.1. The function of existing on-site depressional storage shall be preserved independently of required detention.
- 8.6.2. When depressional storage is removed it must be compensated for by an on-site runoff storage facility at a 1 to 1 ratio. This requirement is in addition to the site runoff storage requirements of this Ordinance.

8.7. Storage Basins. Detention and retention basins shall be designed with the following guidelines:

- 8.7.1. Provisions for all basins.

- (a) The facility shall incorporate either open water or wetland features to improve water

The community may want to add provisions on safety, accessibility, signage and appearance.

25 points are provided in Section 451.e of the CRS

Ordinance	Commentary
<p>quality.</p> <p>(b) The facility shall be designed to remove stormwater pollutants.</p> <p>(c) To the extent feasible, the distance between detention inlets and outlets shall be maximized. Where possible, they should be at opposite ends of the basin.</p> <p>(d) The dry portions of the facility may be made available for recreational use.</p>	<p><i>Coordinator's Manual .</i></p>
<p>8.7.2. Provisions for areas with open water:</p> <p>(a) The water shall be at least three feet deep, excluding nearshore banks and safety ledges. If fish habitat is to be provided, at least twenty-five percent of the bottom area shall be ten feet deep to prevent winter freeze-out.</p> <p>(b) The side slopes shall be no steeper than 5 to 1 (horizontal to vertical).</p> <p>(c) The permanent pool volume at normal depth shall be equal to the runoff volume from its watershed for the 2-year storm. If this can not be achieved, the bottom shall be underdrained or wetland plantings shall be used.</p> <p>(d) Shoreline protection shall be provided to prevent erosion. Native vegetation is the preferred landscaping material.</p> <p>(e) Facilities shall be available, if possible, to allow the pond level to be lowered by gravity flow for cleaning purposes and shoreline maintenance.</p> <p>(f) <i>Aeration facilities may be required to prevent pond stagnation. Agreements for the perpetual operation and maintenance of aeration facilities shall be prepared to the satisfaction of the [title of permit official].</i></p>	<p>The use of aeration facilities is not encouraged because of their marginal benefits and maintenance concerns.</p>

8.7.3. Provisions where wetland features are used:

- (a) The design criteria, vegetation selection, performance criteria, and maintenance and monitoring guidelines in *Naturalized Stormwater Management Facilities* (South Suburban Mayors and Managers Association, May, 2000) shall be followed.
- (b) Sediment basins should be provided at all major inlets to the facility. The volume of the basins should be at least 500 cubic feet per acre of impervious surface in the drainage area. Side slopes below one foot of depth should be no steeper than 3 to 1 (horizontal to vertical) and basin depth should be at least 3 feet and designed to allow access for sediment removal equipment.
- (c) There should be no low flow bypass between the inlet and outlet. Paved low flow channels shall not be used.

Copies of *Naturalized Stormwater Management Facilities* can be obtained by calling SSMMA at 708/206-1155.

8.7.4. Provisions for shoreline zones.

- (a) The “shoreline zone” is that area between one foot above normal pool stage and one foot below normal pool stage.
- (b) The side slope in the shoreline zone shall not be steeper than 10 to 1 (horizontal to vertical).
- (c) Appropriate soil conditions shall be provided in the shoreline zone.
 - (1) Compaction of both subsoil and topsoil shall be minimized (i.e., to less than 275 psi).
 - (2) Where subsoil compaction cannot be avoided, it should be disked to a depth of 6 - 8 inches with a chisel plow before spreading topsoil.

This side slope requirement eliminates the need for a “safety shelf.”

(3) A suitable uncompacted topsoil, at a minimum thickness of one foot, shall be spread to provide a suitable growing medium for aquatic plants. Coarse soils with minimal clay content and a high organic content are recommended.

(d) Water tolerant, preferably native, vegetation shall be used to landscape the shoreline zone.

(1) The selected plants and planting methods shall conform to the soils, hydrology, and water quality conditions present in such facilities, with plants being tolerant of highly variable hydrologic conditions and degraded water quality (e.g., high turbidity and salinity content).

(2) Plant selection should conform to the guidance in the *Native Plant Guide for Streams and Stormwater Facilities in Northeastern Illinois* (NRCS et al, 1998).

8.7.5. Provisions for areas (other than shoreline zones) that are intended to remain dry:

(a) The minimum bottom slope for turf shall be two percent (2%). If this can not be achieved, the bottom shall be underdrained or wetland plantings shall be used.

(b) The side slopes shall be no steeper than 4 to 1 (horizontal to vertical) for all turf areas.

8.8. Streets, Parking and Underground Storage.

8.8.1. No storage basin shall be constructed within a distance of 10 feet plus one and half times the depth of any basin to the right-of-way of any public roadway without written permission from [title of permit official].

This standard follows that defined in the Illinois Department of Transportation legislation, Public Act 86-616.

- 8.8.2. The owner of a parcel being developed adjacent to a state or county road right-of-way shall notify the proper highway authority in writing of the proposed development. The owner shall request that the proper highway authority provide, at the cost of the highway authority or as otherwise provided by law, the amount of additional capacity in any stormwater detention facility to be constructed in the development for the future availability of the highway authority for meeting stormwater detention requirements of any future public construction on the highway.
- 8.8.3. The maximum depth of stormwater storage for paved areas designated for public parking is eight inches.
- 8.8.4. Underground storage of stormwater shall be avoided. If used, adequate storm sewer inlets must be provided to pass the 100-year flow into the underground storage.

8.9. Storage in Floodplains.

- 8.9.1. Stormwater retention and detention facilities shall not be constructed in the SFHA unless approved by [title of permit official].
- 8.9.2. If a storage facility is constructed in the SFHA, the volume of detention storage required to meet the standards of this Section shall be in addition to the floodplain compensatory storage required for the development.

8.10. On-Stream Detention

- 8.10.1. "On-stream" detention means an in-stream impoundment or other detention basin that includes construction of a dam or other barrier in an existing channel.
- 8.10.2. All on-stream detention shall provide a Detention Volume Safety Factor equal to one plus 0.05 times the ratio of off-site tributary drainage area to on-site tributary drainage area. The maximum Detention Volume Safety Factor shall be 1.5.
- 8.10.3. The applicant for a permit to construct an on-

stream detention facility shall provide the [title of permit official] with either an IDNR dam safety permit or a letter from IDNR stating that a dam safety permit is not required.

8.10.4. On-stream detention shall not be allowed if:

- (a) The off-site to on-site tributary drainage area ratio is greater than 10:1, except for developments providing a watershed benefit or
- (b) The tributary drainage area is greater than 640 acres, except for detention that provides a watershed benefit.

8.10.5. The release rate shall be the total of the following:

- (a) 0.04 cubic feet per second per acre of the total tributary drainage area (on-site and off-site) at the elevation created by impoundment of the on-site 2-year storm volume plus the Detention Volume Safety Factor, AND
- (b) 0.15 cubic feet per second per acre of the total tributary drainage area (on-site and off-site) at the elevation created by impoundment of the on-site 100-year storm volume plus the Detention Volume Safety Factor, AND
- (c) the required compensatory storage.
- (d) The release rate and on-site detention volume shall be calculated using the 24-hour storm event. This release rate calculation shall be used unless other site conditions warrant further analysis and modification from this standard or unless watershed-specific release rates have been adopted.

8.10.6. On-stream detention shall provide water quality treatment. One of the following two methods shall be used:

(a) A wet detention facility shall be constructed with a minimum permanent pool volume equal to the calculated sediment volume accumulated over a one-year period for the entire upstream watershed and an average normal water depth of at least four feet. The facility shall also have a live storage volume that meets the standard storage requirements of this Section.

(b) A separate off-line sediment basin shall be used with a volume appropriate for the tributary drainage area to the sediment basin.

8.10.7. Impoundment of the stream as part of on-stream detention shall not prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, and shall not cause or contribute to the degradation of water quality or stream aquatic habitat. These fish species may be present or potentially present.

8.10.8. Compensatory storage requirements shall be satisfied and shall be in addition to detention volume requirements.

8.10.9. No on-stream detention shall be allowed in areas designated as an exceptional functional value wetland.

Section 9. Stormwater Conveyance**9.1. Capacity**

- 9.1.1. Minor stormwater conveyance systems shall be sized to convey the 10-year runoff.
- 9.1.2. Major conveyance systems shall be sized to carry the 100-year runoff.

9.2. Storm Sewers and Swales

- 9.2.1. The 10-year design storm shall be used as a minimum for storm sewers and minor swales.
- (a) Storm sewers shall contain the 10-year storm within the pipes and manholes.
- (b) Roadside ditches and swales shall contain the 10-year storm without water encroaching on the pavement.
- 9.2.2. Storm sewer design shall be based on full flow conditions; otherwise, hydraulic grade calculations shall be performed that show that the rims are not inundated at the design storm.
- 9.2.3. Storm sewers and swales shall not connect to sanitary sewers.

9.3. Existing Systems.

- 9.3.1. Field tile systems disturbed during construction must be reconnected by those responsible for their disturbance unless an approved drainage plan includes provisions for the disturbed system. All abandoned field tiles shall be removed in their entirety.
- 9.3.2. Storm sewers and swales may connect to existing drain tiles or storm sewers only if the applicant submits a maintenance agreement, recorded easements and a report that indicates the existing system has adequate hydraulic capacity and structural integrity. The recorded easement and maintenance agreement must extend from the connection to the discharge point in an open channel.

9.4. Easements

9.4.1. All storm sewers and swales shall be located in a public road right-of-way or maintenance easement.

9.4.2. The following easement widths shall be used to provide sufficient maintenance access:

Pipe diameter (inches)	Easement width (feet)
Less than 11	10
18 to 36	12
36 to 60	15
greater than 60	10 feet plus the diameter of the pipe

9.4.3. The [title of permit official] shall require additional easement widths if the storm sewer depth is greater than average.

9.4.4. All drainage easements shall be accessible to vehicular equipment; however, vehicles do not have to be able to drive down the entire length of the easement.

9.5. Erosion Protection.

9.5.1. All stormwater conveyance systems shall be designed and constructed to withstand the expected velocity of flow from all events up to the base flood without erosion.

9.5.2. Stabilization adequate to prevent erosion shall be provided at the inlets and outlets for all pipe and channel transitions.

9.6. Sewer Design

9.6.1. The minimum storm sewer shall be 10-inches for the first pipe and 12-inches for subsequent reaches unless approved by the [title of permit official].

9.6.2. The minimum design velocity for a storm sewer shall be 2.5 fps. The maximum design velocity for a storm sewer shall be 8.0 fps.

9.6.3. All flared end sections for 12-inch or larger

storm sewers shall have grates to stop people, animals or large debris from entering. The grates shall have openings no larger than 3-inches horizontal to 8-inches vertical.

9.7. Streams and Channels. Where an existing stream or channel is proposed as part of the conveyance system for the development's increased runoff, the following requirements shall apply:

- 9.7.1. The project shall meet all requirements in Sections 10, 11 and 14 on channel and bank protection.
- 9.7.2. Clearing of channel vegetation shall be limited to that which is necessary. A re-vegetation plan is required using the *Native Plant Guide for Streams and Stormwater Facilities in Northeastern Illinois*, NRCS, et al, as a minimum standard.
- 9.7.3. A minimum maintenance easement of 12 feet from the top of bank is required along one side of all channels draining 20 or more acres.

9.8. Overland Flow Paths

- 9.8.1. The development must have an overland flow path that will pass the 100-year flood flow without damage to buildings or property.
- 9.8.2. If the upstream drainage area is less than 20 acres, the storm sewer pipe and inlet systems sized for the base flood can be constructed in lieu of providing an overland flow path.
- 9.8.3. The critical duration 100-year flood flow shall be used to design the overland flow path limits and it shall include all on-site and off-site tributary areas.
- 9.8.4. Overland flow paths shall be protected from fencing, landscaping or storage shed placement, which could impair its function. This protection shall be established through an easement, deed or plat restriction as required in Section 5.7.
- 9.8.5. All principal buildings on parcels containing or adjoining an overland flow path or other high

water level designation shall have a lowest adjacent grade elevation:

- (a) 0.5 feet above the overflow elevation for tributary areas of 20 acres or less.
- (b) 1 foot above the overflow elevation for tributary areas greater than 20 acres.

Section 10. Erosion and Sediment Control

10.1. General Principles

- 10.1.1. The requirements of this Section shall only affect Level 1 and 2 developments.
- 10.1.2. Development should be related to the topography and soils of the site so as to create the least potential for erosion. Areas of steep slopes, where high cut and fills may be required, should be avoided and natural contours should be followed as closely as possible.
- 10.1.3. Natural vegetation should be retained and protected. Clearing of natural ground cover and/or trees within a buffer area as defined in Section 11 should be left undisturbed wherever possible.
- 10.1.4. The smallest practical area of land should be exposed at any one time.
- 10.1.5. Prior to site clearing and grading, sediment basins or traps, filter barriers, diversions and other appropriate control measures shall be installed.
- 10.1.6. Permanent vegetation and structures should be installed and functional as soon as practical during development. Native vegetation is preferred for developments near, or adjacent to high quality natural areas, wetlands and streams.
- 10.1.7. Those areas being converted from agricultural purposes to other land uses shall be vegetated with an appropriate protective cover prior to development.
- 10.1.8. All waste generated as a result of site development shall be properly disposed of and shall be prevented from being carried off the site by either wind or water.

10.2. On-site control measures

The on-site control measures shall be designed based on the size of the disturbed areas as follows:

35 points are provided in Section 451.d.2 of the *CRS Coordinator's Manual*.

- 10.2.1. For disturbed areas draining less than one (1) acre, filter barriers (including filter fences, straw bales, or equivalent control measures) shall be constructed to control all off-site runoff as specified in referenced handbooks. Vegetated filter strips, with a minimum width of twenty-five (25) feet may be used as an alternative where runoff in sheet flow is expected.
- 10.2.2. For disturbed areas draining more than one (1) acre but less than five (5) acres, a sediment trap or equivalent control measure shall be constructed at the downslope point of the disturbed area in conjunction with other filter barriers.
- 10.2.3. For disturbed areas draining more than five (5) acres, a sediment basin or equivalent control measure shall be constructed at the downslope point of the disturbed area in conjunction with other filter barriers.
- 10.2.4. Sediment basin and trap design shall provide for both detention storage and sediment storage. The detention storage shall be for equal volumes of “wet” detention storage and “dry” detention storage. Each shall be sized for the 2-year, 24-hour runoff from the site. The release rate shall be that rate required to achieve a minimum detention time of ten (10) hours. The outlet structure shall be placed such that it only drains the dry detention storage.
- 10.2.5. The sediment storage shall be sized to store the estimated sediment load generated from the site over the duration of the construction period with a minimum storage equivalent to the volume of sediment generated in one year. A sediment removal schedule is required for construction periods exceeding one year.

10.3. Stormwater conveyance channels.

Stormwater conveyance channels, ditches, swales, and diversions, shall convey a 10-year frequency storm without erosion. All channels shall be stabilized within 48 hours, consistent with the following standards:

Ordinance	Commentary
<p>10.3.1. For grades up to 4 percent, seeding in combination with mulch or erosion blankets shall be placed along the channel sides with sod or erosion blanket applied to the bottom</p> <p>10.3.2. For grades of 4 to 8 percent, sod shall be used</p> <p>10.3.3. For grades greater than 8 percent, use rock or rip-rap, or reduce the grade using drop structures.</p>	
<p>10.4. Channel Protection</p> <p>10.4.1. A vegetated buffer strip of at least 25 feet in width shall be preserved and/or re-established, where possible, along existing channels.</p> <p>10.4.2. Land disturbance activities in stream channels and construction vehicle use of channels shall be minimized.</p> <p>10.4.3. Temporary stream crossings shall be constructed, where necessary, to minimize erosion. Temporary crossings shall be constructed of non-erosive materials such as rip-rap or gravel.</p> <p>10.4.4. The temporary stream crossing shall be completely removed and the stream restored to its preconstruction condition within 48 hours after completion of construction, incorporating appropriate native vegetation. Also see Section 14 Requirements in Floodways.</p>	<p>See also the provisions in Sections 11.5 and 14.5.</p>
<p>10.5. Additional Requirements</p> <p>10.5.1. Storm sewer inlets and culverts shall be protected by sediment traps or filter barriers meeting accepted design standards and specifications</p> <p>10.5.2. If dewatering devices are used, discharge locations shall be protected from erosion. All pumped discharges shall be routed through appropriately designed sediment traps or basins, or equivalent.</p>	

10.5.3. Each site shall have graveled entrance roads, access drives and parking areas of sufficient length and width to prevent sediment from being tracked onto public roadways. Any sediment reaching a public or private road shall be removed by shoveling or street cleaning (not flushing) before the end of each workday and transported to a controlled sediment disposal area.

10.6. References Adopted

10.6.1. Specifications for erosion control measures shall be in accordance with the “Illinois Urban Manual” (1995) or latest edition.

10.6.2. Sediment and erosion control planning shall be in accordance with “Procedures and Standards for Urban Soil Erosion and Sedimentation Control in Illinois” (revised July, 1988) by the Urban Committee of the Association of Illinois Soil and Water Conservation Districts (the “Green Book”) Chapters 1-5.

10.6.3. Where the requirements of Sections 10.2 – 10.5 of this ordinance, the Illinois Urban Manual or the “Green Book” conflict, the more restrictive requirement shall prevail.

10.7. Plan Requirements

An erosion and sediment control plan shall include the following:

10.7.1. Proposed sequencing schedule, including dates, for:

- (a) Stripping,
- (b) Installation of temporary on-site control measures and perimeter controls,
- (c) Clearing and grading,
- (d) Construction,

The Illinois Urban Manual has replaced the IEPA’s Standards and Specifications for Soil Erosion and Sediment Control (the Yellow Book).

A community may want to list its own standards and specifications instead of using the standard reference.

Ordinance	Commentary
<p>(e) Installation of storm drainage and paving, and</p> <p>(f) Final grading, removal of temporary measures and landscaping.</p> <p>10.7.2. Location, standard details and design specifics of sediment basins and traps. The design specifics should include outlet details and the drainage area to each measure.</p> <p>10.7.3. Location and description of all control measures, including seeding mixtures and rates, types of sod, method of seedbed preparation, expected seeding dates, kind and quantity of mulching for both temporary and permanent vegetative control measures and types of non-vegetative stabilization measures.</p> <p>10.7.4. Description of dust and traffic control measures and location and specifications for construction entrances.</p> <p>10.7.5. Locations of stockpiles and description of stabilization measures.</p> <p>10.7.6. Volumes, locations and methods of stabilization for off-site fill or borrow.</p> <p>10.7.7. Provisions for maintenance of control measures, including a maintenance schedule.</p> <p>10.7.8. Description of permanent stabilization measures</p> <p>10.7.9. Identification (name, address and telephone) of the person(s) or entity responsible for maintenance during and after construction.</p>	

10.8. Extended Construction Shutdown Period.

Disturbed areas shall be stabilized with temporary or permanent measures within seven (7) calendar days following the end of active disturbance or redisturbance. The condition of the construction site for the winter shut down period shall address proper sediment and erosion control early in the fall growing season. Stabilization measures include seeding, mulching, sodding or erosion control blankets.

10.9. Final Site Stabilization. All temporary control measures shall be disposed of within thirty days after permanent soil stabilization measures have been installed. Trapped sediment and other disturbed soils resulting from the temporary measures shall be permanently stabilized to prevent further erosion and sedimentation.

Section 11. Stream and Wetland Protection

11.1. Buffer Areas Required. Buffer areas shall be required along all streams, lakes, waterways, channels and wetlands, except for the following:

- (a) Roadside ditches,
- (b) Existing excavated stormwater storage facilities,
- (c) Borrow pits and quarries,
- (d) Leveed waterways, and
- (e) Improvements to existing public roads and utilities.

11.2. Buffer Area Dimensions

11.2.1. Linear Buffers. Linear buffers shall be designated along both sides of all streams and natural channels. A minimum buffer of thirty feet on each side of the channel shall be provided.

11.2.2. Water Body Buffers. Water body buffers shall encompass all lakes, wetlands and other non-linear bodies of water. A minimum buffer of thirty feet on each side of the channel shall be provided.

11.2.3. Exceptional functional value wetlands shall have a minimum buffer of one hundred (100) feet.

11.2.4. In areas having state or federal threatened and endangered species present or for Illinois Natural Area Inventory Sites, buffer widths may be modified to meet the terms and conditions specified during consultation with the Illinois Department of Natural Resources or United States Fish and Wildlife Service, pursuant to state and federal laws and regulations.

11.2.5. The buffer area for all Waters of the United

15 points are provided in Section 431.g.3 of the *CRS Coordinator's Manual*.

States shall extend from the ordinary highwater mark. The buffer area for wetlands shall extend from the edge of the delineated wetland. A property may contain a buffer area that originates from the Waters of the United States on another property.

- 11.2.6. Buffer averaging may be allowed by the [title of permit official], provided the buffer width is at least half of the buffer width required by this ordinance or the minimum width required by a Corps of Engineers permit, whichever is wider.

11.3. Buffer Requirements

- 11.3.1. Features of the stormwater management system may be within the buffer area of a development.
- 11.3.2. Access through buffer areas shall be provided, when necessary, for maintenance purposes.
- 11.3.3. Preservation of buffer areas shall be provided by deed or plat restriction.

11.4. Allowed Uses in Buffer Areas

- 11.4.1. All buffer areas shall be maintained free from development except for the following uses:
- (a) Passive recreation, including pedestrian, bicycle or equestrian trails.
 - (b) Construction and maintenance of utilities and stormwater facilities.
- 11.4.2. Structures and impervious surfaces related to recreational facilities, such as trails and paths, may occupy a maximum of twenty (20) percent of the buffer surface area, provided the runoff from such facilities is diverted away from the Waters of the United States or such runoff is directed to enter the buffer area as unconcentrated flow. Boat docks, boathouses and piers shall be allowed and count as a structure when calculating percent of impervious area.
- 11.4.3. Buffer areas hydrologically disturbed by allowing construction or as part of a revegetation plan

shall be revegetated using the *Native Plant Guide for Streams and Stormwater Facilities in Northeastern Illinois*, (NRCS, et al.) as a minimum standard.

11.5. Channel Protection

11.5.1. If the proposed activity involves a channel modification, the permit applicant shall demonstrate that

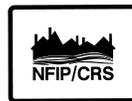

- (a) There are no practicable alternatives to the activity which would accomplish its purpose with less impact to the natural conditions of the body of water affected. Channel modification is acceptable if the purpose is to restore natural conditions and improve water quality and fish and wildlife habitat.
- (b) Water quality, habitat, and other natural functions would be significantly improved by the modification and no significant habitat area may be destroyed, or the impacts are offset by the replacement of an equivalent degree of natural resource values.

11.5.2. A channel modification shall be designed and constructed in a way which will minimize its adverse impacts on the natural conditions of the body of water affected, consistent with the following criteria:

- (a) The physical characteristics of the modified channel shall match as closely as possible those of the existing channel in length, cross-section, slope and sinuosity. If the existing channel has been previously modified, restoration of more natural physical conditions should be incorporated into channel modification design.
- (b) Hydraulically effective transitions shall be provided at both the upstream and downstream ends of the project, designed such

that they will prevent erosion

- (c) One-sided construction of a channel shall be used when feasible. Removal of stream-side (riparian) vegetation should be limited to one side of the channel, where possible, to preserve the shading and stabilization effects of the vegetation.
- (d) Clearing of stabilizing vegetation shall be limited to that which is essential for construction of the channel.
- (e) Channel banks shall be constructed with a side slope no steeper than 3:1 horizontal to vertical, wherever practicable. Native vegetation and gradual side slopes are the preferred methods for bank stabilization. Where high velocities or sharp bends necessitate the use of alternative stabilization measures, soil bioengineering techniques, natural rock or rip-rap are preferred approaches. Artificial materials such as concrete, gabions, or construction rubble should be avoided unless there are no practicable alternatives.
- (f) All disturbed areas associated with the modification shall be seeded or otherwise stabilized as soon as possible upon completion of construction. Erosion blanket or an equivalent material shall be required to stabilize disturbed channel banks prior to establishment of the vegetative cover.
- (g) If the existing channel contains considerable bottom diversity such as deep pools, riffles, and other similar features, such features shall be provided in the new channel. Spawning and nesting areas and flow characteristics compatible with fish habitat shall also be established, where appropriate.
- (h) A sediment basin shall be installed at the downstream end of the modification to reduce sedimentation and degradation of

Ordinance	Commentary
<p>downstream water quality.</p> <p>(i) New or relocated channels should be built in the dry and all items of construction, including vegetation, should be completed prior to diversion of water into the new channel.</p> <p>(j) There shall be no increases in stage or velocity as the channel enters or leaves the project site for any frequency flood unless necessitated by a public flood control project or unless such an increase is justified as part of a habitat improvement or erosion control project.</p> <p>(k) Unless the modification is for a public flood control project, there shall be no reduction in the volume of floodwater storage outside the floodway as a result of the modification.</p> <p>(l) The provisions of Sections 10.4 and 14.5 shall also be met.</p>	
<p>11.6. Dumping</p>	
<p>11.6.1. No person, firm, corporation or governmental agency shall dispose of or dump grass clippings, brush, fill, trash, debris, or other material that may obstruct the flow or storage of water in any channel, swale, culvert, storm sewer, wetland, storage basin or other natural or man-made watercourse or water body.</p>	<p>15 points are provided under Section 541.b of the <i>CRS Coordinator's Manual</i>.</p>
<p>11.6.2. No person, firm, corporation or governmental agency shall dispose of or dump any petroleum products, chemicals, noxious liquids, animal waste or other materials that will pollute the water in any channel, swale, culvert, storm sewer, wetland, storage basin or other natural or man-made watercourse or water body.</p>	

Part 3. Floodplain Development Requirements

Section 12. Regulatory Floodplain Data

12.1. Special Flood Hazard Area.

- 12.1.1. All development within the Special Flood Hazard Area is subject to this ordinance.
- 12.1.2. The “Special Flood Hazard Area” (SFHA) is the area subject to flooding by the base flood and shown on the November 6, 2000, Cook County county-wide Flood Insurance Rate Map as Zone A, A1-30, AE, A0, and/or AH.
- 12.1.3. The SFHA also includes all lands designated as “Zone S” on the *[name] Map prepared by the [name of preparing organization] and dated [date of map]*.

12.2. Base Flood Elevation.

- 12.2.1. The base flood elevation for the SFHAs of _____ (river/creek/stream) shall be as delineated on the 100-year flood profiles in the Cook County county-wide Flood Insurance Study prepared by FEMA and dated November 6, 2000, and such amendments to such study as may be prepared from time to time.

All parts of this section are required by the NFIP or Illinois State law unless otherwise noted.

This ordinance uses the Special Flood Hazard Area shown on the community’s FIRM as the area subject to floodplain regulations. If other areas are known to have flooding problems, communities are encouraged to delineate them on a map and include them in the definition of “SFHA.” If the base flood elevations of these other areas are known, they should also be adopted as part of the definition of “base flood elevation.”

The list of the types of “A” zones can be shortened to reflect those zone designations in the Village or City and adjacent unincorporated areas.

There are no base flood elevations for S Zones, so sections 15.2 and 15.3 are followed to determine their exact boundaries and regulatory flood levels.

The language in italics is recommended and can receive CRS credit under Section 411.a.2 of the *CRS Coordinator's Manual*.

Contact IDNR/OWR to determine which Sections are required for your community. Many communities may only have to adopt portions of this Section, depending on their circumstances.

12.2.2. The base flood elevation for each SFHA delineated as an “Zone AH” or “Zone AO” shall be that elevation (or depth) delineated on the November 6, 2000, Cook County county-wide Flood Insurance Rate Map.

12.2.3. The base flood elevation for all other SFHAs and regulated areas shall be as defined in Section 15.2.

12.3. SFHAs Defined by Elevation. Upon receipt of a development permit application, the [title of permit official] shall compare the elevation of the site to the base flood elevation. Any development located on land that can be shown to be higher than the base flood elevation and which has not been filled since the date of the site’s first Flood Insurance Rate Map as required by this ordinance, is not in the SFHA and therefore not subject to the requirements of this Ordinance.

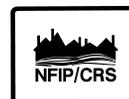

12.4. Flood Protection Elevation (FPE). The Flood Protection Elevation, or “FPE,” shall be the elevation of the base flood plus one foot at any given location in the SFHA.

Such a project will still be subject to the flood insurance purchase requirements unless the owner receives a Letter of Map Amendment from FEMA.

“Freeboard” is an increment of elevation added to the base flood elevation to obtain the flood protection elevation. This provides a factor of safety for uncertainties in calculations, future site development, unknown localized conditions, wave actions and unpredictable effects such as those caused by ice or debris jams. Requiring this extra margin of protection is not an NFIP or State requirement.

One foot is the recommended minimum freeboard. Two or more feet is encouraged and has been adopted by several communities. NIPC has identified watersheds that have changed significantly since the regulatory flood studies were completed. A freeboard of two or three feet is recommended in these areas because the published base flood elevation underestimates the current flood hazard.

100 points are provided in Section 431.a of the *CRS Coordinator’s Manual*. More credit is provided for a freeboard greater than one foot.

12.5. Designated Floodway.

12.5.1. The floodway includes the channel and that portion of the riverine floodplain adjacent to a stream or watercourse as designated by IDNR/OWR, which is needed to store and convey the existing base flood discharge with no more than a 0.1 foot increase in stage due to the loss of flood conveyance or storage, and no more than a 10 percent increase in velocities.

12.5.2. The floodways are designated for _____ (river/creek/stream) on the November 6, 2000, Cook County county-wide Flood Insurance Rate Map.

12.6. Challenges to Regulatory Floodplain Data.

When a party disagrees with the regulatory floodplain data proscribed by this ordinance, he/she may finance the detailed engineering study needed to replace existing data with better data and submit it to IDNR/OWR and FEMA.

To locate the designated floodway boundary on any site, the floodway boundary should be scaled off the floodway map and located on a site plan, using reference marks common to both maps. Where interpretation is needed to determine the exact location of the designated floodway boundary, IDNR/OWR should be contacted for the interpretation.

Section 13. Requirements in all Special Flood Hazard Areas

13.1. Jurisdiction. All development projects in all types of Special Flood Hazard Areas shall comply with this section. Development proposed in floodways and in SFHAs without regulatory floodplain data shall also comply with the additional requirements of sections 14 and 15.

13.2. Public Health Protection.

- 13.2.1. No development in the SFHA shall create a threat to public health or safety.
- 13.2.2. No development in the SFHA shall include locating or storing chemicals, explosives, buoyant materials, animal wastes, fertilizers, flammable liquids, pollutants, or other hazardous or toxic materials below the FPE.
- 13.2.3. New and replacement water supply systems, wells, and sanitary sewer lines may be permitted providing all manholes or other above ground openings located below the FPE are watertight.
- 13.2.4. Septic systems and other on-site waste disposal systems are prohibited in the SFHA.

13.3. Filling and Grading. Whenever a development project proposes to fill or grade vacant land in order to remove a portion of it from the SFHA or to change the floodway boundary,

- 13.3.1. The top of the resulting filled or graded area shall be at or above the FPE, and
- 13.3.2. The [title of permit official] shall not issue a development permit until the applicant has received a Conditional Letter of Map Revision from FEMA.

All parts of this section are required by the NFIP or Illinois State law unless otherwise noted.

Communities are encouraged to match their zoning ordinance to the flood hazard and prohibit intensive or hazardous development from the SFHA. The best zoning districts would be for conservation, open space, agriculture or low density residential uses.

5 points are provided in Section 431.g.1.b of the *CRS Coordinator's Manual*.

This is a more restrictive standard recommended by SSMMA to prevent health complications arising from septic systems in wet soils. The minimum NFIP requirement is to include "on-site waste disposal systems" in the previous section on water and sewer lines.

Going to the FPE instead of the BFE insures that areas removed from the SFHA are protected to the same level as buildings left in the SFHA.

This insures that there are sufficient floodplain details before any earthwork permit is granted. Often the grading work is done months before the final Letter of Map Revision (LOMR) request is submitted and issued. If FEMA has any ques-

13.3.3. The [title of permit official] shall not issue a certificate of occupancy until the applicant has received a Letter of Map Revision from FEMA.

13.4. Compensatory Storage.

13.4.1. Whenever any portion of a floodplain is authorized for use, the volume of space which will be occupied by the authorized fill or building below the base flood elevation shall be compensated for and balanced by a hydraulically equivalent volume of excavation taken from below the base flood elevation.

13.4.2. The excavation volume shall be at least equal to 1.25 times the volume of storage lost due to the fill or building.

13.4.3. In the case of streams and watercourses, such excavation shall be made opposite or adjacent to the areas so filled or occupied.

13.4.4. All floodplain storage lost below the existing 10-year flood elevation shall be replaced below the proposed 10-year flood elevation at at least a 1:1 ratio. All floodplain storage lost above the existing 10-year flood elevation shall be replaced above the proposed 10-year flood elevation at at least a 1:1 ratio.

13.4.5. If the compensatory storage will not be placed at the location of the proposed construction, the applicant's engineer shall demonstrate through a determination of flood discharges and water surface elevations that the compensatory storage is hydraulically equivalent.

tions, the ground would be too disturbed to prepare accurate topographic mapping.

This section requires compensatory storage in all SFHAs. Compensatory storage in the floodway is required by IDNR/OWR.

Compensatory storage in the flood fringe is recommended. If your community does not require compensatory storage in the fringe, it may be reflected in the floodway delineation in future mapping for your and adjacent communities. Contact IDNR/OWR to discuss the mapping repercussions before deciding to not enforce this provision.

70 points are provided in Section 431.f.2 of the *CRS Coordinator's Manual*.

The 1.25 factor is an SSMMA recommendation. This safety factor is intended to compensate for uncertainties in the estimation of the base flood elevation and in the determination of project impacts.

The project's total volume of compensatory storage must be at a ratio of least 1.25 :1. The development must have at least a 1:1 compensation for all lost storage below the 10-year flood level and for all lost storage above the 10-year level. The developer may choose where the additional 25% is taken.

If the location of the compensatory storage site is in the floodway, an IDNR/OWR permit is required.

Ordinance	Commentary
<p>13.4.6. All such excavations shall be constructed to drain freely and openly to the watercourse.</p>	
<p>13.4.7. <i>This compensatory storage requirement does not apply to small temporary structures (such as above ground swimming pools) where such projects are located on small lots with existing buildings where the site does not have sufficient space to provide compensating storage.</i></p>	<p>This optional language does not exempt larger structures, such as a garage or room addition, from the compensatory storage requirement. However, a builder can construct these so water flows into or under them and no floodwater storage is lost.</p> <p>Compensatory storage is not required for small storage sheds and other minor activities that are not considered “development.” See the definition of “development” in Section 3.</p>
<p>13.5. Protecting Buildings.</p>	
<p>13.5.1. All new buildings and improvements and repairs to buildings located within the SFHA shall be protected from flood damage below the FPE.</p>	
<p>13.5.2. This building protection requirement applies to the following situations:</p>	<p>See the definition of “building” in Section 3 Definitions.</p>
<p>(a) Construction or placement of a new building.</p>	
<p>(b) Remodeling or other activity that will result in a substantially improved building.</p>	<p>See the definition of “substantially improved” in Section 3 Definitions.</p>
<p>(c) An addition that will result in a substantially improved building.</p>	<p>Under (b), the entire building must be brought up to the flood protection requirements when it is substantially improved. This is an NFIP requirement.</p>
	<p>This is an NFIP requirement. If the addition does not alter the common wall and the improvements to the original building are minimal, then only the addition has to be elevated or otherwise protected from the base flood.</p>

- (d) An existing building that has been substantially damaged.
- (e) Installing a manufactured home on a new site or a new manufactured home on an existing site. This building protection requirements does not apply to returning a manufactured home to the same site it lawfully occupied before it was removed to avoid flood damage.
- (f) Installing a recreational vehicle or travel trailer on a site for more than 180 days.
- (g) *Construction of new buildings and substantial improvements in the 500-year floodplain,*

Many communities want to make sure that all additions are protected from flooding. Here is alternative language that would protect smaller additions.

An addition that will result in a substantially improved building *or that will increase the first floor area by more than 20 percent.*

An addition that will result in a substantially improved building *or that will increase the first floor area.*

The language in italics is recommended and can receive CRS credit under Sections 431.c.3 or d.6 of the *CRS Coordinator's Manual*.

See the definition of “substantially damaged” in Section 3. Definitions.

Under (d), the entire building must be brought up to the flood protection requirements when it is substantially damaged. This is an NFIP requirement.

This language is recommended because floods don't stop at lines drawn on maps. All buildings proposed at locations which are at or below the FPE should be protected. In situations where a community has identified a flood protection elevation which is higher than the base flood elevation (i.e., it has a freeboard requirement), its building protection requirements should, by definition, extend beyond the SFHA.

13.5.3. This building protection requirement may be met by the methods specified in Sections 13.6 – 13.9. Only nonresidential buildings may use the methods specified in section 13.9. Buildings are also subject to the other requirements of this ordinance, including the floodway restrictions in section 14.

13.5.4. A certification of occupancy shall not be issued for a building project until the permit applicant provides the [title of permit official] with a properly completed, signed and sealed as-built FEMA Elevation or Floodproofing Certificate.

13.6. Buildings on Fill. A residential or non-residential building may be constructed on permanent land fill in accordance with the following:

13.6.1. The lowest floor (including basement) of the building or addition shall be at or above the FPE.

13.6.2. The fill shall be placed in layers no greater than one foot deep before compacting and should extend at least ten feet beyond the foundation of the building before sloping below the base flood elevation.

13.6.3. The top of the fill shall be above the base flood elevation. However, the ten foot minimum may be waived if a structural engineer certifies an alternative method to protect the building from damage due to erosion, scour and other hydrodynamic forces.

13.6.4. The fill shall not adversely affect the flow or surface drainage from or onto neighboring properties.

13.7. Elevated Buildings. A residential or non-residential building may be elevated in accordance with the following:

The 500-year floodplain is shown as the shaded X Zone on the FIRM. 500-year flood elevations are provided in the Flood Insurance Study flood profiles.

If a building is built to these specifications and the lowest floor (including basement) of the building is at or above the FPE, then the owner may apply for a Letter of Map Revision (LOMR) based on fill to remove the property from the SFHA and the flood insurance purchase requirement. The purchase of flood insurance is still recommended.

These fill standards are not specifically mandated by the NFIP or State. However, they help protect the fill and the building it supports during a flood.

20 points are provided in Section 431.b.2 of the *CRS Coordinator's Manual*.

More information on elevating buildings can be found in FEMA's *Elevated Residential Structures*, FEMA-54, March 1984.Q

Ordinance	Commentary
<p>13.7.1. The lowest floor (including basement) and all electrical, heating, ventilating, plumbing, and air conditioning equipment and utility meters shall be located at or above the FPE.</p>	
<p>13.7.2. The building or improvements shall be elevated on crawlspace, stilts, piles, walls, or other foundation that is permanently open to flood waters and not subject to damage by hydrostatic pressures of the base flood.</p>	
<p>13.7.3. Water and sewer pipes, electrical and telephone lines, submersible pumps, and other water-proofed service facilities may be located below the FPE.</p>	
<p>13.7.4. The foundation and supporting members shall be anchored and aligned in relation to flood flows and adjoining buildings so as to minimize exposure to known hydrostatic and hydrodynamic forces such as uplift, current, waves, ice and floating debris.</p>	
<p>13.7.5. All areas below the FPE shall be constructed of materials resistant to flood damage.</p>	
<p>13.7.6. The areas below the FPE may only be used for the parking of vehicles, building access or storage of non-floatable and non-hazardous materials in an area other than a basement. The applicant shall be advised that equipment, machinery and fixtures not required for support of the building and contents located below the lowest floor are not covered by a flood insurance policy.</p>	<p>Elevating buildings at least eight feet and using the lower area as parking is encouraged for two reasons. First, the lowest floor will be well above the FPE, providing extra flood protection. Second, by putting parking under the building, less open space is used for impervious parking surface, reducing the amount of runoff from the site.</p>
<p>13.7.7. If the building is on a crawlspace or other design where the walls below the FPE are enclosed, the following requirements apply:</p> <p>(a) The walls shall be designed to automatically equalize hydrostatic flood forces on exterior walls by allowing for the entry and exit of floodwaters. Designs for meeting this requirement must either be certified by a Licensed Professional Engineer or architect or meet or exceed the following mini-</p>	<p>The specifications in subsection (a) are a minimum requirement of the NFIP.</p>

Ordinance	Commentary
<p>mum criteria:</p> <p>(1) There shall be a minimum of two openings having a total net area of not less than one square inch for every square foot of enclosed area subject to flooding shall be provided.</p> <p>(2) The bottom of all openings shall be no higher than one foot above grade.</p> <p>(3) Openings may be equipped with screens, louvers, valves, or other coverings or devices provided that they permit the automatic entry and exit of floodwaters.</p> <p>(b) The floor of the crawlspace shall not be lower than the lowest grade adjacent to the building's exterior.</p> <p>(c) Gravity storm and sanitary sewer connections are prohibited in the enclosed area. If there are facilities in the enclosed area connected to storm and sanitary sewers, the connections must be to sumps, pumps and overhead sewer lines.</p> <p>(d) <i>If the lowest floor is more than five feet above the floor of the crawlspace, the owner shall sign a nonconversion agreement to assure that the enclosed lower area will not be improved, finished or converted to a use other than parking, building access or storage of materials.</i></p>	<p>This provision allows positive drainage from the crawlspace after it is flooded. If the crawlspace floor is lower than the outside grade level, the building will be rated at the more expensive "with basement" flood insurance rates.</p> <p>This language is required for communities within the jurisdiction of the Metropolitan Water Reclamation District of Greater Chicago.</p> <p>A sample nonconversion agreement is available from the South Suburban Mayors and Managers Association. It should be reviewed and approved by the municipal attorney before it is used.</p> <div data-bbox="987 1539 1114 1640" data-label="Image"> </div> <p>The language in italics is recommended and can receive 50 points under Section 431.h.2.b of the <i>CRS Coordinator's Manual</i>.</p>

Ordinance	Commentary
<p>13.8. Manufactured Homes and Recreational Vehicles</p> <p>13.8.1. In addition to the requirements of Sections 13.5 - 13.7, manufactured homes</p> <ul style="list-style-type: none"> (a) Shall have the lowest floor elevated to or above the FPE and (b) Shall be anchored to resist flotation, collapse, or lateral movement by being tied down in accordance with the Rules and Regulations for the Illinois Mobile Home Tie-Down Act issued pursuant to 77 Ill. Adm. Code Part 870. <p>13.8.2. Recreational vehicles or travel trailers shall be required to meet the above elevation and anchoring requirements for manufactured homes unless:</p> <ul style="list-style-type: none"> (a) They are on site for fewer than 180 consecutive days and (b) They are fully licensed and ready for highway use. A recreational vehicle is ready for highway use if it is on its wheels or jacking system, is attached to the site only by quick disconnect type utility and service devices, and has no permanently attached additions. 	<p>This language is slightly more restrictive than the minimum NFIP requirement. The NFIP allows manufactured homes located in existing manufactured home or mobile home parks to be elevated three feet above grade regardless of the FPE. Because there are few such locations in south suburban floodplains with flood depths greater than three feet, this language is recommended to treat all manufactured homes similarly.</p> <p>More information on protecting manufactured housing can be found in FEMA's <i>Manufactured Home Installation in Flood Hazard Areas</i>, FEMA-85, September 1985.</p>
<p>13.9. Floodproofed Buildings. Only a non-residential building may be structurally dry floodproofed (in lieu of elevation) provided that:</p> <p>13.9.1. A Licensed Professional Engineer shall certify that the building has been structurally dry floodproofed below the FPE and that the building and attendant utility facilities are watertight and capable of resisting the effects of the base flood.</p>	<p>Floodproofing is the least dependable flood protection measure and is limited to nonresidential buildings.</p>

Ordinance	Commentary
<p>13.9.2. The building design shall take into account flood velocities, duration, rate of rise, hydrostatic and hydrodynamic forces, the effects of buoyancy, and impacts from debris or ice.</p>	<p>More information on floodproofing criteria can be found in FEMA's <i>Floodproofing Nonresidential Structures</i>, FEMA-102, May 1986 and the Corps' <i>Flood-Proofing Regulations</i>, US Army Corps of Engineers, EP 1165 3 314, 31 March 1992</p>
<p>13.9.3. Floodproofing measures shall be operable without human intervention and without an outside source of electricity (levees, berms, floodwalls and similar works are not considered floodproofing for the purpose of this subsection).</p>	
<p>13.10. Accessory Buildings. <i>Tool sheds and detached garages on an existing single-family platted lot, may be constructed with the lowest floor below the FPE provided the building meets the following requirements:</i></p>	<p>This section is optional.</p>
<p>13.10.1. <i>The building is not used for human habitation.</i></p>	<p>Tool sheds and detached garages can be constructed below the flood protection elevation if this section is included in the ordinance. Communities desiring a more restrictive use of the floodplain, should omit this section.</p>
<p>13.10.2. <i>The building shall meet the permanent opening criteria of section 13.7.7.</i></p>	
<p>13.10.3. <i>All areas below the FPE shall be constructed with waterproof material.</i></p>	
<p>13.10.4. <i>Service facilities such as electrical and heating equipment shall be elevated or floodproofed to the FPE.</i></p>	
<p>13.10.5. <i>The building shall be anchored to prevent flotation.</i></p>	<p>Before this language is adopted, the community should note that such buildings will increase the potential for flood damages to equipment, machinery vehicles and materials stored in them and that some stored materials may contribute to water quality contamination during a flood.</p>
<p>13.10.6. <i>The building shall be less than 500 square feet in floor size.</i></p>	
<p>13.10.7. <i>The building shall be less than \$7,500 in value.</i></p>	
<p>13.10.8. <i>The building shall be used only for the storage of vehicles or tools and may not contain other rooms, workshops, greenhouses or similar uses.</i></p>	

13.11. Critical Facilities.

13.11.1. Critical facilities are defined as:

- (a) Buildings or facilities that produce, use, or store highly volatile, flammable, explosive, toxic and/or water-reactive materials;
- (b) Hospitals, nursing homes, and housing likely to contain occupants who may not be sufficiently mobile to avoid death or injury during a flood;
- (c) Police stations, fire stations, vehicle and equipment storage facilities, and emergency operations centers that are needed for flood response activities before, during, and after a flood;
- (d) Public and private utility facilities that are vital to maintaining or restoring normal services to flooded areas before, during, and after a flood.

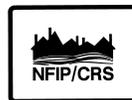

13.11.2. No critical facility shall be allowed in the SFHA.

13.12. Known Flood Hazards. The (Board of Trustees/City Council) shall take into account flood hazards, to the extent that they are known in all official actions related to land management, use and development.

There is no official definition of critical facilities, so each community should identify what it considers appropriate for extra protection. It could include facilities as varied as schools, suppliers of flood fighting supplies and bridges. The list should be prepared with input from the local emergency manager.

There is no NFIP or IDNR restriction on locating critical facilities, other than the IDNR floodway rules. Guidance on a variance to this restriction is in Section 6.4.6.

Alternatively, communities are encouraged to prohibit critical facilities from the 500-year floodplain or require them to be protected from the 500-year flood.

Up to 100 points are provided in Section 431.e.2 of the *CRS Coordinator's Manual*.

This section means that the community must protect new development from damage from any known source of flooding, even if it does not appear on the floodplain map. This is an NFIP requirement.

Ordinance	Commentary
<p>13.13. Major Developments.</p> <p>13.13.1. Subdivisions, annexation agreements, planned unit developments (PUDs), manufactured home parks and other major developments shall be reviewed to assure that the proposed developments are consistent with the provisions of this ordinance and the need to minimize flood damage.</p> <p>13.13.2. Streets, blocks, lots, parks and other public grounds shall be located and laid out in such a manner as to preserve and utilize natural streams and channels. Wherever possible, the floodplains shall be included within parks or other public grounds.</p> <p>13.13.3. The surface of all new arterial streets shall be at or above the base flood elevation. The surface of all new collector streets shall be at or above eight inches below the base flood elevation.</p>	<p>This is an NFIP requirement.</p> <p>See also the additional requirements for subdivision plats in Section 5.6.</p>

Section 14. Requirements in Floodways

14.1. Jurisdiction. This section applies to proposed development, redevelopment, site modification or building modification within a floodway.

14.1.1. Only those uses and buildings which meet the criteria in this section shall be permitted.

14.1.2. All floodway modifications shall be the minimum necessary to accomplish the purpose of the project.

14.1.3. All development projects shall also meet the requirements of section 13 of this ordinance.

14.2. Terminology.

14.2.1. The term “designated floodway” refers to floodways that have been mapped and designated by IDNR. These floodways are subject to the special requirements of 92 Ill. Adm. Code Part 3708.

14.2.2. The term “regulatory floodway” refers to floodways that have not been mapped and designated by IDNR but are determined by the developer pursuant to section 15.3 of this ordinance.

14.3. Smaller Development Projects in Designated Floodways. The following development projects may be permitted by the [title of permit official] provided there is no increase in flood levels. All other projects in the designated floodway are subject to the requirements of Sections 14.4 and 14.5.

14.3.1. Underground and overhead utilities that meet the following requirements.

(a) The utility shall not result in any increase in existing ground elevations.

(b) The project shall not require the placement of above ground structures in the floodway.

All parts of this section are required by the NFIP or Illinois State law unless otherwise noted.

The “designated floodway” is defined and adopted in section 12.5.

Local governments are encouraged to evaluate these exemptions and delete any which, based on local experience, should be subject to IDNR/OWR review. The community may want to identify some that are subject to a professional engineer's review.

- (c) In the case of underground stream crossings, the top of the pipe or encasement shall be buried a minimum of 3' below the existing streambed.
- (d) Overhead utility lines shall be constructed above the FPE or attached above the low chord of an existing bridge (with the permission of the bridge owner). Supporting towers shall not be placed in the watercourse and shall be designed so as to not catch debris during a flood.
- (e) Disturbance of streamside vegetation shall be kept to minimum during construction to prevent erosion and sedimentation. All disturbed floodway areas, including the stream banks shall be restored to their original contours and seeded or otherwise stabilized upon completion of construction.
- (f) A utility crossing carrying material which may cause water pollution as defined by the Environmental Protection Act 415 ILCS 5 shall be provided with shut-off valves on each side of the body of water to be crossed.
- (g) All Illinois Commerce Commission, National Electric Safety Codes, and federal requirements for clearance must be met.

14.3.2. Storm and sanitary sewer relief outfalls that:

- (a) Do not extend riverward or lakeward of the existing adjacent natural bank slope,
- (b) Do not result in an increase in ground elevation, and
- (c) Are designed so as not to cause stream erosion at the outfall location.

14.3.3. Construction of sidewalks, athletic fields (excluding fences), properly anchored playground equipment and patios at grade.

Ordinance	Commentary
<p>14.3.4. Construction of shoreline and streambank protection that:</p> <ul style="list-style-type: none"> (a) Does not exceed 1000 feet in length. (b) Materials are not placed higher than the existing top of bank. (c) Materials are placed so as not to reduce the cross-sectional area of the stream channel or bank of the lake. <p>14.3.5. Temporary stream crossings that meet the following requirements:</p> <ul style="list-style-type: none"> (a) The approach roads will be 1/2 foot or less above natural grade. (b) The crossing will allow stream flow to pass without backing up the water above the stream bank vegetation line or above any drainage tile or outfall invert. (c) The top of the roadway fill in the channel will be at least 2' below the top of the lowest bank. <i>Any fill in the channel shall be non-erosive material, such as rip-rap or gravel.</i> (d) All disturbed stream banks will be seeded or otherwise stabilized as soon as possible upon installation and again upon removal of construction. (e) The access road and temporary crossings will be removed within one year after authorization. 	<p>Stabilization activities involving 1000 feet or less of shoreline or streambank, and which utilize vegetative or soil bioengineering techniques, need not be subject to the review of a registered professional engineer. However, "artificial" methods, such as concrete lining or gabions, which are likely to increase conveyance and potentially exacerbate erosion and/or flooding downstream, should be subject to the review of a registered professional engineer.</p> <p>The italicized language is recommended.</p>
<p>14.4. Smaller Development Projects in Regulatory Floodways. Within all riverine SFHAs where the floodway has not been designated, the following standards shall apply:</p> <p>14.4.1. The requirements of section 15.3 shall be met.</p>	

14.4.2. Within the regulatory floodway, the following activities may be permitted by the [title of permit official] All other projects in the designated floodway are subject to the requirements of Sections 14.5 and 14.6.

- (a) All activities listed in section 14.3.
- (b) The construction of light poles, sign posts and similar structures.
- (c) The construction of properly anchored, un-walled, open structures such as playground equipment, pavilions, and carports built at or below existing grade that would not obstruct the flow of flood waters.
- (d) The placement of properly anchored buildings not exceeding seventy (70) square feet in size, nor ten (10) feet in any one dimension (e.g., animal shelters and tool sheds).
- (e) The construction of additions to existing buildings which do not increase the first floor area by more than twenty (20) percent, which are located on the upstream or downstream side of the existing building, and which do extend beyond the sides of the existing building that are parallel to the flow of flood waters.
- (f) Minor maintenance dredging of a stream channel where:
 - (1) The affected length of stream is less than 1000 feet.
 - (2) The work is confined to reestablishing flows in natural stream channels, or
 - (3) The cross-sectional area of the dredged channel conforms to that of the natural channel upstream and downstream of the site.

See the definition of "channel" in Section 3.

Ordinance	Commentary
<p>14.5. Work in Channels.</p> <p>14.5.1. If the proposed project involves a channel modification, the applicant shall submit the following information:</p> <ul style="list-style-type: none"> (a) A discussion of the purpose of and need for the proposed work; (b) A discussion of the feasibility of using alternative locations or methods to accomplish the purpose of the proposed work; (c) An analysis of the extent and permanence of the impacts each feasible would have on the physical and biological conditions of the body of water affected; and (d) An analysis of the impacts of the proposed project, considering cumulative effects on the physical and biological conditions of the body of water affected. <p>14.5.2. Construction of shoreline and streambank protection in the channel may be permitted by the [title of permit official] provided:</p> <ul style="list-style-type: none"> (a) The project does not exceed 1000 feet in length. (b) Materials are not placed higher than the existing top of bank. (c) Materials are placed so as not to reduce the cross-sectional area of the stream channel by more than 10 percent. <p>14.5.3. The flood carrying capacity within any altered or relocated watercourse shall be maintained.</p> <p>14.5.4. The [title of permit official] shall notify the appropriate offices of adjacent communities at least 30 days before issuing a permit on a project that will alter, relocate or modify a channel.</p>	<p>“Channel modifications” are defined in Section 3. They are of particular concern because of their potential impacts on erosion, water quality and habitat, as well as flood height and velocity. Therefore, specific additional information is required to assess their impacts.</p> <p>Certain activities involving fill in existing channels are also regulated by the US Army Corps of Engineers, which requires its own assessment of environmental impacts. Review of such activities should be coordinated with the Corps.</p> <p>See also the provisions in Sections 10.4 and 11.5.</p> <p>NFIP requirement</p> <p>NFIP requirement</p>

Ordinance	Commentary
<p>14.6. Larger Floodway Projects. All development proposals other than those permitted under sections 14.3, 14.4 and 14.5 require a permit from IDNR/OWR. The [title of permit official] shall not issue a permit for a proposed project until the applicant first obtains a permit or written documentation that a permit is not required from IDNR/OWR, issued pursuant to 615 ILCS 5/5 et seq.</p>	<p>Note: IDNR/OWR has a program to delegate its floodway permitting activities to interested and qualified communities. These communities agree to assume responsibility for the types of projects that this model ordinance defers to IDNR/OWR in this section.</p> <p>If your community has such delegated powers, this section should read:</p> <p style="padding-left: 40px;">“All development proposals other than those permitted under sections 14.3, 14.4 and 14.5 require a review by a Licensed Professional Engineer under the employ or contract of the (Village/City). The [title of permit official] shall not issue a permit for a proposed project until the review engineer provides written documentation that the project complies with the requirements of 615 ILCS 5/5 et seq.”</p> <p>If you are unsure of your community’s status, contact IDNR/OWR.</p>
<p>14.6.1. Application for an IDNR/OWR permit shall be submitted on a form according to procedures specified by IDNR/OWR.</p> <p>14.6.2. No development site shall be occupied, no certificate of occupancy shall be issued, and no subdivision or other development shall be accepted by the (City Council/Village Board of Trustees) unless and until all provisions of the IDNR/OWR permit are met.</p>	<p>The IDNR/OWR office is at:</p> <p style="padding-left: 40px;">201 West Center Court Schaumburg, IL 60196 847/705-4341</p> <p>Because this ordinance depends on IDNR/OWR permits to assure compliance with the community’s NFIP requirements, the community is responsible for ensuring that the project is constructed in conformance with IDNR/OWR permits.</p>
	<p>The local permit official should talk to the IDNR/OWR office to discuss how the project will be inspected. Many minor projects, such as room additions and garages, can be inspected by the community as part of the regular building inspection process. More complicated projects may need a site inspection by an engineer or IDNR/OWR staff to verify compliance.</p>

Ordinance	Commentary
<p>14.6.3. Only appropriate uses are allowed in a floodway. “Appropriate uses” are activities which:</p> <ul style="list-style-type: none"> (a) will not cause a rise in the base flood elevation, (b) will not create a damaging or potentially damaging increase in flood heights or velocity, (c) will not be a threat to public health and safety and welfare, and (d) will not impair the natural hydrologic and hydraulic functions of the floodway or channel, or permanently impair existing water quality or aquatic habitat. <p>14.6.4. The approved appropriate uses are as follows:</p> <ul style="list-style-type: none"> (a) Flood control structures, dikes, dams and other public works or private improvements relating to the control of drainage, flooding, erosion, or water quality or habitat for fish and wildlife. (b) Buildings, structures or other facilities relating to the use of, or requiring access to, the water or shoreline, such as in-stream aeration and similar treatment facilities, and facilities and improvements related to recreational boating, commercial shipping and other functionally water dependent use; (c) Storm and sanitary sewer relief outfalls; (d) Underground and overhead utilities; (e) Open space and recreational facilities such as playing fields and trail systems, including any related fencing (at least 50 percent open when viewed from any one direction) built parallel to the direction of flood flows; 	<p>The “appropriate use” approach is specified by state law for Northeastern Illinois. This list is taken from 17 Ill. Adm. Code Part 3708.</p> <p>The official responsible for administering this section should explain to permit applicants that these are the only things that IDNR/OWR or the community can allow in a floodway. In many cases, this should cause the applicant to revise his/her plans and/or avoid development in the floodway altogether.</p> <p>Toilet facilities and other potential obstructions to flows and/or sources of pollution should be discouraged in the floodway. If such facilities are necessary to serve a recreational use, they should be located outside the floodplain, or at least in the flood fringe.</p>

Ordinance	Commentary
<p>(f) Detached garages, storage sheds, or other non-habitable accessory buildings that will not block flood flows nor reduce floodway storage;</p> <p>(g) Bridges, culverts, roadways, sidewalks, railways, runways and taxiways and any modification thereto;</p> <p>(h) Parking lots built at or below existing grade where the surface of the parking lot shall be at or above nine inches below the base flood elevation.</p> <p>(i) Designated floodway regrading, without fill, to create a positive non-erosive slope toward a watercourse. Regrading or other modifications of the floodway for the convenience of site design for a private development is not considered an appropriate use.</p> <p>(j) Floodproofing activities to protect previously existing lawful buildings including dry floodproofing a building and the construction of floodwalls where the outside toe of the floodwall shall be no more than ten (10) feet away from the exterior wall of the existing building;</p> <p>(k) The replacement, reconstruction, or repair of a damaged building, provided that the outside dimensions are not increased.</p> <p>(l) Modifications to an existing building that will not increase the enclosed floor area of the building below the FPE and which will not block flood flows, including, but not limited to, fireplaces, bay windows, decks, patios and second story additions.</p>	<p>Garages, storage sheds and other non-habitable accessory buildings may be allowed if they are in the hydraulic shadow of an existing building and are designed to be wet floodproofed (see section 13.10).</p> <p>Undrained, depressional areas in a floodway function to retain floodwaters after a flood has passed, discharging it slowly to the channel or recharging groundwater. Regrading such areas should be discouraged.</p> <p>The project must still comply with the requirements of Section 13. If the building is substantially damaged, it must be protected from flood damage.</p> <p>The project must still comply with the requirements of Section 13. If the project is a substantial improvement, the building must be protected from flood damage.</p>

14.6.5. Appropriate uses do not include:

- (a) The construction or placement of any new buildings, fill or building additions;
- (b) Critical facilities or wastewater treatment plants;
- (c) Excavation or channel modifications done to accommodate otherwise non-appropriate uses in the floodway;
- (d) Fencing (including landscaping or planting designed to act as a fence);
- (e) Storage of materials except as specifically defined above as an appropriate use.

Section 15. Areas Without Regulatory Floodplain Data.

15.1. Jurisdiction. This section applies to proposed development, redevelopment, site modification or building modification in SFHAs and other regulated areas where base flood elevations have not been established and/or floodways have not been identified. Within these areas, all appropriate requirements of section 13 shall apply.

15.2. Base Flood Elevations. The base flood elevation shall be the best data available in the Illinois State Water Survey's Floodplain Information Repository. If the State Water Survey does not have data sufficient for regulatory purposes, the following procedures shall be used to obtain the base flood elevation for a site.

15.2.1. If the base flood elevation is needed for a level 2 or 3 development in a riverine SFHA, then the base flood elevation shall be determined using the "Quick – 2 Computer Program" or similar method described in *Managing Floodplain Development in Approximate Zone A Areas*, FEMA publication 265, and accepted by the State Water Survey.

15.2.2. If the base flood elevation is needed for a level 1 development project within a riverine SFHA, then:

- (a) The base flood elevation shall be determined from a backwater model, such as HEC-II, WSP-2, or a dynamic model such as HIP.
- (b) The flood flows used in the hydraulic models shall be obtained from a hydrologic model, that meets the requirements of Section 7.9 Design Methods.

(c) *Along any watercourses draining more than*

All parts of this section are required by the NFIP or Illinois State law unless otherwise noted.

If all of the SFHAs in your community *and* in areas likely to be annexed into your community have base flood elevations and floodways, then this section does not need to be included in your ordinance.

The State Water Survey's office is at

2204 Griffith Drive
Champaign, IL 61820
217/333-5482

See the definition for "level 2" and "level 3" development. This approach reduces the expense of conducting a detailed flood study for smaller development projects.

Managing Floodplain Development in Approximate Zone A Areas, FEMA publication 265, July 1995, is free and can be ordered by calling 800/480-2520. The "Quick – 2 Computer Program" is included with the publication.

The results of the study should be provided to the State Water Survey for its repository.

See the definition for "level 1 development."

CRS credit is provided in Section 411.a of the *CRS Coordinator's Manual*.

one square mile, the analyses shall be submitted to IDNR/OWR for approval. Once approved it must be submitted to the Illinois State Water Survey Floodplain Information Repository for filing.

15.2.3. For a non-riverine SFHA:

- (a) The base flood elevation shall be the highest historic flood recorded plus three feet, unless calculated by a detailed engineering study.
- (b) *In drainage areas greater than one square mile, the calculations shall be approved by IDNR/OWR.*

15.3. Designated Floodway. An applicant for a permit in an SFHA without a designated floodway may:

15.3.1. Treat the entire SFHA as the designated floodway.

15.3.2. Have an engineering study performed by a Licensed Professional Engineer to determine a regulatory floodway. The regulatory floodway may be submitted to IDNR/OWR for inclusion on IDNR/OWR's designated floodway list.

15.3.3. If the application is for a level 2 or 3 development project, treat the 90% of the floodplain closest to the channel as the regulatory floodway and the 10% of the floodplain farthest from the channel as fringe.

15.4. Level 1 Developments. Proposals for new level 1 developments:

15.4.1. Shall include base flood elevation data and floodway delineations. The applicant's engineer shall be responsible for calculating the needed data.

15.4.2. The applicant's engineer shall submit the data to IDNR/OWR for review and approval as best available regulatory data and then send it to the State Water Survey.

This provision does not differentiate between the three levels of developments. There are no methods of calculating a base flood elevation in a non-riverine floodplain short of a detailed engineering study.

NFIP requirement 44 CFR 60.3(b)(3) only requires base flood elevations to be shown for subdivisions greater than 5 acres or 50 lots.

Section 16. Enactment.

This Ordinance shall be in full force and effect from and after its passage and approval and publication, as required by law.

This section sets the date when this Ordinance goes into effect and contains sections which the authorized officials must sign to approve passage.

Naturalized Stormwater Management Facilities

Background

This guidance paper is taken from a Technical Policy Directive developed by the Village of Flossmoor, Illinois. It has been reviewed and recommended for use by the SSMMA Stormwater Management Ordinance Task Force. It may be revised and updated as needed to reflect new techniques and lessons learned.

Purpose

These criteria are intended to apply to projects involving the creation of wetland and prairie planting areas for the purpose of naturalizing stormwater facilities. The purpose is to ensure that the overall design intent for these facilities -- including detention basins, drainage swales, and filter strips - is achieved and maintained, particularly during the initial plant establishment period. The design intent for such facilities is to provide an aesthetic, healthy, diverse community of native vegetation to meet the objectives of soil stabilization, stormwater treatment, and wild-life habitat (where appropriate). Monitoring is required annually for a minimum period of three full growing seasons following planting.

If the planting incorporates existing wetland habitat that is subject to a Clean Water Act Section 404 permit, the developer will be subject to U.S. Army Corps of Engineers monitoring and performance standards, typically including the requirements for a five- year monitoring and approval period. A brief outline of typical Corps performance standards is attached to this document.

The purpose of this policy directive will be accomplished by the following actions:

1. Development and implementation of an effective landscape/planting plan.
2. Routine site inspection and monitoring of planting success.
3. Follow-up repair, reseeding, and/or replanting to meet performance criteria.
4. Routine monitoring and maintenance/remediation of shoreline and slope erosion, debris accumulation, and sediment accumulation.
5. Preparation of annual reports documenting monitoring results and maintenance and remedial activities.

Design Criteria

In order to maximize the success of native plantings, it is critical that 1) stable slopes are provided via site grading to minimize erosion potential, 2) a suitable growing medium is provided for seeding and/or planting, and 3) vegetation is selected based on its appropriateness to the expected soils and hydrologic regime, or wetness. In particular, stormwater facilities should be designed in recognition of expected significant fluctuations of water levels.

Slopes and grading: Stable slope criteria are provided below for detention basins, drainage swales, and filter strips.

Detention basins designed with conventional steep slopes (e.g., 3:1) are susceptible to erosion, particularly at elevations near the normal water level, and are difficult to vegetate. Therefore, shoreline slopes should be no steeper than 10: 1 (horizontal to vertical) from one foot above the normal pool stage to at least one foot below the normal pool stage. For *wet-bottom basins* (i.e., where the basin bottom is excavated to provide open water several feet deep), this slope will provide for a relatively flat underwater safety shelf with a minimum width of at least 10-feet around the periphery of the basin. The shelf will have an average depth of six inches and a maximum depth of 12 inches below the normal pool stage to facilitate the growth of emergent wetland vegetation. For *wetland-type basins* (i.e., where the basin bottom elevation is at or just slightly below the invert of the outlet structure), bottom slopes should be no steeper than 10: 1 in areas that are to be vegetated with wetland plants. Upper slopes of detention basins (higher than one foot above normal stage) should be no steeper than 4: 1. (Flatter slopes (i.e., 5: 1) are preferred to enhance plant establishment and to facilitate long-term maintenance.)

To facilitate the efficient trapping and removal of sediment, detention basins should be constructed with sediment basins or forebays at all major inlets to the basins. Such sedimentation basins should be at least 4 feet deep and designed to allow access for sediment removal equipment.

Drainage swales should be no steeper (longitudinally) than 10: 1 (horizontal to vertical). Where steeper slopes exist in the natural terrain, drop structures (or check dams) should be installed to reduce the effective slope to 10:1. The cross-sectional shape of swales should be trapezoidal or parabolic, not v-shaped. Side slopes of swales shall be no steeper than 4: 1, and preferably flatter.

Filter strips should be no steeper than 15 percent (6.5:1) longitudinally. Wherever practical, side slopes should be no steeper than 10: 1. Flatter slopes will minimize flow concentration and erosion and maximize effectiveness in infiltrating and treating stormwater.

Suitable growing medium - soils: A critical consideration in site preparation is the provision of an adequate growing medium for new plants. Because construction of stormwater facilities typically requires extensive grading, natural soils become highly disturbed and unsuitable for planting. Two design factors, as described in the *Native Plant Guide for Streams and Stormwater Facilities in Northeastern Illinois* (NRCS et al, 1998), are critical. First, it is important to minimize soil compaction (i.e., to less than 275 psi) of both subsoil and topsoil. Where subsoil compaction cannot be avoided, it is desirable to disc the subsoil to a depth of 6 - 8 inches with a chisel plow before spreading topsoil. Second, it is important that suitable topsoil be provided. A minimum of one foot of uncompacted topsoil should be spread over the site in areas that will be vegetated with native plants. Coarse soil with minimal clay content is preferred because it minimizes the potential for compaction. Soils with a higher organic content are preferred in the bottom of wetland detention basins and along the shoreline and safety shelf of wet basins to promote the growth of wetland plants.

Vegetation selection: Native vegetation is the preferred landscaping material for detention facilities, drainage swales, and filter strips. However, it is critical that the selected plants and planting methods conform to the soils, hydrology, and water quality conditions present in such facilities. In general, plants selected for stormwater facility applications should be tolerant of highly variable hydrologic conditions and degraded water quality (e.g., high turbidity and salinity content).

Plant selection should conform to the guidance in the *Native Plant Guide*, which is hereby adopted by reference. The *Native Plant Guide* provides recommended plantings for three detention basin zones (emergent, saturated, and upland), for vegetated drainage swales, and for filter strips (use "upland buffers" recommendations for filter strips).

Guidance on plant and seed installation, including optimal time of year, also is provided in the *Native Plant Guide*. Ideally, the project should be planned to allow planting immediately after site preparation is completed. However, if grading is completed during dry summer conditions, for example, it may not be appropriate to immediately seed native upland plants.

Planting can be done with live plants and/or seeds. Use of live plants, tubers, or root stock is preferred in shoreline zones and shallow ponded areas of detention basins, and in other areas prone to frequent inundation, because it results in rapid establishment of stabilizing vegetative cover. It is desirable to install most live plants, tubers and root stock in the spring or early summer (i.e., before summer dry periods) to allow for effective root establishment before the following winter. Likewise, most trees and shrubs should be planted in spring or early summer, or can be planted in a dormant state in the fall.

Because most project budgets will allow for only limited use of live plants, seeding typically is used over the majority of the upland portions of the site. Where seeding is to be done on upland slopes, it is important to use a cover crop, such as wild rye or oats, to quickly establish a stable vegetative cover. Depending on the season, planting native vegetation seeds may be deferred until moisture and temperature conditions are appropriate. In general, most native plants should be seeded in the spring. As an alternative, dormant seeding may be done in the late fall or winter. The *Native Plant Guide* should be consulted as a reference for seeding times.

To prevent seeds and soil from washing away, several techniques should be considered. First, the seed should be raked or drilled into the ground. Erosion blanket should be installed in swales and on detention basin side slopes to maintain soil moisture and minimize erosion. On flat upland areas (i.e., slopes less than 10-15%) where inundation is infrequent, straw mulch is a less-expensive alternative to erosion blanket.

Finally, areas newly planted with live plants may need to be protected from predation, particularly by Canada geese. Protection in the form of "goose cages," or similar devices that fence out plant predators, is particularly important in emergent wetland zones and areas adjacent to significant open water.

Performance Criteria

The intention of this policy directive is to help establish native landscapes that are functional, aesthetic, and cost-effective. The performance criteria for such landscapes need not be as rigorous as for federally permitted wetland mitigation projects or ecologic restoration projects.

In naturalized detention basins, swales, and filter strips, the sideslopes should be maintained with a permanent vegetation cover at all times to minimize erosion. Erosion of upland slopes or open water edges negatively impacts both the stormwater facility and downstream water bodies. Areas of erosion are to be noted qualitatively during each site inspection. If rills or gullies are forming, or if a significant accumulation of sediment is collecting at the toe of the slope, remedial measures should be implemented immediately. If erosion is a problem, recommended management practices, such as spot dressing/repair, light mulching, and over-seeding or replanting, shall be required.

The success of natural landscaping in meeting the stated objectives can be affected by the appropriateness of the plant species selected, the effectiveness of the grading and installation, the quality of the plants and seeds, and the adequacy of early maintenance. The success of the project will be formally evaluated by the following vegetation performance standards monitored over time.

1st Season: By the end of the first full growing season, the planted areas should have complete vegetation cover. At least 75 percent of *the plugs, root stock and tubers*, and 90 percent of the *species* planted as plugs, root stock, and tubers, should be present and alive. No upland area (i.e., non-wetland) greater than 2.5 square feet shall be devoid of vegetation. However, if an area is designed as an aquatic or emergent system, it is anticipated that portions of the submerged area will be periodically exposed and without vegetation cover due to fluctuating water levels. If, by the end of the first full growing season, the basin emergent zones and/or side slopes fail to support the establishment of sufficient vegetation, then corrective measures to the fundamental design of the area and/or planting plan shall be required.

2nd Season: During the second growing season, a minimum of 25 percent of the permanent species planted in *seed form* should be evident. Ninety percent or more of species planted as plugs, root stock, and tubers shall have persisted into the second season. If this level of vegetation establishment fails to occur, a determination must be made as to why, and a remedial action plan shall be necessary. Remediation shall include overseeding and/or plugging of appropriate species. Finally, undesirable, invasive plant species shall not be prevalent in the stormwater facility. Specifically, none of the following shall be among the five most dominant plant species in the overall vegetative cover.

- Reed canary grass (*Phalaris arundinacea*)
- Common reed (*Phragmites australis*)
- Purple loosestrife (*Lythrum salicaria*)
- Buckthorn (*Rhamnus spp.*)
- Field thistle (*Cirsium arvense*)
- Sweet clover (*Melilotus spp.*)
- Kentucky bluegrass (*Poa pratensis*)
- Sandbar willow (*Salix interior.*)
- Honeysuckle (*Lonicera spp.*)
- Multiflora rose (*Rosa multiflora*)
- Box elder (*Acer negundo*)
- Teasel (*Dipsacus spp*)

3rd Season: At the end of the third full growing season, a minimum of 75 percent of the seeded permanent species and 90 percent or more of species planted as plugs, root stock, and tubers are expected to be established. (Alternatively, native perennial species that volunteer on the site, excluding undesirable invasive species, may also be counted in determining the preceding criteria.)

Commonly, if the planted species are not evident by the end of the third season, the likelihood of subsequent appearance is much reduced. Acceptable species defined as native to the region and not invasive (as listed in the *Native Plant Guide*), shall provide at least two-thirds of the relative aerial coverage. Also, the five most dominant species of the overall vegetative cover shall not include any of the undesirable species listed above under the 21 season performance standards.

If the identified level of species development fails to occur, a determination must be made as to why, and a remedial action plan must be prepared and submitted to the Village for approval. The approved remedial plan must be implemented and continued monitoring will be required beyond the third growing season until these Performance Criteria are met.

Long term: With ongoing landscape maintenance and management, the plant community should continue to improve over time. As a minimum, though, the site should continue to meet the vegetation performance standards of the 3rd season, as specified above, with regard to erosion control, vegetation coverage, species diversity, and control of invasive species.

Monitoring Guidelines

The following individual tasks shall be performed to address the various parameters to be monitored. To describe the degree of success of the project, three principal assessment protocols are recommended:

1. An inventory of all naturally landscaped areas of stormwater facilities (i.e., all detention basins, swales, and filter strips) to determine the extent to which species planted have become established and the extent of undesirable species;
2. The establishment of permanent photographic monitoring locations; and
3. Routine inspections to evaluate soil stability and other maintenance concerns.

The first two protocols shall be performed annually in late summer (August - September). Inspections to evaluate erosion and other maintenance concerns shall be performed four times per year, and more frequently during the initial construction and planting. Each protocol shall be performed for a minimum of three full growing seasons, or until it is evident that plant system development has stabilized and meets the Performance Criteria.

Inventory of all naturally landscaped areas: This inventory shall determine overall vegetative cover, the total number of seeded and planted species, and the prevalence of undesirable/invasive species, consistent with the specified "Performance Criteria." This inventory is critical to determine where follow-up seeding or planting are needed and to identify, locate, and remove undesirable plants on a yearly basis.

Establishment of permanent photographic monitoring locations: Photographs shall be taken to document the establishment of vegetative cover, erosion problems, and any other relevant maintenance concerns. The photographs must be of satisfactory quality and resolution to accomplish the intent of the Technical Policy Directive. For consistency, photographs of each vegetative community shall be taken from the same locations during each monitoring event. A detailed description of the camera/photo location (i.e., based on distance from a permanent structure), the orientation of the photo, and the vegetation zone being photographed shall be provided. Additional photos should be taken of problem areas and remedial activities.

Routine inspections to evaluate soil stability and other maintenance concerns: Notation of area's and type of erosion (e.g., rills, gullies, slumping accumulation) shall be depicted on a site plan. Other maintenance problems, including sediment or debris accumulation and obstructions of culverts or outlets also should be noted and remediated.

Further, sediment accumulation in sediment basins and forebays should be routinely monitored. Sediment removal should be initiated when one foot or more of sediment has accumulated in the basin bottom.

Reporting: An annual monitoring report will be submitted to the Village. This report will include the following items:

- Data on the status of vegetation, including an assessment of compliance with the Performance Criteria identified in Section IV.
- A description of vegetation maintenance activities, including overseeding, replanting, and control of undesirable species, undertaken during the previous 12 months, and an assessment of their effectiveness in meeting the Performance Criteria.
- Photographs, and accompanying descriptions, taken at permanent monitoring stations.
- A discussion of erosion control, sediment and debris removal, and other maintenance activities undertaken during the previous 12 months.
- A discussion of planned maintenance activities for the coming year.

Maintenance and Management Requirements and Guidelines

Maintenance activities should be based, in part, on problems identified in the annual monitoring effort. Although specific maintenance and management considerations will be determined in the field, based upon the individual characteristics and performance of the project, standard management protocols should include the following measures. The management guidelines correspond to the initial vegetation establishment period, as well as recommended long-term procedures.

1st Season: The naturalized stormwater facility area will be planted with a combination of native seed, tubers, rootstocks, and plant plugs, as described previously under Design Criteria.

A temporary cover crop must be planted on all slopes immediately upon completion of grading to prevent erosion. Soil stabilization and seedbed protection in the form of erosion blanket or straw mulch also must be installed, consistent with the "Design Criteria." Within 3 months, upland areas should have complete vegetation coverage. If the desired long-term slope vegetation is not planted with the temporary crop, it must then be planted in the first available growing season appropriate for each species. Use of a no-till drill to plant through the cover crop is recommended under these circumstances. If unusually dry conditions persist after planting or seeding, short-term irrigation may be necessary to prevent desiccation. Irrigation generally will not be necessary, however, if planting is done in the recommended seasons.

Under normal weather conditions, and given the proper habitat, it is anticipated that the plant plugs, tubers, and rootstocks will become nearly mature or fully established during the first full growing season. The seeded plants, depending on the germination and growth characteristics of specific species, may require two or three years to become established.

Control of undesirable plant species (as listed in the *Native Plant Guide* and under "Performance Criteria"), shall be done in a timely manner. Methods of control include hand pulling, mowing, spot herbicide application, or a combination of these methods. The appropriateness of a particular control method depends on the plant species present and their density or prevalence.

Hand pulling can be an effective method to control some undesirable species prior to the development and maturity of the plants. This method is most feasible when plants are present in small quantities and have shallow, immature root systems. If the entire root mass cannot be successfully removed, hand pulling may be ineffective. Recognizing that the timing of plant removal can be important in controlling invasive species, hand pulling should include the removal of all above-ground and below-ground stems, roots, and flower masses prior to the development of seeds. Care should be taken to disturb as little soil as possible during hand pulling to avoid exposure of additional weed seed in the soil layer.

Mowing is a recommended management option to control undesirable upland species, especially if they persist over a large area. Mowing is recommended during the first growing season on approximately a monthly frequency, with the mower set to a height of about 6 inches. Mowing is effective in reducing the shading effect of undesirable species on slow-growing native species and in preventing undesirable species (e.g., non-native clover) from going to seed. Advantages of mowing versus hand pulling include better soil stabilization and maintaining fuel for subsequent burns.

Under certain circumstances, selective herbiciding may be indicated. Systemic herbicides are generally used because they are absorbed through the plant tissues and work their way into the root system, effectively killing the plant. Wetland areas are usually treated with a herbicide such as Rodeo or a similar product specifically labeled for wetland use. A limited degree of graminoid (grass-like) weed growth may actually be desirable because it can contribute to the fuel requirement necessary for the initial burns.

If by the end of the first full growing season, there are significant failures in vegetation development in or near areas which were designed for occasional or routine shallow inundation, basin hydrologic design and other relevant factors (e.g., predation, turbidity) should be reevaluated before additional resources are deployed on vegetation replacement. Such areas should be re-designed and/or replanted, as appropriate.

2nd Season: During the second growing season, the native plant species will continue to develop root systems and it is anticipated that many native species should be more apparent. Weed growth in the second season may be treated by targeted herbiciding, hand pulling, or mowing. The appropriate protocol should be determined in the field.

If sufficient fuel is present, a controlled burn may be scheduled at the end of the second growing season. A controlled burn both stimulates the growth of native plants and effectively controls most undesirable species. Controlled burn management should be incorporated, where possible, as the primary long-term management tool in all created or restored native plant communities. Controlled burns should be conducted every two to four years, either in the fall or late winter/early spring, as conditions allow.

Controlled burns should be conducted only after receipt of all required permits and by trained individuals or contractors. The Village and neighboring property owners must be notified. Prior to any anticipated burn (preferably within 30 days) in accordance with local, state, and federal requirements for open burning. The Village also should be re-notified within 24 hours of a burn

once weather conditions become more certain. The site manager must be prepared to present evidence of a secured IEPA burn permit and a burn plan upon request before initiating the burn.

3rd Season: By the third growing season, it is anticipated that controlled burn management will serve as the primary form of plant community management. Selective woody plant removal, weeding, mowing, or herbiciding also may be incorporated, as necessary.

During the third growing season, the native grasses, as well as many of the seeded and planted forbs, should be relatively well established, particularly in areas subject to less frequent inundation. Weed growth should be declining significantly, and control measures should be continued on an as-needed basis.

Long Term: Continued maintenance shall be provided to maintain a diverse native plant community, consistent with the Performance Criteria; minimize the proliferation of weeds and undesired woody vegetation; and minimize erosion of slopes and shorelines. Long-term maintenance should consist primarily of controlled burn management every one to three years, as indicated by site conditions. Once the native plant communities are established, minimal spot weed control may be necessary.

Long term maintenance also shall include the routine removal of unsightly accumulation of trash or debris and the removal of obstructions from the basin outlet structure. Periodic removal of accumulated sediment (e.g., from swales, forebays, and settling basins) also shall be done to maintain the function and aesthetics of stormwater facilities. At a minimum, sediment shall be removed from forebays and sediment basins whenever one foot or more of sediment has accumulated in the basin bottom.

U.S. Army Corps of Engineers (COE)

Performance Standards and Monitoring Guidelines

If the project involves wetland mitigation, the specified performance standards and criteria for the COE Section 404 permit shall be evaluated and satisfied. All projects involving a Section 404 permit shall submit to the Village a copy of the permit and the COE-approved 5-year Monitoring and Maintenance Plan for the project. In addition to complying with the COE permit requirements, the project also shall conform to the *long term* maintenance requirements of this Technical Policy Directive as specified under "Management Requirements and Guidelines."

The COE permit will outline specific conditions and site-specific performance standards. Typically, however, based on new COE performance standard, mitigation wetlands must achieve the following standards:

1. A temporary cover crop must be planted on all slopes immediately upon completion of mitigation grading to prevent erosion. Within 3 months, at least 90% of the slopes, as measured by aerial coverage, will be vegetated. If the desired long-term slope vegetation is not planted with the temporary crop, it must then be planted in the first available growing season appropriate for each species. If a temporary cover crop is not planted immediately upon completion of grading, an erosion blanket must be installed to prevent erosion.
2. By the end of the fifth year, a native mean coefficient of conservatism value (native mean C value) of greater than or equal to 3.5 must be achieved, measured over the entire mitigation area. The native mean C value generally should increase each successive year after planting.

native plant species coefficients of conservatism are designated in Swink and Wilhelm (1994).

3. By the end of the fifth year, the native floristic quality index value (native FQI) must be greater than or equal to 20 as measured over the entire mitigation site. The native FQI must increase each successive year after planting. The floristic quality assessment method is also described in Swink and Wilhelm.
4. By the end of the fifth year, the native mean wetness coefficient (native mean W. -5 to +5) must be less than or equal to 0 in wetland plant communities. Coefficients of wetness (W) have been assigned by Wilhelm (1992, Technical Comments on the Proposed Revisions to the 1989 Wetland Delineation Manual, *Erigenia* 12:41-50) to the eleven wetland indicator categories, where: OBL = -5, FACW + = 4, FACW = -3, FACW = -2, FAC+ = -1, FAC 0, FAC = 1, FACU + = 2, FACU = 3, FACU = 4, UPL =5.

Wetness coefficients are derived from the five main National Wetland Indicator Categories given by Reed, Porter B., National List of Plant Species that Occur in Wetlands: North Central (Region 3), U.S. Fish Wildlife Service Rep. 8 (26.3, 1998): OBL = obligate, FACW = facultative wet, FAC = facultative, FACU = facultative upland, and UPI, = upland. These categories are given for local plants in Swink and Wilhelm (1994).

The National Wetland Indicator Categories define the estimated probability for which a species occurs in wetlands. Positive signs (+) and (-) signs attached to the three Facultative categories express exaggerated tendencies for those species.

The '+' sign denotes that the species generally has a greater estimated probability of occurring in wetlands than species having the general indicator category, but a less estimated probability of occurring in wetlands than those having the next wettest general indicator. The '-' sign denotes that the species generally has a lesser estimated probability of occurring in wetlands than the species having the general indicator status.

5. The relative importance value (RIV) of native plants should increase each successive year after planting.
6. By the end of the fifth year, no area over the entire mitigation site greater than 0.6 square meter should be devoid of vegetation, as measured by aerial coverage, unless specified on approved mitigation plans. This standard does not apply to emergent and aquatic communities.
7. By the end of the fifth year, none of the three most dominant plant species in any of the wetland community zones may be non-native species or weedy species, including but not limited to *Typha spp*, *Phragmites australis*, *Poa compressa*, *Poa pratensis*, *Lythrum salicariae*, *Salix Interior*, *Echinochloa crusgalli*, or *Phalens arundinacea*, unless otherwise indicated on the approved mitigation plan.
8. If the native mean C value, native FQI, and/or RIV have not increased from the previous year, necessary corrective actions might be indicated. It is in the permittee's best interest to take any necessary corrective measures early in the mitigation effort.
9. The above standards do not apply to aquatic communities. If aquatic or open water mitigation is to be evaluated, performance standards should be proposed by the applicant.

The Community Rating System

The materials in this chapter were taken from FEMA's *CRS Coordinator's Manual* and *CRS Credit for Outreach Projects*. More information on the CRS can be obtained from

Mike Knox
ISO/CRS Specialist

Background on the CRS

The National Flood Insurance Program (NFIP) provides federally backed flood insurance that encourages communities to enact and enforce floodplain regulations. Since its inception in 1968, the program has been very successful in helping flood victims get back on their feet. There are over 4 million policies in force. Since 1978, over 650,000 losses totaling more than \$8 billion have been paid.

To be covered by a flood insurance policy, a property must be in a community that participates in the NFIP. To qualify for the program, a community adopts and enforces a floodplain management ordinance to regulate development in flood hazard areas. The basic objective of the ordinance is to ensure that such development will not aggravate existing flooding conditions and that new buildings will be protected from flood damage. Today, over 19,000 communities participate in the NFIP.

The NFIP has been successful in requiring new buildings to be protected from damage by a 100-year flood. However, flood damage still results from floods greater than the 100-year flood and from flooding in unmapped areas. Under the Community Rating System (CRS), there is an incentive for communities to do more than just regulate construction of new buildings to minimum national standards. Under the CRS, flood insurance premiums are adjusted to reflect community activities that reduce flood damage to existing buildings, manage development in areas not mapped by the NFIP, protect new buildings beyond the minimum NFIP protection level, help insurance agents obtain flood data, and help people obtain flood insurance.

Objective

The objective of the CRS is to reward communities that are doing more than meeting the minimum NFIP requirements to help their citizens prevent or reduce flood losses. The CRS also provides an incentive for communities to initiate new flood protection activities. The goal of the CRS is to encourage, by the use of flood insurance premium adjustments, community and state activities beyond those required by the National Flood Insurance Program to:

- Reduce flood losses, i.e.,
 - protect public health and safety,
 - reduce damage to buildings and contents,
 - prevent increases in flood damage from new construction,

- reduce the risk of erosion damage, and
- protect natural and beneficial floodplain functions.

- Facilitate accurate insurance rating, and
- Promote the awareness of flood insurance.

Operation

There are 10 CRS classes: Class 1 requires the most credit points and gives the greatest premium reduction; Class 10 receives no premium reduction. A community that does not apply for the CRS, or does not obtain the minimum number of credit points, is a Class 10 community.

Community participation in the CRS is VOLUNTARY. Any community in full compliance with the rules and regulations of the NFIP may apply for a CRS classification better than Class 10. The applicant community submits the *CRS Application* along with documentation which shows that it is implementing the activities for which credit is requested. All CRS credit is verified according to the detailed discussion of the activities in the *Coordinator's Manual*.

The *Coordinator's Manual* identifies 18 creditable activities, organized under four categories labeled Sections 300 through 600: Public Information, Mapping and Regulations, Flood Damage Reduction, and Flood Preparedness. The *Coordinator's Manual* assigns credit points based upon the extent to which an activity advances the three goals of the CRS. Communities are invited to propose alternative approaches to these activities in their applications.

Some CRS activities may be implemented by the state or a regional agency rather than at the community level. For example, some states have disclosure laws that are creditable under Activity 340 (Flood Hazard Disclosure). Any community in those states will receive those credit points when it applies for CRS credit and demonstrates that the law is effectively implemented within its jurisdiction.

An application for a CRS classification may be submitted at any time. The community's activities and performance are reviewed during a verification visit. FEMA sets the credit to be granted and notifies the community, the state, insurance companies, and other appropriate parties. The classification is effective on either April 1 or October 1, whichever comes first after the community's program is verified.

Each year the community must recertify or reverify that it is continuing to perform the activities that are being credited by the CRS. Recertification is an annual activity that includes progress reports for certain activities. The reverification takes place every few years and is conducted in the form of another verification visit to the community.

If a community is not properly or fully implementing the credited activities, its credit points, and possibly its CRS classification, will be revised. A community may add credited activities each year in order to improve its CRS classification.

The day to day work with communities is conducted by the Insurance Services Office, Inc. (ISO), for FEMA. Communities are encouraged to call on their ISO/CRS Specialist for assistance at any time. A week-long CRS course for local officials is offered free at FEMA's Emergency Management Institute.

Community Responsibilities

Once it has submitted its *CRS Application*, a community must continue to implement its credited activities to keep its classification. Specifically, a community is responsible for:

- cooperating with the ISO/CRS Specialist and the verification procedures,
- recertifying each year that it is continuing to implement its activities,
- submitting the appropriate documents with its recertification,
- advising FEMA and its ISO/CRS Specialist of modifications in its activities,
- maintaining elevation certificates, other permit records, and old Flood Insurance Rate Maps (FIRMs) forever,
- maintaining other records of its activities for five years, or until the next verification visit, whichever comes sooner, and
- participating in the reverification process.

Costs and Benefits

Communities should prepare and implement those activities which best deal with their local problems, whether or not they are creditable under the CRS. Few, if any, of the CRS activities will produce premium reductions equal to or in excess of their implementation costs. In considering whether to undertake a new floodplain management activity, a community must consider all of the benefits the activity will provide (not just insurance premium reductions) in order to determine whether it is worth implementing.

Costs. No fee is charged for a community to apply for participation in the CRS. The only costs the community incurs are those of implementing creditable floodplain management activities and the staff time needed to prepare the *CRS Application*.

Benefits. It is important to note that reduced flood insurance rates are only one of the rewards a community receives from participating in the CRS. There are several other benefits.

1. The CRS floodplain management activities provide enhanced public safety, a reduction in damage to property and public infrastructure, avoidance of economic disruption and losses, reduction of human suffering, and protection of the environment.
2. A community can evaluate the effectiveness of its flood program against a nationally recognized benchmark.
3. Technical assistance in designing and implementing some activities is available at no charge.
4. A CRS community's flood program benefits from having an added incentive to maintain its flood programs over the years. The fact that the community's CRS status could be affected by the elimination of a flood-related activity or a weakening of the regulatory requirements for new development, should be taken into account by the governing board when considering

such actions. A similar system used in fire insurance rating has had a strong impact on the level of support local governments give to their fire protection programs.

5. Implementing some CRS activities, such as floodplain management planning, can help a community qualify for certain federal assistance programs.

CRS Activities

There are 18 activities organized under 4 series. The following list summarizes the activities and the average number of points that communities have received for them. Each 500 points brings a better CRS class and an additional 5% premium rate reduction.

Public Information Activities (Series 300)

310 (Elevation Certificates) Maintain FEMA elevation certificates for all new construction after the date of CRS application. This is a minimum requirement for any CRS credit. (72)

320 (Map Information) Respond to inquiries to identify a property's FIRM zone and publicize this service. (138)

330 (Outreach Projects) Send information about the flood hazard, flood insurance, and flood protection measures to floodprone residents or all residents of the community. (81)

340 (Hazard Disclosure) Real estate agents advise potential purchasers of floodprone property about the flood hazard; or regulations require a notice of the flood hazard. (24)

350 (Flood Protection Library) The public library maintains references on flood insurance and flood protection. (22)

360 (Flood Protection Assistance) Give inquiring property owners technical advice on how to protect their buildings from flooding and publicize this service. (57)

Mapping and Regulatory Activities (Series 400)

410 (Additional Flood Data) Develop new flood elevations, floodway delineations, wave heights, or other regulatory flood hazard data for an area that was not mapped in detail by the flood insurance study; or have the flood insurance study's hydrology or allowable floodway surcharge based on a higher state or local standard. (148)

420 (Open Space Preservation) Guarantee that a portion of currently vacant floodplain will be kept free from development. (206)

430 (Higher Regulatory Standards) Require freeboard; require soil tests or engineered foundations; require compensatory storage; zone the floodplain for minimum lot sizes of 1 acre or larger; regulate to protect sand dunes; or have regulations tailored to protect critical facilities or areas subject to special flood hazards (e.g., alluvial fans, ice jams, or subsidence). (159)

440 (Flood Data Maintenance) Keep flood and property data on computer records; use better base maps; or maintain elevation reference marks. (78)

450 (Stormwater Management) Regulate new development throughout the watershed to ensure that post-development runoff is no worse than pre-development runoff. (122)

Flood Damage Reduction Activities (Series 500)

510 (Floodplain Management Planning) Prepare, adopt, implement, and update a comprehensive flood hazard mitigation plan using a standard planning process. (34)

520 (Acquisition and Relocation) Acquire and/or relocate floodprone buildings so that they are out of the floodplain. (177)

530 (Retrofitting) Document floodproofed or elevated pre-FIRM buildings. (66)

540 (Drainage System Maintenance) Conduct periodic inspections of all channels and retention basins and remove debris as needed. (236)

Flood Preparedness Activities (Series 600)

610 (Flood Warning Program) Provide early flood warnings to the public and have a detailed flood response plan keyed to flood crest predictions. (99)

620 (Levee Safety) Maintain levees that are not credited with providing base flood protection. (153)

630 (Dam Safety) All communities in a state with an approved dam safety program receive credit. (59 points in Illinois)

ORDINANCE #

AN ORDINANCE AMENDING ORDINANCE NO.
558,
THE DEVELOPMENT CODE,

THIS ORDINANCE PROVIDES FOR THE
CONTROL OF STORMWATER DRAINAGE AND
DETENTION, SOIL EROSION AND SEDIMENT
CONTROL WITHIN IN THE
VILLAGE OF CASEYVILLE, ILLINOIS

Table of Contents

Chapter 1.0 - Authority and Purpose; Other Relevant Permitting; Applicability; Exemptions; Exceptions; Separability, and Responsibility:	4.
Section 1.0 - Authority and Purpose:	4.
Section 2.0 - Other Relevant Permitting:	5.
Section 3.0 - Applicability:	5.
Section 4.0 - Exemptions:	6.
Section 5.0 - Exceptions:	6.
Section 6.0 - Separability	7.
Section 7.0 - Responsibility:	7.
Chapter 2.0 - Definitions:	8.
Chapter 3.0 - Stormwater Drainage and Detention:	15.
Section 1.0 - Drainage Plan Submittal Requirements:	15.
Section 2.0 - Minimization of Increases in Runoff Volumes and Rates:	16.
Section 3.0 - Water Quality and Multiple Uses:	16.
Section 4.0 - Design Criteria, Standards, and Methods:	17.
Section 5.0 - Accommodating Flows From Upstream Tributary Areas:	23.
Section 6.0 - Early Completion of Detention Facilities:	24.
Section 7.0 - Fee in Lieu of Detention:	24.
Chapter 4.0 - Soil Erosion and Sediment Control:	25.
Section 1.0 - Findings:	25.
Section 2.0 - General Principles:	25.
Section 3.0 - Erosion and Sediment Control Plan Submittal Requirements:	27.
Section 4.0 - Design and Operation Standards and Requirements:	27.
Section 5.0 - Maintenance of Control Measures:	32.
Chapter 5.0 - Long Term Maintenance Responsibility:	33.
Section 1.0 - Long Term Maintenance Responsibility:	33.
Chapter 6.0 - Inspections:	34.
Section 1.0 - Inspections:	34.
Section 2.0 - Special Precautions:	34.
Section 3.0 - Admendment of Plans:	35.
Chapter 7.0 - Permitting:	36.
Section 1.0 - Application for Development Permit:	36.

Section 2.0 - Bond Required:	36.
Section 3.0 - Review and Approval:	36.
Section 4.0 - Expiration of Development Permit	37.
Section 5.0 - Appeals:	37.
Section 6.0 - Retention of Plans	38.
Chapter 8.0 - Enforcement:	39.
Section 1.0 - Stop-Work Order; Revocation of Development Permit:	39
Section 2.0 - Violations and Penalties	39.
Chapter 9.0 - Effective Date:	40.
Appendix A - Stormwater Drainage and Detention	41.
Appendix B - Erosion and Sediment Control	42.
Appendix C - Desirable Trees Native to Illinois	43.

Chapter 1.0 - Authority and Purpose; Other Relevant Permitting; Applicability; Exemptions; Exceptions; and Separability:

Section 1.0 - Authority and Purpose: This ordinance is enacted pursuant to the police powers granted to the Village of Caseyville, Illinois by the Illinois Compiled Statutes, 65 ILCS 5/1-2-1, 5/11-12-12, 5/11/30-2, and 5/11/31-2.

The purpose of this ordinance is to diminish threats to public health and safety, protect property, prevent damage to the environment and promote public welfare by guiding, regulating and controlling the design, construction, use and maintenance of any new development or redevelopment or other activity which disturbs or breaks the topsoil or otherwise results in the movement of earth and/or changes the stormwater drainage pattern and/or stormwater flows from that which would have occurred if the land had been left in its natural state. This stormwater runoff and resulting soil erosion could result in the inundation of damageable properties, the erosion and destabilization of downstream channels, and the pollution of valuable stream and lake resources. One cause of increases in stormwater runoff quantity or rate and impairment of quality, and loss of valuable topsoil is the new development or redevelopment of the land. This ordinance regulates these activities to minimize adverse impacts.

This ordinance is adopted to accomplish the following objectives:

- 1.) To assure that new development or redevelopment does not increase the drainage or flood hazards, or create unstable conditions susceptible to soil erosion;
- 2.) To protect new buildings and major improvements to buildings from flood damage due to increased stormwater runoff and soil erosion;
- 3.) To protect human life and health from the hazards of increased flooding and soil erosion on a watershed basis;
- 4.) To lessen the burden on the taxpayer for flood control projects, repairs to flood-damaged public facilities and utilities, correction of channel erosion problems, and flood rescue and relief operations caused by stormwater runoff and soil erosion quantities from new development or re-development;
- 5.) To protect, conserve, and promote the orderly development of land and soil, water, air, animal, and plant resources;
- 6.) To preserve the natural hydrologic and hydraulic functions of watercourses and flood plains and to protect water quality and aquatic habitats;

- 7.) To preserve the natural characteristics of stream corridors in order to manage flood and stormwater impacts, improve water and groundwater quality, reduce soil erosion, protect aquatic and riparian habitat, maintain quality forest resources, provide recreational opportunities, provide aesthetic benefits, enhance community and economic development.

Section 2.0 - Other Relevant Permitting: Before a Development Permit under this ordinance becomes effective, all required Federal, State, and Local permits will have been received for the site subject to new development or redevelopment. The acquisition of these permits shall be the sole responsibility of the applicant. These may include but are not limited to Section 404 of the Clean Waters Act, Section 106 of the National Historic Preservation Act, Section 10 of the Rivers and Harbors Act or permitting required by the Illinois Department of Natural Resources, Office of Water Resources in accordance with the Rivers, Lakes and Streams Act, 615 ILCS, the Soil and Water Conservation Districts Act, 70 ILCS, the Farmland Preservation Act, 505 ILCS the Illinois Groundwater Protection Act, 415 ILCS and the National Pollutant Discharge Elimination System Permit (NPDES) thru the Illinois Environmental Protection Agency, Division of Water Pollution Control. Compliance is also required with but not limited to the Development Code of the Village of Caseyville, Illinois.

Section 3.0 - Applicability: This ordinance shall apply to all new development or re-development in the Village of Caseyville, Illinois. Except as otherwise provided in this ordinance, no person, firm or corporation, public or private, the State of Illinois and its agencies or political subdivisions, the United States of America, and its agencies or political subdivisions, any agent, servant, officer or employee of any of the foregoing which meets the following provisions or is otherwise exempted in this ordinance, shall not commence any development activities without first having obtained a development permit from the Building and Zoning Administrator of the Village of Caseyville, Illinois.

3.1 - Any new development or re-development that will include an area that will meet or exceed ten thousand (10,000) square feet of total impervious surface (i.e., streets, roof, patio or parking area or any combination thereof); or

3.2 - Any land disturbing activity (i.e., clearing, grading, stripping, excavation, fill, or any combination thereof) that will affect an area that will meet or exceed of ten thousand (10,000) square feet or that will exceed 100 cubic yards; or

3.3 - Any land disturbing activity if the activity is within 25 feet of a river, lake, pond, stream, sinkhole, or wetland; and is done in conjunction with sections 3.1 or 3.2; or

3.4 - Any land disturbing activity on the sloping side of the slope disturbance line and is in conjunction with sections 3.1, 3.2, or 3.3; or

3.5 - Any tree cutting or mechanized land clearing where the tree, native to Southwestern Illinois, is in excess of eight (8) inches in diameter and is done in conjunction with Chapter 1.0, Sections 3.1, 3.2, 3.3 or 3.4.

Section 4.0 - Exemptions: A development permit shall not be required for the following:

- 1.) Any new development, re-development or other activity falling below the minimum standards as set forth in Chapter 1.0, Section 3.0.
- 2.) The agricultural use of land, including the implementation of conservation measures included in a farm conservation plan approved by the Soil and Water Conservation District, and including the construction of agricultural structures.
- 3.) The maintenance of any existing stormwater drainage/detention component or structure or any existing soil erosion/sediment control component or structure; including dredging, levee restoration, tree removal or other function which maintains the original design capacities of the above.
- 4.) The construction of, improvements to, or the maintenance of any street, road, highway or interstate highway performed by any unit of government whose powers grant such authority.

Section 5.0 - Exceptions: The Board of Appeals may, in accordance with the following procedures, authorize exceptions to any of the requirements and regulations set forth in this ordinance:

5.1 - Application for exception shall be made by a verified petition of the applicant for a development permit, stating fully the grounds of the petition and the facts relied upon by the applicant. Such petition shall be filed with the development permit application. In order for the petition to be granted, it shall be necessary that the Board of Appeals find all of the following facts with the respect to the land referred to in the petition:

1. That the land is of such shape or size or is affected by such physical conditions or is subject to such title limitations or record, that it is impossible or impractical for the applicant to comply with all of the requirements of this ordinance;
2. That the exception is necessary for the preservation and enjoyment of a substantial property right of the applicant; and
3. That the granting of the exception will not be detrimental to the public welfare, environment or injurious to other property in the vicinity of the subjects property.

5.2 - Each application for an exception shall be made to the Building and Zoning Administrator. The Administrator and the Village of Caseyville Engineer will review and transmit recommendations to the Board of Appeals, which shall review such recommendations prior to granting or denying the exception.

5.3 - The Board of Appeals shall hold a public hearing on each application for exception, within thirty (30) days after receiving the application, in the manner provided with respect to appeals. Within thirty (30) days after public hearing, the Board of Appeals shall either approve the site development permit application with the exceptions and conditions it deems necessary or it shall disapprove such development permit application and exception application or it shall take other such action as appropriate.

Section 6.0 - Separability: The provisions and sections of this ordinance shall be deemed to be separable, and the invalidity of any portion of this ordinance shall not affect the validity of the remainder.

Section 7.0 - Responsibility: The applicant shall not be relieved of responsibility for damage to persons or property otherwise imposed by law, and the Village of Caseyville, Illinois or its officers or agents will not be made liable for such damage, by (1) the issuance of a development permit under this ordinance, (2) compliance with the provisions of that development permit or conditions attached to it by the Building and Zoning Administrator, (3) failure of Village of Caseyville Officials to observe or recognize hazardous or unsightly conditions, (4) failure of Village of Caseyville Officials to recommend denial or to deny a development permit, or (5) exemptions from development permit requirements of this ordinance.

Chapter 2.0 - Definitions:

Section 2.0 - Definitions: For the purposes of this ordinance certain terms are defined and set forth below:

2.1 - Adverse Impacts: Any negative impact on plant, soil, air or water resources affecting their beneficial uses including recreation, aesthetics, aquatic habitat, quality, and quantity.

2.2 - Applicant: Any person, firm, or governmental agency who executes the necessary forms to procure official approval of a development or permit to carry out construction of a new development or re-development from the Village of Caseyville, Illinois.

2.3 - Base Flood Elevation: The elevation at all locations delineating the level of flooding resulting from the 100-year frequency flood event, which has a one (1) percent chance of occurring in any given year.

2.4 - Building Permit: A permit issued by the Village of Caseyville, Illinois for the construction, erection or alteration of a structure or building and the related ground and surface preparation prior to and after completion of construction, erection or alteration of a structure or building.

2.5 - Bypass Flows: Stormwater runoff from upstream properties tributary to a property's drainage system but not under its control.

2.6 - Certify or Certification: Formally attesting that the specific inspections and tests were performed, and that such inspections and tests comply with the applicable requirements of this ordinance.

2.7 - Channel: Any defined river, stream, creek, brook, branch, natural or artificial depression, ponded area, on-stream lake or impoundment, karst area (sinkhole), flowage, slough, ditch, conduit, culvert, gully, ravine, wash, or natural or manmade drainageway, which has a definite bed and bank or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.

2.8 - Channel Modification: Alteration of a channel by changing the physical dimensions or materials of its bed or banks. Channel modification includes damming, riprapping (or other armoring), filling, widening, deepening, straightening, relocating, lining, and significant removal of bottom or woody rooted vegetation. Channel modification does not include the man-made clearing of debris or removal of trash.

2.9 - Clearing: Any activity which removes the natural vegetative ground cover.

2.10 - Compensatory Storage: An artificially excavated, hydraulically equivalent volume of storage within the floodplain used to balance the loss of natural flood storage capacity when fill or structure are placed within the floodplain.

2.11 - Conduit: Any channel, pipe, sewer or culvert used for the conveyance or movement of water, whether open or closed.

2.12 - Cubic Yard: A one (1) yard by one (1) yard by one (1) yard amount of material in excavation and/or fill.

2.13 - Detention Basin: A facility constructed or modified to provide for the temporary storage of stormwater runoff and the controlled release by gravity of this runoff at a prescribed rate during and after a flood or storm.

2.14 - Detention Time: The amount of time stormwater is held within a detention basin.

2.15 - Development: Any manmade change to real estate or property, including:

- 1.) The division or subdivision of any duly recorded parcel of property;
- 2.) Construction, reconstruction or placement of a building or any addition to a building;
- 3.) Installation of a manufactured home on a site, preparing a site for a manufactured home, or installing a travel trailer on a site for more than 180 days per year;
- 4.) Construction of roads, bridges, or similar projects;
- 5.) Redevelopment of a site;
- 6.) Filling, dredging, grading, clearing, excavating, paving or other non-agricultural alterations of a ground surface;
- 7.) Storage of materials or deposit of solid or liquid waste;
- 8.) Any other activity that might alter the magnitude, frequency, direction, or velocity of stormwater flows from a property.

2.16 - Drainage Plan: A plan, including engineering drawings and supporting calculations, which describes the existing stormwater drainage system and environmental features, including grading, as well as proposed alterations or changes to the drainage system and environment of a property.

2.17 - Dry Basin: A detention basin designed to drain after temporary storage of stormwater flows and to normally be dry over much of its bottom area.

2.18 - Erosion: The general process whereby soil or earth is moved by rainfall, flowing water, wind or wave action.

2.19 - Excavation: Any act by which organic matter, earth, sand, gravel, rock or any other similar material, is cut into, dug, quarried, uncovered, removed, displaced, re-located or bulldozed and shall include the conditions resulting from such actions.

2.20 - Excess Stormwater Runoff: The volume and rate of flow of stormwater discharged from a new development or re-development which is or will be in excess of that volume and rate which existed before development or re-development.

2.21 - Existing Grade: The vertical location of the existing ground surface prior to excavation or filling.

2.22 - Fill: Any act by which earth, sand, gravel, rock, or any other material, is deposited, placed, replaced, pushed, dumped, pulled, transported or moved by man to a new location and shall include the conditions resulting therefrom.

2.23 - Final Grade: The vertical location of the ground surface after grading work is completed in accordance with the engineering plans.

2.24 - Flood Fringe: That area as designated by the Federal Emergency Management Agency (FEMA) on either side of the floodway. This area is subject to inundation from the base flood but conveys little or no flow.

2.25 - Flood Hazard Boundary Map (FHBM): A very generalized map prepared by the Federal Emergency Management Agency (FEMA) which shows only where floodplains are located based on very basic data. FHBM's do not include base flood elevations.

2.26 - Flood Insurance Rate Map (FIRM): A map prepared by the Federal Emergency Management Agency (FEMA) that depicts the special flood hazard area (SFHA) within a community. This map includes insurance rate zones and regulatory floodplains and may or may not depict regulatory floodways.

2.27 - Floodplain: That land adjacent to a body of water with ground surface elevations at or below the base flood or the 100-year frequency flood elevation which is subject to inundation. The floodplain as designated by the Federal Emergency Management Agency (FEMA) is also known as the Special Flood Hazard Area (SFHA). This area is the collective combination of the regulatory floodway and the flood fringe.

2.28 - Floodway: The channel and that portion of the floodplain, including on-stream lakes, adjacent to a stream or watercourse which is needed to store and convey the anticipated existing and future 100-year frequency flood discharge with no more than a 0.1 foot increase in

stage due to any loss of flood conveyance or storage and no more than a ten percent (10%) increase in velocities.

2.29 - Grading: The excavation or fill or any combination thereof and shall include the conditions resulting from any excavation or fill.

2.30 - Hydrograph: A graph showing for a given location on a stream or conduit, the flow rate with respect to time.

2.31 - Hydrograph Method: This method estimates runoff volume and runoff hydrographs for the point of interest by generating hydrographs for individual subareas, combining them, and routing them through stream lengths and reservoir structures. Factors such as rainfall amount and distribution, runoff curve number, time of concentration, and travel time are included.

2.32 - Impervious Surface: That area of property that is covered by materials other than soil and vegetation and that has no intended capacity to absorb stormwater, such as parking lots, driveways, sidewalks, patios, tennis courts, roofs and other structures.

2.33 - Infiltration: The passage or movement of water into the soil surfaces.

2.34 - Loessal Soil: A sediment, commonly non-stratified and un-consolidated, composed predominately of silt sized particles with accessory clay and sand.

2.35 - Lot: An individual platted parcel in an approved subdivision.

2.36 - Major Drainage System: That portion of a drainage system needed to store and convey flows beyond the capacity of the minor drainage system.

2.37 - Minor Drainage System: That portion of a drainage system designed for the convenience of the public. It consists of street gutters, storm sewers, small open channels, and swales and, where manmade, is to be designed to handle the 10-year runoff event.

2.38 - Mitigation: Mitigation is when the prescribed controls are not sufficient and additional measures are required to offset the development, including those measures necessary to minimize the negative effects which stormwater drainage and development activities might have on the public health, safety and welfare. Examples of mitigation include, but are not limited to compensatory storage, soil erosion and sedimentation control, and channel restoration.

2.39 - Modified Rational Method: As described in the Illinois Department of Transportation "Drainage Manual" is based on the principal that the maximum rate of runoff from a given drainage area occurs at that point in time when all parts of the watershed are contributing to the flow. The rainfall generating the peak flow is assumed to be of uniform intensity for the entire watershed with a rainfall duration equal to the time of concentration.

2.40 - Natural: Conditions resulting from physical, chemical, and biological processes without intervention by man.

2.41 - Natural Drainage: Channels formed in the existing surface topography of the earth prior to changes made by unnatural causes.

2.42 - One Hundred-Year Event: A rainfall, runoff, or flood event having a one percent chance of occurring in any given year. A 24 hour storm duration is assumed unless otherwise noted.

2.43 - Parcel: All contiguous land in one ownership.

2.44 - Peak Flow: The maximum rate of flow of water at a given point in a channel or conduit.

2.45 - Permittee: Any person to whom a building permit is issued.

2.46 - Person: Any individual, firm or corporation, public or private, the State of Illinois and its agencies or political subdivisions, the United States of America, and its agencies or political subdivisions, and any agent, servant, officer or employee of any of the foregoing.

2.47 - Positive Drainage: Provision for overland paths for all areas of a property including depressional areas that may also be drained by storm sewer.

2.48 - Prime Farmland: Prime farmland is land that is best suited to food, feed, forage, fiber and oilseed crops. It may be cropland, pasture, woodland, or other land, but it is not urban and built up land or water areas. It is either used for food or fiber or is available for those uses. The soil qualities, growing season and moisture supply are those needed for a well managed soil to economically produce a sustained high yield of crops. Prime farmland produces the highest yields with minimum inputs of energy and economic resources, and farming it results in the least damage to the environment.

2.49 - Property: A parcel of real estate.

2.50 - Retention Basin: A facility designed to completely retain a specified amount of stormwater runoff without release except by means of evaporation, infiltration, emergency bypass or pumping.

2.51 - Sedimentation: The process that deposits soils, debris, and other materials either on other ground surfaces or in bodies of water or stormwater drainage systems.

2.52 - Site: A parcel of land, or a contiguous combination thereof, where grading work is performed as a single unified operation.

2.53 - Sinkhole, (Karst Areas): A Sinkhole or Karst topography is a land surface depression or blind valley which may or may not have surface openings to cavernous

underground areas and are the result of water movement through silts and jointed limestone. These conditions make such areas unstable and susceptible to subsidence and surface collapse. Fractures in the limestone may channel runoff water to public or private water supplies, making those sources especially susceptible to groundwater contamination.

2.54 - Slope Disturbance Line: The line which delineates relatively level building areas from areas where slopes exceed 8 percent (8%) and where special precautions must be taken.

2.55 - Stormwater Drainage System: All means, natural and manmade, used for conducting stormwater to, through or from a drainage area to the point of final outlet from a property. The stormwater drainage system includes but is not limited to any of the following: conduits and appurtenance features, canals, channels, ditches, streams, culverts, streets, storm sewers, detention basins, swales and pumping stations.

2.56 - Stormwater Runoff: The waters derived from melting snow or rain falling within a tributary drainage basin which are in excess of the infiltration capacity of the soils of that basin, which flow over the surface of the ground or are collected in channels or conduits.

2.57 - Storm Sewer: A closed conduit for conveying collected stormwater.

2.58 - Stream: Any river, creek, brook, branch, flowage, ravine, or natural or man-made drainageway which has a definite bed and banks or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.

2.59 - Stripping: Any activity which removes the vegetative surface cover including tree removal, by spraying or clearing, and storage or removal of top soil.

2.60 - Ten-Year Event: A runoff, rainfall, or flood event having a ten percent (10%) chance of occurring in any given year. A 24 hour storm duration is assumed unless otherwise note.

2.61 - Time of Concentration: The elapsed time for stormwater to flow from the most hydraulically remote point in a drainage basin to a particular point of interest in that watershed.

2.62 - Tributary Watershed: All of the land surface area that contributes runoff to a given point.

2.63 - Two-Year Event: a runoff, rainfall, or flood event having a fifty percent (50%) chance of occurring in any given year. A 24 hour storm duration is assumed unless otherwise noted.

2.64 - Vacant: Land on which there are no structures or only structures which are secondary to the use or maintenance of the land itself.

2.65 - Watershed: All land area drained by, or contributing water to, the same stream, creek, ditch, lake, marsh, stormwater facility, groundwater or depressional area.

2.66 - Wet Basin: A detention basin designed to maintain a permanent pool of water after the temporary storage of stormwater runoff.

2.67 - Wetlands: Wetlands are defined by regulation as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." For general, but not inclusive locations of designated wetlands refer to mapping prepared jointly by the U.S. Department of Interior, Fish and Wildlife Service and the Illinois Department of Natural Resources, Office of Resource Conservation; National Wetlands Inventory Mapping, 1987. The applicant may be required to provide a field investigation by a qualified wetland delineator.

Chapter 3.0 - Stormwater Drainage and Detention:

Section 1.0 - Drainage Plan Submittal Requirements: Each applicant shall submit the following information, to ensure that the provisions of this ordinance are met. The submittal shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts and benefits of the development on water resources both on-site and off-site, and the effectiveness of the proposed drainage plan in managing stormwater runoff, and meet the provisions of Chapter 1.0, Section 2.0. The applicant shall certify on the drawings that all clearing, grading, drainage, and construction shall be accomplished in strict conformance with the drainage plan. The following information shall be submitted for both existing and proposed property conditions for all new developments or re-developments that meet or exceed the minimum requirements of Chapter 1.0, Section 3.0.

1.1 - Drainage Plan Requirements: A topographic survey of the property at two-foot (2) contours unless otherwise specified or approved by Village of Caseyville, Engineer. The plan map shall be keyed to a consistent datum specified by the Village of Caseyville, Illinois. If the mapping is compiled using a digital format and the Global Positioning System (GPS), the applicant will provide both paper and digital copies including GPS points.

1.1.1 - Mapping and Descriptions: An existing drainage and proposed drainage plan for the property and one hundred (100) feet surrounding the property at a scale of not more than one hundred (100) feet to one (1) inch, and including the following:

- 1.) property boundary, dimensions, and approximate acreage;
- 2.) building setback lines;
- 3.) all existing and proposed structures and sizes;
- 4.) square feet of existing and proposed impervious surface;
- 6.) all existing, or proposed easements;
- 7.) all existing, abandoned, or proposed water or monitoring well head locations;
- 8.) all sanitary or combined sewer lines and septic systems;
- 9.) the banks and centerline of streams and channels;
- 10.) shoreline of lakes, ponds, and detention basins with normal water level elevation;
- 11.) farm drains and tiles;
- 12.) soils classifications;
- 13.) location, size and slope of stormwater conduits and drainage swales;
- 14.) depressional storage areas;
- 15.) detention facilities;
- 16.) roads, streets and associated stormwater inlets including finished grades;
- 17.) base flood elevation, flood fringe, and regulatory floodway;
- 18.) basis of design for the final drainage network components.
- 19.) a statement giving any applicable engineering assumptions and calculations;

- 20.) a vicinity map showing the relationship of the site to its general surroundings at a scale of not less than two thousand (2,000) feet to one (1) inch (1:24,000)
- 21.) title, scale, north arrow, legend, seal of Licensed Professional Engineer, date, and name of person preparing plans.
- 22.) cross-section data for open channel flow paths and designated overland flow paths;
- 23.) direction of storm flows;
- 24.) flow rates and velocities at critical points in the drainage system;
- 25.) a statement by the design engineer of the drainage system's provision for handling events greater than the 100-year, 24 hour runoff; and
- 26.) a statement of certification of all drainage plans, calculations, and supporting data by a Licensed Professional Engineer.

1.1.2 - Environmental Features: A depiction of environmental features of the property and immediate vicinity including the following:

- 1.) the limits of designated regulatory and non-regulatory wetland areas;
- 2.) the location and limits of sinkholes (karst areas);
- 3.) the location of trees greater than eight (8) inches in diameter
- 4.) any designated natural areas, prime farmland; and
- 5.) any proposed environmental mitigation features.

Section 2.0 - Minimization of Increases in Runoff Volumes and Rates: In the selection of a drainage plan for a new development or re-development, the applicant shall evaluate and implement site design features which minimize the increase in runoff volumes and rates from the site. The applicant's drainage plan submittal shall include evaluations of site design features which are consistent with the following hierarchy:

- 1.) Preservation of regulatory floodplains, flood prone and wetland areas;
- 2.) Minimize impervious surfaces on the property, consistent with the needs of the project;
- 3.) Attenuate flows by use of open vegetated swales and natural depressions and preserves the existing natural stream channel.
- 4.) Infiltration of runoff on-site
- 5.) Provide stormwater retention structures;
- 6.) Provide wet or wetland detention structures;
- 7.) Provide dry detention structures; and
- 8.) Construct storm sewers.

Section 3.0 - Water Quality and Multiple Uses: The drainage system should be designed to minimize adverse surface and groundwater quality impacts off-site and on the property itself. Detention basins shall incorporate design features to capture stormwater runoff pollutants. In particular, designers shall give preference to wet bottom and wetland type designs and all flows from the development shall be routed through the basin (i.e. low flows shall not be bypassed).

Detention of stormwater shall be promoted throughout the property's drainage system to reduce the volume of stormwater runoff and to reduce the quantity of runoff pollutants.

The drainage system should incorporate multiple uses where practicable. Uses considered compatible with stormwater management include open space, aesthetics, aquatic habitat, recreation (boating, fishing, trails, playing fields), wetlands and water quality mitigation.

Section 4.0 - Design Criteria, Standards, and Methods:

4.1 - Release Rates: The drainage system for new developments or re-developments shall be designed to control the peak rate of discharge from the property for the two year, 24-hour and 100-year, 24 hour events to levels which will not cause an increase in flooding or channel instability downstream when considered in aggregate with other developed properties and downstream drainage capacities. For new developments or re-developments meeting the provisions of Section Section 3.0 the Modified Rational Method of design as specified in the Illinois Department of Transportation (IDOT) "Drainage Manual" will be used to calculate release rates. The peak discharge rate from events less than or equal to the 2 year, 24 hour event and the peak discharge rate for the 100-year, 24 hour event shall be determined by the Village of Caseyville, Engineer.

4.1.1 - Detention Basin Outlet Design: Backwater on the outlet structure from the downstream drainage system shall be addressed when designing the outlet.

4.2 - Detention Storage Requirements: The design maximum storage to be provided in the detention basin shall be based on the runoff from the runoff difference before and after development from the 100-year, 24-hour event. All detention basin storage shall be computed using Hydrograph Methods utilizing reservoir routing (also called modified puls or level pool) or equivalent method.

4.3 - Drainage System Design and Evaluation: The following criteria should be used in evaluating and designing the drainage system. The design will provide capacity to pass the 2-year, 24 hour peak flow in the minor drainage system and an overload flow path for flows in excess of the design capacity. Whenever practicable, the stormwater systems shall not result in the interbasin transfer of drainage unless no other alternative exists.

4.3.1 - Design Methodologies: Major and minor conveyance systems as well as detention basins shall be designed as specified in Section 4.1.

4.3.2 - Positive Drainage: Whenever practicable, all developments must be provided an overland flow path that will pass the 100-year, 24 hour flow at a stage at least one (1) foot below the lowest foundation grade in the vicinity of the flow path. Overland flow paths designed to handle flows in excess of the minor drainage system capacity shall be provided drainage easements. Street ponding and flow depths shall not exceed curb heights.

4.4 - Rainfall: Unless a continuous simulation approach to drainage system hydrology is used, all design rainfall events shall be based on the Illinois State Water Survey's Bulletin 70.

The first quartile point rainfall distribution shall be used for the design and analysis of conveyance systems with critical durations less than or equal to 12 hours. The third quartile point rainfall distribution shall be used for the design and analysis of detention basins and conveyance system with critical durations greater than 12 and less than or equal to 24 hours. The fourth quartile distribution shall be used in the design and analysis of systems with durations greater than 24 hours. The first, third, and fourth quartile distributions described by Huff are presented in Table 37 of Bulletin 70. Refer to Table 13 of Bulletin 70 for rainfall depth, duration, and frequency. The NRCS Type II distribution may be used as an alternate to the Huff distributions.

4.5 - Antecedent Moisture: Computations of runoff hydrographs which do not rely on a continuous accounting of antecedent moisture conditions shall use wet antecedent moisture condition as a minimum.

4.6 - Wet Detention Basin Design: Wet detention basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing, and as much as feasible to be available for recreational use.

4.6.1 - Wet Basin Depths: Wet basins shall be at least three feet deep, excluding near-shore banks and safety ledges. If fish habitat is to be provided they shall be at least eight (8) feet deep over twenty-five (25%) percent of the bottom area to prevent winterkill.

4.6.2 - Wet Basin Shoreline Slopes: The side slopes of wet basins at the normal pool elevation shall not be steeper than three to one (3 to 1 horizontal to vertical). It is recommended that aquatic vegetation be established around the perimeter to provide protection from shoreline erosion.

4.6.3 - Permanent Pool Volume: The permanent pool volume in a wet basin at normal depth shall be equal to the runoff volume from its watershed for the 2-year, 24 hour event as a minimum.

4.6.4 - Wet Basin Inlet and Outlet Orientation: The distance between detention inlets and outlets shall be maximized. Inlets and outlets shall be at opposite ends of the basin providing that the orientation does not create undue hardship based on topography or other natural constraints. Designers are encouraged to use baffles or berms in the basin bottom to prevent short circuiting. There shall be no low flow bypass between the inlet and outlet. Paved low flow channels shall not be used. The minimum flow length shall be ten (10) feet with a recommended minimum ratio of two to one (2:1) for width.

4.7 - Dry Detention Basin Design: In addition to the other requirements of this ordinance, dry basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing and as much as feasible to be available for multiple uses.

4.7.1 - Dry Basin Drainage: Dry basins shall be designed so that eighty percent (80%) of their bottom area shall have standing water no longer than seventy-two (72) hours for any runoff event less than the 100-year, 24 hour event. Grading plans shall clearly distinguish the

wet portion of the basin bottom. Underdrains directed to the outlet may be used to accomplish this requirement.

4.7.2 - Velocity Dissipation: Velocity dissipation measures shall be incorporated into dry basin designs to minimize erosion at inlets and outlets and to minimize resuspension of pollutants.

4.7.3 - Dry Basin Inlet and Outlet Orientation: Shall be the same as Chapter 3.0, Section 4.6.4

4.7.4 - Temporary Stilling / Sedimentation Basin: A stilling / sedimentation basin shall be constructed at each major inlet to a dry basin during construction. The volume of the basin shall be a minimum of 500 ft.³ per acre of impervious surface in the drainage area. Side slopes shall be no steeper than three (3) feet to one (1) foot and basin depths shall be minimum of three (3) feet to minimize resuspension.

4.8 - Existing Depressional Areas: Existing depressional storage volume will be maintained and the volume of detention storage provided to meet the requirements of this ordinance shall be in addition to existing storage.

4.9 - Minimum Detention Outlet Size: Where a single pipe outlet or orifice plate is to be used to control discharge, it shall have a minimum diameter of twelve (12) inches. If this minimum orifice size permits release rates greater than those specified in this section, and regional detention is not a practical alternative, outlets, structures such as perforated risers, or flow control orifices shall be used.

4.10 - Detention in Flood Plains: The placement of detention basins within the flood plain is strongly discouraged because of questions about their reliable operation during flood events. However, the stormwater detention requirements of this ordinance may be fulfilled by providing detention storage within flood fringe areas on the project site provided the following provisions are met as well as compliance with Chapter 1.0, Section 2.0.

4.10.1 - Detention in Flood Fringe Areas: The placement of a detention basin in a flood fringe area shall require compensatory storage for 1.5 times the volume below the base flood elevation occupied by the detention basin including any berms. The release from the detention storage provided shall still be controlled consistent with the requirements of this section. The applicant shall demonstrate its operation for all stream-flow and flood plain backwater conditions. Excavations for compensatory storage along watercourses shall be opposite or adjacent to the area occupied by detention. All flood plain storage lost below the existing ten-year flood elevation shall be replaced below the existing ten-year elevation. All flood plain storage lost above the existing ten-year flood elevation shall be replaced above the existing ten-year flood elevation. All compensatory storage excavations shall be constructed to drain freely and openly to the watercourse and comply with Chapter 1.0, Section 2.0.

4.10.2 - Detention on Prime Farmland: The placement of detention basins shall avoid the utilization of prime farmland. All detention basin construction shall examine potential

impacts to adjacent agricultural land and shall address measures that will be implemented to eliminate such impacts and comply with Chapter 1.0, Section 2.0.

4.10.3 - Detention in Floodways: Detention basins shall be placed in the floodway only in accordance with Chapter 3.0, Section 4.10

4.10.4 - On-Stream Detention: On-stream detention basins are discouraged but allowable if they provide regional public benefits and if they meet the other provisions of this ordinance with respect to water quality and control of the two-year and 100-year, 24-hour events from the property. Further criteria are presented in Chapter 3.0, Section 5.0 of this ordinance. If on-stream detention is used in watersheds larger than one square mile, the applicant will use hydrographic modeling to demonstrate that the design will not increase the water level for any properties upstream or downstream of the property. Also, impoundment of the stream as part of on-stream detention:

- 1.) shall not prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, such as for spawning,
- 2.) shall not cause or contribute to the degradation of water quality or stream aquatic habitat,
- 3.) shall include a design calling for gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin,
- 4.) shall not involve any stream channelization or the filling of wetlands,
- 5.) shall require the implementation of an effective non-point source management program throughout the upstream watershed which shall include as a minimum: runoff reduction "Best Management Practices" (BMP's) consistent with Chapter 3.0, Section 2.0; 2 year, 24 hour detention / sedimentation basins for all development consistent with Chapter 3.0, Section 4.10.4.
- 6.) shall not occur downstream of a wastewater discharge, and
- 7.) shall not contribute to the duration or flood frequency of any adjacent land.
- 8.) shall comply with Chapter 1.0, Section 2.0.

4.11 - Drainage Into Wetlands, Rivers, Streams, Lakes, Ponds, and Depressional Storage Areas: Wetlands, lakes, ponds and depressional storage areas shall be protected from damaging modifications and adverse changes in runoff quality and quantity associated with land developments. In addition to the other requirements of this ordinance, the following requirements shall be met for all developments whose drainage flows into wetlands, rivers, lakes, ponds or depressional storage areas:

4.11.1 -Detention in Wetlands, Rivers, Streams, Lakes, Ponds or Depressional Storage Areas: Existing wetlands, rivers, lakes, ponds or depressional storage areas shall not be modified for the purposes of stormwater detention unless it is demonstrated that the proposed modifications will maintain or improve its habitat and ability to perform beneficial functions and shall comply with Chapter 1.0, Section 2.0. Existing storage and release rate characteristics of wetlands, rivers, lakes, ponds or depressional storage areas shall be

maintained and the volume of detention storage provided to meet the requirements of this section shall be in addition to this existing storage.

4.11.2 - Sediment Control: The existing wetlands, rivers, lakes, ponds, or depressional storage areas shall be protected during construction and as further regulated in Chapter 4.0 of this ordinance, and shall not be filled.

4.11.3 - Alteration of Drainage Patterns: Site drainage patterns shall not be altered to substantially decrease or increase the existing area tributary to the wetlands, rivers, lakes, ponds or depressional storage areas.

4.11.4 - Detention/Sedimentation: All runoff from the development shall be routed through a preliminary detention/sedimentation basin designed to capture the two-year, 24-hour event and hold it for at least 24 hours, before being discharged to the wetland, river, lake, pond, or depressional storage area. This basin shall be constructed before property grading begins and shall be maintained throughout the construction process. In addition, the drainage hierarchy defined in Chapter 3.0, Section 1.0 should be followed to minimize runoff volumes and rates being discharged to the wetland, river, stream, lake, pond, or depressional storage area and as further regulated in Chapter 2.0 and Chapter 4.0 of this ordinance.

4.11.5 - Vegetated Buffer Strip: A buffer strip of at least 25 feet in width, preferably vegetated with native plant species, shall be maintained or restored around the periphery of a wetland, river, stream, lake, pond or depressional storage area.

4.11.6 - Loessal Soils: Care must be taken to avoid open flow discharges of stormwater over silt (loessal) soils due to high potential for erosion.

4.11.7 - Sinkholes, Karst Area: The following requirements apply for new developments or re-developments where sinkholes are determined to be present:

1. A stormwater detention basin shall not be placed in or over a sinkhole.
2. Stormwater detention basins shall not be located closer than one hundred (100) feet from the rim of a sinkhole
3. The outflow from a stormwater detention basin, channel, ditch or any stormwater runoff generated as a result of a new development or redevelopment shall not empty into or be directed, redirected by any means into or through any sinkhole.
4. If, after the review of the stormwater drainage plan, the City/Village/County Engineer may determine that more detailed information is required, a sinkhole evaluation may be required. A sinkhole evaluation which addresses the geologic, engineering and environmental factors resulting from a new development or redevelopment be performed by a professional with experience and expertise in karst topography, whom shall certify the results of the evaluation. This evaluation shall be the responsibility of the applicant and performed at no cost to the Village of Caseyville, Illinois. After a

review of this evaluation and with the consultation of the County Soil and Water Conservation District, the Village of Caseyville, Engineer may either approve or disapprove the drainage plan as submitted.

5. Whenever a new sinkhole appears or it becomes apparent that the sinkhole has not yet been identified, it shall be reported to the County Soil and Water Conservation District.
6. Shall comply with Chapter 1.0, Section 2.0

4.12 - Street Detention, Parking Lot Detention, and Culvert Drainage:

4.12.1 - Street Detention: If streets are to be used as part of the minor or major drainage system, ponding depths shall not exceed curb heights and shall not remain flooded for more than eight (8) hours for any event less than or equal to the 100-year, 24 hour event.

4.12.2 - Parking Lot Detention: The maximum stormwater ponding depth in any parking area shall not exceed six (6) inches for more than four (4) hours.

4.12.3 - Culvert, Road and Driveway Crossings: Sizing of culvert crossings shall consider entrance and exit losses as well as tailwater conditions on the culvert.

4.13 - Infiltration Practices: To effectively reduce runoff volumes, infiltration practices including basins, trenches, and porous pavement should be located in hydrologic soil groups "A" and "B" as designated by the U.S.D.A. Natural Resources Conservation Service. Infiltration basins and trenches designed to re-charge groundwater shall not be located within seventy-five (75) feet of a water supply well or building foundation and comply with Chapter 1.0, Section 2.0. A sediment settling basin shall be provided to remove coarse sediment from stormwater flows before they reach infiltration basins or trenches. Stormwater shall not be allowed to stand more than seventy-two hours over eighty percent of the dry basin's bottom area for the maximum design event to be ex-filtrated. The bottom of infiltration basins or trenches shall be a minimum of four feet above the seasonally high groundwater and bedrock level. Engineering calculations demonstrating infiltration rates shall be included with the application.

4.13.1 - Vegetated Filter Strips and Swales: To effectively filter stormwater pollutants and promote infiltration of runoff, sites should be designed to maximize the use of vegetated filter strips and swales. Whenever practicable, runoff from impervious surfaces should be directed onto filter trips and swales comprised of native grasses and forbs before being routed to a storm sewer or detention basin.

4.14 - Safety Considerations: The drainage system components, especially all detention basins, shall be designed to protect the safety of any children or adults coming in contact with the system during runoff events and shall comply with Chapter 1.0, Section 2.0.

4.14.1 - Side Slopes: The side slopes of all detention basins at 100-year, 24 hour capacity shall be as level as practicable to prevent accidental falls into the basin and for stability and ease of maintenance. Side slopes of detention basins and open channels shall not be steeper than three (3) to one (1) (horizontal to vertical).

4.14.2 - Safety Ledge: All wet detention basins shall have a level safety ledge at least four feet in width 2.5 to 3 feet below the normal water depth.

4.14.3 - Velocity: Velocities throughout the surface drainage system shall be controlled to safe levels taking into consideration rates and depths of flow.

4.14.4 - Overflow Structures: All stormwater detention basins shall be provided with an overflow structure capable of safely passing excess flows at a stage at least one foot below the lowest foundation grade in the vicinity of the detention basin. The design flow rate of the overflow structure shall be equivalent to the 100-year, 24 hour inflow rate.

4.15 - Maintenance Considerations: The stormwater drainage system shall be designed to minimize and facilitate maintenance. Turfed side slopes shall be designed to allow lawnmowing equipment to easily negotiate them. Wet basins shall be provided with alternate outflows which can be used to completely drain the pool for sediment removal. Pumping may be considered if drainage by gravity is not feasible. Pre-sedimentation basins shall be included, where feasible, for localizing sediment deposition and removal. Site access for heavy equipment shall be provided.

Section 5.0 - Accommodating Flows From Upstream Tributary Areas: Stormwater runoff from areas tributary to the property shall be considered in the design of the property's drainage system. Whenever practicable, flows from upstream areas that are not to be detained should be routed around the basin being provided for the site being developed.

5.1 - Upstream Areas Not meeting Ordinance Requirements: When there are areas not meeting the storage and release rates of this ordinance, tributary to the applicant's property, regionalized detention on the applicant's property shall be explored by the applicant. The following steps shall be followed:

- 1.) The applicant shall compute the storage volume needed for his property using the release rates of Chapter 3.0, Section 4.0, the applicant's property area, and the procedures described in Chapter 3.0, Section 3.0.
- 2.) Areas tributary to the applicant's property, not meeting the storage and release rate requirements of this ordinance, shall be identified.
- 3.) Using the areas determined above plus the applicant's property area, total storage needed for the combined properties shall be computed.

Allowable release rates shall be computed using the combined property areas. Storage shall be computed as described in Chapter 3.0, Section 4.0. If tributary areas are not developed, a reasonable fully developed land cover, based on local zoning, shall be used for the purposes of computing storage.

Once the necessary combined storage is computed the Village of Caseyville, Illinois may choose to pay for over-sizing the applicant's detention basin to accommodate the regional

flows. The applicant's responsibility will be limited to the storage for his property as computed above. If regional storage is selected by the Village of Caseyville, Illinois, then the design produced in Chapter 3.0, Section 3.0 shall be implemented. If regional storage is rejected by the Village of Caseyville, Illinois, the applicant shall bypass all tributary area flows around the applicant's basin whenever practicable. If the applicant must route upstream flows through his basin and the upstream areas exceed one-square mile in size, the applicant must meet the provision of Section 4.8.3 for on-stream basins.

5.2 - Upstream Areas Meeting Ordinance Requirements: When there are areas which meet the storage and release rate requirements of this ordinance, tributary to the applicant's property, the upstream flows shall be bypassed around the applicant's detention basin if this is the only practicable alternative. Storage needed for the applicant's property shall be computed as described in Chapter 3.0, Section 5.1. However, if the Village of Caseyville, Illinois decides to route tributary area flows through an applicant's basin, the final design stormwater releases shall be based on the combined total of the applicant's property plus tributary areas. It must be shown that at no time will the runoff rate from the applicant's property exceed the allowable release rate for his/her property alone.

Section 6.0 - Early Completion of Detention Facilities: Where detention, retention, or depressional storage areas are to be used as part of the drainage system for a property, they shall be constructed as the first element of the initial earthwork program. Any eroded sediment captured in these facilities shall be removed by the applicant on a regular basis and before project completion in order to maintain the design volume of the facilities.

Section 7.0 - Fee in Lieu of Detention: All new development or re-development not exceeding fifteen thousand (15,000) square feet of impervious surface may pay a fee of \$10,000 for each acre-foot of detention which would be required under this ordinance rather than installing detention facilities on the property, unless specifically directed to do otherwise by the appropriate local official. The Village of Caseyville, Illinois also shall have the option for new development or re-development exceeding fifteen thousand (15,000) square feet of impervious surface of requiring a fee of \$10,000 for each acre-foot of detention needed in lieu of the applicant building a basin on-site provided the property will discharge stormwater to the Village of Caseyville, Illinois storm sewer system if applicable.

In instances where regional benefits and economies of scale can be achieved, it will be permissible for adjacent properties to utilize a common regional detention basin. Applicants shall have the option of paying a fee of \$10,000 for each acre-foot of detention required so that the Village of Caseyville, Illinois can build regional facilities or they can jointly build the necessary facilities themselves.

Chapter 4.0 - SOIL EROSION AND SEDIMENT CONTROL:

Section 1.0 - Findings: The Village of Caseyville, Illinois hereby finds that:

1. The soil types found in the Village of Caseyville, Illinois are susceptible to erosion and if left unprotected could cause severe loss of soil with resultant damage to property;
2. The topography of the Village of Caseyville, Illinois contains areas with steep slopes upon which, if clearing of trees and/or inappropriate construction takes place, could result in severe erosion and slope stability problems which could result in damage to property;
3. Excessive quantities of soil may erode from areas undergoing development for certain non-agricultural uses including but not limited to the construction of dwelling units, commercial buildings and industrial plants, the building of roads and highways, the modification of stream channels and drainageways, and the creation of recreational facilities;
4. The washing, blowing, and falling of eroded soil across and upon roadways endangers the health and safety of users thereof, by decreasing vision and reducing traction of road vehicles;
5. Soil erosion necessitates the costly repairing of gullies, washed out fills, and embankments;
6. Sediment from soil erosion tends to clog sewers and ditches and to pollute and silt rivers, streams, lakes, sinkholes, wetlands, and reservoirs;
7. Sediment limits the use of water and waterways for most beneficial purposes, promotes the growth of undesirable aquatic weeds, destroys fish and other desirable aquatic life, and is costly and difficult to remove; and
8. Sediment reduces the channel capacity of waterways and the storage capacity of flood plains and natural depressions, resulting in increased chances of flooding at risk to public health and safety.

Section - 2.0 - General Principles: It is the objective of this ordinance to control soil erosion and sedimentation caused by development activities, including clearing, grading, stripping, excavating, and filling of land, in the Village of Caseyville, Illinois. Measures taken to control soil erosion and off-site sediment runoff shall be adequate to assure that sediment is not transported from the site by a storm event of ten-year, 24 hour frequency or less. The

following principles shall apply to all new development or redevelopment activities within the Village of Caseyville, Illinois and to the preparation of the submissions required under Chapter 4.0, Section 3.0 of this ordinance.

1. New development or redevelopment shall be related to the topography and soils of the site so as to create the least potential for erosion. Areas of steep slopes greater than eight percent (8%) where high cuts and fills may be required are to be avoided wherever possible, and natural contours should be followed as closely as possible.
2. Natural vegetation shall be retained and protected wherever possible. Areas immediately adjacent to natural watercourses, lakes, ponds, sinkholes, and wetlands are to be left undisturbed wherever possible. Temporary crossings of watercourses, when permitted, must include appropriate stabilization measures.
3. Special precautions shall be taken to prevent damages resultant from any necessary development activity within or adjacent to any stream, lake, pond, sinkhole or wetland. Preventive measures shall reflect the sensitivity of these areas to erosion and sedimentation.
4. The smallest practical area of land should be exposed for the shortest practical time during development.
5. Sediment basins or traps, filter barriers, diversions, and any other appropriate sediment or runoff control measures shall be installed prior to site clearing and grading and maintained to remove sediment from run-off waters from land undergoing development.
6. The selection of erosion and sediment control measures shall be based on assessment of the probable frequency of climatic and other events likely to contribute to erosion, and on evaluation of the risks, costs, and benefits involved.
7. In the design of erosion control facilities and practices, aesthetics and the requirements of continuing maintenance must be considered.
8. Provision shall be made to accommodate the increased run-off caused by changed soil and surface conditions during and after development. Drainageways should be designed so that their final gradients and the resultant velocities and rates of discharge will not create additional erosion on-site or downstream.
9. Permanent vegetation and structures shall be installed and functional as soon as practical during development.

10. Those areas being converted from agricultural purposes to other land uses shall be vegetated with an appropriate protective cover prior to development.
11. All waste generated as a result of site development activity shall be properly disposed of and shall be prevented from being carried off the site by either wind or water.
12. All construction sites shall provide measures to prevent sediment from being tracked onto public or private roadways.
13. All temporary soil erosion and sediment control practices shall be maintained to function as intended until the contributing drainage area has been permanently stabilized at which time they shall be removed.

Section 3.0 - Erosion and Sediment Control Plan Submittal Requirements: Each applicant shall submit the information depending on development size, as regulated to ensure that the provisions of this ordinance are met. The submittal shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts of the development related to erosion both on-site and off-site, and the effectiveness of the proposed erosion and sediment control plan in reducing sediment loss and meet the provisions of Chapter 1.0, Section 2.0. The applicant shall certify on the drawing that all clearing, grading, drainage, and construction shall be accomplished in strict conformance with the erosion and sediment control plan. The following information shall be submitted for both existing and proposed property conditions; new developments or re-developments meeting the requirements of Chapter 1.0, Section 3.0.

3.1 - Erosion and Sediment Control Plan Requirements: Shall meet the requirements of Chapter 3.0, Section 1.1, Section 1.1.1, and Section 1.1.2.

3.1.1 - Mapping and Descriptions: The existing and proposed erosion and sediment control features of the property and immediate vicinity including:

- 1.) As required in Chapter 3.0, Section 1.1, Section 1.1.1, and Section 1.1.2;
- 2.) Location of the slope disturbance line;
- 3.) Location and description of the erosion and sediment control measures to be employed during construction;
- 4.) For any structures proposed to be located on the slope side of the slope disturbance line the map shall include the limits of disturbance including tree removal, erosion and sediment control measures during construction, cross section view of any proposed cut or fill, erosion and sediment control measures during construction, details of method(s) proposed for providing slope stability, permanent

stormwater control measures, and permanent erosion and sediment control measures all being certified by a registered professional engineer or a "Certified Professional Erosion Control Specialist."

- 5.) The predominant soil types on the site, their location, and their limitations for the proposed use as defined by the U.S.D.A. Natural Resources Conservation Service.
- 6.) The proposed use of the site, including present and planned development, areas of clearing, stripping, grading, excavation and filling; proposed contours, finished grades, and street profiles; the stormwater plan as required in Chapter 2.0; kinds and locations of utilities, areas and acreages proposed to be paved, sodded or seeded, vegetatively stabilized, or left undisturbed; and the location of trees over eight (8) inches in diameter and their type.
- 7.) The erosion and sediment control plan showing all measures necessary to meet the requirements of this ordinance throughout all phases of construction and those remaining permanently after completion of the development of the site, including:
 - a.) Location and description, including standard details, of all sediment control measures, runoff control measures, including diversions, waterways and outlets, and design specifics of sediment basins and traps including outlet details.
 - b.) Location and description of all soil stabilization and erosion control measures, including seeding mixtures and rates, types of sod, method of seedbed preparation, expected seeding dates, type and rate of lime and fertilizer application, kind and quantity of mulching for both temporary and permanent vegetative control measures, and types of non-vegetative stabilization measures.
 - c.) Location and description of methods to prevent tracking of sediment off-site including construction entrance details, as appropriate.
 - d.) Description of dust and traffic control measures.
 - e.) Locations of stockpiles and description of stabilization methods.
 - f.) Location of off-site fill or borrow volumes, locations and methods of stabilization.

- g.)** Provisions for maintenance of control measures, including type and frequency of maintenance, easements, and estimates of the cost of maintenance.
- h.)** The proposed phasing of development of the site, including stripping and clearing, rough grading and construction, and final grading and landscaping. Phasing should identify the expected date on which clearing will begin, the estimated duration of exposure of cleared area, and the sequence of installation of temporary sediment control measures (including perimeter controls), installation of stormwater drainage, paving streets and parking areas, final grading and the establishment of permanent vegetative cover, and the removal of temporary measures. It shall be the responsibility of the applicant to notify the Building and Zoning Administrator of any significant changes which occur in the site development schedule after the initial erosion and sediment control plan has been approved.

Section 4.0 - Design and Operation Standards and Requirements:

The preparation of soil erosion and sediment control plans shall follow the principles outlined in the "Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control", excepting Chapter six (6) published by the Urban Committee of the Association of Illinois Soil and Water Conservation Districts. The design criteria, standards, and methods shall be prepared in accordance with the requirements of this ordinance and the standards and specifications contained in "Illinois Urban Manual" prepared for the Illinois Environmental Protection Agency by the U.S.D.A. Natural Resources Conservation Service, which standards and methods are hereby incorporated into this ordinance by reference. In the event of conflict between the provisions of said manuals and of this ordinance, this ordinance shall govern.

4.1 - Erosion and Sediment Control Design Requirements: New developments or re-developments shall comply with Chapter 4.0, Section 3.0 and meet the following:

4.1.1 - Control measures shall be constructed to control runoff from the property to such an extent possible that sediment is retained on-site.

4.1.2 - Temporary on-site control measures required shall be constructed and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

4.1.3 - Disturbed areas shall be stabilized with permanent measures within seven (7) calendar days following the end of active disturbance, or re-disturbance consistent with the following criteria:

- 1.** Appropriate permanent stabilization measures shall include seeding, mulching, sodding, with non-vegetative measures as a last resort.

2. Areas having slopes greater than 12% shall be stabilized with sod, mat, or blanket in combination with seeding or equivalent.

4.1.4 - All temporary and permanent erosion and sediment control practices must be maintained and repaired as needed to assure effective performance of their intended function.

4.1.5 - All temporary erosion and sediment control measures shall be disposed in a proper manner within thirty (30) days after final site stabilization is achieved with permanent soil stabilization measures. Trapped sediment and other disturbed soils resulting from the disposition of temporary measures shall be permanently stabilized to prevent further erosion and sedimentation.

4.1.6 - Site Development Requirements: On-site sediment control measures, as specified by the following criteria, shall be constructed as specified in the referenced handbooks, and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

1. For new developments or re-developments less than one (1) acre, filter barriers (including filter fences, straw bales, or equivalent control measures) shall be constructed to control all on-site runoff. Vegetated filter strips, with a minimum width of twenty five (25) feet, may be used as an alternative only where runoff in sheet flow is expected.
2. For new developments or re-developments more than one (1) acre but less than five (5) acres, a sediment trap or equivalent control measure shall be constructed at the downslope point of the disturbed area.
3. For new developments or re-developments greater than five (5) acres, a sediment basin or equivalent control measure shall be constructed at the downslope point of the disturbed area.
4. Sediment basin and sediment trap designs shall provide for both "dry" detention and "wet" detention sediment storage. The detention storage shall be composed of equal volumes of "wet" detention storage and "dry" detention storage and each shall be sized as regulated in Chapter 3.0. The release rate of the basin shall be that rate as regulated in Chapter 3.0. The elevation of the outlet structure shall be placed such that it only drains the dry detention storage.
5. The sediment storage shall be sized to store the estimated sediment load generated from the site over the duration of the construction period with a minimum storage equivalent to the volume or sediment generated in one year. For construction periods exceeding one year, the 1-year sediment load and a sediment removal schedule may be substituted.

6. The alteration of sinkholes by filling, grading or excavation is prohibited, including an area within twenty five (25) feet from the rim.
7. To the extent possible or as otherwise regulated in this ordinance all desirable trees eight (8) inches in diameter and larger shall be protected for their present and future value for erosion protection and other environmental benefits. Trees that have been selected for preservation shall be marked prior to the beginning of any clearing, grading, stripping, excavation, or filling of the site. A "No" construction zone shall be established and marked at the perimeter of the dripline of each tree which is to be preserved.

4.1.7 - Stormwater conveyance channels, including ditches, swales, and diversions, and the outlets of all channels and pipes shall be designed and constructed as regulated in Chapter 3.0. All constructed or modified channels shall be stabilized within 48 hours, consistent with the following standards and as required in the referenced handbooks:

1. For grades up to 4 percent, seeding in combination with mulch, erosion blanket, or an equivalent control measure shall be applied. Sod or erosion blanket or mat shall be applied to the bottom of the channel.
2. For grades of 4 to 8 percent, sod or an equivalent control measure shall be applied in the channel.
3. For grades greater than 8 percent, rock, riprap, or an equivalent control measure shall be applied over filter fabric or other type of soil protection, or the grade shall be effectively reduced using drop structures.

4.1.8 Land disturbance activities in stream channels shall be avoided, where possible, or as regulated in Chapter 3.0. If disturbance activities are unavoidable, the following requirements shall be met.

1. Construction vehicles shall be kept out of the stream channel to the maximum extent practicable. Where construction crossings are necessary, temporary crossings shall be constructed of non-erosive material, such as riprap or gravel.
2. The time and area of disturbance of stream channels shall be kept to a minimum. The stream channel, including bed and banks, shall be stabilized within 48 hours after channel disturbance is completed, interrupted, or stopped.
3. Whenever channel relocation is necessary, the new channel shall be constructed under dry conditions and fully stabilized before flow is

diverted, incorporating meanders, pool and riffle sequence, and riparian planting.

4.1.9 - Storm sewer inlets and culverts shall be protected by sediment traps or filter barriers meeting accepted design standards and specifications.

4.1.10 - Soil storage piles containing more than 10 cubic yards of material shall not be located with a downslope drainage length of less than 25 feet to a roadway, drainage channel, or sinkhole. Filter barriers, including straw bales, filter fence, or equivalent, shall be installed immediately on the downslope side of the piles.

4.1.11 - If dewatering devices are used, discharge locations shall be protected from erosion. All pumped discharges shall be routed through appropriately designed sediment traps or basins, or equivalent and shall not be deposited into a sinkhole.

4.1.12 - Each site shall have graveled (or equivalent) entrance roads, access drives, and parking areas of sufficient length and width to prevent sediment from being tracked onto public or private roadways. Any sediment reaching a public or private road shall be removed by shoveling or street cleaning (not flushing) before the end of each workday and transported to a controlled sediment disposal area.

Section 5.0 - Maintenance of Control Measures: All soil erosion and sediment control measures necessary to meet the requirements of this ordinance shall be maintained periodically by the applicant or subsequent land owner during the period of land disturbance and development of the site in a satisfactory manner to ensure adequate performance.

Chapter 5.0 - Long Term Maintenance Responsibility:

Section 1.0 - Long Term Maintenance Responsibility: Maintenance of stormwater drainage, and erosion and sediment control facilities located on private property shall be the responsibility of the owner of that property. Before an appropriate permit is obtained from the Village of Caseyville, Illinois the applicant shall execute a maintenance agreement with the Village of Caseyville, Illinois of guaranteeing that the applicant and all future owners of the property will maintain its stormwater drainage and erosion and sediment control system. Such agreement shall be recorded with the Recorder of Deeds of the County. The maintenance agreement shall include a schedule for regular maintenance of each aspect of the property's stormwater drainage and erosion and sediment control system and shall provide for access to the system for inspection by authorized personnel of the Village of Caseyville, Illinois of. The maintenance agreement shall also stipulate that if the appropriate personnel of the Village of Caseyville, Illinois notify the property owner in writing of maintenance problems which require correction, the property owner shall begin such corrections within twenty four (24) hours and shall not extend beyond seven (7) calendar days of such notification. If the corrections are not made within this time period the Village of Caseyville, Illinois may have the necessary work completed and assess the cost to the property owner. The Village of Caseyville, Illinois has the option of requiring a bond to be filed by the property owner for maintenance of the stormwater drainage and erosion and sediment control system.

Chapter 6.0 - Inspections:

Section 1.0 - Inspections: The Building and Zoning Administrator shall make inspections as hereinafter required and shall either approve that portion of the work completed or shall notify the permittee wherein the work fails to comply with the stormwater drainage or erosion and sedimentation control plan as approved. Plans for grading, stripping, excavating, and filling work bearing the stamp of approval of the Building and Zoning Administrator shall be maintained at the site during progress of the work. In order to obtain inspections and to ensure compliance with this ordinance, the permittee shall notify the Building and Zoning Administrator within two (2) working days of the completion of the construction stages specified below:

1. Upon completion of installation of the stormwater drainage and erosion and sediment control measures (including perimeter controls and diversions), prior to proceeding with any other earth disturbance or grading,
2. After stripping and clearing,
3. After rough grading,
4. After final grading,
5. After seeding and landscaping deadlines, and
6. After final stabilization and landscaping, prior to removal of sediment controls.

If stripping, clearing, grading and/or landscaping are to be done in phases or areas, the permittee shall give notice and request inspection at the completion of each of the above work stages in each phase or area. If an inspection is not made and notification of the results given within five working days after notice is received by the Village of Caseyville, Illinois from the permittee, the permittee may continue work at his/her own risk, without presuming acceptance by the Village of Caseyville, Illinois. Notification of the results of the inspection shall be given in writing at the site.

Section 2.0 - Special Precautions: If at any stage of the grading of any development site the Building and Zoning Administrator determines by inspection that the nature of the site is such that further work authorized by an existing permit is likely to imperil any property, public way, stream, lake, wetland, or drainage structure, the Building and Zoning Administrator may require, as a condition of allowing the work to be done, that such reasonable special precautions to be taken as is considered advisable to avoid the likelihood of such peril. "Special precautions" may include, but shall not be limited to, a more level exposed slope, construction of additional drainage facilities, berms, terracing, compaction, or cribbing, installation of plant materials for erosion control, and recommendations of a

registered soils engineer and/or engineering geologist which may be made requirements for further work.

2.0.1 - Where it appears that storm damage may result because the grading on any development site is not complete, work may be stopped and the permittee required to install temporary structures or take such other measures as may be required to protect adjoining property or the public safety. On large developments or where unusual site conditions prevail, the Building and Zoning Administrator may specify the time of starting grading and time of completion or may require that the operations be conducted in specific stages so as to ensure completion of protective measures or devices prior to the advent of seasonal rains.

Section 3.0 - Amendment of Plans: Major amendments to stormwater drainage and detention or erosion and sediment control plans shall be submitted to the Building and Zoning Administrator and shall be processed and approved or disapproved in the same manner as the original plans. Field modification of a minor nature may be authorized by the Building and Zoning Administrator by written authorization to the permittee.

Chapter 7.0 - Permitting:

Section 1.0 - Application for Permit: Application for a development permit shall be made by the owner of the property or his authorized agent to the Building and Zoning Administrator on a form furnished for that purpose. Each application shall bear the name(s) and address(es) of the owner or developer of the site, the contractor(s) and of any consulting firm retained by the applicant together with the name of the applicant's principal contact at such firm, and shall be accompanied by a filing fee. Each application shall include certification that any land clearing, construction, or development involving the movement of earth shall be in accordance with the plans approved upon issuance of the permit.

Section 2.0 - Bond Required: The applicant for a development permit may be required to file with the Village of Caseyville, Illinois, a faithful performance bond or bonds, letter of credit, or other improvement security satisfactory to the Village of Caseyville, Illinois Attorney in an amount deemed sufficient by the Building and Zoning Administrator to cover all costs of improvements, landscaping, maintenance of improvements and landscaping, and soil erosion and sediment control measures for such period as specified by the Village of Caseyville, Illinois, and engineering and inspection costs to cover the cost of failure or repair of improvements installed on the site.

Section 3.0 - Review and Approval: Each application for a development permit shall be reviewed and acted upon according to the following procedures:

1. The Building and Zoning Administrator will review each application for a development permit to determine its conformance with the provisions of this ordinance. The Officer may also refer any application to the County Soil and Water Conservation District and/or any other local government or public agency within whose jurisdiction the site is located for review and comment. Within thirty (30) days after receiving an application, the Building and Zoning Administrator shall in writing:
 - a. Approve the permit application if it is found to be in conformance with the provisions of this ordinance, and issue the permit;
 - b. Approve the permit application subject to such reasonable conditions as may be necessary to secure substantially the objectives of this ordinance, and issue the permit subject to these conditions; or
 - c. Disapprove the permit application, indicating the deficiencies and the procedure for submitting a revised application and/or submission.

3.1 - No development permit shall be issued for an intended development site unless:

1. The development, including but not limited to subdivision or planned unit development, has been approved by the Village of Caseyville, Illinois in Illinois where applicable, or
2. such permit is accompanied by or combined with a valid building permit issued by the Village of Caseyville, Illinois, or
3. the proposed earth moving is coordinated with any overall development program previously approved by the Village of Caseyville, Illinois for the area in which the site is situated; and
4. all relevant federal and state permits have been received for the portion of the site subject to soil disturbance as noted in Chapter 1.0, Section 2.0.

3.2 - Failure of the Building and Zoning Administrator to act on an original or revised application within thirty (30) days of receipt shall authorize the applicant to proceed in accordance with the plans as filed and in compliance with the regulations contained herein, unless such time is extended by agreement between the Building and Zoning Administrator and the applicant. Pending preparation and approval of a revised plan, development activities shall be allowed to proceed in accordance with conditions established by the Building and Zoning Administrator.

Section 4.0 - Expiration of Permit: Every development permit shall expire and become null and void if the work authorized by such permit has not been commenced within one hundred and eighty (180) days, or if not completed by a date which shall be specified in the permit; except that the Building and Zoning Administrator may, if the permittee presents satisfactory evidence that unusual difficulties have prevented work being commenced or completed within the specified time limits, grant a reasonable extension of time if written application is made before the expiration date of the permit. The Building and Zoning Administrator may require modification of the erosion control plan to prevent any increase in erosion or off-site sediment runoff resulting from any extension.

Section 5.0 - Appeals: The applicant, or any person or agency which received notice of the filing of the application, may appeal the decision of the Building and Zoning Administrator to the Board of Appeals. Upon receipt of an appeal, the Board of Appeals shall schedule and hold a public hearing, after giving fifteen (15) days notice thereof. The Board shall render a decision within thirty (30) days after the hearing. Factors to be considered on review shall include, but need not be limited to, the effects of the proposed development activities on the surface water flow to tributary and downstream lands, any comprehensive watershed management plans, or the use of any retention facilities; possible saturation of fill and unsupported cuts by water, both natural and domestic; runoff surface waters that produce erosion and silting of drainageways; nature and type of soil or rock which when disturbed by the proposed development activities may create earth movement and produce slopes that

cannot be landscaped; and excessive and unnecessary scarring of the natural landscape through grading or removal of vegetation.

Section 6.0 - Retention of Plans: Plans, specifications, and reports for all site developments shall be retained in original form or on microfilm by the Building and Zoning Administrator.

Chapter 8.0 - Enforcement:

Section 1.0 - Stop-Work Order; Revocation of Permit: In the event any person holding a development permit pursuant to this ordinance violates the terms of the permit, or carries on-site development in such a manner as to materially adversely affect the health, welfare, environment, or safety of persons residing or working in the neighborhood of the development site or so as to be materially detrimental to the public welfare or injurious to property or improvements in the neighborhood, the Building and Zoning Administrator may suspend or revoke the development permit.

1.1 - Suspension of a permit shall be by a written stop-work order issued by the Building and Zoning Administrator and delivered to the permittee or his agent or the person performing the work. The stop-work order shall be effective immediately, shall state the specific violations cited, and shall state the conditions under which work may be resumed. A stop-work order shall remain in effect until the next regularly scheduled meeting of the Board of Appeals at which time the conditions of Chapter 7.0, Section 5.0 below can be met.

1.2 - No development permit shall be revoked until a hearing is held by the Board of Appeals. Written notice of such hearing shall be served on the permittee, either personally or by registered mail, and shall state:

1. The grounds for complaint or reasons for suspension or revocation, in clear and concise language; and
2. The time when and place where such hearing will be held.

Such notice shall be served on the permittee at least five (5) days prior to the date set for the hearing. At such hearing, the permittee shall be given an opportunity to be heard and may call witnesses and present evidence on his behalf. At the conclusion of the hearing the Board of Appeals shall determine whether the permit shall be revoked.

Section 2.0 - Violations and Penalties: No person shall construct, enlarge, alter, repair or maintain any grading, excavation or fill, or cause the same to be done, contrary to or in violation of any terms of this ordinance. Any person violating any of the provisions of this ordinance shall be deemed guilty of a misdemeanor, and each day during which any violation of any of the provisions of this ordinance is committed, continued, or permitted shall constitute a separate offense. Upon conviction of any such violation, such person, partnership, or corporation shall be punished by a fine of not more than One Thousand Dollars (\$1000) for each offense. In addition to any other penalty authorized by this section, any person, partnership, or corporation convicted of violating any of the provisions of this ordinance shall be required to restore the site to the condition existing prior to commission of the violation, or to bear the expense of such restoration.

Chapter 9.0 - Effective Date

This ordinance shall be in full force and effect from and after its passage and approval and publication, as required by law.

Passed by Village Board of the Village of Caseyville, Illinois, this 19th. day of August, 1998.

DIFFERENCES BETWEEN THE PEORIA, TAZEWELL AND WOODFORD COUNTY EROSION, SEDIMENT, AND STORM WATER CONTROL ORDINANCES

1. Tazewell County – p. 4, Sec. 7-7-2 (1)(d) excludes Tazewell County Road Departments from applicability of the Ordinance (they are not required to obtain a permit).
2. Peoria County – p.8, Sec. 7.5-66 (1)(d)(1) states that applicant must provide a map showing the drainage area boundaries, including off-site drainage areas that drain “into **or onto** the site,” whereas Tazewell and Woodford Ordinances state “into the site” only.
3. In Sec. 7.5-66(1)(d)(2) and (3) Peoria County uses the language “all drainage areas” and “drainage area” where Woodford and Tazewell Counties use “entire watershed” and “subwatershed”. Peoria County defines “drainage area” in its ordinance while Woodford and Tazewell do not.
4. Additional language in Tazewell County’s Ordinance (Sec. 7-7-12): “The provisions and sections of this ordinance shall be deemed separable and the invalidity of any portion of this chapter shall not effect the validity of the remainder”. This is not present in the Peoria or Woodford County Ordinances.
5. **FEES FOR GENERAL EROSION AND SEDIMENT CONTROL PERMITS ***
(The most significant difference between the ordinances)

	<u>Standard Plan Application</u>	<u>Site Specific Plan Application</u>
Peoria	\$100	\$150
Tazewell	\$50	\$100
Woodford	\$100	\$150

FEES FOR EROSION, SEDIMENT AND STORM WATER PERMITS *

Peoria	\$50/acre, \$250 minimum, \$2,000 maximum
Tazewell	\$50/acre, \$250 minimum, \$2,000 maximum
Woodford	\$25/acre, \$100 minimum, \$2,000 maximum

* These rates are from the original date of ordinance adoption. They may have increased.

6. Effective Dates

Peoria	4-1-96
Tazewell	4-15-96
Woodford	4-15-96

7. Each county has established an intergovernmental agreement with NRCS and the local SWCD. Responsibilities of signatory parties vary by county. Contact the County or local NRCS/SWCD Office for details.

ARTICLE 1—AUTHORITY, PURPOSE AND DEFINITIONS**§ 100. Statutory authority**

(a) This ordinance shall be known, and may be cited, as the Kane County Stormwater Management Ordinance.

(b) The Kane County Board adopts this ordinance pursuant to its authority to regulate stormwater management and govern the location, width, course, and release rate of all stormwater runoff channels, streams, and basins in the County, in accordance with the Kane County Comprehensive Countywide Stormwater Management Plan. The statutory authority for this ordinance is contained in 55 ILCS 5/5-1041, 5-1042, 5-1049, 5-1062, 5-1063, 5-1104, 5-12003 and 5-15001 *et seq.*, and 415 ILCS 5/43, and other applicable authority, all as amended from time to time.

(c) As applicable, the municipalities within the County adopt and enforce this ordinance pursuant to 55 ILCS 5/5-1062, 65 ILCS 5/1-2-1, 11-12-12, 11-30-2, 11-30-8, and 11-31-2; and 615 ILCS 5/5, *et seq.*, including 5/18g.

§ 101. Kane County Comprehensive Countywide Stormwater Management Plan

The Kane County Comprehensive Countywide Stormwater Management Plan was recommended by the Kane County Stormwater Management Committee and adopted by the County Board, after review by the appropriate agencies and a public hearing, by Ordinance No. 98-251 on October 13, 1998. The Plan is available for public inspection in the office of the Kane County Clerk.

§ 102. Purposes of this ordinance

(a) The principal purpose of this ordinance is to promote effective, equitable, acceptable and legal stormwater management measures by establishing reasonable rules and regulations for development. Other purpose of this ordinance include—

(1) managing and mitigating the effects of urbanization on stormwater drainage throughout Kane County through planning, appropriate engineering practices and proper maintenance;

(2) protecting the public health and safety and reducing the potential for loss of human life and property from flood damage;

(3) protecting the public from the degradation of water quality on a watershed basis;

(4) preserving and enhancing the natural hydrologic and hydraulic functions and natural characteristics of watercourses and floodplains to protect water quality, aquatic habitats, reduce flood damage, reduce soil erosion, provide recreational and aesthetic benefits and enhance community and economic development;

(5) controlling sediment and erosion in and from stormwater facilities, developments, agricultural fields, and construction sites and reducing and repairing streambank erosion;

(6) requiring planning for development to provide for water resource management, taking into account natural features such as vegetation, wildlife, waterways, wetlands and topography in order to reduce the probability that new development will create unstable conditions susceptible to erosion or degrade the quality of ground and surface waters;

(7) protecting environmentally sensitive areas from deterioration or destruction by private or public actions;

(8) protecting and enhancing the quantity and quality of potable groundwater and potable surface water supplies;

(9) requiring appropriate and adequate provision for site runoff control, especially when the land is developed with a large amount of impervious surface;

(10) requiring the design and evaluation of each site stormwater management plan to be consistent with watershed capacities;

(11) encouraging the use of stormwater storage and infiltration of stormwater in preference to stormwater conveyance;

(12) lessening the taxpayers' burden for flood-related disasters, repairs to flood-damaged public facilities and utilities, and flood rescue and relief operations;

(13) meeting the IDNR-OWR floodway permitting requirements delineated in 615 ILCS 5/18g, (*An Act in Relation to the Regulation of the Rivers, Lakes, and Streams of the State of Illinois* (1992)), as amended from time to time;

(14) complying with the rules and regulations of the National Flood Insurance Program thereby making federally subsidized flood insurance available to persons throughout the County;

(15) minimizing conflicts and incompatibilities between agricultural and urban drainage systems and maintaining agriculture as a viable and productive land use;

(16) encouraging cooperation and consistency in stormwater management activities within and between units of government having floodplain and stormwater management jurisdiction;

(17) restricting development in the floodplain to facilities that will not adversely affect the potential for flood damage;

(18) protecting and improving surface water quality and promoting beneficial uses of ponds, lakes, wetlands, rivers and streams by reducing point source and non-point source discharges of pollutants;

(19) requiring regular, planned maintenance of stormwater management facilities;

(20) requiring control of stormwater quantity and quality at the most site-specific or local level and preventing unauthorized or unmitigated discharge of flow offsite;

(21) protecting the quantity and quality of wetlands;

(22) allowing the use of simple technologies whenever appropriate and realistic, but requiring the use of more sophisticated techniques when necessary to insure the adequacy of stormwater controls;

(23) providing a procedure by which communities throughout the County may petition the Committee for authority to implement and enforce the provisions of this ordinance; and

(24) requiring strict compliance with and enforcement of this ordinance.

(b) The purposes of this ordinance are consistent with and supersede the Plan.

§ 103. Reference to watershed plans

(a) This ordinance recognizes the integrated nature of the watershed system and the need to study certain flood control alternatives and other stormwater management functions on a watershed-wide basis.

(b) Individual watershed plans or interim watershed plans which recognize the unique attributes of each watershed may be prepared and periodically updated for the major watersheds to identify management projects and establish criteria for development.

(c) Watershed plans or interim watershed plans may be adopted which contain more or less stringent requirements than those of this ordinance. Watershed-specific requirements established in such watershed plans or interim watershed plans will be set forth in §§ 105 through 117 of this ordinance.

§ 104. Definitions

In this ordinance—

(1) **ADID** means advanced identification of wetlands and aquatic resources under a study authorized and funded by the United States Environmental Protection Agency and adopted by the County;

(2) **Administrator** means the person designated by the permitting authority to administer and enforce this ordinance;

(3) **agricultural land** means land predominantly used for agricultural purposes;

(4) **agricultural subsurface drainage** is a water management technique driven by economic and safety concerns, where the rate at which surplus groundwater should be removed is determined primarily by the moisture/air requirements of the vegetation;

(5) **applicable engineering practice** means procedures, methods or materials recommended in standard engineering textbooks or references as suitable for the intended purpose;

(6) **applicant** means any person who submits an application for a permit under this ordinance;

(7) **appropriate use** means a use of the regulatory floodway permitted under Article 4;

(8) **base flood** means the flood having a one percent probability of being equaled or exceeded in a given year;

(9) **BFE** or **base flood elevation** means the highest water surface elevation that can be expected during the base flood;

(10) **BMP** or **best management practices** means a measure used to control the adverse stormwater-related effects of development, and includes structural devices (for example, swales, filter strips, infiltration trenches, and site runoff storage basins), designed to remove pollutants, reduce runoff rates and volumes, and protect aquatic habitats, and nonstructural approaches, such as public education efforts to prevent the dumping of household chemicals into storm drains;

(11) **building** means a structure that is principally aboveground and is enclosed by walls and a roof; a building includes a gas or liquid storage tank, a manufactured home or prefabricated building;

(12) **buffer** means an area of predominantly deeply rooted native vegetated land adjacent to channels, wetlands, lakes or ponds for the purpose of stabilizing banks, reducing contaminants, including sediments, in stormwater that flows to such areas;

(13) **Bulletin 70** means *Frequency Distributions and Hydroclimatic Characteristics of Heavy Rainstorms in Illinois*, by Floyd Huff and James Angel of the Illinois State Water Survey (1989);

(14) **certified community** means a community certified under Article 11;

(15) **channel** means any river, stream, creek, brook, branch, natural or artificial depression, ponded area, flowage, slough, ditch, conduit, culvert, gully, ravine, wash, or natural or manmade drainageway which has a definite bed and bank or shoreline, in or into which surface, groundwater, effluent, or industrial discharges flow either perennially or intermittently;

(16) **channel modification** means alteration of a channel by changing the physical dimensions or materials of its bed or banks, and includes damming, riprapping (or other armoring), widening, deepening, straightening, relocating, lining, and significant removal of bottom or woody rooted vegetation, but does not include the clearing of debris or removal of trash or dredging to previously documented thalweg elevations and sideslopes;

(17) **commercial** means having the qualities associated with the transaction of business with the public at large where the traffic generated warrants construction of site improvements;

(18) **commercial redevelopment** means development on a site already devoted to a commercial use but specifically does not include additions to existing buildings and additions of new impervious surfaces after the effective date;

(19) **Committee** means the Kane County Stormwater Management Committee;

(20) **community** means the County or any municipality within the County;

(21) **compensatory storage** means an excavated, hydrologically and hydraulically equivalent volume of storage created to offset the loss of existing flood storage;

(22) **CLOMA** or **Conditional Letter of Map Amendment** means a FEMA comment letter on a development proposed to be located in, and affecting only that portion of, the area of floodplain outside the regulatory floodway and having no impact on the existing regulatory floodway or base flood elevations;

(23) **CLOMR** or **Conditional Letter of Map Revision** means a letter that indicates that FEMA will revise base flood elevations, flood insurance rate zones, flood boundaries or floodways as shown on an effective FIRM or FBFM, after the record drawings are submitted and approved;

(24) **COE** means the United States Army Corps of Engineers;

(25) **control structure** means a structure designed to control the rate of flow that passes through the structure given a specific upstream and downstream water surface elevation;

(26) **County** means Kane County, Illinois;

(27) **critical duration** means the duration of a storm event that results in the greatest peak runoff;

(28) **dam** means any obstruction, wall embankment, or barrier, together with any abutments and appurtenant works, constructed to store or divert water or to create a pool (not including underground water storage tanks);

(29) **Department** means the Kane County Department of Environmental Management;

(30) **depressional storage** means the volume contained below a closed contour on a one foot contour interval topographical map, the upper elevation of which is determined by the invert of a surface gravity outlet;

(31) **developer** means a person who creates or causes a development;

(32) **development** means any manmade change to the land and includes—

(A) the construction, reconstruction, repair, or replacement of a building or an addition to a building;

(B) the installation of utilities, construction of roads, bridges or similar projects;

(C) drilling and mining;

(D) the construction or erection of levees, walls, fences, dams, or culverts;

(E) channel modifications, filling, dredging, grading, excavating, paving, or other nonagricultural alterations of the ground surface;

(F) the storage of materials and the deposit of solid or liquid waste;

(G) the installation of a manufactured home on a site, the preparation of a site for a manufactured home, or the installation of a recreational vehicle on a site for more than 180 days;

(H) any wetland impact; and

(I) any other activity of man that might change the direction, height, or velocity of flood or surface water, including the extensive removal of vegetation;

development, however, does not include—

(J) maintenance of existing buildings and facilities such as re-roofing or resurfacing of roads where there is no increase in elevation;

(K) for agricultural uses, maintenance of existing drainage systems for the limited purpose of maintaining cultivated areas and crop production; or

(L) for agricultural uses, improvements undertaken pursuant to a written NRCS conservation plan;

(33) **Director** means the Director of the Department;

(34) **drainable water** means water that readily drains from soil under the influence of gravity;

(35) **drainage area** means the land area above a given point that may contribute runoff flow at that point from rainfall;

(36) **effective date** means January 1, 2002;

(37) **elevation certificate** means a form published by FEMA used to certify the base flood elevation and the lowest elevation of usable space to which a building has been constructed;

(38) **ephemeral stream** means a stream whose bed elevation does not intersect the groundwater table and carries flow only during and immediately after a runoff producing rainfall event;

(39) **erosion** means the process whereby soil is detached by the action of water or wind;

(40) **farmed wetlands** means wetlands that have been identified as farmed wetlands by NRCS in a Certified Wetland Determination;

(41) **FEMA** means the Federal Emergency Management Agency and its regulations at 44 CFR 59-79, effective September 29, 1989, as amended;

(42) **flood** means a general and temporary condition of partial or complete inundation of normally dry land areas from overflow of inland or tidal ways or the unusual and rapid accumulation of runoff of surface waters from any source;

(43) **FBFM** or **Flood Boundary and Floodway Map** means a floodplain management map published by FEMA that depicts, based on detailed analysis, the boundaries of the base flood, the 0.2% probability flood and the floodway;

(44) **flood frequency** means a frequency normally expressed as a period of years, based upon a percent chance of occurrence in any given year from statistical analysis, during which a flood of a stated

magnitude may be expected to be equaled or exceeded, as in the two-year flood frequency has a 50% chance of occurrence in any given year and the 100-year flood frequency has a 1% chance of occurrence in any given year;

- (45) ***flood fringe*** means that portion of the floodplain outside of the designated floodway;
- (46) ***FIRM*** or ***Flood Insurance Rate Map*** means a map published by FEMA on which FEMA has delineated both the special flood hazard areas and the risk premium zones applicable to a community;
- (47) ***FIS*** or ***Flood Insurance Study*** means a study of flood discharges and flood profiles for a community adopted and published by FEMA;
- (48) ***floodplain*** means that land typically adjacent to a body of water with ground surface elevations at or below the base flood or the 100-year frequency flood elevation and includes detached special flood hazard areas, ponding areas and the like;
- (49) ***FPE*** or ***Flood Protection Elevation*** means the BFE plus two feet of freeboard for structures within the plan limits of the BFE; outside the plan limits, the water table or 100-year design water surface elevation of any adjacent stormwater facility, whichever is higher, plus two feet of freeboard; along the Fox River and within its backwater zone the BFE plus three feet of freeboard;
- (50) ***floodproof*** means any combination of structural and nonstructural additions, changes or adjustments to structures or property which reduce or eliminate flood damage to real estate, water and sanitary facilities, structures and their contents;
- (51) ***Floodproofing Certificate*** means a form published by FEMA that is used to certify that a building has been designed and constructed to be structurally dry floodproofed to the FPE;
- (52) ***floodway*** or ***designated floodway*** means the channel, onstream lakes and that portion of the floodplain adjacent to a stream or channel which is needed to store and convey the critical duration 100-year frequency flood discharge with no more than a 0.1 foot increase in flood stage due to the loss of flood conveyance or storage, and no more than a 10% increase in velocities;
- (53) ***floodway conveyance*** means the measure of the flow carrying capacity of the floodway section and is defined using Manning's equation, $K=1.49 AR^2/n$, where "n" is Manning's roughness factor, "A" is the effective area of the cross-section, and "R" is the ratio of the wetted area to the wetted perimeter;
- (54) ***FQI*** or ***Floristic Quality Index*** means the parameter related to the number of native plant species present, as defined by Floyd Swink and Gerald Wilhelm in *Plants of the Chicago Region*, 4th Ed. (1994) or by Gerald Wilhelm and Linda Masters in *Floristic Quality Assessment and Application Computer Programs for the 22-County Chicago Region*, Conservation Design Forum (2000);
- (55) ***freeboard*** means an increment of height added to the BFE, groundwater table or 100-year design water surface elevation to provide a factor of safety for uncertainties in calculations, unknown local conditions, wave action and unpredictable effects such as those caused by ice or debris jams;
- (56) ***functional*** means that a facility performs its primary purpose but may not be completed;
- (57) ***groundwater*** means water that is located within soil or rock below the surface of the earth;
- (58) ***groundwater control system*** means a designed system which may consist of tiles, underdrains, French drains or other appropriate stormwater facilities whose purpose is to lower the groundwater table to a predictable elevation throughout the year;
- (59) ***historic structure*** means a structure or site that is (a) listed individually in the National Register of Historic Places, or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing in the National Register; (b) certified or preliminarily determined by the Secretary of the Interior as contributing to an historic district or a district preliminarily determined by the Secretary to qualify as a

registered historic district; (c) individually listed on the State Inventory of Historic Places by the Illinois Historic Preservation Agency; or (d) individually listed on a local inventory of historic places that has been certified by the Illinois Historic Preservation Agency;

(60) ***hemimarsh*** means an isolated wetland dominated on the edges by tall emergent vegetation with an interior area of shallow open water;

(61) ***hydraulics*** means the science and study of the mechanical behavior of water in physical systems and processes;

(62) ***hydraulically connected impervious area*** means those areas of concrete, asphalt and gravel that, along with building roof surfaces, convey flows directly to an improved drainage system consisting of storm sewers or paved channels and includes roadways drained by curb and gutter and storm sewers and driveways hydraulically connected to those roadways, but does not include roof surfaces which discharge to unpaved surfaces which absorb and filter stormwater runoff nor roadways whose primary conveyance is through open ditches and swales;

(63) ***hydraulically equivalent compensatory storage*** means compensatory storage either adjacent to the floodplain fill or not located adjacent to the development but which can be shown by hydrologic and hydraulic analysis to be equivalent to compensatory storage located adjacent to the development;

(64) ***hydrologically disturbed*** means an area where the land surface has been cleared, grubbed, compacted or otherwise modified that changes runoff, volumes, rates or direction;

(65) ***hydrology*** means the science of the behavior of water, including its dynamics, composition and distribution in the atmosphere, on the surface of the earth and underground;

(66) ***IDNR-OWR*** means the Illinois Department of Natural Resources, Office of Water Resources, or its duly authorized designee;

(67) ***industrial redevelopment*** means development on an improved site already devoted to an industrial use but does not include additions to existing buildings and the addition of new impervious surfaces after the effective date;

(68) ***interim watershed plan*** means a regional study of a watershed which does not address the entire range of purposes, goals and objectives outlined in the Plan;

(69) ***intermittent stream*** means a stream whose bed intersects the groundwater table for only a portion of the year on average or any stream that flows continuously for at least one month out of the year, but not the entire year;

(70) ***isolated wetland*** means a wetland that does not have an identifiable surface water connection to other Waters of the U.S.;

(71) ***LOMA*** or ***Letter of Map Amendment*** means the official determination by FEMA that a specific structure is not in a regulatory floodplain and amends the effective Flood Hazard Boundary Map, FBFM, or FIRM;

(72) ***LOMR*** or ***Letter of Map Revision*** means a letter from FEMA that revises BFE, flood insurance rate zones, flood boundaries or floodway as shown on an effective Flood Hazard Boundary Map, FBFM, or FIRM;

(73) ***lake*** means a body of water two or more acres in size which retains water throughout the year;

(74) ***lineal Waters of the U.S.*** means wetlands along creeks, streams, rivers, ponds, lakes, or impoundments that are hydraulically connected to surface water;

(75) **major stormwater system** means that portion of a stormwater facility needed to store and convey flows beyond the capacity of the minor stormwater system;

(76) **manufactured home** means a structure transportable in one or more sections which is built on a permanent chassis and is designated for use with or without a permanent foundation when attached to the required utilities and includes park trailers, travel trailers and other similar vehicles onsite for more than 180 consecutive days but does not include a recreational vehicle;

(77) **manufactured home park or subdivision** means a parcel (or contiguous parcels) of land divided into two or more manufactured home lots for rent or sale;

(78) **mass grading** means development in which the primary activity is a change in topography affected by the movement of earth materials;

(79) **minor stormwater system** means all infrastructure including curb, gutter, culverts, roadside ditches and swales, storm sewers and subsurface drainage systems intended to convey stormwater runoff at less than a 100-year flood frequency;

(80) **mitigation** means measures taken to offset negative impacts from development in waters of the U.S. including wetlands or the floodplain;

(81) **NFIP or National Flood Insurance Program** means the federal program codified in Title 44 of the Code of Federal Regulations;

(82) **net benefit in water quality** means the institution of best management practices as part of a development that when compared to the pre-development condition can be judged to reduce downstream sediment or pollutant loadings;

(83) **net watershed benefit** means a finding that, when compared to the existing condition, the development will substantially reduce (more than 10%) downstream peak discharges, will reduce downstream flood stages (more than 0.1 feet), or will reduce downstream damage to structures occurring in the pre-development condition and must be demonstrated by detailed hydrologic and hydraulic analysis of watersheds on a regional scale as approved by the Administrator;

(84) **non-riverine** means areas not riverine in character such as isolated depressional storage areas, ponds and lakes;

(85) **NRCS** means the United States Department of Agriculture, Natural Resources Conservation Service;

(86) **nuisance flow** means primarily a dry weather flow resulting from groundwater pumped by individual sump pumps and other human activities not directly related to rainfall events and surface runoff;

(87) **observation structures** are structures built on a field tile where the pipe inflow and outflow is visible upon removal of a lid;

(88) **open channel** means a conveyance system with a definable bed and banks carrying the discharge from field tiles and surface drainage, but does not include grassed swales within farm fields under agricultural production which are ephemeral in nature;

(89) **open water** means surface water in lakes, ponds, impoundments and wetlands devoid of vegetative cover;

(90) **OHWM or ordinary high water mark** means the point on the bank or shore up to which the presence and action of surface water is so continuous as to leave a distinctive mark, such as by erosion, destruction or prevention of terrestrial vegetation, predominance of aquatic vegetation, or other easily recognized characteristic;

(91) ***overland flow path*** means a design feature of the major stormwater system which carries flows in excess of the minor stormwater system design capacity in an open channel or swale, or as sheet flow or weir flow over a feature designed to withstand the particular erosive forces involved;

(92) ***parcel*** means a separate tract of land identified by its own legal description;

(93) ***perennial stream*** means a riverine watercourse whose thalweg intersects the groundwater table continuously and flows throughout the year;

(94) ***permitting authority*** means the community having jurisdiction under this ordinance to issue permits;

(95) ***person*** means an individual, partnership, corporation, limited liability company, unincorporated association, trust, municipal corporation, unit of local government or other government agency or authority, or any combination of any of the foregoing;

(96) ***Plan*** means the Kane County Comprehensive Countywide Stormwater Management Plan adopted by the County Board on October 13, 1998, as amended from time to time;

(97) ***plant communities*** means groups of plants with similar habitat requirements and planting regimes;

(98) ***pond*** means a body of water less than two acres in size which retains a normal water level year-round;

(99) ***primary gravity outlet*** means the outlet structure designed to meet the release rate requirements of this ordinance, the invert (lowest elevation) of which shall be considered the high water elevation for required stormwater retention;

(100) ***professional land surveyor*** means a land surveyor registered in the State of Illinois under the Illinois Land Surveyors Act (225 ILCS 330/1, *et seq.*, as amended);

(101) ***professional engineer*** means an engineer registered in the State of Illinois under the Illinois Professional Engineering Practice Act (225 ILCS 325/1, *et seq.*, as amended);

(102) ***public flood control project*** means a flood control project which will be operated and maintained by a public agency or entity to reduce flood damage to existing buildings and structures which includes a hydrologic and hydraulic study of the existing and proposed conditions of the watershed;

(103) ***public flood easement*** means an easement acceptable to the appropriate jurisdictional body that meets the regulations of IDNR-OWR, the Department and the community and provides legal assurances that all areas subject to flooding in the created backwater of the development will remain open to allow flooding;

(104) ***record drawings*** means drawings prepared, signed and sealed by a professional engineer or professional land surveyor representing the final record of the actual in-place elevations, locations of structures and topography;

(105) ***registered structural engineer*** means a person licensed under the laws of the State of Illinois as a structural engineer;

(106) ***regulatory floodplain*** means the floodplain depicted on maps recognized by IDNR-OWR for regulatory purposes;

(107) ***regulatory floodway*** means those portions of the floodplain depicted as floodway on maps recognized by IDNR-OWR for regulatory purposes;

- (108) **retention facility** means a facility which stores stormwater runoff without a gravity release;
- (109) **riverine** means related to, formed by or resembling a channel and includes creeks and rivers;
- (110) **runoff** means the waters derived from melting snow or rain falling within a tributary drainage basin that exceeds the infiltration capacity of the soils of that basin;
- (111) **seasonal high groundwater table** means the upper limits of the soil temporarily saturated with water, being usually associated with spring wetness conditions which may be indicated by soil mottles with a Munsell color of two chroma or less;
- (112) **sedimentation** means the process that deposits hydraulically moved soils, debris and other materials on other ground surfaces or in bodies of water or stormwater drainage systems;
- (113) **sedimentation trap** means a structure or area that allows for the temporary deposit and removal or disposal of sediment materials from stormwater runoff;
- (114) **seepage** means the movement of drainable water through soil and rock;
- (115) **site** means all of the land contemplated to be part of a coordinated development of one or more parcels;
- (116) **site runoff storage facility** means a manmade structure for the temporary storage of stormwater runoff with a controlled release rate;
- (117) **SFHA** or **Special Flood Hazard Area** means an area having special flood, mudslide or mudflow, or flood related erosion hazards and which is shown on an FHBM or FIRM as Zone A, AO, A1-30, AE, A99, AH, VO, V1-30, VE, V, M or E;
- (118) **special management area** means a floodplain, regulatory floodplain, wetland, wetlands mitigation area, stream, river, or other water body;
- (119) **stormwater facility** means all ditches, channels, conduits, bridges, culverts, levees, ponds, natural and manmade impoundments, wetlands, riparian environment, tile, swales, sewers or other natural or artificial structures or measures which serve as a means of draining surface water and groundwater from land;
- (120) **stormwater management permit** means the permit issued under Article 5;
- (121) **structure** means a manmade change to the land constructed on or below the ground, including the construction, reconstruction or placement of a building or any addition to a building;
- (122) **substantial improvement** means (a) an improvement made to a building the cost of which is greater than or equal to 50% of building's market value before the improvement; (b) reconstruction or repair of a building, the cost of which is greater than or equal to 50% of the building's market value before reconstruction or repair; or (c) an addition to a building the cost of which is greater than or equal to 50% of the building's market value before the addition or that increases the floor area by more than 20%;
- (123) **subsurface drainage** means the removal of excess soil water to control water table levels at predetermined elevations for structural, environmental or other reasons in areas already developed or being developed for agricultural, residential, industrial, commercial or recreational uses;
- (124) **Technical Manual** means the manual adopted by the County which refers to this ordinance and provides additional explanations and examples;
- (125) **thalweg** means a line along the lowest point in a channel;

(126) **transition section** means the reaches of the stream or floodway where water flows from a narrow cross-section to a wide cross-section, or vice versa;

(127) **usable space** means space used for dwelling, storage, utilities or other beneficial purposes and includes basements;

(128) **water table** means the upper limit of a free water surface in a saturated soil or underlying material;

(129) **Waters of the U.S.** is defined by COE in 33 CFR 328.3 and, for purposes of this ordinance, includes wetlands, lakes, rivers, streams, creeks, bogs, fens, ponds and isolated wetlands but does not include maintained stormwater facilities;

(130) **watershed** means all land drained by, or contributing water to the same stream, lake, stormwater facility, or draining to a point;

(131) **watershed characteristics** means the land use, physiology, habitat, climate, drainage system and community profile of a watershed;

(132) **watershed plan** means a study and evaluation of an individual drainage basin's stormwater management, floodplain management, water quality and flood control needs capabilities adopted by the County;

(133) **wetland** is defined by COE in the *1987 Corps of Engineers Wetland Delineation Manual, Technical Report Y-87-1*, U.S. Army Engineers Waterways Experiment Station, Vicksburg, Mississippi (the "1987 Manual"), or other federally recognized methodology;

(134) **wetland impact** means—

(A) the dredging or filling of any wetland having an FQI greater than 25; or

(B) the dredging or filling of any other wetland if—

(i) such cumulative wetland dredging or filling is 0.25 acres (10,890 sq. ft.) or more in size; and

(ii) such wetland is not then regulated by COE; or

(iii) such dredging or filling is not an approved impact under a conservation plan administered by any federal agency under the Food Security Act, as amended (16 U.S.C. § 3801, *et seq.*);

(135) **wetland mitigation** means the creation and long-term maintenance of wetlands to offset wetland impacts from development;

(136) **wetland mitigation facility** means a parcel in the County specifically dedicated for the creation and long-term maintenance of wetlands and other aquatic resources and includes any area designated as a compensatory storage facility when such area is used for wetland mitigation; and

(137) **wetland mitigation bank** means one or more parcels in the County approved by COE or the Director where wetlands and/or other aquatic resources are restored, created, enhanced or, in exceptional circumstances, preserved expressly for the purpose of providing compensatory mitigation in advance of authorized impacts to similar resources.

(Sections 105 through 117 reserved)

ARTICLE 2—REQUIREMENTS FOR STORMWATER MANAGEMENT**§ 200. General information**

- (a) All developments shall meet the requirements of § 201, § 202 and Articles 3 and 6.
- (b) Developments shall comply with § 203 if—
 - (1) two or more one or two family residences are to be constructed on a site three or more acres in size;
 - (2) a single-family attached dwelling, apartment or condominium, attached townhome or other multifamily residential building comprised of more than two units is to be constructed on a site more than one acre in size;
 - (3) any non-residential land use is to be constructed on a site more than one acre in size;
 - (4) development after the effective date of this ordinance on a site one acre or more in size devoted to an existing multifamily or nonresidential land use exceeds in the aggregate 25,000 square feet; or
 - (5) road development after the effective date of this ordinance in rights-of-way under the ownership or control of a unit of local government exceeds in the aggregate one acre.
- (c) The developer of a commercial redevelopment or industrial redevelopment may ask that a fee-in-lieu of site runoff storage be approved under Article 13 if—
 - (1) the drainage plan will not increase existing flood damage; and
 - (2) the drainage plan provides a net benefit in water quality compared to the existing development.
- (d) The developer of a development consisting only of mass grading may ask that a fee-in-lieu of site runoff storage be approved under Article 13 if—
 - (1) there is no net increase in impervious surfaces;
 - (2) no structure is constructed, reconstructed or improved; and
 - (3) the quality of site runoff is improved.

§ 201. General stormwater requirements

- (a) No development shall—
 - (1) result in any new or additional expense to any person other than the developer for flood protection; or
 - (2) increase flood elevations or decrease flood conveyance capacity upstream or downstream of the site.
- (b) Analysis and design of all stormwater facilities required for a development shall—
 - (1) comply with the standards and criteria established in any applicable watershed plan or interim watershed plan; and
 - (2) be consistent with the Technical Manual.
- (c) Stormwater facilities shall be functional before any building permit is issued for any other construction on a site.

(2) Building permits may be issued but stormwater facilities shall be functional where practicable before any other construction begins on a site to be comprised when finished of only one parcel.

(d) All developments shall have an overland flowpath at the downstream limit of the site that will pass the base flood flow without increasing flood damage. If the upstream drainage area is less than 20 acres, a storm sewer pipe and inlet sized for the base flood may be constructed in lieu of providing an overland flowpath. Overland flowpaths internal to the site shall be considered part of the major stormwater system and shall be designed for conveyance of a minimum of one cfs per tributary acre without damage to structures.

(e) All usable space in new buildings or added to existing buildings hydraulically connected to a major stormwater system, site runoff storage facility or overland flowpath shall be elevated, floodproofed or otherwise protected to at least two feet above the 100-year design elevation or current FIS elevation, whichever is greater. The design elevation is the elevation associated with the design release rate as determined in § 202(c).

(f) The design of any development shall incorporate the following specific planning principles:

(1) Impervious surfaces are the minimum necessary to satisfy the intended design function. Where requirements of zoning ordinances conflict with this principle, consideration has been given to asking for a zoning variance.

(2) Where feasible, allow sufficient right-of-way and easement widths so that stormwater runoff may be conveyed in vegetated swales. Storm sewers may be used for conveyance of nuisance flows and where conveyance in vegetated swales is impractical.

(3) Existing open channels have been preserved and incorporated into the design.

(4) Best management practices have been used in the site drainage plan.

(5) Existing high-quality wetlands have been avoided, preserved or enhanced.

(6) Retention and infiltration of stormwater onsite have been enhanced to the extent practicable to reduce the volume of stormwater runoff and the quantity of runoff pollutants.

(g) The function of existing onsite depressional storage shall be preserved as an additional volume to required site runoff storage. When the depressional storage is removed it must be compensated for in the site runoff storage facility at a 1:1 ratio. Offsite areas tributary to the existing depressional storage shall be routed through the site runoff storage facility unless the existing depressional storage is reserved independently. This requirement is in addition to the site runoff storage requirements of § 203.

§ 202. Site runoff requirements

(a) Stormwater facilities shall be required and designed so that runoff exits the site at the point where it exited prior to development (unless a change is required and approved in writing by the Administrator) and in a manner so as not to increase flood damage downstream. Concentrated discharges from new developments must enter conveyance systems capable of carrying the design flow rate without increasing flood damage, erosion or maintenance costs downstream.

(b) Minor stormwater systems shall be sized to convey runoff from the tributary watershed under fully developed conditions consistent with the design requirements of the permitting authority.

(c) Major stormwater systems shall be sized to carry the base flood without causing additional flood damage.

(d) Stormwater systems shall properly incorporate and be compatible with existing subsurface and surface drainage systems including agricultural systems. Designs shall not cause damage to existing drainage systems or to existing adjacent or tributary agricultural land uses. The following principles and requirements shall be observed in the design:

(1) Offsite outfall: Agricultural subsurface and surface drainage systems shall be evaluated with regard to their capacity and capability to properly convey low flow groundwater and site runoff storage facility release without damage to downstream structures and land uses. If the outfall drain tile and surface drainage systems prove to be inadequate it will be necessary to modify the existing systems or construct new systems which will not conflict with the existing systems and will not impact existing land uses.

(2) Onsite: Agricultural drainage systems shall be evaluated in accordance with Article 5. All existing onsite agricultural drain tile not serving a beneficial use shall be abandoned by trench removal prior to other development and recorded on record drawings. If any existing drain tiles continue to upland watersheds the developer must maintain drainage service during construction until new storm sewers can be installed for a permanent connection.

(3) Offsite tributary: Existing drainage systems shall be evaluated with regard to existing capabilities and reasonable future expansion capacities. All existing tributary drain tiles shall be incorporated into the new stormwater system including observation structures located at the limits of the site and shall provide a free flow discharge. Agricultural tributary surface conveyance shall be accepted by the new development with consideration given to water quality and sediment filtering control.

(4) New roadway construction shall preserve existing subsurface systems within the right-of-way. Inspection wells shall be placed at the right-of-way and tiles found not to be flowing between inspection wells at the end of construction shall be replaced.

(e) Design runoff rates shall be calculated using event hydrograph methods. Acceptable event hydrograph methods are HEC-HMS, HEC-1 (SCS runoff method), TR-20 or TR-55 tabular method. Event methods must incorporate the assumptions contained in § 203(b). Design runoff rates for minor conveyance systems may be calculated using the Rational Method if the design watershed is less than 20 acres.

(f) Any design runoff rate calculation method shall use Bulletin 70 northeast sectional rainfall statistics and shall calculate flow from all tributary areas upstream of the point of design. Peak discharges for conveyance design purposes shall be based on the critical duration considering the appropriate rainfall distribution.

(g) Major and minor stormwater systems shall be located within easements or rights-of-way explicitly providing for public access or maintenance of such facilities. New facilities constructed offsite pursuant to § 202(d) need not comply with this requirement.

(h) Maximum flow depths for new transverse stream crossings shall not exceed one foot at the crown of the road during the base flood condition. The maximum flow depth on a roadway shall not exceed six inches at the crown for flow parallel to the roadway. For flow over a roadway or parallel to a roadway the product of the flow depth (in feet) and velocity (in feet per second) shall not exceed four for the base flood condition.

(i) Transfers of waters between watersheds (diversions) shall be prohibited except when such transfers will not violate the provisions of § 201(a) and are otherwise lawful. Watersheds for the purposes of this section shall be the major watershed divides shown in Appendix A of this ordinance.

(j) Developments shall incorporate all best management practices required under the Clean Water Act (33 U.S.C. § 1251, *et seq.*, as amended).

§ 203. Site runoff storage requirements (detention)

(a) The area of hydrological disturbance on the site shall be used to calculate the required site runoff storage volume. The tributary area of the site at the point of discharge shall be used to calculate the allowable release rate of the primary restrictor for the site runoff storage facility.

(b) Absent any applicable watershed plan or interim watershed plan, sufficient storage shall be provided such that the probability of the post-development release rate exceeding 0.1 cfs/acre of development shall be less than 1% per year. Design runoff volumes shall be calculated using event hydrograph methods.

(c) Event hydrograph routing methods such as HEC-1, HEC-HMS, TR-20 or TR-55 tabular method using SCS curve number methodology shall be used to calculate design runoff volumes for facilities with more than five acres of tributary area or when areas tributary to the facility extend offsite. For facilities with less than five acres of tributary area all onsite, the nomograph relating *%-Impervious to Unit Area Detention* developed by NIPC may be used to calculate the volume of site runoff storage required. Event methods shall incorporate the following assumptions:

(1) antecedent moisture condition equals two;

(2) appropriate Huff rainfall distribution except that SCS Type II distribution is acceptable with TR-55 tabular method only; and

(3) 24-hour duration storm with a 1% probability (100-year) of occurrence in any one year as specified by Bulletin 70 northeast sectional rainfall statistics.

(d) For sites where the undeveloped release rate is less than the maximum release rate in § 203(b), the developed release rate and corresponding site runoff storage volume shall be based on the existing undeveloped release rate for the development site.

(e) Hydraulic computations for the release structure must assume appropriate backwater conditions considering the likelihood of concurrent flood events on the site and receiving stream.

(f) Reserved.

(g) development shall be stored below the elevation of the primary gravity outlet (retention) of the site runoff storage facility. The facility may be designed to allow for evapotranspiration or infiltration of this volume into a subsurface drainage system and shall not be conveyed through a direct positive connection to downstream areas.

(2) The hydraulically connected impervious area used in the calculation of required retention volume may be reduced by the Administrator if the soils are undisturbed *in-situ* or prepared to maximize infiltration and deep-rooted grasses or other plants which help promote infiltration and transpiration are planted in areas appropriately dedicated. The reduction in hydraulically connected impervious area used in the calculation shall be equal to the area of the development meeting the above soils/planting requirement.

(3) Residential, industrial, commercial, institutional or multi-family developments where the downstream outlet is not directly connected to a new or municipal storm sewer outletting to an open channel will also be required to meet the retention requirement of this section, except that the area of new roadway impervious area shall be used as a minimum to calculate the required volume.

(4) Subsurface drainage systems may be designed as a component of the retention portion of the site runoff storage basin to assist in infiltration in accordance with the following criteria:

(A) The retention volume shall be discharged at a rate no greater than that required to empty the calculated retention volume within five days of the storm event.

(B) No such subsurface drainage pipe shall be located within ten feet of drainage pipes directly connected to the site runoff storage basin.

(C) For purposes of meeting the maximum subsurface drainage requirements, flow control orifices and weirs may be used.

(D) The design shall be consistent with the methodologies and intent of the Technical Manual.

(h) Storage facilities shall be designed and constructed with the following characteristics:

(1) Water surface depths two feet above the base flood elevation will not damage the storage facility.

- (2) The storage facilities shall be accessible and easily maintained.
- (3) All design site runoff storage volume shall be provided above the seasonal high groundwater table or the invert elevation of the groundwater control system.
- (4) Storage facilities shall facilitate sedimentation and catchment of floating material. Unless specifically approved by the Administrator, concrete lined low flow ditches shall not be used in site runoff storage basins.
- (5) Storage facilities shall minimize impacts of stormwater runoff on water quality by incorporating best management practices.
- (6) Storage facilities shall maximize the distance between site runoff storage inlets and outlets to the extent possible.
- (7) Storage facilities shall be designed such that the existing conditions pre-development peak runoff rate of the 100-year, critical duration rainfall will not be exceeded assuming the primary restrictor is blocked.
- (8) Storage facilities with single pipe outlets shall have a minimum inside diameter of twelve inches. If design release rates necessitate a smaller outlet, structures such as perforated risers or flow control orifices shall be used.
- (9) A mechanically opened outlet to draw down the permanent pool or retention area for maintenance purposes to the lowest available invert at the site boundary shall be provided.
 - (i) Storage facilities located within the regulatory floodplain shall (a) comply with Article 4; and (b) store the required amount of site runoff to meet the release rate requirement under all streamflow and backwater conditions up to the ten-year flood elevation on the adjacent receiving watercourse. The Administrator may approve designs which can be shown by detailed hydrologic and hydraulic analysis to provide a net watershed benefit not otherwise realized by strict application of the requirements set forth in (a) and (b) of this subsection.
 - (j) Storage facilities located within the regulatory floodway shall (a) meet the requirements for locating storage facilities in the regulatory floodplain; (b) be evaluated by performing hydrologic and hydraulic analysis consistent with the standards and requirements for watershed plans; and (c) provide a net watershed benefit.
 - (k) Site runoff storage facilities may be located offsite if (a) the offsite storage facility meets all of the requirements of this Article; (b) adequate storage capacity in the offsite facility is dedicated to the development; and (c) the development includes means to convey stormwater to the offsite storage facility.
 - (l) Site runoff storage volume provided by enlarging existing regulatory floodplain storage (onstream site runoff storage) will be allowed only as a variance. The applicant must demonstrate that flood damage will not be increased and the development will not increase flood flows for both the two-year and 100-year floods.
 - (m) Structures built across the channel to impound water to meet site runoff storage requirements shall be prohibited on any perennial stream unless part of a public flood control project with a net watershed benefit. Those streams appearing as blue on a USGS Quadrangle Map shall be assumed to be perennial unless better data is provided by the developer. In all cases it must be demonstrated that all such structures will not cause short-term or long-term stream instability. Where such facilities are approved the applicant must also comply with § 203(g).

ARTICLE 3—EROSION AND SEDIMENT CONTROL

§ 300. Erosion and sediment control

(a) Erosion and sediment control planning shall be part of the initial site planning process. In planning the development of the site, the applicant shall consider the sensitivity of existing soils to erosion and topographical features such as steep slopes, stream corridors and special management areas which must be protected to reduce the amount of erosion and sediment which occurs. Where appropriate, existing vegetation shall be protected from disturbance during construction by fencing or other means. In the planning process the applicant shall also address the following:

(1) For projects that involve phased construction, existing land cover for those areas not under current development shall be addressed. If existing land cover does not consist of an appropriate dense vegetation then these phases shall be planted temporarily to reduce erosion from idle land.

(2) In planning the erosion and sediment control strategy, preference shall be given to reducing erosion rather than controlling sediment. In order to accomplish this the plan must carefully consider the construction sequence of the phases so that the amount of land area exposed to erosive forces is the minimum consistent with completing construction.

(b) Standards and specifications for erosion and sediment control measures shall be in accordance with the *Illinois Urban Manual*, (1995, or current edition). Erosion and sediment control planning shall be in accordance with *Procedures and Standards for Urban Soil Erosion and Sedimentation Control in Illinois*, (revised, July, 1988) by the Urban Committee of the Association of Illinois Soil and Water Conservation Districts (the *Green Book*), Chapters 1-5. Where the *Illinois Urban Manual* conflicts with the *Green Book*, the *Illinois Urban Manual* shall prevail.

(c) The runoff from disturbed areas shall not leave the site without first passing through sediment control measures or devices. This requirement shall apply to all phases of construction and shall include an ongoing process of implementation of measures and maintenance of those measures during both the construction season and any construction shutdown periods.

(d) The condition of the construction site for winter shutdown shall be addressed early in the fall growing season so that slopes and other bare earth areas may be stabilized with temporary and/or permanent vegetative cover for proper erosion and sediment control. All open areas that are to remain idle throughout the winter shall receive temporary erosion control measures including temporary seeding, mulching and/or erosion control blanket prior to the end of the fall growing season. The areas to be worked beyond the end of the growing season must incorporate soil stabilization measures that do not rely on vegetative cover such as erosion control blanket and heavy mulching.

(e) In the hydraulic and hydrologic design of major erosion control measures (those whose tributary drainage area is greater than three acres) such as sediment basins and traps, diversions and the like, the design frequency shall be commensurate with the risk of the design event being exceeded. The following design frequencies shall be regarded as minimum design frequencies for the construction period:

(1) If development is estimated to be completed in less than six months, the storm event having a 50% chance (two-year event) of being exceeded in any year shall be used for design purposes.

(2) If development is estimated to be completed in more than six months but less than one year, the design frequency for major sediment basins shall be a rainfall event with a 20% (five-year event) chance of been exceeded in any one year.

(3) If development is estimated to take more than one year to complete, major sediment basins shall be designed for a rainfall event with a 10% (ten-year event) chance of been exceeded in any one year.

(4) All sediment basins shall be designed for a minimum residence time of ten hours for detained runoff and shall include a volume for sediment storage reflective of the clean out schedule for the basin.

(f) The erosion and sediment control plan shall designate a series of practices which shall be implemented either at the direction of the applicant or the applicant's representative onsite or at the direction of the Administrator should an inspection of the site indicate a deficiency in soil and sediment erosion control measures. At a minimum, these measures shall include (a) sedimentation basins; (b) sediment traps; (c) diversion swales; (d) silt fences; (e) temporary seeding; (f) mulching; and (g) erosion control blankets.

(g) The area of disturbance onsite at any one time shall be limited to 20 acres. An additional 20 acres (a maximum of 40 acres of disturbance at any one time) may be disturbed if necessary to balance cut and fill onsite. The Administrator may approve a larger area of disturbance pursuant to a plan for phased construction or after development has begun, if the developer adequately demonstrates the need therefor and the Administrator finds that adequate temporary and permanent erosion and sediment control measures can be maintained and that the developer is proposing an area of disturbance which at any one time is the smallest practical area consistent with the intent to limit disturbed area and minimize the risk of sediment being introduced into site runoff and being carried offsite. No additional area may be disturbed without the permission of the Administrator until the previously disturbed areas have been temporarily or permanently stabilized. All disturbed areas shall be stabilized within 14 days of final grading or when left idle for more than seven days. Maintained haul roads and the area of sediment basins, site runoff storage facilities, utility corridors having a maximum width of 20 feet, and any permanently stabilized areas are excluded from this limitation.

(h) Erosion and sediment control plans shall be in accordance with Article 5 and shall include the following:

(1) Detailed construction phasing plan identifying erosion and sediment control measures to be in place for each phase shall be submitted.

(2) Erosion and sediment control measures to be installed initially prior to stripping existing vegetation or mass grading shall be indicated on the plans.

(3) Permanent stabilization measures shall be indicated on a separate plan.

(4) The expected two-year and ten-year runoff rates from all offsite areas draining into the site shall be identified on the plan.

(5) Methods for conveying flows through the site during construction shall be indicated. These methods must include the temporary and permanent stabilization measures to be used to reduce velocity and erosion from flow through the construction zone.

(6) A maintenance schedule of each measure used shall be indicated on the plan. As a minimum, all erosion and sediment control measures onsite shall be inspected weekly or after a one-half inch or greater rainfall event and any required repairs shall be made to keep these measures functional as designed.

(7) Special management areas and any required buffers shall be indicated on the erosion and sediment control plan.

(i) To the extent practicable, proposed ditches and waterways which are to convey offsite flows through the site shall be stabilized upon construction. Where new waterways are constructed they shall be stabilized to the extent practicable prior to their use to convey flood flows.

(j) Stockpiles of soil and other building materials (sand, limestone, etc.) shall not be located in special management areas or required buffers. If a stockpile is to remain in place for more than three days, erosion and sediment control shall be provided.

(k) Storm sewer inlets shall be protected with sediment trapping and/or filter control devices during construction.

(l) Water pumped or which is otherwise discharged from the site during construction dewatering shall be filtered and a means provided to reduce erosion.

(m) Graveled roads, access drives, parking areas of sufficient width and length and vehicle wash-down facilities if necessary, shall be provided to prevent soil from being tracked onto public or private roadways. Any soil tracked onto a public or private roadway shall be removed before the end of each workday or sooner as directed by the authority maintaining the roadway.

(n) Temporary stream crossings of intermittent and perennial streams used only for and during construction shall be designed to convey a two-year flood (minimum), without overtopping unless a more frequent design event is allowed by the Administrator and will not obstruct the portion of the channel carrying the base flow. The entire crossing shall be designed to withstand hydrodynamic and erosive forces up to the base flood event without washing out. Ephemeral streams may be crossed at temporary at-grade crossings provided that the crossing point is stabilized with materials resistant to the erosive forces produced by runoff from the upstream drainage area and the design is approved by the Administrator. All temporary stream crossings shall be completely removed and the stream restored to its preconstruction condition upon completion of construction. Restoration shall incorporate appropriate native vegetation.

ARTICLE 4—PROTECTION OF SPECIAL MANAGEMENT AREAS

§ 400. Reserved

§ 401. Disclaimer

Nothing in this ordinance purports to alter or affect the regulatory program administered by IDNR-OWR. Anything in this ordinance to the contrary notwithstanding, if under the rules and regulations administered by IDNR-OWR a submittal need not be made to IDNR-OWR, or a review, approval or permit from IDNR-OWR need not be obtained, then nothing in this ordinance shall be construed to impose a requirement that such a submittal be made or that such a review, approval or permit be obtained from IDNR-OWR. Similarly, if IDNR-OWR has delegated its regulatory authority to another entity, then anything in this ordinance to the contrary notwithstanding, if required by such entity, such submittal shall be made or such review, approval or permit shall be obtained from such entity.

§ 402. Statewide and regional permits

Development that qualifies for any of the self-issuing statewide or regional permits administered by IDNR-OWR (Statewide Permits Nos. 1 through 14 and Regional Permit No. 3), are similarly permitted under this Article. The developer need only submit to the Administrator such information as shall show the Administrator that the development qualifies for the particular statewide or regional permit in question under the regulations established by IDNR-OWR for such permit and no further submittal need be made under this Article. All other provisions of this ordinance applicable to such development, however, continue to apply.

§ 403. Floodplain management

All development shall meet the requirements set forth in Table 403.

Table 403 - Summary of requirements for development in floodplains

	§ 404	§ 405	§ 406	§ 407	§ 408	§ 409	§ 410	§ 411	§ 412	§ 413

Note 1. Riverine, floodplains only

Note 2. For buildings meeting appropriate use criteria

Note 3. See exclusion in § 413(c)

§ 404. Floodplain, regulatory floodplain, BFE and regulatory floodway locations

(a) The BFE shall be delineated on the site topography to establish the regulatory floodplain area limits for regulation under this ordinance. Regulatory floodplains shall be delineated on the site map from the current FEMA FIRM, FBFM or LOMR and include those areas of the SFHA which are not regulatory floodplains. A list of the current regulatory maps for Kane County to be consulted is maintained by the Director.

(b) insurance (c) The BFE shall be the elevation of the 100-year profile shown for the site on the current flood

FEMA. A public notice inviting public comment on the proposed change in the BFE or location of the regulatory floodway will be issued by IDNR/OWR or its designee before a CLOMR is issued. Filling, grading, dredging or excavating may take place upon issuance of a conditional approval from IDNR/OWR and the Administrator. No further development activities shall take place in the existing or proposed floodplain until a LOMR is issued by FEMA unless such activities meet all the requirements of §§ 403 through 413 of this ordinance. The Director shall be copied on all related correspondence.

(E) In the circumstances listed below and located in a regulatory floodway, at a minimum, the information set forth below shall be submitted to IDNR/OWR for its review and approval:

- (i) analysis of the flood profile due to a proposed bridge, culvert crossing or roadway approach;
- (ii) an engineer's determination that an existing bridge, culvert crossing or approach road is not a source of flood damage and the analysis indicating the proposed flood profile;
- (iii) alternative transition sections and hydraulically equivalent compensatory storage; and
- (iv) stormwater management permits issued to local units of government for regulatory floodway and floodplain development.
- (v) IDNR/OWR will issue permits for any IDNR/OWR, state, federal or community projects.

§ 405. General performance standards

The following general performance standards are applicable to all development in a regulatory floodplain. The standards of this section apply except when superseded by more stringent requirements in subsequent sections.

(a) No development shall be allowed in the regulatory floodplain that singularly or cumulatively creates any increase in flood stage or velocity offsite, or a damaging or potentially damaging increase in flood heights or velocity onsite or a threat to the public health, safety and welfare.

(b) For all projects involving a channel modification, fill, stream maintenance or a levee, the flood conveyance and storage capacity of the regulatory floodplain shall not be reduced.

(c) If the proposed development would result in a change in the regulatory floodplain or BFE the applicant shall obtain a LOMR from FEMA. No buildings may be built in the existing or proposed regulatory floodplain until the LOMR is obtained from FEMA unless the building meets all the building protection standards of § 407. Proposed changes to the regulatory floodway delineation and the BFE must be submitted to IDNR/OWR for approval.

(d) If the development is located in the Fox River a permit must also be received from IDNR/OWR.

(e) Prior to the commencement of any construction, modification or removal of a dam the developer shall obtain an IDNR/OWR Dam Safety Permit or letter indicating a permit is not required.

(f) For public flood control projects, §§ 403 through 413 will be deemed met if the applicant demonstrates to IDNR/OWR and the Committee—

(1) by hydraulic and hydrologic modeling that the proposed project will not singularly or cumulatively result in increased flood heights outside the project site or that any increases will be contained in easements for all flood events up to and including the base flood event;

(2) that the project will be operated and maintained by a public entity;

(3) that the project will reduce flood damage to an existing building or structure.

Nothing in this section precludes the design, engineering, construction or financing, in whole or in part, of a public flood control project by persons who are not public entities.

§ 406. Public health protection standards

(a) New and replacement water supply systems, wells and sanitary sewer lines may be permitted if all manholes or other above-ground openings located below the FPE are watertight.

(b) New onsite waste disposal systems, such as septic systems, shall not be constructed within the regulatory floodplain.

(c) New, substantially improved or replacement wastewater treatment plants shall have watertight openings for those openings located below the FPE. Such facilities should be located to avoid impairment to the facility or contamination of flood waters during the base flood.

§ 407. Building protection standards

This section applies to all buildings located in the regulatory floodplain. However, most new and replacement buildings are not appropriate uses of the regulatory floodway.

(a) The lowest floor including basements of all new residential structures, substantially improved structures and additions shall be elevated at least to the FPE. An attached garage for a structure must be elevated at least six inches above the BFE.

(1) If placed on fill, the top of the fill for a residential structure shall be above the FPE. The top of fill for an attached garage shall be at least six inches above the BFE. The fill shall be placed at that elevation for a distance of ten feet out from the building unless the building design is certified by a registered structural engineer to be protected from damage due to hydrostatic pressures. Additionally, the fill shall not settle below the FPE for a residential structure and not below six inches above the base flood for an attached garage, and shall be adequately protected against erosion, scour and differential settlement. A LOMR shall be obtained from FEMA removing the residential site from the floodplain.

(2) If elevated by means of walls, pilings, or other foundation, the building's supporting structure must be permanently open to flood waters and not subject to damage by hydrostatic pressures of the base flood. The permanent openings shall be no more than one foot above existing grade and consist of a minimum of two openings. The openings must have a total net area of not less than one square inch for every one square foot of enclosed area subject to flooding below the BFE. The lowest inside grade must match the lowest existing outside grade adjacent to the structure. The foundation and supporting members shall be anchored and aligned in relation to flood flows and adjoining structures so as to minimize exposure to known hydrodynamic forces such as current, waves, ice and floating debris. All areas below the FPE shall be constructed of materials resistant to flood damage. The lowest floor (including basement) for a residential structure and all electrical, heating, ventilating, plumbing and air conditioning equipment and utility meters shall be located at or above the FPE. An attached garage must be elevated at least six inches above the BFE. Water and sewer pipes, electrical and telephone lines, submersible pumps and other waterproofed service facilities may be located below the FPE. No area less than two feet above the BFE shall be used for storage.

(b) The lowest floor including the basement of all new or substantially improved non-residential buildings shall be elevated at least to the FPE as described above or be structurally dry floodproofed to at least the FPE. A non-residential building may be structurally dry floodproofed (in lieu of elevation) provided that a professional engineer or registered structural engineer shall certify that the building has been structurally dry floodproofed below the FPE and the structure and attendant utility facilities are watertight and capable of resisting the effects of the base flood. The building design shall take into account flood velocities, duration, rate of rise, hydrostatic and hydrodynamic forces, the effects of buoyancy and impacts from debris or ice. Floodproofing measures shall be operable without human intervention and without an outside source of electricity. Levees, berms, floodwalls and similar works are not considered floodproofing for the purpose of this subsection.

(c) Manufactured homes and recreational vehicles to be installed on a site for more than 180 days shall be at or above the FPE and shall be anchored to resist flotation, collapse or lateral movement in accordance with the Illinois Manufactured Home Tie-Down Code (77 Ill. Adm. Code 870 (1999), as amended).

(d) Accessory structures such as tool sheds and detached garages which are not substantial improvements on an existing single family lot, may be constructed with the lowest floor below the FPE in accordance with the following criteria:

(1) The building shall not be used for human habitation.

(2) All areas below the FPE shall be constructed with waterproof material. Structures located in a regulatory floodway shall meet the floodway standards of § 411.

(3) The structure shall be anchored to prevent flotation and movement.

(4) Service facilities such as electrical and heating equipment shall be elevated or floodproofed to the FPE.

(5) The building shall be no greater than 576 square feet in floor size and cost not more than \$12,000 to construct.

(6) The building shall meet the requirements of § 407(a)(2).

(7) The building shall be used only for the storage of vehicles or tools and may not contain other rooms, workshops, greenhouses or similar uses.

Accessory structures that do not meet all of the above criteria may be constructed if they are dry floodproofed or elevated at least six inches above the BFE.

(e) The lowest floor of an addition to an existing industrial use may be constructed at the BFE plus one foot provided this elevation is required by the industrial process as demonstrated by the applicant and the Administrator approves the elevation in writing.

§ 408. Non-conforming structures

A non-conforming structure damaged by flood, fire, wind or other disaster may be restored unless the damage is equal to or greater than 50% of its fair market value before it was damaged, in which case it shall conform to § 407.

§ 409. Lowest opening

For proposed structures located outside the regulatory floodplain, the lowest opening shall be above the FPE.

§ 410. Compensatory storage volume standards

The following standards apply within the regulatory floodplain:

(a) Hydraulically equivalent compensatory storage volume will be required for development in a riverine regulatory floodplain and shall be at least equal to the regulatory floodplain flood storage volume displaced multiplied by 1.5. The storage volume displaced below the existing ten-year frequency flood elevation must be replaced below the proposed ten-year frequency flood elevation. The storage volume displaced above the ten-year existing frequency flood elevation must be replaced above the proposed ten-year frequency flood elevation. The additional compensatory flood storage required beyond a 1:1 ratio may be placed above or below the ten-year flood elevation.

(b) Compensatory storage volume for development in a non-riverine regulatory floodplain area that is also adjacent to a lake shall be equal to the storage volume displaced.

(c) Compensatory storage volume requirements for development in a non-riverine regulatory floodplain that is not adjacent to a lake shall be replaced in accordance with the requirements for the loss of depressional storage in § 201(g).

(d) Compensatory storage areas shall be designed to drain freely and openly to the channel and shall be located adjacent to the development. This standard does not apply to non-riverine regulatory floodplain or the replacement of depressional storage.

(e) A recorded covenant running with the land is required to maintain the compensatory storage volume in areas modified to provide compensatory storage volume.

§ 411. Floodway standards

The only development in a regulatory floodway which will be allowed are appropriate uses which will not cause an increase in flood heights or velocities for all flood events up to and including the base flood. Only those appropriate uses listed below will be allowed in the regulatory floodway. Appropriate uses do not include the construction or placement of any new structures, fill, building additions, buildings on stilts, fencing (including landscaping or planting designed to act as a fence) and storage of materials except as specifically defined below as an appropriate use. If the development is proposed for the regulatory floodway portion of the regulatory floodplain, the following standards apply in addition to the standards for the regulatory floodplain:

(a) Only the construction, modification, repair or replacement of the following appropriate uses will be allowed in the regulatory floodway:

(1) public flood control structures and private improvements relating to the control of drainage and flooding of existing buildings, erosion, water quality or habitat for fish and wildlife;

(2) structures or facilities relating to functionally water dependent uses such as additions, modifications and improvements to existing wastewater treatment plants and facilities (not including new wastewater treatment plants or habitable structures at existing wastewater treatment plants) and improvements relating to recreational boating;

(3) storm and sanitary sewer outfalls;

(4) underground and overhead utilities if sufficiently floodproofed;

(5) recreational facilities such as playing fields, open pavilions, gazebos and trail systems including any related fencing (at least 50% open when viewed from any one direction) built parallel to the direction of flood flows;

(6) detached garages, storage sheds, boat houses or other non-habitable structures without sanitary facilities that are accessory to existing buildings and will not block flood flows nor reduce regulatory floodway storage;

(7) bridges, culverts and associated roadways, sidewalks and railways, required for crossing the regulatory floodway or for access to other appropriate uses in the regulatory floodway and any modification thereto;

(8) parking lots built at or below existing grade provided that either—

(A) the BFE is less than one foot above the proposed parking lot; or

(B) the parking lot is accessory to short-term outdoor recreational facilities and the owner agrees to restrict access during periods of inundation and agrees to accept liability for all damage caused by vehicular access during flooding events;

(9) regulatory floodway grading, without fill, to create a positive non-erosive slope toward a channel;

(10) floodproofing activities to protect previously existing lawful structures including the construction of watertight window wells, elevating structures or the construction of flood walls or berms around residential, commercial or industrial principal structures where the outside toe of the floodwall or berm is no more than ten feet away from the exterior wall of the existing structure and where such activities are not considered to be a substantial improvement to the structure;

(11) the repair, replacement or reconstruction of a damaged building, provided that none of the outside dimensions of the building are increased and such repair, replacement or reconstruction does not constitute a substantial improvement;

(12) modifications to an existing building such as fireplaces, bay windows, decks, patios and second story addition which do not constitute a substantial improvement, do not increase the enclosed floor area of the building below the BFE and do not block flood flows; no enclosed floor areas may be built on stilts.

(b) No change shall be made to the list of appropriate uses without the prior approval of IDNR-OWR and the Committee.

(c) All development in the regulatory floodway shall require a stormwater management permit and must be in accordance with all provisions of this ordinance.

(d) An appropriate use may be permitted if the proposed project meets the following engineering and mitigation criteria and is so stated in writing with supporting plans, calculations and data prepared and signed by a professional engineer.

(1) All effective regulatory floodway conveyance lost due to the development of appropriate uses, other than bridge or culvert crossings or onstream structures or dams, shall be replaced for all flood events up to and including the base flood.

(2) The following expansion and contraction ratios shall be used to determine transition sections in calculations of effective regulatory floodway conveyance:

(A) Flowing water will expand no faster than a rate of one foot horizontally for every four feet of the flooded stream's length.

(B) Flowing water will contract no faster than at a rate of one foot horizontally for every one foot of the flooded stream's length.

(C) Flowing water will not expand or contract faster than one foot vertically for every ten feet of flooded stream's length.

(D) All cross-sections used in the calculations shall be perpendicular to flood flows.

(E) Transition sections must be used to determine the effective conveyance areas on adjacent properties.

(3) Development of an appropriate use will not result in an increase in the average channel or regulatory floodway velocities or stage. However, in the case of bridges or culverts or onstream structures built for the purpose of backing up water in the stream during normal or flood flows, velocities may be increased at the structure site if scour, erosion and sedimentation will be avoided by the use of rip-rap or other design measures.

(4) In the case of onstream structures built for the purpose of backing up water during normal or flood flows, the increase in flood stage when compared to existing conditions for all storm events up to and including the base flood event shall be contained within recorded easements or the channel banks. A Dam Safety Permit or letter indicating a Dam Safety Permit is not required must be obtained from IDNR/OWR for such structures. If floodproofing construction is required beyond the outside dimensions of an existing habitable residential or

commercial building, the outside perimeter of the floodproofing construction shall be no further than ten feet from the building. Compensation for lost storage and conveyance will not be required for floodproofing within the ten-foot perimeter provided flood damage to other buildings is not increased.

(5) If floodproofing construction is required beyond the outside dimensions of an existing habitable residential or commercial building, the outside perimeter of the floodproofing construction shall be no further than ten feet from the building. Compensation for lost storage and conveyance will not be required for floodproofing within the ten-foot perimeter provided the probability of flood damage to other buildings is not increased.

(6) IDNR/OWR will issue permits for all IDNR/OWR, state, federal or community projects.

§ 412. Riverine Floodplain

These standards apply to riverine regulatory floodplains without a regulatory floodway. The applicant shall obtain approval from IDNR/OWR for all development, any portion of which is located within the regulatory floodplain (without a delineated regulatory floodway) with a tributary drainage area of 640 acres or more.

(a) The development shall not singularly or cumulatively result in an obstruction of flood flows or potential flood damages outside the site due to an increase in flood heights, velocities or loss of floodplain area storage.

(b) A professional engineer shall submit a study that—

(1) determines a floodway which meets the definition of a regulatory floodway and demonstrates that the proposed development meets the floodway standards in § 411; or

(2) determines a BFE and demonstrates that the proposed development will maintain the existing conditions conveyance, will not increase flood velocities, will not increase flood profiles and will compensate for any lost floodplain storage in accordance with § 410; or

(3) shows that the proposed development will meet the requirements for regulatory floodplains in §§ 406 and 407.

§ 413. Bridge and culvert standards

These standards are for the reconstruction, modification or new construction of bridges, culvert crossings and roadway approaches located in the regulatory floodplain.

(a) A proposed new structure shall not result in an increase of upstream flood stages greater than 0.1 foot when compared to the existing conditions for all flood events up to and including the base flood event unless contained within the channel banks or recorded easements. The evaluation must be submitted to IDNR-OWR for review and issuance of a permit.

(b) If the proposed new structure will increase upstream flood stages greater than 0.1 foot, the applicant must contact IDNR/OWR for a Dam Safety Permit or waiver. The Director shall be copied on all related correspondence.

(c) Lost regulatory floodplain storage must be replaced as required in § 410 except that artificially created storage lost due to a reduction in head loss behind an existing bridge or culvert crossing shall not be required to be replaced, provided no flood damage will be incurred downstream.

(d) Velocity increases must be mitigated by use of appropriate measures to avoid scour, erosion and sedimentation at the structure.

(e) For modification or replacement of existing structures in a regulatory floodway, the existing structure must first be evaluated in accordance with IDNR/OWR Rules (17 Ill. Adm. Code Part 3708) to determine if the existing structure is a source of flood damage. If the structure is a source of flood damage, the applicant's engineer shall justify allowing the damage to continue and evaluate the feasibility of relieving the structure's impact.

Modifications to or replacement of structures shall not increase flood stages (0.0 feet) compared to the existing condition for all flood events up to and including the base flood event. The evaluation must be submitted to IDNR/OWR for review and approval before a permit is issued. The Director shall be copied on all related correspondence.

(f) If any work is proposed in, near or over the Fox River, a permit or letter indicating a permit is not required must be obtained from IDNR/OWR.

(g) The hydraulic analysis for the backwater caused by the bridge showing the existing condition and proposed regulatory profile must be submitted to IDNR/OWR for concurrence that a CLOMR is not required.

(h) Construction vehicles shall cross streams by the means of existing bridges or culverts. Where an existing crossing is not available, a temporary crossing, for which a permit or waiver has been issued by IDNR-OWR, shall be constructed in which—

(1) the approach roads will be six inches or less above existing grade;

(2) the crossing will allow stream flow to pass without backing up the water above the stream bank vegetation line or above any drainage tile or outfall;

(3) the top of the roadway fill in the channel will be at least two feet below the top of the lowest bank;

(4) any fill in the channel shall be non-erosive material, such as rip-rap or gravel; and

(5) the access road and temporary crossings will be removed within one year after installation, unless an extension of time is granted by the Administrator

§ 414. Requirements for wetland delineation

(a) Before any development in or near Waters of the U.S., or in or near isolated wetlands or farmed wetlands, a written report identifying and evaluating the boundaries, location, limits, area and quality of all onsite wetlands shall be submitted. The presence and limits of wetland areas shall be determined by a wetland delineation conducted in accordance with the 1987 Manual. The presence of farmed wetlands shall be determined by NRCS.

(b) Before any development on agricultural land, in addition to the onsite delineation required under the previous paragraph, a Certified Wetland Determination shall be obtained from NRCS.

(c) The quality of the wetlands shall be evaluated based upon the FQI.

(d) Delineations for permitting purposes shall be performed only during the period beginning on the last Monday of March and ending on the third Friday of November.

(e) The approximate location, extent and relative quality of wetlands within 50 feet of the site shall be identified and included in the written report. The location and extent of such offsite wetlands shall be determined by using the first of the following documents or procedures pertaining at the time of development:

(1) site specific delineation according to the 1987 Manual. If such delineation is not available, then—

(2) wetlands identified in watershed plans or ADID studies. If such plans are not available, then—

(3) wetlands identified in interim watershed plans. If such plans are not available, then—

(4) wetlands identified on NRCS wetlands inventory maps.

§ 415. Mitigation to be local

All wetland mitigation required under a COE § 404 permit for wetland disturbances in Kane County shall be provided in Kane County.

§ 416. Threatened and endangered species consultation

Prior to the issuance of a stormwater management permit the applicant shall consult with IDNR and the United States Fish and Wildlife Service with respect to the presence of threatened or endangered species and shall obtain a “positive outcome” letter or other instrument of approval.

§ 417. Wetland preservation during development

Preserved wetlands shall be protected during development such that an FQI calculated two years after the commencement of development will not be more than 2 points less than the FQI originally calculated. The developer shall mitigate for any wetland not so preserved at the ratio required for the FQI originally calculated.

§ 418. Buffer requirements

The requirements of this section are not applicable to commercial or industrial redevelopment projects on sites adjacent to the main channel of the Fox River. The requirements of this section are also not applicable to isolated wetlands or Waters of the U.S. that, in either case, are below the threshold size limitations for mitigation requirements under the COE § 404 permit program (currently, less than 0.25 acres).

(a) Buffers shall be designated on development plans for all areas defined as Waters of the U.S. that are adjacent to protected Waters of the U.S. shall be shown to be within appropriate easements on all new plats. Additionally, the maintenance requirements for the buffer shall be noted on the plat or included as a covenant running with the land in any deed which conveys any portion of a buffer area.

(2) Buffer widths required as a part of a COE permit supersede the widths required in this section, unless the width required herein is greater. If a COE permit is obtained to permanently fill a portion of a wetland and no buffer is required, the buffer width required by this ordinance immediately adjacent to the area of impact does not apply. Immediately adjacent refers to the area within 15 feet of the area of impact. In no case shall additional wetland area be filled to provide buffer required by this ordinance.

(3) A jurisdictional Waters of the U.S., or wetland may not constitute buffer. Buffer widths are to be 50 feet wide unless otherwise determined using the criteria specified in §§ 418(a)(3)(A) and/or 418(a)(3)(B). Buffer width averaging is acceptable at the discretion of the Administrator. When using buffer width averaging, the width may not be more than 20% less, at the narrowest point, than the specified width. The buffer width may never be less than 15 feet, except in the case of Waters of the U.S. or wetlands with a calculated FQI of less than 7 where the buffer at its narrowest point may not be less than 12 feet in width.

(A) Linear buffers shall be designated along Waters of the U.S. and wetlands associated with water courses, i.e. swales, creeks, streams, rivers, etc. Refer to § 418(a)(3)(B) in cases where wetlands are adjacent to and not part of the main channel, i.e. floodplain wetland, backwater slough, oxbow, bordering wetland complex.

(i) When the lineal Waters of the U.S. have a drainage area greater than 640 acres, measured at the downstream property line, or is designated as ADID because of high biological value or an adjacent wetland has a calculated FQI greater than 16, the buffer shall be 50 feet.

(ii) When the lineal Waters of the U.S. have a drainage area less than 640 acres, measured at the downstream property line, the buffer width shall be determined utilizing the formula, $X = (A * 0.0547) + 15$, where X equals the buffer width in feet and A equals the drainage area in acres. The width calculated by this formula shall be rounded up to the nearest multiple of five. Figure 1 may be used to determine buffer widths provided the resultant width is increased to the nearest multiple of five.

(iii) If protective measures are installed along the perimeter of a buffer, the width may be reduced by up to 15% immediately adjacent to the protective measure. The reduction in width that may be applied due to installation of protective measures may not be applied where buffer width averaging has been used and the buffer would be more than 20% less than originally specified. Protective measures may consist of fencing, sediment basins, biological filter strips or other methods approved by the Administrator.

(iv) If lineal Waters of the U.S. are completely or partially relocated, the newly created portion must be constructed in a manner which will allow naturalizing to occur, for example, meandering, pools, riffles, and the like. Additionally, all disturbed areas must be replanted for stability with native vegetation where appropriate, appropriately managed and maintained and protected by an appropriately sized buffer.

(B) Water body buffers shall encompass non-linear bodies of water meeting the definition of Waters of the U.S., including wetlands.

(i) If protective measures are installed along the perimeter of a buffer, the width may be reduced by up to 15% immediately adjacent to the protective measure. The reduction in width that may be applied due to installation of protective measures may not be applied where buffer width averaging has been used and the buffer would be more than 20% less than originally specified. Protective measures may consist of fencing, sediment basins, biological filter strips or other methods approved by the Administrator.

(ii) For all non-linear water bodies or Waters of the U.S. designated as ADID or wetlands with an FQI greater than 16, a minimum buffer width must be established in accordance with Table 418(a)(3)(B)(ii).

(iii) For non-ADID wetlands with an FQI of 7 to 16 a minimum buffer width must be established in accordance with Table 418(a)(3)(B)(iii).

(iv) For non-ADID wetlands with an FQI of less than 7 a minimum buffer width must be established in accordance with Table 418(a)(3)(B)(iv).

(b) Buffers shall be replanted or reseeded using appropriate predominately native deep-rooted vegetation, appropriately managed and maintained following disturbance.

(c) The buffer area for all lineal and non-linear Waters of the U.S. except wetlands shall extend from the jurisdictional limits of the Waters of the U.S. ordinary high water mark. The buffer area for wetlands shall extend from the edge of the approved delineated wetland boundary. A site may contain buffer that originates from a Waters of the U.S. or wetland located on another property.

(d) Constructed stormwater management features shall not require a buffer and may constitute buffer. The total width of the buffer required may not be reduced by the installation of a stormwater management facility unless the facility can be considered a protective measure. If the facility can be considered to be a protective measure then the width of the buffer maybe reduced as specified in § 418(a)(3)(A)(iii).

(e) If a buffer area is disturbed by permitted activities during construction, the buffer strip shall be stabilized in accordance with § 300.

(f) Access through buffer areas shall be allowed when necessary for maintenance purposes. Unless otherwise dedicated for a public purpose, buffer areas shall remain private property and are not generally accessible to the public.

(g) The following are exempt from buffer requirements provided they do not meet the definition of Waters of the U.S.:

- (1) roadside drainage ditches;
- (2) channels;
- (3) conveyance systems between site runoff storage facilities;

- (4) excavated site runoff storage facilities, compensatory storage and sediment basins;
- (5) roadway crossings and their associated installations;
- (6) downspout and sump pump discharge; and
- (7) constructed stormwater management facilities.

(h) Undetained stormwater which has not passed through a site runoff storage facility shall discharge through an area or structure meeting the definition of best management practices or buffer before entering a jurisdictional Waters of the U.S. or wetland.

(i) All buffer areas once established shall be maintained free from development, except as follows:

(1) A buffer area may be used for passive recreation (e.g. birdwatching, walking, jogging, bicycling, horseback riding and picnicking) and it may contain pedestrian, bicycle or equestrian trails, provided that the created path is no wider than ten feet. If the path leads to a wetland, it must be a winding path to help prevent erosion.

(2) Non-habitable structures (i.e., tool shed) and impervious surfaces may occupy a maximum of 15% of the portion of the required buffer that extends onto or is part of an individual property.

(3) Utility maintenance, and maintenance of drainage facilities and drainage easements shall be allowed provided the maintenance activity meets all other federal, state and local regulations.

(4) Anchoring and placement of boat docks and piers shall be allowed provided the structure meets all other federal, state and local regulations.

BUFFER WIDTH CALCULATION TABLES

Table 418(a)(3)(B)(ii) - High Quality Wetlands - FQI > 16

BUFFER RATIO	WETLAND AREA (Acres)	BUFFER AREA (Acres)	BUFFER WIDTH (Feet)
0.5	0.25	0.125	15.0
0.5	0.5	0.25	20.0
0.5	0.75	0.375	25.0
0.5	1	0.5	30.0
0.5	1.25	0.625	30.0
0.5	1.5	0.75	35.0
0.5	1.75	0.875	35.0
0.5	2	1	40.0
0.5	2.25	1.125	40.0
0.5	2.5	1.25	45.0

ARTICLE 5—REQUIRED SUBMITTALS FOR STORMWATER MANAGEMENT PERMITS

§ 500. General requirements

(a) A stormwater management permit is required if—

- (1) the development is located in the regulatory floodplain;
- (2) a substantial improvement is to be located in the regulatory floodplain;
- (3) there is any regulatory floodplain within the site; or
- (4) the development disturbs more than 5,000 square feet of ground, unless the development consists solely of—

(A) the installation, renovation or replacement of a septic system, potable water service line or other utility serving an existing structure;

(B) the excavation or removal of vegetation in rights-of-way or public utility easements for the purpose of installing or maintaining utilities not including storm sewers;

(C) the maintenance, repair or at grade replacement of existing lawn areas not otherwise requiring a stormwater permit under this ordinance;

(D) the maintenance of an existing stormwater facility, not requiring other state or federal permits or approvals.

(b) All appropriate stormwater management related approvals and permits, including, without limitation, an IDNR-OWR Floodway/Floodplain Construction Permit, a COE 404 Permit and an IDNR-OWR Dam Safety Permit, if required, shall be obtained from all federal, state and regional authorities prior to the issuance of a stormwater management permit.

(c) All permit fees shall be paid at the time of application. Permit fees shall be established by separate ordinance. Fees may be established based upon all costs incurred by the permitting authority in the administration of the permit, including, without limitation, the costs of review and inspections both during and after construction within the period for the establishment of permanent cover.

(d) The design of stormwater facilities, calculations for the design of the regulatory floodplain and calculations of the impacts of development shall meet the standards of this ordinance and shall be prepared, signed, and sealed by a professional engineer. The signature and seal of such professional engineer shall stand as his or her opinion that the submittals which accompany the permit application meet the requirements of this ordinance.

(2) The submittal shall include evidence that the embankment design and construction specifications are adequate for the design conditions. This review shall include consideration of the existing foundation soils for the embankment, the materials from which the embankment is to be constructed, compaction requirements for the embankment and protection of the embankment from failure due to overtopping. Specifications for the construction and materials for all such embankments shall be included. When directed by the Administrator, or when the impounded water pressure differential exceeds three feet or when appropriate considering the volume impounded and water surface elevation differential to which the embankment is subjected, these calculations may be required to be reviewed, signed and sealed by a qualified geotechnical or registered structural engineer.

(B) For structures (not including earth embankments) that are subject to a differential water pressure greater than three feet the submittal shall, at a minimum, be reviewed by a professional engineer. Such reviews

shall include stability of the structure under design conditions considering the protection of downstream life and property in the event of a failure. When directed by the Administrator the calculations submitted for such structures shall be reviewed, signed and sealed by a registered structural engineer.

(3) A topographical map of the site, record drawings and other required drawings shall be prepared, signed, and sealed by a professional land surveyor or professional engineer and referenced to the National Geodetic Vertical Datum, 1929 adjustment, any FEMA benchmarks and, if the site is more than 20 acres, to the Kane County Survey Control Network. Plats for new subdivisions more than 20 acres in size shall be submitted to the Director in one of the electronic formats designated by the County.

§ 501. Duration and revision of permits

(a) Permits expire on December 31 of the third year following the date of their issuance.

(b) If the permitted activity has begun but is not complete by the expiration date of the permit, the permittee may submit a written request for an extension to the Administrator with a copy to the Director. Upon receipt of such request, the Administrator may extend the expiration date for up to three years for permitted activities outside special management areas. Expiration dates for permitted activities within special management areas may also be extended for up to three years provided the activity is in compliance with the then current requirements of this ordinance. An permittee may apply for any number of extensions.

(c) If the permittee revises the approved plans after issuance of the permit, the permittee shall submit the revised plans to the Administrator with a copy to the Director, along with a written request for approval. If the Administrator determines that the revised plans are in compliance with the then current requirements of this ordinance, an amended permit may be issued.

§ 502. Required submittals

(a) Refer to Table 502 for the submittals required to accompany the permit application based upon the type of development. The Administrator may, in his or her discretion, modify the submittal requirements on a case by case basis considering the size, complexity and likelihood that a development will affect the discharge of stormwater. Such modifications shall be requested and approved in writing. The Administrator’s response shall note the relevant findings and be specific as to what submittal requirements are changed. The Director shall be copied on all related correspondence. The Administrator may not modify submittal requirements for any aspect of the development requiring state or federal permits or approvals, nor for any application in which any variance is

Table 502 - Permit submittal requirements

Type of Development	Required Submittals (refer to sections noted for specific requirements)							
	Section No./Description							
	503	504	505	506	507	508	509	510
	Application and Project Overview	Plan Set Submittal	Stormwater Submittal	Floodplain Submittal	Wetland Submittal	Performance Security	Maintenance Schedule and Funding	Record Drawings
All requiring a permit	X	X				X	X	X
All on sites with floodplain	X	X		X		X	X	X
All on sites with or adjacent to waters of the United States	X	X			X	X	X	X
All applications for variances	X	X	X	If on site	If on site	X	X	X
All requiring site runoff storage	X	X	X			X	X	X

requested.

§ 503. Application and project overview

(a) The applicant shall at a minimum, provide the following information on forms or in a format approved by the Administrator:

- (1) the names and legal addresses of all owners of the site;
- (2) the names and legal addresses of the developer or developers responsible for completing the development according to the plans submitted, the terms and conditions of the permit and the requirements of this ordinance;
- (3) the common address, legal description and parcel identification number (PIN) of all parcels which comprise the site;
- (4) the name of the project, area of the site in acres and type of development;
- (5) a general narrative description of the development, existing and proposed conditions and project planning principles considered, including best management practices used;
- (6) a statement of opinion by a qualified person as to the presence of special management areas on the site;
- (7) copies of all other permits or permit applications as required;
- (8) a subsurface drainage investigation report; and
- (9) an engineer's estimate of probable construction cost of the stormwater facilities and the installation and maintenance of soil erosion and sediment control measures.

(b) The application shall be signed by all owners and developers identified in (a) (1) and (2) above and shall contain their attestation that they have read and understand the provisions of this ordinance and agree to bind themselves to the permitting authority to comply therewith. If at any time prior to completion and final inspection and approval of the development the identity of the persons required to be disclosed in (a)(1) and (2) above changes, an amended application containing the current information shall be filed and the permit shall be amended accordingly.

§ 504. Plan set submittal

All applicants for a stormwater permit shall provide the following basic plan exhibits: Site Topographical Map, General Plan View Drawing, Sediment/Erosion Control Plan and a Vicinity Topographical Map. Each exhibit may be on more than one drawing for clarity. The specific information to be included on each exhibit shall be as noted below.

- (a) Site Topographical Map:
- (1) map scales as 1 inch = 100 feet (or less) and accurate to +/- 0.5 feet;
 - (2) existing and proposed contours onsite (one foot maximum contour interval) and within 100 feet of the site;
 - (3) existing and proposed drainage patterns and watershed boundaries;
 - (4) delineation of pre-development regulatory floodplain and floodway limits;
 - (5) delineation of post-development regulatory floodplain and floodway limits;
 - (6) location of cross-sections and any other hydrologic or hydraulic computer modeled features;

- (7) location of all onsite drain tiles;
- (8) boundaries of all wetlands, lakes, ponds, etc. with normal water elevation noted; (show areas of wetlands to be impacted either under permit or otherwise if a permit is not required);
- (9) location of all existing buildings and those to remain on the site noted;
- (10) nearest base flood elevations;
- (11) FEMA and reference benchmarks used; and
- (12) all contours used in the calculation of depressional storage highlighted.

(b) General Plan View Drawing:

- (1) drawing at the same scale as the Site Topographical Map;
- (2) existing major and minor stormwater systems;
- (3) proposed major and minor stormwater systems;
- (4) design details for stormwater facilities (i.e. structure and outlet work detail drawings, etc.);
- (5) scheduled maintenance program for permanent stormwater facilities including BMP;
- (6) planned maintenance tasks and schedule;
- (7) identification of persons responsible for maintenance;
- (8) permanent public access maintenance easements granted or dedicated to, and accepted by, a government entity;
- (9) proposed regulatory floodplain and floodway location (with the base flood and flood protection elevations noted);
- (10) existing Waters of the U.S. including wetlands and required buffers;
- (11) areas of directly connected impervious areas and any off-setting landscaped areas as defined in § 203(g) indicated;
- (12) all plan areas at elevations below the 100-year high water elevation of site runoff storage facilities highlighted; and
- (13) where a 500-year regulatory flood profile is available, the plan limit of the 500 year floodplain.

(c) Sediment and Erosion Control Plan:

- (1) drawings at the same scale as the Site Topographical Map;
- (2) sediment and erosion control installation measures and schedule;
- (3) existing and proposed roadways, structures, parking lots, driveways, sidewalks and other impervious surfaces;
- (4) limits of clearing and grading;

- (5) special management areas located;
- (6) proposed buffer locations, existing soil types, vegetation and land cover conditions;
- (7) list of maintenance tasks and schedule for sediment and erosion control measures; and
- (8) the name, address and phone number at which the person responsible for erosion and sediment control may be reached on a 24-hour basis.

(d) Vicinity Topographical Map.

(1) vicinity topographical map identifying all offsite areas draining to the development and downstream to the receiving intermittent or perennial stream; (a two-foot contour map is preferred at a scale readable by the reviewer but a USGS Quadrangle map is acceptable);

(2) watershed boundaries for areas draining through or from the development;

(3) soil types related to hydrologic soils group, vegetation and land cover affecting runoff upstream of the site for any area draining through the site;

(4) location of site within the major watershed(s); and

(5) shows the overland flow path from the downstream end of the development to the receiving intermittent or perennial stream.

§ 505. Stormwater submittal

The stormwater submittal shall include a narrative discussion and calculations to support a finding by the qualified review specialist that the proposed development complies with the technical requirements of this ordinance. The submittal shall consist at a minimum of the following material:

(a) a narrative description of the existing and proposed site drainage patterns and conditions; include description of offsite conditions which help to identify stormwater issues considered in the design;

(b) a schedule for implementation of the site stormwater plan;

(c) onsite and offsite runoff calculations which address the following:

(1) documentation of the procedures and assumptions used to calculate hydrologic and hydraulic conditions for sizing major and minor systems;

(2) cross-section data for open channels;

(3) hydraulic grade line and water surface elevations under design flow conditions; and

(4) hydraulic grade line and water surface elevations under base flood flow conditions; and

(d) site runoff storage calculations, which address the following:

(1) calculation of hydraulically connected impervious area and corresponding retention volume;

(2) documentation of the procedures and assumptions used to calculate hydrologic and hydraulic conditions for determining the allowable release rate;

(3) documentation of the procedures and assumptions used to calculate onsite depressional storage;

(4) documentation of the procedures and assumptions used to calculate hydrologic and hydraulic conditions for determining the storage volume;

(5) elevation-area-storage data and calculations for site runoff storage; and

(6) elevation-discharge data and calculations specifically related to the outlet control structure depicted in the plan exhibits.

§ 506. Floodplain submittal

The applicant shall obtain approval from IDNR-OWR and FEMA when required for all new base flood and floodway determinations or as required in § 404. Documentation supporting a finding by the qualified review specialist that the proposed development is in compliance with § 403 shall be submitted with the application. At a minimum, the following material shall be submitted for approval with the application:

(a) regulatory floodplain boundary determination:

(1) provide source of flood profile information; and

(2) provide all hydrologic and hydraulic study information for site-specific floodplain studies, unnumbered Zone A area elevation determinations, and floodplain map revisions;

(b) floodway hydrologic and hydraulic analyses for the following conditions:

(1) existing conditions (land use and stream systems);

(2) proposed conditions (land use and stream systems);

(3) tabular summary of 100-year flood elevations and discharges for existing and proposed conditions;

(4) calculations used for model development; and

(5) hydraulic/hydrologic computer model input/output;

(c) floodplain fill and compensatory storage calculations for below and above ten-year flood elevation up to the base flood elevation:

(1) tabular summary for below and above ten-year flood elevation of fill, compensatory storage and compensatory storage ratios provided in proposed plan; and

(2) cross-sections used for the above calculations; and

(d) floodproofing measures:

(1) narrative discussion of floodproofing measures including material specifications, calculations, design details and operation summary; and

(2) flood easements when required by this ordinance.

(e) statewide and regional self-issuing permits (Statewide Permits Nos. 1 through 14 and Regional Permit No. 3):

(1) such information as shall show that the development qualifies for particular permit in question under the regulations established therefor by IDNR-OWR.

§ 507. Wetland submittal

(a) The applicant shall obtain a permit for all regulated activities involving Waters of the U.S. from the appropriate federal authorities. For any activities which will directly impact onsite Waters of the U.S. but are not regulated by federal authorities, a narrative description of the wetland size and relative quality shall be provided to the Administrator with a copy to the Director, accompanied by a written opinion from a qualified wetlands review specialist on the applicability of current federal permits and noting any special procedures which must be followed in connection with the proposed activity. The applicant shall indicate on the plan set the location of any onsite wetland mitigation required by a COE permit and, in narrative form, the location of all offsite mitigation.

(b) A wetland submittal in accordance with the detailed requirements of §§ 403, 414 and 415 shall be required. In general, the submittal will consist of the following material:

- (1) wetland delineation report (COE format);
 - (2) calculation of required buffer (including size and quality when calculated); and
 - (3) Wetland Delineation Plan View Drawing:
 - (A) all existing and proposed impacted or undisturbed onsite wetlands;
 - (B) location of buffers;
 - (C) planting plan for buffers; and
 - (D) identify all required wetland management activities.
 - (4) For all stream modifications, the following shall be submitted:
 - (A) a plan and profile of the existing and proposed channel; and
 - (B) supporting calculations for channel width, depth, sinuosity, riffle locations and the like.
- (c) If the development will have a wetland impact, the requirements of Article 15 shall be met.

§ 508. Performance security

Performance security in accordance with Article 12 shall be required prior to permit issuance.

§ 509. Maintenance schedule and funding

A completed maintenance schedule for the stormwater management facilities and special management areas in accordance with Article 6 shall be submitted along with identification of the persons responsible for maintenance and funding and back-up funding sources for maintenance in accordance with § 605.

§ 510. Record drawings

The permittee is required to submit record drawings of all permitted stormwater facilities. The record drawings shall be signed and sealed by a professional engineer or professional land surveyor who shall state that the project as constructed is substantially in conformance with the development as permitted.

§ 511. Terms of permit/denial—appeal

(a) Within 10 days after being served with the permit or notice that the permit has been denied, the applicant may appeal the terms or denial of the permit to the oversight committee. The appeal shall be made by filing a notice thereof with the oversight committee specifying the specific provisions appealed from and the grounds therefor. The oversight committee shall conduct a hearing on the appeal not more than 60 days after the filing of

the notice of appeal. The hearing shall be *de novo*. Notice of the hearing shall be served upon the applicant, the Administrator, the Director and upon all communities within the same watershed as the development to which the appeal relates. The hearing may be continued from time to time. The oversight committee may adopt rules for the taking of evidence and conduct of such hearings.

(b) Within 30 days of the conclusion of the hearing, the oversight committee shall decide whether to affirm or reverse, in whole or in part, the terms or denial of the permit. The decision of the oversight committee shall be in writing and shall include the specific findings and conclusions supporting its determination. A copy of the decision and order shall be served upon all parties entitled to notice in accordance with § 1006.

(c) Within 10 days of being served with the order of the oversight committee, the applicant may (and if the denial of the permit or any of the terms thereof have been reversed, in whole or in part, by the oversight committee, the Administrator shall), further appeal to the decision-making authority. The decision-making authority shall decide the appeal upon the record before the oversight committee. The decision-making authority shall decide the appeal within 45 days of its receipt thereof. The decision-making authority shall affirm the order of the oversight committee if it is supported by substantial evidence in the record. A copy of the decision and order of the decision-making authority shall be served upon all parties entitled to notice in accordance with § 1006.

(d) Within 10 days of being served with the order of the decision-making authority, the applicant may (and if the effect of the decision-making authority's decision is that the denial of the permit or any of the terms thereof have been reversed, in whole or in part, the Administrator shall), further appeal to the Committee. The Committee shall decide the appeal upon the record below. The Committee shall decide the appeal within 45 days of its receipt thereof. The Committee shall affirm the order of the decision-making authority if it is supported by substantial evidence in the record. A copy of the decision and order of the Committee shall be served upon all parties entitled to notice in accordance with § 1006.

(e) From a final order of the Committee, the applicant may appeal to the courts under the Illinois Administrative Review Law.

ARTICLE 6—LONG TERM MAINTENANCE**§ 600. Long-term maintenance**

Unless maintenance responsibility has been delegated to and accepted by another person under this section, the owner shall maintain that portion of a stormwater drainage system, including any special management areas, located upon his land. With the approval of the Administrator the stormwater drainage system and special management areas, or specified portions thereof, may be—

- (a) dedicated or otherwise transferred to and accepted by the permitting authority or other public entity; or
- (b) conveyed or otherwise transferred to and accepted by a homeowner's association, or similar entity, the members of which are to be the owners of all of the lots or parcels comprising the development; or
- (c) conveyed to one or more persons or in one or more undivided interests to one or more persons.

Except for those portions of the stormwater drainage system and special management areas to be dedicated or otherwise transferred to the permitting authority or other public entity, included in the application for a stormwater permit shall be a plan for the long term management, operation and maintenance of the stormwater drainage system and special management areas and a description of the sources of funding therefor. Amendments to the plan must be approved by the Administrator.

§ 601. Transfer to permitting authority or other public entity

If any portion of the stormwater drainage system or special management areas are to be dedicated or otherwise transferred to the permitting authority or other public entity under § 600(a), appropriate easements for ingress and egress to and maintenance of such portions shall be reserved for the benefit of such entity on the final plat.

§ 602. Transfer to homeowner's or similar association

If any portion of the stormwater drainage system or special management areas are to be conveyed or otherwise transferred to a homeowner's or similar association under § 600(b) then—

- (a) appropriate easements for ingress and egress to and maintenance of such portions shall be reserved for the benefit of such association and the permitting authority on the final plat;
- (b) the association shall be duly incorporated and a copy of the Certificate of Incorporation, duly recorded, and bylaws, and any amendment to either of them, shall be delivered to the Administrator;
- (c) the bylaws of the association shall, at a minimum, contain—
 - (1) a provision acknowledging and accepting the association's obligation to maintain those portions of the stormwater drainage system and special management areas conveyed or otherwise transferred to it under this ordinance;
 - (2) a mechanism for imposing an assessment upon the owners of all of the lots or parcels comprising the development sufficient, at a minimum, to provide for the maintenance of those portions of the stormwater drainage system and special management areas conveyed or otherwise transferred to it under this ordinance; and the payment of all taxes levied thereon;
 - (3) a provision adopting the plan of long term maintenance set forth in the application for a stormwater management permit, with approved amendments;
 - (4) a provision identifying the officer of the association responsible for carrying out the obligations imposed upon the association under this ordinance;

(5) a provision requiring the consent of the permitting authority to any amendment of the bylaws changing any of the provisions of the bylaws required by this ordinance; and

(6) a provision requiring the consent of the permitting authority to the dissolution of the association; and

(d) any conveyance or other instrument of transfer delivered under § 600(b) shall include a covenant affirmatively imposing upon the association the obligations set forth in this section and the association's affirmative acceptance thereof.

§ 603. Conveyance to one or more persons

If any portion of the stormwater drainage system or special management areas are to be conveyed to one or more persons under § 600(c), then—

(a) appropriate easements for ingress and egress to and maintenance of such portions shall be reserved for the benefit of the permitting authority on the final plat;

(b) the final plat shall contain a legend imposing the maintenance obligations of this section upon the grantee and his successors in interest as a covenant running with the land and incorporating by reference the plan of long term maintenance set forth in the application for a stormwater management permit, with approved amendments;

(c) the final plat shall contain a legend reserving the right of the permitting authority to enter upon the land to perform the maintenance required in this section if the owner does not do so and to place a lien against the land for the cost thereof; and

(d) any conveyance delivered under § 600(c), and any subsequent conveyance, shall include a covenant affirmatively imposing upon the grantee the obligations, restrictions and provisions set forth in this section and the grantee's affirmative acceptance thereof.

§ 604. Incorporation of maintenance obligations in stormwater management permit

The provisions of this section shall be incorporated by reference in the stormwater management permit and the applicant's acceptance of the permit shall be deemed to be the applicant's acceptance and assumption of the obligations imposed under this section. At the option of the Administrator, the stormwater management permit may be recorded.

§ 605. Funding of long-term maintenance of stormwater facilities

As a condition of approval of any application for a stormwater management permit, unless the maintenance responsibility for the stormwater drainage system and special management areas to be constructed, installed or preserved in connection therewith has been accepted by a public entity, the Administrator will require the establishment of a special service area pursuant to 35 ILCS 200/27-5, *et seq.*, either as the primary means of providing for the long term maintenance of the facilities, or as a backup vehicle in the event the person designated by the applicant as having primary maintenance responsibility fails to adequately carry out its duties. If the establishment of a special service area is required, the Administrator shall make a good faith estimate of the tax rate required to produce a tax to be levied upon all taxable property within the area, sufficient for the long term maintenance of the facilities and submit the same to the permitting authority which shall incorporate such rate into its enactment of the ordinances necessary for the establishment of the area. The ordinances to be enacted by the permitting authority shall be substantially in the form set forth in Appendix D. On or before August 1 of each year thereafter, the Administrator shall submit to the permitting authority a good faith estimate of the amount of tax required to be levied upon all taxable property within the area for the next fiscal year for the continued maintenance of the stormwater drainage system.

ARTICLE 7—ENFORCEMENT AND PENALTIES**§ 700. Inspection and maintenance authority**

Pursuant to the authority granted by 55 ILCS 5/5-1104 and 5-1062, the County may, upon 30 days' notice to the owner or occupant, enter upon any lands or waters within the County for the purpose of inspecting and/or maintaining any stormwater facilities or causing the removal of any obstruction to an affected watercourse.

§ 701. Required inspections

Any development constructed pursuant to a stormwater management permit may be periodically inspected by the Administrator or Director to ensure its conformity with this ordinance and the terms and conditions of its permit.

§ 702. Offenses

(a) Any person who violates, disobeys, omits, neglects, refuses to comply with, or resists the enforcement of any provision of this ordinance (*ordinance violation*), or any requirement or condition in any permit issued pursuant to this ordinance (*permit violation*), and, in the case of a permit violation, fails to correct such violation, omission or neglect, or cease such disobedience, refusal or resistance after notice and reinspection as provided below, shall be guilty of an offense under this ordinance.

(b) Whenever the Administrator or Director determines that a permit violation exists, he shall serve notice of the violation in the manner prescribed in § 1006 to the permittee. Such notice shall state the nature of the violation and fix a date not less than 10 days after the date of the notice when the site will be reinspected.

§ 703. Offenses - penalties; remedies

(a) Any person found guilty of an offense under this ordinance shall pay a civil fine in an amount not less than \$25 and not more than \$750. Each calendar day during which such violation continues to exist shall constitute a separate offense.

(b) In addition to any fine imposed under this section, the Administrator or the Director may revoke any stormwater management permit issued to such person.

(c) In addition to any fine imposed or permit revocation undertaken pursuant to this section, the Administrator or the Director may issue an order requiring the suspension of any further work on the site. Such stop-work order shall be in writing, shall indicate the reason for its issuance, and shall specify the action, if any, required to be taken in order to resume work. One copy of the stop-work order shall be posted on the site in a conspicuous place and one copy shall be served in the manner prescribed in § 1006 upon the permittee, if any, or if none, upon the person in whose name the site was last assessed for taxes as disclosed by the records of the Supervisor of Assessments.

(d) In addition to any fine imposed under this section, the Administrator or the Director may recover all costs and expenses, including reasonable attorney fees, incurred in the enforcement of this ordinance.

(e) In the enforcement of this ordinance, the Administrator or the Director may bring any action, legal or equitable, including an action for injunctive relief, as they deem necessary.

ARTICLE 8—GENERAL PROVISIONS**§ 800. Scope of Regulation**

This ordinance applies to all development within the County and to all development within the corporate boundaries of any certified community, including that under the control of any governmental entity, agency, or authority. Any person undertaking a development shall obtain a stormwater management permit from the permitting authority within whose boundaries the development is located. Any person undertaking a development having a wetland impact shall obtain a permit from the Director. Any certified community undertaking development in the regulatory floodway, or regulatory floodplain where no regulatory floodway has been designated, shall obtain a permit from IDNR-OWR if required prior to issuance of a stormwater management permit. All units of local government shall obtain stormwater management permits from the permitting authority within whose boundaries the development is located.

§ 801. Exemptions

(a) This ordinance does not apply to—

- (1) development which has been substantially completed before January 1, 2002;
- (2) development which has been determined to be exempt by the Committee; and
- (3) wetland impacts occurring before the effective date.

(b) Nonconforming structures shall not be replaced or enlarged in any manner unless such replacement or enlargement conforms to the requirements of this ordinance.

§ 802. Committees's determination of exemption

(a) Before January 1, 2002, each community shall submit to the Director a list of proposed exempt developments prepared and adopted in accordance with § 803. At its next regularly scheduled meeting occurring not less than 15 days after the Directors's receipt of the list, the Committee shall consider the developments listed therein. Any member of the Committee may remove from the list for further consideration, any development located within the zone represented by that member on the Committee. Additionally, the Committee, upon motion made and seconded and passed by a majority of those members present, may remove any development from the list for further consideration. After such removals, the developments remaining on the list shall be determined to be exempt from the provisions of this ordinance.

(b) With respect to those developments removed from the list, the Committee shall determine each development to be exempt from the provisions of this ordinance if—

- (1) substantial development has commenced; or
- (2) the stormwater plan for such development—
 - (A) provides site runoff storage which at a minimum meets a 0.15 cfs/acre release rate standard;
 - (B) includes a designed conveyance system for flow rates up to the base flood for offsite and onsite flows without damage to structures; and
 - (C) provides for soil erosion and sediment control in accordance with the *Illinois Urban Manual*.

(c) Notwithstanding the Committee's determination that a particular development is exempt from the provisions of this ordinance, all mitigable wetland impacts from any development occurring after the effective date shall be mitigated.

§ 803. Community's list of proposed exempt developments

- (a) A community may place a development on its list of proposed exempt developments only if—
- (1) a stormwater plan has been submitted and substantially approved by the community engineer; or
 - (2) a contractual agreement, specifically exempting the development from the stormwater regulations of the community, was entered into before January 1, 2001.
- (b) corporate authorities of the community. Prior to taking such action, the community shall publish in accordance with § 1007, a notice in substantially the following form:

On [date], at [time], the [corporate authorities] of the [type of community] of [community] will consider and take formal action with respect to the approval of the following list of developments proposed as exempt from the provisions of the Kane County Stormwater Management Ordinance, adopted by the Kane County Board on November 14, 2000. Any person wishing to do so, may attend the meeting and be heard prior to the [corporate authorities] taking such action.

[List of proposed exempt developments]

- (2) In addition to the published notice, not less than 15 days prior to taking any such action, the community shall place a sign in a conspicuous place at each of the developments on the list advising the public that the development is on the list of developments proposed as exempt from the provisions of this ordinance and of the date and time of the meeting at which formal action with respect to the approval of the list will be taken and of the public's right to appear to be heard prior to such approval.
- (c) Once submitted, the list may not be changed except that a developer of a development inadvertently omitted from the list by the community may apply directly to the Committee for a determination that the development meets all of the requirements of this Article for being exempt.

§ 804. Interpretation

- (a) This ordinance shall be liberally construed to protect the health, welfare, safety, and the environment of the residents of the County and to effectuate the purposes of this ordinance and the enabling legislation.
- (b) Nothing in this ordinance shall be deemed to consent to, license, permit to locate, construct, or maintain any structure, site, facility or operation, or to carry on any trade, industry, occupation, or activity.
- (c) When provisions of this ordinance differ from any other applicable law, statute, ordinance, rule or regulation, the more stringent provision shall apply.
- (d) The provisions of this ordinance are cumulative of all other laws, statutes, ordinances, rules and regulations which relate to the subject matter hereof and, except as otherwise expressly provided herein, nothing in this ordinance shall be construed as a limitation upon the application or enforcement of any such law, statute, ordinance, rule or regulation. To the greatest extent possible, the provisions of this ordinance shall be construed to be consistent with the provisions of such other laws, statutes, ordinances, rules or regulations, and with each other, to the end that all such provisions may be given their fullest application.

§ 805. Warning and disclaimer of liability

- (a) The degree of flood protection provided by this ordinance is considered reasonable for regulatory purposes and is based upon engineering experience and scientific methods of study. Increased flooding may result from causes beyond the control of any governmental authority. This ordinance does not, therefore, guarantee that areas outside the floodplain or permitted land uses within the floodplain will be free from flooding and associated damages.

(b) Nothing in this ordinance shall be construed or applied in any manner to create liability on the part of or a cause of action against the County, any municipality or other governmental authority, or any elected official, or any officer, agent, or employee of any of the foregoing, or any qualified engineer review specialist or qualified wetland review specialist for any flood damage resulting from reliance on the provisions of this ordinance.

§ 806. Choice of planning jurisdiction

Pursuant to 55 ILCS 5/5-1062 (b), a community that is located in more than one county may choose, at the time of the formation of the Committee, and based upon watershed boundaries, to participate in the stormwater management planning program of either or both of the counties. Unless the community, at the time of the formation of the Committee, has chosen to participate in the stormwater management planning program of another County, the Committee shall include such community within the scope of its planning and enforcement jurisdiction.

§ 807. Severability

(a) The provisions of this ordinance shall be severable in accordance with the following rules:

(1) If any court of competent jurisdiction shall adjudge any provision of this ordinance to be invalid, such judgment shall not affect any other provision of this ordinance.

(2) If any court of competent jurisdiction shall adjudge to be invalid the application of any provision of this ordinance to a particular parcel of land, a particular structure, or a particular development, such judgment shall not affect the application of said provision to any other land, structure or development.

§ 808. Repealer

This ordinance repeals the original ordinance or resolution which was adopted to meet the National Flood Insurance Program regulations, but is not intended to replace any ordinance or resolution passed in order to establish initial eligibility for the National Flood Insurance Program.

§ 809. Amendments

No amendment to this ordinance may be passed without a public hearing first being held before the Committee upon notice published as provided in § 1007.

§ 810. Effective date

After its passage, approval and publication according to law, this ordinance shall take effect on January 1, 2002.

ARTICLE 9—VARIANCES

§ 900. Purpose

In order to provide a narrowly circumscribed means by which relief may be granted when strict compliance with the requirements of this ordinance is impossible or impracticable, variances from the specific provisions of this ordinance may be granted according to the standards set forth in this Article.

§ 901. Application for variance

An application for a variance, signed by at least one of the persons identified in § 503(a)(1) and (2) with respect to the development to which it relates, shall be filed with the Administrator. No application for a variance will be accepted for filing unless it relates to a previously or contemporaneously filed application for a stormwater management permit. Applications for a variance shall be filed in such number of duplicate copies as the Administrator may designate by administrative order. No action will be taken on an application for a variance unless it and the corresponding application for a stormwater management permit to which it relates are complete as determined by the Administrator. The Administrator shall send a copy of the complete application to the Director and to all other communities within the same watershed. Applications for a variance need not be made upon any specific form, but shall contain the information set forth in **Table 901**

Table 901 - Application for variance

<p>An application for variance shall set forth—</p> <ol style="list-style-type: none"> 1. the common address(es) and legal description of the site; 2. the persons identified in § 503(a)(1) and (2); 3. the names and addresses of all consultants retained in connection with the application for a variance; 4. the names and addresses of all owners of record of land within 250 feet of the site; 5. the specific feature or features of the development that require a variance; 6. the specific provisions of this ordinance from which a variance is sought and the precise extent of the variance therefrom; 7. a statement of the characteristics of the development that prevent compliance with the provisions of this ordinance; 8. a statement that the variance requested is the minimum variance necessary to permit the development; 9. a statement as to how the variance requested satisfies the standards set forth in Section 904 of this ordinance.

§ 902. Application fee

With the filing of the application for a variance, the applicant shall pay a fee to be prescribed by separate ordinance.

§ 903. Public hearing

When the application is complete, the Administrator will so notify the applicant and will schedule a public hearing on the application before the oversight committee. Notice of the hearing shall be published as provided in § 1007 and served as provided in § 1006 upon the applicant, the Director, all owners of record of land within 250 feet of the site as disclosed in the application, and upon each community within the same watershed as the development. The notices given under the section shall set forth the common name, address and legal description of the development and a brief description of the variance is requested.

§ 904. Granting of variances

(a) The oversight committee shall not recommend nor shall the decision-making authority grant a variance from the provisions of this ordinance unless the variance is consistent with the purposes of this ordinance and meets the following standards based upon substantial evidence submitted at the hearing:

(1) The variance will not increase the probability of flood damage or create an additional threat to the public health, safety and welfare.

(2) The variance is the minimum required considering each of the following statements of policy underlying this ordinance and there are no means other than the requested variance by which the demonstrated

hardship can be avoided or remedied to a degree sufficient to permit the reasonable continuation of the development:

(A) Site runoff storage of stormwater shall also contribute to the improvement of the quality of stormwater runoff.

(B) The volume of site runoff storage provided in open-air vegetated facilities is maximized consistent with other site constraints on land use, including zoning requirements essential for the proposed development.

(C) Conveyance of stormwater shall not disproportionately absorb the design capacity of existing offsite conveyance facilities for any storm event from the two-year to the 100-year flood frequency.

(D) High quality natural areas shall be preserved on the site, including without limitation, stands of native trees, existing wetlands, natural floodplain storage or other valuable environmental and biological resources.

(3) The variance is not requested solely for the purpose of increasing the density of the development nor impervious areas on the site.

(4) The variance is not requested solely as a result of economic hardship.

(5) If applicable, the variance is required due to unique, natural topographical features of the site.

(6) The applicant's circumstances are not self-imposed.

(b) Variances requested in connection with the restoration of an historic structure may be granted using criteria more permissive than those set forth above provided that—

(1) the repair or rehabilitation is the minimum necessary to preserve the historic character and design of the historic structure; and

(2) the repair or rehabilitation will not result in the structure no longer meeting the definition of an historic structure under this ordinance.

(c) No variance shall be granted for any development in the regulatory floodway, regulatory wetlands or critical wetlands, the effect of which would be to create regulations less restrictive than the federal or state minimum standards applicable to development in such areas.

(d) When a variance would lessen the degree of protection to any structure, the Administrator shall notify the applicant that the variance, if granted, may result in increased rates for flood insurance.

§ 905. Recommendations

(a) The Administrator shall review the application for a variance and present his or her written recommendations to the oversight committee at the public hearing.

(b) Not more than 45 days after the close of the hearing, the oversight committee shall forward the application with its written recommendations to the decision-making authority. If the oversight committee fails to act within 45 days, it shall be deemed to have forwarded the application with no recommendation to the decision-making authority. The written recommendations of the oversight committee, when forwarded, shall be accompanied by written findings of fact with respect to each of the elements set forth in § 904 with citations to the evidence taken at the public hearing.

§ 906. Decision

The decision-making authority shall grant the variance, grant the variance with modifications or conditions, or deny the variance in writing within 45 days after receipt of the application from the oversight committee. The

failure of the decision-making authority to act within 45 days, absent the agreement of the applicant to any extension of the time, shall be deemed to be a decision approving the variance.

§ 907. Conditions

(a) A variance less than or different from that requested may be granted when the record supports the applicant's right to some relief, but not to the relief requested.

(b) In granting a variance, the decision-making authority may impose such specific conditions and limitations on the applicant concerning any matter relating to the purposes and objectives of this ordinance as may be necessary or appropriate.

(c) Whenever any variance is granted subject to any condition to be met by the applicant, upon meeting such condition, the applicant shall file evidence to that effect with the Administrator.

ARTICLE 10—ADMINISTRATION**§ 1000. Responsibility for administration**

(a) The oversight committee shall oversee the enforcement of this ordinance.

(b) The Director and Administrator shall administer this ordinance. In performing their duties, the Director and the Administrator may delegate routine responsibilities to any named designee.

(c) Each community shall remain solely responsible for its standing in the National Flood Insurance Program, including —

(1) the maintenance of all records and the submission of all reports required for eligibility in the program, including elevation certificates, floodproofing certificates, and lowest floor elevations; and

(2) the notification of the Director, FEMA, IDNR-OWR, COE, NRCS, the Soil and Water Conservation District, the United States Fish and Wildlife Service, the Illinois Environmental Protection Agency, and the United States Environmental Protection Agency of any proposed amendment to this ordinance.

§ 1001. Duties of Director

The Director shall —

(a) supervise the enforcement of this ordinance;

(b) supervise the development, revision and implementation of the Plan for approval by the Committee and the County;

(c) supervise the review of complex stormwater management permits for any community that requests such assistance;

(d) notify all of the communities in the County, FEMA, IDNR-OWR, COE, NRCS, the Soil and Water Conservation District, the United States Fish and Wildlife Service, the Illinois Environmental Protection Agency, and the United States Environmental Protection Agency of any amendments to the Plan or to this ordinance;

(e) administer the qualified engineer review specialist and qualified wetland review specialist programs;

(f) maintain a current list of all maps considered regulatory under this ordinance; and

(g) administer Article 15.

§ 1002. Duties of Administrator

The Administrator shall —

(a) ensure that all required stormwater related federal, state, regional and County permits and approvals are received prior to issuing any permit under this ordinance;

(b) ascertain whether any special management areas exist on any site which is the subject of an application for a permit under this ordinance;

(c) use qualified review specialists and qualified wetland review specialists for the review of permit applications and consider their recommendations in granting or denying any permit under this ordinance;

(d) ensure that the required notice of an application for a variance has been given and published in accordance with §§ 1006 and 1007;

- (e) notify an applicant for a variance that such variance may result in increased rates for flood insurance, if applicable;
- (f) notify the Director of an application for a CLOMR or LOMR;
- (g) provide for inspections of developments as required by this ordinance;
- (h) investigate complaints of violations of this ordinance within his or her community;
- (i) notify violators within regulatory floodplains that failure to comply with the provisions of the National Flood Insurance Program could make them ineligible to receive flood insurance;
- (j) initiate any proceeding necessary to enforce this ordinance within his or her community;
- (k) advise, consult and cooperate with other governmental agencies to promote the purposes of this ordinance;
- (l) maintain copies of all applications and submittals, federal and state permits, variances, CLOMR, LOMR, CLOMA, LOMA and all documentation associated with any of the foregoing for public inspection;
- (m) maintain documentation and data on the cost of any improvement to a structure in the floodplain in order to enforce the provisions of this ordinance pertaining to substantial improvements to such structures;
- (n) notify adjacent communities in writing 30 days prior to the issuance of a stormwater management permit involving the alteration or relocation of a watercourse; and
- (o) ensure that all wetland impacts have been mitigated.

§ 1003. Representative capacity

In all cases when any action is taken by the Director or the Administrator, or his or her duly appointed designee, to enforce the provisions of this ordinance, such action shall be taken either in the name of the County or the certified community, as the case may be, and neither the Director nor the Administrator, nor his or her designee, in so acting shall be rendered personally liable.

§ 1004. Oversight committee

The corporate authorities of each certified community within the County shall establish an oversight committee to oversee the implementation and enforcement of this ordinance within its jurisdiction and to perform the duties assigned to the oversight committee in this ordinance. The oversight committee may be comprised of the corporate authorities or any committee thereof, plan commission, zoning board of appeals, or other existing body, or the corporate authorities may, according to their own rules and procedures, establish a separate oversight committee. The Executive Committee of the County Board shall designate the oversight committee for the County. The oversight committee, when considering an appeal or request for a variance under this ordinance, may request an opinion from a qualified engineer review specialist or qualified wetland review specialist on technical issues.

§ 1005. Decision-making authority

The corporate authorities of each certified community within the County shall by separate resolution designate a decision-making authority to perform the duties assigned to the decision-making authority in this ordinance. The decision-making authority may be comprised of the corporate authorities or any committee thereof, plan commission, zoning board of appeals, or other existing body, or the corporate authorities may, according to their own rules and procedures, establish a separate decision making authority. The Development Committee of the County Board shall act as the decision-making authority for the County. The decision-making authority, when considering an appeal or request for a variance under this ordinance, may request an opinion from a qualified engineer review specialist or qualified wetland review specialist on technical issues.

§ 1006. Service

Unless otherwise provided herein, service of any notice or other instrument under this ordinance may be made upon any person—

(a) by first class mail, postage prepaid, addressed to address then on file for such person, if any, or if none, to such person's last known address; or

(b) by any method prescribed under the Illinois Code of Civil Procedure.

§ 1007. Publication

Unless otherwise provided herein, publication of any notice or other instrument under this ordinance shall be made by publishing such notice or other instrument once in a newspaper published within the community having jurisdiction over the matter to which the publication relates (or, if no newspaper is published within the community, then a newspaper published in the County and having a general circulation within the community), such publication being not less than 15 nor more than 30 days before the hearing or other event to which the publication relates.

ARTICLE 11—CERTIFIED COMMUNITY ENFORCEMENT**§ 1100. Enforcement authority**

Pursuant to Section 5-1062 of the Counties Code (55 ILCS 5/5-1062 (1996))—

(a) The County shall enforce all of the provisions of this ordinance within the unincorporated areas of the County, within any County right-of-way, within any portion of an uncertified community that lies within the County, and, pursuant to intergovernmental agreement, within any portion of an uncertified community that lies outside the County.

(b) The County shall enforce the provisions of Article 15 within that portion of any certified community that lies within the County and, pursuant to intergovernmental agreement, within that portion of any certified community that lies outside the County.

(c) A community certified under this Article shall enforce all of the provisions of this ordinance with the exception of Article 15 within the community.

§ 1101. Petition for certification and waiver of enforcement

Any community that wishes to enforce the provisions of this ordinance within its borders shall file a petition for certification and waiver of enforcement (*petition for certification*), on or before December 1, 2001. After December 1, 2001, petitions for certification may be filed during the month of June of each year.

§ 1102. Filing and contents of petition for certification

A petition for certification shall be filed with the Director. The petition need not be on any particular form but, at a minimum, shall set forth and be accompanied by—

(a) the agreement of the corporate authorities of the community to adopt, if certified, this ordinance by reference;

(b) the community's plan for the implementation and enforcement of this ordinance, including proposed staffing;

(c) the agreement of the corporate authorities of the community to include in any new annexation agreement a provision requiring every other party to the agreement to affirmatively agree to comply with the provisions of this ordinance, as amended from time to time;

(d) the agreement of the corporate authorities of the community that the community will follow the rules and procedures of the Committee in any proceeding concerning its certification and be bound by the decision of the Committee in granting or failing to grant, or suspending or revoking its certification and reasserting County jurisdiction over the enforcement of this ordinance within the boundaries of the community;

(e) if a portion of the community lies outside the County, the agreement of the corporate authorities of the community to enter into, if certified, an intergovernmental agreement with the County providing for the County's enforcement of the provisions of Article 15 within those portions of the community lying outside the County;

(f) evidence of the community's ability to comply with Article 14 pertaining to the use of qualified review specialists and qualified wetland review specialists;

(g) the list of projects to which this ordinance or some portion of this ordinance do not apply pursuant to the requirements of Article 8.

§ 1103. Committee consideration of petition for certification

The Committee shall consider each properly filed petition for certification at a regular or special meeting called for such purpose not later than 60 days after the filing of the petition. The meeting may be continued from time to time. The Committee may adopt rules for the taking of evidence and conduct of such meetings.

§ 1104. Standards for certification

Upon a finding of the committee that the community has complied with §§ 1101 and 1102, that the community's plan for the implementation and enforcement of this ordinance is reasonably feasible, and that the community has demonstrated the ability to comply with Article 14, the Committee shall grant the petition for certification. The Committee's decision shall be in writing, and shall specify the reasons for granting or denying the petition.

§ 1105. Certified community records

(a) Every certified community shall maintain adequate records of every stormwater management permit issued and every variance granted under this ordinance for development within its borders.

(b) Every certified community shall retain record drawings of all improvements made pursuant to a stormwater management permit issued or variance granted by such community.

(c) The records of each certified community maintained under this ordinance may be periodically inspected by the Department.

(d) Every certified community shall report annually to the Director on forms provided by the Department concerning stormwater management permits issued in the preceding year.

§ 1106. Committee review of enforcement by certified community

The Committee shall periodically review the implementation and enforcement of this ordinance by each certified community.

§ 1107. Investigations; compliance

(a) The Director upon his own initiative or at the request of any person may conduct an investigation into a certified community's implementation and enforcement of this ordinance. Such investigation may include, but is not limited to, an examination of all relevant records maintained by the community and field inspections of relevant developments, structures or stormwater facilities. If upon such investigation, the Director determines that the community has failed in some significant way, or has repeatedly failed, to implement or enforce this ordinance, then he shall prepare a report of his findings along with a complaint for the suspension, revocation or partial revocation of the community's certification and file them with the Committee. The complaint shall contain a short and plain statement describing how the certified community has failed in some significant way, or has repeatedly failed, to implement or enforce this ordinance.

(b) Upon receipt of a written complaint, the Committee shall serve a copy thereof along with a copy of the report of the Director upon the community named therein in accordance with § 1006. A copy of the complaint and report shall also be served upon IDNR-OWR, FEMA, all communities within the same watershed, and upon any person who has requested an investigation of the community's enforcement of this ordinance by the Director within six months immediately preceding the filing of the complaint. The community may file a written answer to the complaint within 30 days after being served.

§ 1108. Hearing on complaint

The Committee shall conduct a hearing on the complaint not less than 75 nor more than 120 days after service of the complaint upon the community. Notice of the hearing shall be served upon the community and all parties which received a copy of the complaint and published in accordance with § 1007. The hearing may be

continued from time to time. The Committee may adopt rules for the taking of evidence and conduct of such hearings.

§ 1109. Committee decision

Within 30 days of the conclusion of the hearing, the Committee shall decide whether or not to suspend or to revoke in whole or in part the certification of the community. The decision of the Committee shall be in writing and shall include the specific findings and conclusions supporting its determination. A copy of the decision and order shall be served upon the community and all parties which received a copy of the complaint in accordance with § 1006. The decision of the Committee to suspend or to revoke the certification of the community in whole or in part, is final and may not be appealed to any court. If the community's certification is suspended, the community shall automatically become re-certified upon the expiration of the period of suspension. If the community's certification is revoked in whole or in part, the community may reapply for certification at or after such time as the Committee shall specify in its order of revocation.

ARTICLE 12— PERFORMANCE SECURITY**§ 1200. General security requirements**

(a) To secure the performance of the developer's obligation to complete the construction of the stormwater facilities required by the stormwater management permit, and to pay all costs, fees and charges due under this ordinance, and to fully and faithfully comply with all of the provisions of this ordinance, the applicant shall, prior to the issuance of a stormwater management permit—

(1) post the security provided in § 1201; and

(2) post the security provided in § 1202 if an erosion and sediment control plan is required under this ordinance.

(b) The applicant shall bear the full cost and responsibility of obtaining and maintaining the security required by this Article.

§ 1201. Development security

(a) In all cases the applicant shall post—

(1) a schedule, agreed upon by the applicant and the Administrator for the completion of any stormwater facilities required by the permit;

(2) a statement of the estimated probable cost to complete the construction of any stormwater facilities required by the permit which estimate is subject to the approval of the Administrator; and

(3) an irrevocable letter of credit in favor of the permitting authority, or such other adequate security as the Administrator may approve, in an amount equal to 110% of the approved estimated probable cost to complete the construction of any required stormwater facilities.

(b) The security required by this section shall be maintained by the applicant in favor of the permitting authority until all stormwater facilities required by the permit have been completed, all conditions set forth in the permit have been satisfied and the applicant has complied with all of the provisions of this ordinance.

(c) The Administrator may approve periodic reductions in the amount of the security based upon the progress of construction. At no time, however, shall more than 90% of the security be released prior to approval of record drawings and final inspection. A minimum of 10% of the original amount of the security shall be retained for a period of one year after completion of all required stormwater facilities.

§ 1202. Erosion and sediment control security

(a) If an erosion and sediment control plan is required under this ordinance the applicant shall post—

(1) a statement of the estimated probable cost to install and maintain the erosion and sediment control measures required by the plan which estimate is subject to the approval of the Administrator; and

(2) an irrevocable letter of credit in favor of the permitting authority, or such other adequate security as the Administrator may approve, in an amount equal to 110% of the approved estimated probable cost to install and maintain the required erosion and sediment control measures.

(b) The security required by this section shall be maintained by the applicant in favor of the permitting authority until construction has been completed, vegetation had been established, sediment has been removed from all stormwater facilities and the development has been finally inspected and approved by the Administrator at which time it shall be released.

§ 1203. Wetland mitigation and performance security

(a) If a wetland mitigation is required under this ordinance and the applicant chooses to mitigate within a wetland mitigation facility, the applicant shall post—

(1) a statement of the estimated probable cost to install, monitor and maintain the wetland mitigation facility required by the plan for five years which estimate is subject to the approval of the Director; and

(2) An irrevocable letter of credit in favor of the County, or such other adequate security as the Director may approve, in an amount equal to 110% of the approved estimated probable cost.

(b) The security required by this section shall be maintained by the applicant in favor of the County until construction has been completed, vegetation has been established and the wetland mitigation facility has been evaluated by the Director and found to meet the performance standards of § 1506 at which time it shall be released.

§ 1204. Letters of credit

(a) Letters of credit posted pursuant to this Article shall be in a form satisfactory to the Administrator.

(b) Each letter of credit shall be drawn on an institution (1) acceptable to the Administrator; (2) having assets of at least \$10 million; (3) having an office in the Chicago metropolitan area; and (4) that is a member of the Federal Deposit Insurance Corporation.

(c) Each letter of credit shall provide that—

(1) it is irrevocable;

(2) the consent of the applicant is not required prior to its presentment for payment; and

(3) if at any time it will expire within 45 or any lesser number of days, and if it has not been renewed and the renewal submitted to the Administrator, and if any obligation of the applicant for which it stands as security remains uncompleted or is unsatisfactory, then the Administrator may, without notice and without being required to take any further action of any nature whatsoever, present the letter of credit for payment and thereafter either hold all proceeds as security for the satisfactory completion of all such obligations or employ the proceeds to complete all such obligations and reimburse the permitting authority for any and all costs and expenses, including legal fees and administrative costs, incurred by the permitting authority.

(d) If the Administrator at any time determines that the amount of the letter of credit is not, or may not be, sufficient to pay in full the remaining unpaid cost of the construction of all stormwater facilities or the installation and maintenance of all erosion and sediment control measures, then, within 10 days following a demand by the Administrator, the applicant shall increase the amount of the letter of credit to the amount determined by the Administrator to be sufficient to pay such unpaid costs. Failure to increase the amount of the letter of credit shall be grounds for the Administrator to present the letter of credit for payment.

(e) If at any time the Administrator determines that the bank issuing the letter of credit is without assets of at least \$10 million, is unable to meet any federal or state requirement for reserves, is insolvent, is in danger of becoming any of the foregoing, or is otherwise in danger of being unable to honor such letter of credit at any time during its term, or if the Administrator otherwise reasonably deems the permitting authority to be insecure, then the Administrator shall have the right to demand that the applicant provide a replacement letter of credit from a bank meeting the requirements of this section. Such replacement letter of credit shall be deposited with the Administrator not less than 10 days following such demand. Upon such deposit, the Administrator shall surrender the original letter of credit to the applicant.

(f) If the applicant fails or refuses to fully meet any of its obligations under this ordinance then the Administrator may, in his or her discretion, present the letter for payment and thereafter either hold all proceeds as security for the satisfactory completion of all such obligations or employ the proceeds to complete all such

obligations or otherwise mitigate the effects of such failure or refusal and may reimburse the permitting authority for any and all costs and expenses, including legal fees and administrative costs, incurred by the permitting authority. If as a result of such default, the remaining amount of the letter of credit is less than the amount otherwise required to be then maintained under this Article, then the applicant shall, upon demand of the Administrator therefor, immediately deposit with the Administrator such additional funds as the Administrator determines to be required to be then maintained.

ARTICLE 13—FEE-IN-LIEU OF SITE RUNOFF STORAGE AND WETLAND MITIGATION**§ 1300. Fee-in-lieu of site runoff storage**

(a) The Director or the Administrator may require, or in the limited circumstances prescribed in Article 2 an applicant may request approval of, the payment of a fee-in-lieu of site runoff storage to fulfill all or part of the site runoff storage requirement for a development. The fee to be paid in lieu of site runoff storage shall be the lesser of—

(1) the fee for each acre-foot or part thereof of storage otherwise required computed under a schedule adopted for such purpose by the permitting authority; or

(2) the verifiable cost of otherwise providing the required storage, including the value of the land required and all construction costs. For this purpose the land required shall be valued according to the use to which it will ultimately be put if not used to provide the required storage.

§ 1301. Procedures; use of funds

(a) An applicant's request for approval of the payment of a fee-in-lieu of site runoff storage shall be submitted to the Administrator with a copy to the Director. The Administrator shall grant or deny the request with 45 days, unless the applicant agrees to an extension.

(b) Fees paid in lieu of site runoff storage shall be deposited by the community in a separate fund created for such purpose. Provisions shall be made so that all receipts and disbursements of such funds may be accounted for according to the individual watershed in which the development for which they were paid was located.

(c) Fees paid in lieu of site runoff storage may be expended to plan, design, construct or improve stormwater management systems within the watershed in which the development for which they were paid was located if such expenditure is consistent with a watershed or interim watershed plan or floodplain study.

§ 1302. Fee-in-lieu of wetland mitigation

If a wetland mitigation is required under this ordinance and the applicant chooses to satisfy the mitigation requirement by paying a fee-in-lieu of mitigation, the applicant shall—

(a) prepare a statement of the estimated probable cost to acquire the land, install, monitor and maintain a wetland mitigation facility for five years (which estimate is subject to the approval of the Director), as if the applicant had chosen to satisfy the mitigation requirement by mitigating within a wetland mitigation facility; and

(b) if mitigation credits are available from any wetland mitigation bank, the applicant shall also prepare a statement of the estimated probable cost of satisfying the mitigation requirement through the purchase of credits from a wetland mitigation bank (which estimate is subject to the approval of the Director) as if the applicant had chosen to satisfy the mitigation requirement in such manner.

(c) The fee-in-lieu of wetland mitigation to be paid under this section shall be the lesser of (a) or (b) above.

§ 1303. Procedures; use of funds

(a) An applicant's statement of its intention to satisfy the wetland mitigation requirement by the payment of a fee-in-lieu of wetland mitigation shall be in writing and filed with the Director along with the estimates described in the preceding section.

(b) Fees paid in lieu of wetland mitigation shall be deposited by County in a separate fund created for such purpose. Provisions shall be made so that all receipts and disbursements of such funds may be accounted for according to the individual watershed in which the development for which they were paid was located.

(c) Fees paid in lieu of wetland mitigation shall be expended to plan, design, construct, improve, acquire, create or enhance wetlands within the County, wetland mitigation facilities and wetland mitigation banks.

ARTICLE 14— QUALIFIED REVIEW SPECIALISTS**§ 1400. General**

The review of an application for a stormwater management permit shall be performed by a qualified engineer review specialist and a qualified wetland review specialist. The qualified engineer review specialist and qualified wetland review specialist together with the Administrator shall determine whether the permit application meets the requirements of this ordinance. The Director shall maintain a list of qualified engineer review specialists and qualified wetland review specialists together with the categories of review in which they have obtained qualification. Review of wetland submittals by a qualified wetland review specialist may be waived if a COE permit is required.

§ 1401. Requirements for qualified engineer review specialists

In order to be included on the list of qualified engineer review specialists an applicant must—

- (a) be a professional engineer registered in Illinois;
- (b) have expertise either by training or significant experience in the following areas:
 - (1) design and permitting of stormwater management facilities;
 - (2) identification of floodplains and floodways, familiarity with FEMA and IDNR-OWR floodplain maps and their policies and procedures;
 - (3) erosion and sediment control practices and procedures; and
 - (4) construction practices and inspection procedures;
- (c) complete, sign, and professionally seal the Qualified Engineer Review Specialist Statement in the form included as Appendix B to this ordinance; and
- (d) file the Qualified Engineer Review Specialist Statement with the Department and pay a fee in an amount to be prescribed by separate ordinance.

§ 1402. Requirements for qualified wetland review specialists

In order to be included on the list of qualified wetland review specialists an applicant must—

- (a) complete a COE approved or other wetland delineation course approved by the Director; and
- (b) have a Bachelors's Degree in an earth science, biological science or engineering together with at least one of the following:
 - (1) three years (cumulative) full-time experience in the Upper Midwest Region engaged in consulting on wetland related projects; or
 - (2) the completion of 100 wetland delineations in the Upper Midwest Region; or
 - (3) six years (cumulative) full-time experience engaged in consulting on wetlands related projects; or
 - (4) 300 hours spent in field review of wetland indications in the Upper Midwest Region; and
- (c) have personally been involved with the design of at least 10 wetland mitigation areas; and
- (d) complete and sign the Qualified Wetland Review Specialist Statement in the form included as Appendix C to this ordinance; and

(e) file the Qualified Wetland Review Specialist Statement with the Department and pay a fee in an amount to be prescribed by separate ordinance.

§ 1403. Review of qualifications

(a) Within 30 days of filing of the application, the Director will notify the applicant of his or her inclusion on the list of qualified engineer review specialists and/or qualified wetland review specialists, as the case may be. If the applicant is not accepted for inclusion in the list, the Director shall specify the reasons for his decision. Within 30 days of his receipt of the decision of the Director, the applicant may appeal to the RSQC by filing a notice thereof with the Department. The RSQC shall conduct a hearing on the appeal in the manner prescribed by §§ 1406 and 1407 from which the applicant may further appeal in the manner prescribed by § 1408.

(b) Once accepted, the applicant, no later than January 1 of each year, shall resubmit the Qualified Engineer Review Specialist Statement and/or Qualified Wetland Review Specialist Statement together with an annual maintenance fee in an amount to be prescribed by separate ordinance in order to maintain his or her inclusion on the list.

§ 1404. Review Specialist Qualification Committee

There is hereby created a Review Specialist Qualification Committee (“*RSQC*”). The RSQC shall consist of three members, one of them designated as chairman, appointed by the Chairman of the County Board with the approval of the County Board. Each member shall be a qualified engineer review specialist or qualified wetland review specialist. One member of the committee shall serve for an initial term of one year, another for an initial term of two years and the third for an initial term of three years. The members shall decide which of them shall serve for a one, two or three year term by lot at the first meeting of the RSQC. Thereafter, each member of the committee shall serve for a term of three years. No member may serve for more than two consecutive terms.

§ 1405. Investigation; compliance

(a) The Director upon his own initiative or at the request of any person may conduct an investigation into the qualifications of a qualified engineer review specialist or qualified wetland review specialist, or such specialist’s performance of permit reviews under this ordinance. Such investigation may include, but is not limited to, an examination of all relevant records maintained by the community and field inspections of relevant developments, structures or stormwater facilities. If upon such investigation, the Director determines that the specialist has failed in some significant way, or has repeatedly failed to conduct such reviews in conformance with this ordinance, then he shall prepare a report of his findings along with a complaint for the suspension or revocation of the specialist’s certification and file them with the RSQC. The complaint shall contain a short and plain statement describing how the specialist has failed in some significant way, or has repeatedly failed to conduct such reviews in conformance with this ordinance.

(b) Upon receipt of a written complaint, the RSQC shall serve a copy thereof along with a copy of the report of the Director upon the specialist named therein in accordance with § 1006. A copy of the complaint and report shall also be served upon every community for whom the specialist has conducted permit reviews. The specialist may file a written answer to the complaint within 30 days after being served.

§ 1406. Hearing on complaint

The RSQC shall conduct a hearing on the complaint not less than 75 nor more than 120 days after service of the complaint upon the specialist. Notice of the hearing shall be served upon the specialist and upon any community which received a copy of the complaint and published in accordance with § 1007. The hearing may be continued from time to time. The RSQC may adopt rules for the taking of evidence and conduct of such hearings.

§ 1407. Decision of the RSQC

Within 30 days of the conclusion of the hearing, the RSQC shall decide whether or not to remove, either temporarily or permanently, the name of the specialist from the list of qualified review specialists. The decision of the RSQC shall be in writing and shall include the specific findings and conclusions supporting its determination. A copy of the decision and order shall be served upon the specialist and upon any community which received a copy of the complaint in accordance with § 1006. If the specialist's name is to be temporarily removed from the list, the specialist shall automatically become requalified upon the expiration of the designated period. If the specialist's name is to be permanently removed, the specialist may apply for qualification at or after such time as the RSQC shall specify in its order.

§ 1408. Appeals

(a) Within 30 days after being served with the order of the RSQC, the specialist may appeal to the Committee. The appeal shall be made by filing a notice thereof with the Department. The Committee shall conduct a hearing on the appeal not less than 75 nor more than 120 days after the filing of the notice of appeal. The hearing shall be *de novo*. Notice of the hearing shall be served upon all parties as for the hearing before the RSQC. The hearing may be continued from time to time. The Committee may adopt rules for the taking of evidence and conduct of such hearings.

(b) Within 30 days of the conclusion of the hearing, the Committee shall decide whether to affirm or reverse, in whole or in part, the order of the RSQC. The decision of the Committee shall be in writing and shall include the specific findings and conclusions supporting its determination. A copy of the decision and order shall be served upon all parties in accordance with § 1006 as for the hearing before the RSQC.

(c) From a final decision of the Committee, the specialist may appeal to the courts under the Illinois Administrative Review Law.

ARTICLE 15— WETLAND IMPACTS AND MITIGATION**§ 1500. General**

All developments having a wetland impact shall comply with this Article. A permit for any wetland impact shall be obtained from the Director.

§ 1501. Unmitigable wetlands—exceptions

(a) Wetlands identified as having an FQI greater than or equal to 25 shall not be filled or dredged as part of any development. The FQI shall be based solely on the wetland vegetation. Buffers and adjacent plant communities shall not be included in the calculation.

(b) If the application of this section would (i) have the effect of depriving the owner of all economically beneficial or productive use of the land; or (ii) make the construction or installation of an essential public improvement by a public entity impossible or highly impracticable the applicant may apply for a variance from the requirements of this section under Article 9. If such a variance is granted mitigation for the wetland impact allowed shall be made according to §§ 1503(a) and 1503(e).

§ 1502. Mitigation required

All mitigable wetland impacts shall be mitigated as described herein with the following exceptions:

(a) A wetland impact created by the dredging of a wetland with an FQI of less than 7 need not be mitigated.

(b) A wetland impact upon manmade wetlands created by excavation or other unfinished development activities in previously non-wetlands areas need not be mitigated.

(c) Wetland impacts upon wetlands created by irrigation which would revert to non-wetlands areas if irrigation were to cease need not be mitigated.

(d) Wetland impacts upon wetlands created by the construction of manmade stormwater management facilities in previously non-wetlands areas need not be mitigated. Proof may be required to verify the purpose and use of the facility.

(e) Wetland impacts created by the construction of manmade ponds in previously non-wetlands areas need not be mitigated.

(f) Wetland impacts occurring on agricultural land that has been enrolled in any program under the Food Security Act for the previous three years need not be mitigated.

§ 1503. Mitigation requirements

(a) For all mitigable wetland impacts—

- (1) mitigation may be made within a wetland mitigation facility;
- (2) mitigation may be made by the purchase of credits from a wetland mitigation bank;
- (3) mitigation may be made by the payment of a fee-in-lieu of mitigation under § 1302;

(b) Wetland impacts upon wetlands with an FQI of less than 7 shall be mitigated at a ratio of 1:1. The applicant may request permission to mitigate within the site runoff storage facility area. The applicant may earn wetland credits by enhancing preserved wetlands with an FQI of 5 or less at the ratio of one-quarter wetland credit per one acre of wetland enhanced. If this option is chosen the entire wetland shall be enhanced even if credit in excess of that required for the development is generated. The enhanced wetland shall meet the performance standards of § 1506.

(c) Wetland impacts upon wetlands with an FQI of 7 or more but less than 16 shall be mitigated at a ratio of 2:1.

(d) Wetland impacts upon wetlands with an FQI of 16 or more but less than 25 shall be mitigated at a ratio of 3:1.

(e) Wetland impacts upon wetlands with an FQI of more than 25 shall be mitigated at a minimum ratio of 10:1 plus one half for each point by which the FQI exceeds 25 rounded up to the nearest whole number. For example, a wetland having an FQI of 32 shall be mitigated at a ratio of 14:1 ($(32-25)/2 = 3\frac{1}{2}$ rounded up to the nearest whole number = 4); $10 + 4 = 14$).

(f) Wetland impacts upon wetlands inhabited by a threatened or endangered species shall be mitigated at a ratio of 3:1.

(g) Mitigation for wetland impacts upon more than one wetland within a site shall meet the standards applicable to the highest quality wetland impacted.

§ 1504. Wetland mitigation plan

(a) In addition to the requirements of Article 5, if wetland mitigation is required a wetland mitigation plan shall be submitted. At a minimum the plan shall contain—

(1) a narrative of the proposed plan including a description of the proposed hydrologic regime, soils and site geomorphology, where applicable;

(2) drawings depicting each wetland impacted and each wetland mitigation facility together with an individual listing contained in a summary table;

(3) specifications for rough and final grading, soil types, soils placement, plant procurement, water control structures and a planting plan that lists the plant materials by scientific and common name, seeding rate or spacing distance and special planting provisions; and

(4) maintenance and monitoring provisions including an annual work schedule describing each task in detail and time of year when it will be performed.

(b) The wetland mitigation plan shall be designed so that—

(1) every wetland mitigation facility shall contain at least two wetland plant communities (for example, wet prairie, emergent, floating vascular, forested wetland, sedge meadow, or hemi marsh); and

(2) open water shall not constitute more than 20% of the entire wetland mitigation facility.

§ 1505. Buffer requirements for wetland mitigation facilities

Wetland mitigation facilities shall be buffered according to the requirements of § 418. Reductions are allowed in accordance with § 418(a)(3)(B)(ii), 418(a)(3)(B)(iii) and 418(a)(3)(B)(iv). No buffer is required for that portion of a wetland mitigation facility which is adjacent to an existing preserved wetland.

§ 1506. Wetland mitigation performance standards

(a) All wetland mitigation facilities shall meet the following performance standards:

(1) They shall meet the definition of a wetland under this ordinance.

(2) All vegetated zones within any wetland mitigation facility shall achieve 85% cover.

- (3) The emergent community shall achieve 60% aerial coverage.
- (4) The floating vascular community shall meet 25% aerial coverage.
- (5) Open water shall have 0% vegetative coverage.

(b) A wetland mitigation facility designed to mitigate for impacts upon wetlands with an FQI of less than 7 shall achieve a minimum FQI 3 points greater than the FQI of the wetland impacted within the five-year monitoring period.

(c) A wetland mitigation facility designed to mitigate for impacts upon wetlands with an FQI of 7 or more but less than 25 shall achieve a minimum FQI 5 points greater than the FQI of the wetland impacted within the five-year monitoring period.

(d) A wetland mitigation facility shall not be dominated or contain cumulatively more than 25% cover of the following species: Buckthorn (*Rhamnus cathartica* or *frangula*), Reed-Canary Grass (*Phalaris arundinacea*), Purple Loosestrife (*Lythrum salicaria*), or Giant Reed (*Phragmites australii*).

§ 1507. Mitigation monitoring

The wetland mitigation facility shall be monitored and managed for five years beginning on the day the wetland planting is completed. The procedures for monitoring wetland mitigation facilities shall be those set forth in the current Chicago District protocol promulgated by COE. An annual report shall be filed with the Director by February 15 of each year for every wetland mitigation facility under permit. Once a wetland mitigation facility reaches its required FQI and meets the performance standards of § 1506, a request for the release of the performance security may be made to the Director. A release of the performance security may be requested of the Director as early as the end of the third full growing season. At the end of the five-year monitoring and management period, or upon acceptance by the Director, the wetland mitigation facility shall be maintained in accordance with Article 6.

§ 1508. Mitigation required for non-performing wetland

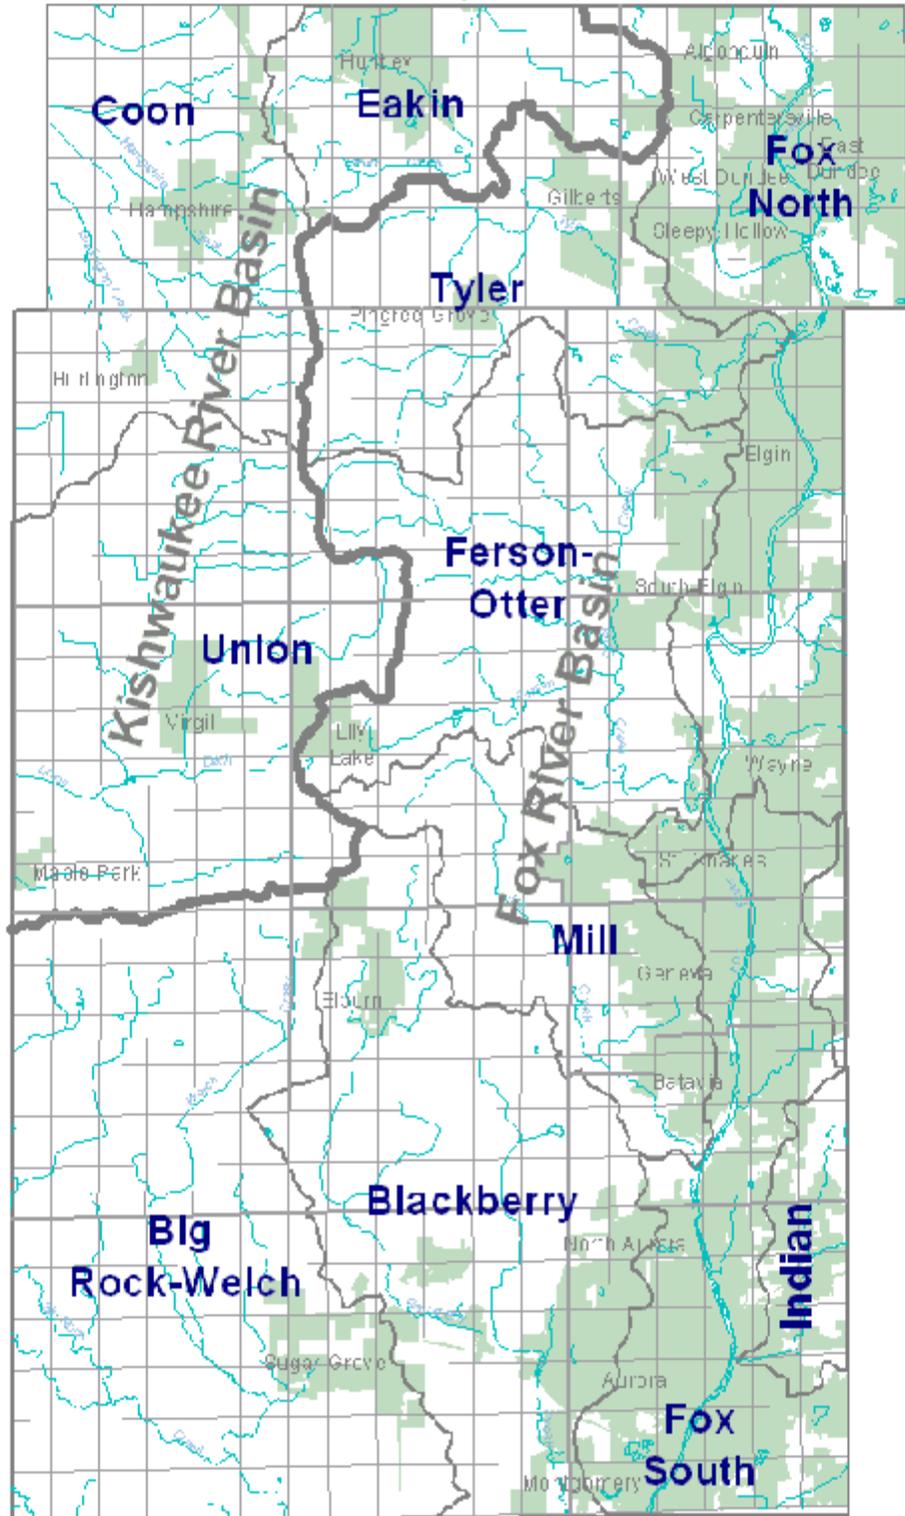

At the end of the five-year monitoring period or upon an earlier request for the release of the performance security, the Director shall evaluate the wetland mitigation facility for compliance with the performance standards of § 1506. If the Director determines that the facility meets the standards he shall release the performance security. If the Director determines that the facility does not meet the standards he shall make an estimate of the probable cost of mitigating for the shortfall in performance. The Director shall reduce so much of the performance security to cash as is required to mitigate for the shortfall in performance and shall release the remainder. The amount withheld for mitigation shall be deposited in the fund created under and expended in the manner described in § 1303.

§ 1509. Denial of permit—appeal

The denial of a permit under this Article may be appealed in the manner described in § 511.

APPENDIX A—WATERSHED BOUNDARIES

Appendix A. Watershed Boundaries for Major Watersheds Kane County, Illinois

APPENDIX B—QUALIFIED ENGINEER REVIEW SPECIALIST STATEMENT

I, _____, of _____, with professional licensure in the State of Illinois, do hereby state that I have read and understand the Kane County Stormwater Ordinance and the Technical Manual which accompanies it, and will obtain, read and abide by any amendments thereto. I affirmatively state that I meet the requirements set forth in § 1401 of the ordinance. I will review projects for compliance with the ordinance using my expertise in stormwater management system design and permitting, floodplain and floodway policies and procedures, soil erosion and sediment control procedures and practices, and construction practices and inspections. I will exercise professional judgment with respect to projects submitted for my review in accordance with the customary standard of care applicable to persons providing similar services in the same or similar communities in order to insure substantial conformance with the ordinance. I understand that failure to adequately discharge this obligation may, with due process, result in loss of this status. It is my responsibility to provide the Director with any changes to the information provided.

APPENDIX C—QUALIFIED WETLAND REVIEW SPECIALIST STATEMENT

I, _____, of _____, do hereby state that I have read and understand the Kane County Stormwater Ordinance and the Technical Manual which accompanies it, and will obtain, read and abide by any amendments thereto. I affirmatively state that I meet the requirements set forth in § 1402 of the ordinance. I will review projects for compliance with those sections of the ordinance pertaining to wetlands, including, without limitation, wetland delineation and the calculation of buffer widths. I will use my expertise in wetland delineations or field identification of wetland indicators in the Upper Midwest. I understand that failure to adequately discharge this obligation may, with due process, result in loss of this status. It is my responsibility to provide the Director with any changes to the information provided.

APPENDIX D—SAMPLE SPECIAL SERVICE AREA ORDINANCES

[CITY/VILLAGE] OF _____

ORDINANCE NO. _____

**AN ORDINANCE PROPOSING THE ESTABLISHMENT OF THE
_____ SPECIAL SERVICE AREA [or SPECIAL SERVICE AREA
NO. _____] OF _____, ILLINOIS
AND THE LEVY OF TAXES FOR THE PURPOSE OF PAYING THE COST
OF PROVIDING SPECIAL SERVICES IN AN FOR SUCH AREA**

**ADOPTED BY THE
[MAYOR AND CITY COUNCIL/PRESIDENT AND BOARD OF TRUSTEES]
OF THE
[CITY/VILLAGE] OF _____**

[DATE]

ORDINANCE NO. _____

AN ORDINANCE PROPOSING THE ESTABLISHMENT OF THE _____ SPECIAL SERVICE AREA [or SPECIAL SERVICE AREA NO. _____] OF _____, ILLINOIS AND THE LEVY OF TAXES FOR THE PURPOSE OF PAYING THE COST OF PROVIDING SPECIAL SERVICES IN AN FOR SUCH AREA

WHEREAS pursuant to the provisions of the 1970 Constitution of the State of Illinois (the *Constitution*), the [City/Village] of _____, Kane County, Illinois (the [*City/Village*]), is authorized to create special service areas in and for the [City/Village]; and

WHEREAS special service areas are established by non-home rule¹ units pursuant to Section 7(6) of Article VII of the Constitution, which provides that—

[M]unicipalities...which are not home rule units shall have...powers...to levy or impose additional taxes upon areas within their boundaries in the manner provided by law for the provision of special services to those areas and for the payment of debt incurred in order to provide those special services;

and are established “in the manner provided by law” pursuant to the provisions of “AN ACT to provide the manner of levying or imposing taxes for the provision of special services to areas within the boundaries of home rule units and non-home rule municipalities and counties,” approved September 21, 1973, as amended, and pursuant to the Revenue Act of 1939 of the State of Illinois, as amended; and

WHEREAS it is in the public interest that the establishment of the area hereinafter described as a special service area for the purposes set forth herein and to be designated as the _____ Special Service Area [or Special Service Area No. _____], of the [City/Village] (the *Area*) be considered; and

WHEREAS the Area is compact and contiguous, totally within the corporate limits of the [City/Village]; and

WHEREAS the Area will benefit specially from the municipal services to be provided by the [City/Village] (the *Services*), and the Services are unique and in addition to the services provided to the [City/Village] as a whole, and it is, therefore, in the best interests of the [City/Village] that the establishment of the Area be considered; and

WHEREAS it is in the public interest that the levy of a direct annual *ad valorem* tax upon all taxable property within the Area be considered for the purpose of paying the cost of providing the Services; and

WHEREAS the revenue from such tax shall be used solely and only for Services for which the [City/Village] is authorized under the provisions of the Illinois Municipal Code, as amended, to levy taxes or special assessments or to appropriate the funds of the [City/Village], all of the Services to be in and for the Area and all of the necessary construction and maintenance to be on property now owned or to be acquired by the [City/Village], or property in which the [City/Village] will obtain an interest sufficient for the provision of the Services; and

WHEREAS said direct annual *ad valorem* tax shall be levied upon all taxable property within the Area for an indefinite period of time beginning for the year _____ and shall not exceed an annual rate of _____ of the assessed valuation of each tax parcel within the Area and shall be in addition to all other taxes permitted by law; and

WHEREAS a public hearing will be held at _____, on the _____ day of _____, _____, in the [City/Village] Hall, _____, _____, Illinois _____ (the *Hearing*), to consider the establishment of the Area for the purpose of providing the Services and the levy of an

¹Home rule municipalities should alter this language accordingly.

additional direct annual *ad valorem* tax for the purpose of paying the cost thereof, all as described in the Notice of Public Hearing set forth in Section 2 hereof (the *Notice*); and

WHEREAS the Notice shall be given by publication and mailing. Notice by publication shall be given by publication on a date, such date being not less than 15 days prior to the Hearing, in a newspaper published within the [City/Village] [or, of general circulation within the [City/Village], there being no newspaper published therein]. Notice by mailing shall be given by depositing the Notice in the United States Mail addressed to the person or persons in whose name the general taxes for the last preceding year were paid on each lot, block, tract, or parcel of land lying within the Area. The Notice shall be mailed not less than 10 days prior to the time set for the Hearing. In the event taxes for the last preceding year were not paid, the Notice shall be sent to the person last listed on the tax rolls prior to that year as the owner of said property.

NOW, THEREFORE, Be it Ordained by the [Mayor and City Council/President and the Board of Trustees] of the [City/Village] of _____, Kane County, Illinois, as follows:

§1. Incorporation of preambles

The preambles of this ordinance are hereby incorporated into this text as if set out herein in full.

§2. Notice

The [Mayor and City Council/President and Board of Trustees] determine that the Notice is in the proper statutory form as set forth as follows:

NOTICE OF PUBLIC HEARING
[City/Village] OF _____, KANE COUNTY, ILLINOIS
_____ SPECIAL SERVICE AREA [or NO. _____]

NOTICE IS HEREBY GIVEN that on _____, at _____, in the [City/Village] Hall, _____, _____, Illinois, a public hearing (the *Hearing*) will be held by the [Mayor and City Council/President and Board of Trustees] of the [City/Village] of _____, Kane County, Illinois (the [City/Village]), to consider the establishment of the _____ Special Service Area [No. _____], (the *Area*), of the [City/Village], consisting of the following described territory:

SEE ATTACHED EXHIBIT A

Said territory consists of approximately ___ acres lying [insert general description of location]. An accurate map of said territory is on file in the office of the [City/Village] Clerk and is available for public inspection.

The purpose of the establishment of the Area is to provide the following special services (the *Services*) to the Area: the operation, maintenance, repair, rehabilitation, replacement and reconstruction of any storm water site runoff storage area, drainageway, ditch, swale, storm sewer or other stormwater facility; costs of design, engineering and other consulting services, surveying and permits, public liability insurance, and all administrative, legal and other costs or expenses incurred in connection therewith and with the administration of the Area, including the repayment of any loan or debt incurred for the provision of any of such Services, all of the Services to be in and for the Area.

All of the Services are to be on property now owned or to be acquired by the [City/Village], or property in which the [City/Village] will obtain an interest sufficient for the provision of the Services.

The levy of a direct annual *ad valorem* tax upon all taxable property within the Area for the purpose of paying the cost of the Services will also be considered at the Hearing. The tax shall be levied upon all taxable property within the Area for an indefinite period of time beginning for the year _____ and shall not exceed an annual rate of _____ of the assessed valuation of each tax parcel within the Area and shall be in addition to all other taxes permitted by law.

All interested persons affected by the establishment of the Area or tax levy, including all owners of real estate located within the Area, will be given an opportunity to be heard at the Hearing regarding the establishment of the Area and the tax levy and an opportunity to file objections to the establishment of the Area or the tax levy.

At the Hearing, any interested persons affected by the Area may file with the [City/Village] Clerk written objections to and may be heard orally in respect to any issues embodied in this notice. The [Mayor and City Council/President and Board of Trustees] shall hear and determine all protests and objections at the Hearing, and the Hearing may be adjourned to another date without further notice other than a motion to be entered upon the minutes fixing the time and place of its adjournment.

If a petition signed by at least 51% of the electors residing within the Area and by at least 51% of the owners of record of the land included within the boundaries of the Area is filed with the [City/Village] Clerk within 60 days following the final adjournment of the Hearing objecting to the creation of the Area or the levy or imposition of a tax for the provision of the Services to the Area, no such Special Service Area may be created or no tax may be levied or imposed.

By order of the [Mayor and City Council/President and Board of Trustees] of the [City/Village] of _____, Kane County, Illinois.

DATED this _____ day of _____, _____.

/s/

[City/Village] Clerk, [City/Village] of _____,
Kane County, Illinois

§3. Miscellaneous

The [City/Village] agrees to produce or file such forms, statements, proceedings and supporting documents as may be required and in a timely manner in order to establish the Area and levy the taxes and, if deemed necessary or advisable by its officers, to employ and pay fiscal agents, financial advisors, attorneys and other persons to assist the [City/Village] in these endeavors.

§4. Repealer; effective date

All ordinances, orders and resolutions and parts thereof in conflict herewith be and the same are hereby repealed, and this ordinance be in full force and effect forthwith upon its passage, approval and publication as provided by law.

ORDINANCE NO. _____

AN ORDINANCE ESTABLISHING THE
_____ SPECIAL SERVICE AREA [or NO. ____] OF
_____, ILLINOIS
AND PROVIDING FOR THE LEVY OF TAXES FOR THE PURPOSE OF
PAYING THE COST OF PROVIDING SPECIAL SERVICES
IN AND FOR SUCH AREA

WHEREAS, pursuant to the provisions of the 1970 Constitution of the State of Illinois (the *Constitution*), the [City/Village] of _____, Kane County, Illinois (the [City/Village]), is authorized to create special service areas in and for the [City/Village]; and

WHEREAS, special service areas are established by non-home rule² units pursuant to Section 7(6) of Article VII of the Constitution, which provides that—

municipalities...which are not home rule units shall have only the powers granted to them by law and the powers...(6) to levy or impose additional taxes upon areas within their boundaries in the manner provided by law for the provision of special services to those areas and for the payment of debt incurred in order to provide those special services;

and

WHEREAS, special service areas are established “in the manner provided by law” pursuant to the provisions of “AN ACT to provide the manner of levying or imposing taxes for the provision of special services to areas within the boundaries of home rule units and non-home rule municipalities and counties,” approved September 21, 1973, as amended (the *Act*), and pursuant to the provisions of the Revenue Act of 1939 of the State of Illinois, as amended; and

WHEREAS, it is in the public interest that the area hereinafter described be established as the _____ Special Service Area [or No. _____] of the [City/Village] for the purposes set forth herein (the *Area*); and

WHEREAS, the Area is compact and contiguous and totally within the boundaries of the [City/Village]; and

WHEREAS, the Area will benefit specially from the services to be provided by the [City/Village] (the *Services*), and the Services are unique and in addition to the services provided to the [City/Village] as a whole, and it is, therefore, in the best interests of the [City/Village] that the Area be established; and

WHEREAS, the cost of providing the Services shall be paid by the levy of a direct annual *ad valorem* tax upon all taxable property within the Area; and

WHEREAS, said direct annual tax shall be levied upon all taxable property within the Area for an indefinite period of time beginning for the year _____ and shall not exceed an annual rate of _____ of the assessed valuation of each tax parcel within the Area and shall be in addition to all other taxes permitted by law; and

WHEREAS, the establishment of the Area was proposed by the [City Council/Board of Trustees] of the [City/Village] (the [Council/Board]) pursuant to Ordinance No. _____, entitled:

AN ORDINANCE proposing the establishment of the _____ Special Service Area [or No. _____] of _____, Illinois, and the levy of

²Home rule units should alter this language accordingly.

taxes for the purpose of paying the cost of providing special services in and for such Area.

(the *Proposing Ordinance*), duly adopted on _____, and was considered at a public hearing (the *Hearing*) held by the [Council/Board] on _____; and

WHEREAS, notice of the Hearing was given by publication at least once not less than 15 days prior to the Hearing in _____, the same being a newspaper published in the [City/Village] [or, of general circulation with the [City/Village], there being no newspaper published therein]; and

WHEREAS, mailed notice of the Hearing was given by depositing notice in the United States mails addressed to the person or persons in whose name the general taxes for the last preceding year were paid on each lot, block, tract or parcel of land lying within the Area not less than 10 days prior to the time set for the Hearing, and in the event taxes for the last preceding year were not paid, the notice was sent to the person or persons last listed on the tax rolls prior to that year as the owner or owners of said property; and

WHEREAS, said notice complied with all of the applicable provisions and requirements of the Act; and

WHEREAS, all interested persons affected by the establishment of the Area or the levy of the tax to pay the cost of providing the Services, including all owners of real estate located within the Area, were given an opportunity to be heard at the Hearing regarding the establishment of the Area and the levy of said tax and an opportunity to file objections to the establishment of the Area or the levy of said tax; and

WHEREAS, at the Hearing, all interested persons affected by the Area were permitted to file with the [City/Village] Clerk written objections to and to be heard orally in respect to any issue embodied in the notice given of the Hearing; and

WHEREAS, the Council/Board has determined and does hereby determine that it is in the public interest and in the interest of the [City/Village] and the Area that the Area be established;

NOW, THEREFORE, Be It Ordained by the [Mayor and City Council/President and Board of Trustees] of the [City/Village] of _____, Kane County, Illinois, as follows:

§1. Incorporation of preambles

The preambles of this ordinance are hereby incorporated into this text as if set out herein in full.

§2. Final adjournment of Hearing

The Hearing was finally adjourned on _____.

§3. Establishment of Area

(a) The _____ Special Service Area [or No. _____] of the [City/Village] is hereby established in and for the [City/Village] and shall consist of the territory legally described in Exhibit A attached.

(b) Said territory consists of approximately _____ acres lying [insert a general description of the location of the area] in the [City/Village]. An accurate map of the Area is attached hereto and made a part hereof.

§4. Purpose of the establishing the Area

The purpose of establishing the Area is to provide the Services to the Area, including the operation, maintenance, repair, rehabilitation, replacement and reconstruction of any site runoff storage area, drainageway, ditch, swale, storm sewer, or other stormwater facility; costs of design, engineering and other consulting services, surveying and permits, public liability insurance, and all administrative, legal and other costs or expenses incurred in connection therewith and with the administration of the Area, including the repayment of any loan or debt incurred for the provision of any of such Services, all of the Services to be in and for the Area and all of said

construction and improvements to be on property now owned or to be acquired by the [City/Village], or property in which the [City/Village] will obtain an interest sufficient for the provision of the Services.

§5. Tax Levy

The cost of the Services shall be paid by the levy of a direct annual *ad valorem* tax upon all taxable property within the Area for an indefinite period of time beginning for the year _____ and shall not exceed an annual rate of _____ of the assessed valuation of each tax parcel within the Area and shall be in addition to all other taxes permitted by law.

§6. Filing

The [City/Village] Clerk is hereby directed to file a certified copy of this ordinance, including an accurate map of the Area, in the office of the Kane County Clerk and in the office of the Kane County Recorder forthwith after its adoption and approval.

§7. Repealer

All ordinances, orders and resolutions and parts thereof in conflict herewith be and the same are hereby repealed, and this ordinance be in full force and effect forthwith upon its adoption.

DATED: _____.

Clerk of the [City/Village] of _____,
Kane County, Illinois

mitigation required under this ordinance for wetland impacts in any other county may be provided in such county or in the County.

§ 3. Section 800 is amended to read as follows:

§ 800. Scope of regulation

This ordinance applies to all development within the County and to all development within the corporate boundaries of any certified community, including that under the control of any governmental entity, agency, or authority. Any person undertaking a development shall obtain a stormwater management permit from the permitting authority within whose boundaries the development is located. Any person undertaking a development having a wetland impact shall obtain a permit from the Director (or Administrator in a community certified under this ordinance to administer Article 15). Any certified community undertaking development in the regulatory floodway, or regulatory floodplain where no regulatory floodway has been designated, shall obtain a permit from IDNR-OWR if required prior to issuance of a stormwater management permit. All units of local government shall obtain stormwater management permits from the permitting authority within whose boundaries the development is located.

§ 4. Section 1001 is amended to read as follows:

§ 1001. Duties of Director

The Director shall —

- (a) supervise the enforcement of this ordinance;
- (b) supervise the development, revision and implementation of the Plan for approval by the Committee and the County;
- (c) supervise the review of complex stormwater management permits for any community that requests such assistance;
- (d) notify all of the communities in the County, FEMA, IDNR-OWR, COE, NRCS, the Soil and Water Conservation District, the United States Fish and Wildlife Service, the Illinois Environmental Protection Agency, and the United States Environmental Protection Agency of any amendments to the Plan or to this ordinance;
- (e) administer the qualified engineer review specialist and qualified wetland review specialist programs;

(f) maintain a current list of all maps considered regulatory under this ordinance; and

(g) administer Article 15 **except in those communities certified under this ordinance to administer Article 15.**

§ 5. Sections 1100, 1101 and 1102 are amended to read as follows:

§ 1100. Enforcement authority

Pursuant to Section 5-1062 of the Counties Code (55 ILCS 5/5-1062 (1996))—

(a) The County shall enforce all of the provisions of this ordinance within the unincorporated areas of the County, within any County right-of-way, within any portion of an uncertified community that lies within the County, and, pursuant to intergovernmental agreement, within any portion of an uncertified community that lies outside the County.

(b) ~~{The}~~ **Unless such community has been certified under this Article to administer Article 15, the** County shall enforce the provisions of Article 15 within that portion of any certified community that lies within the County and, pursuant to intergovernmental agreement, within that portion of any certified community that lies outside the County.

(c) A community certified under this Article shall enforce all of the provisions of this ordinance ~~{with the exception of Article 15}~~ within the community **for which it has received certification.**

§ 1101. Petition for certification and waiver of enforcement

Any community that wishes to enforce the provisions of this ordinance within its borders shall file a petition for certification and waiver of enforcement (*petition for certification*), on or before ~~{December 1, 2001. After December 1, 2001}~~ **January 8, 2002.** **After January 8, 2002,** petitions for certification may be filed during the month of June of each year.

§ 1102. Filing and contents of petition for certification

A petition for certification shall be filed with the Director. The petition need not be on any particular form but, at a minimum, shall set forth and be accompanied by—

(a) the agreement of the corporate authorities of the community to adopt, if certified, this ordinance by reference;

(b) the community's plan for the implementation and enforcement of this ordinance, including proposed staffing;

(c) the agreement of the corporate authorities of the community to include in any new annexation agreement a provision requiring every other party to the agreement to affirmatively agree to comply with the provisions of this ordinance, as amended from time to time;

(d) the agreement of the corporate authorities of the community that the community will follow the rules and procedures of the Committee in any proceeding concerning its certification and be bound by the decision of the Committee in granting or failing to grant, or suspending or revoking its certification and reasserting County jurisdiction over the enforcement of this ordinance within the boundaries of the community;

(e) if a portion of the community lies outside the County **and the community has not requested, or if requested does not receive, certification to administer Article 15**, the agreement of the corporate authorities of the community to enter into, if certified **to administer the remaining provisions of this ordinance**, an intergovernmental agreement with the County providing for the County's enforcement ~~{of the provisions}~~ of Article 15 within those portions of the community lying outside the County;

(f) evidence of the community's ability to comply with Article 14 pertaining to the use of qualified review specialists and qualified wetland review specialists;

(g) if the community has requested certification to administer Article 15, evidence of the community's ability to do so;

(h) the list of projects to which this ordinance or some portion of this ordinance do not apply pursuant to the requirements of Article 8.

§ 6. Section 1203 is amended to read as follows:

§ 1203. Wetland mitigation and performance security

(a) If **mitigation for** a wetland ~~{mitigation}~~ **impact** is required under this ordinance and the applicant chooses to mitigate within a wetland mitigation facility, the applicant shall post—

(1) a statement of the estimated probable cost to install, monitor and maintain the wetland mitigation facility required by the plan for five years which estimate is subject to the approval of the Director (or Administrator in a community certified to administer Article 15); and

(2) An irrevocable letter of credit in favor of the County (or community in a community certified to administer Article 15), or such other adequate security as the Director (or Administrator in a community certified to administer Article 15), may approve, in an amount equal to 110% of the approved estimated probable cost.

(b) The security required by this section shall be maintained by the applicant in favor of the County (or community in a community certified to administer Article 15), until construction has been completed, vegetation has been established and the wetland mitigation facility has been evaluated by the Director (or Administrator in a community certified to administer Article 15), and found to meet the performance standards of § 1506 at which time it shall be released.

§ 7. Sections 1302 and 1303 are amended to read as follows:

§ 1302. Fee-in-lieu of wetland mitigation

If a wetland mitigation is required under this ordinance and the applicant chooses to satisfy the mitigation requirement by paying a fee-in-lieu of mitigation, the applicant shall—

(a) prepare a statement of the estimated probable cost to acquire the land, install, monitor and maintain a wetland mitigation facility for five years (which estimate is subject to the approval of the Director ~~†~~(or Administrator in a community certified to administer Article 15)), as if the applicant had chosen to satisfy the mitigation requirement by mitigating within a wetland mitigation facility; and

(b) if mitigation credits are available from any wetland mitigation bank, the applicant shall also prepare a statement of the estimated probable cost of satisfying the mitigation requirement through the purchase of credits from a wetland mitigation bank (which estimate is subject to the approval of the Director ~~†~~(or Administrator in a community certified to administer Article 15)) as if the applicant had chosen to satisfy the mitigation requirement in such manner.

(c) The fee-in-lieu of wetland mitigation to be paid under this section shall be the lesser of (a) or (b) above.

§ 1303. Procedures; use of funds

(a) An applicant's statement of its intention to satisfy the wetland mitigation requirement by the payment of a fee-in-lieu of wetland mitigation shall be in writing and filed with the Director (or Administrator in a community certified to administer Article 15), along with the estimates described in the preceding section.

(b) Fees paid in lieu of wetland mitigation shall be deposited by County (or community if certified to administer Article 15), in a separate fund created for such purpose. Provisions shall be made so that all receipts and disbursements of such funds may be accounted for according to the individual watershed in which the development for which they were paid was located.

(c) Fees paid in lieu of ~~wetland~~ mitigation for wetland impacts within the County shall be expended to plan, design, construct, improve, acquire, create or enhance wetlands within the County, or wetland mitigation facilities and wetland mitigation banks. Fees paid in lieu of mitigation for wetland impacts within any other county may be expended to plan, design, construct, improve, acquire, create or enhance wetlands within such county or within the County, or wetland mitigation facilities and wetland mitigation.

§ 8. Section 1500 is amended to read as follows:

§ 1500. General

All developments having a wetland impact shall comply with this Article. A permit for any wetland impact shall be obtained from the Director (or Administrator in a community certified to administer Article 15).

Passed by the Kane County Board this _____ day of _____, 2001.

APPENDIX A – PERMIT SUBMITTAL CHECKLIST

100.0 AUTHORITY AND PURPOSE

This ordinance is enacted pursuant to the police powers granted to Kendall County, Illinois, by the Illinois Compiled Statutes and the Kendall County Land Resource Management Plan.

The purpose of this ordinance is to diminish threats to public health, safety and welfare caused by excess stormwater runoff from new development and redevelopment. This ordinance seeks to establish stormwater management practices and promote sustainable planning and design to counter increases in stormwater runoff quantity and rate and the impairment of water quality from development and land improvement.

101.0 OBJECTIVES

This ordinance is adopted to accomplish the following objectives:

1. To assure that new development does not increase the drainage or flood hazards to others, or create unstable conditions susceptible to erosion;
2. To protect new buildings and major improvements to buildings from flood damage due to increased stormwater runoff;
3. To protect human life and health from the hazards of increased flooding;
4. To lessen the burden on the taxpayer for flood control projects, repairs to flood-damaged public facilities and utilities, correction of channel erosion problems, and flood rescue and relief operations caused by increased stormwater runoff quantities from new development;
5. To protect, conserve, and promote the orderly development of land and water resources;
6. To preserve the natural hydrologic and hydraulic functions of watercourses and floodplains and to protect water quality and aquatic habitats;
7. To preserve the natural characteristics of the land in order to moderate flood and stormwater impacts, improve water quality, reduce soil erosion, protect aquatic and riparian habitat, provide recreational opportunities, provide aesthetic benefits and enhance community and economic development.

200.0 DEFINITIONS

Adverse Impacts	Any deleterious impact on existing drainage characteristics, water resources, or wetlands affecting their capacity, quality, and beneficial uses including recreation, aesthetics, aquatic habitat.
Applicant	Any person, firm, or governmental agency who executes the necessary forms to procure official approval from Kendall County of a development or permit to carry out construction of a development.
Base Flood	The flood having a one percent probability of being equaled or exceeded in a given year.
Base Flood Elevation	The elevation at all locations delineating the level of flooding resulting from the base flood event.
Best Management Practice (BMP)	A measure used to control the adverse stormwater-related effects of development. BMPs include structural devices (e.g., swales, filter strips, infiltration trenches, and detention basins) designed to remove pollutants, reduce runoff rates and volumes, and protect aquatic habitats. BMPs also include non-structural approaches, such as public education efforts to prevent the dumping of household chemicals into storm drains.
Bulletin71	The document Rainfall Frequency Atlas of the Midwest, by Floyd Huff and James Angel of the Midwest Climate Center, Illinois State Water Survey (1992).
Bypass Flows	Stormwater runoff from upstream properties tributary to a property's drainage system but not under its control.
Channel	Any river, stream, creek, brook, branch, natural or artificial depression, ponded area, flowage, slough, ditch, conduit, culvert, gully, ravine, wash, or natural or manmade drainageway, which has a definite bed and bank or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.
Channel Modification	Alteration of a channel by changing the physical dimensions or materials of its bed or banks. Channel modification includes damming, rip rapping (or other armoring), widening, deepening, straightening, relocating, lining, and significant removal of bottom or woody rooted vegetation. Channel modification does not include the clearing of debris or removal of trash.
Compensatory Storage	An artificially excavated, hydraulically equivalent volume of storage created to balance the loss of existing flood storage capacity.

Conduit	Any channel, pipe, sewer or culvert used for the conveyance or movement of water, whether open or closed.
Control Structure	A structure designed to control the rate of flow that passes through the structure given a specific upstream and downstream water surface elevation.
Critical Duration	The duration of a storm event that results in the greatest peak runoff.
Depressional Storage	The volume contained below a closed contour on a one-foot contour interval topographic map. The upper elevation of depressional storage shall be determined by the high water elevation of a 100-year flood through the site in the pre-developed condition.
Detention Basin	A facility constructed or modified to provide for the temporary storage of stormwater runoff and the controlled release by gravity of this runoff at a prescribed rate during and after a flood or storm.
Detention Time	The mean residence time of stormwater in a detention basin.
Development	Any man-made change to real property, including: (a) Submittal to the County of a final plat of subdivision as of the effective date of this ordinance; (b) Construction, reconstruction, or placement of a building or any addition to a building, with the exception of agricultural structures and accessories thereto; (c) Installation of a manufactured home on a site, preparing a site for a manufactured home, or installing a travel trailer on a site for more than 180 days; (d) Drilling, mining, installing utilities, construction of roads, bridges, or similar projects; (e) Construction or erection of levees, walls, dams, or culverts; (f) Channel modification, filling, dredging, grading, clearing, excavating, paving, or other non-agricultural alterations of the ground surface; (g) Storage of materials or deposit of solid or liquid waste; (h) Any other activity that will alter the magnitude, frequency, deviation, direction, or velocity of stormwater or flood water flows from a property.
Drainage System	All means, natural or man-made, used for conducting stormwater to, through or from a drainage area to the point of final outlet from a property. The stormwater drainage system includes but is not limited to any of the following: conduits and appurtenance features, canals, channels, ditches, streams, culverts, streets, storm sewers, detention basins, swales and pumping stations.

Dry Basin	A detention basin designed to drain completely after temporary storage of stormwater flows and to normally be dry over the majority of its bottom area.
Dynamic Modeling	Continuous simulation hydraulic modeling that considers gradually varied, unsteady flow hydraulics.
Erosion	The general process whereby earth is removed by the action of water, wind, or other forces of nature.
Excess Stormwater Runoff	The volume and rate of flow of stormwater discharged from a developed area which is or will be in excess of that volume and rate which pertained before development.
Flood Frequency	Normally expressed as a period of years, based on a percent chance of occurrence in any given year from statistical analysis, during which a flood of a stated magnitude may be expected to be equaled or exceeded. For example, the 2-year flood frequency has a fifty percent chance of occurring in any given year, the 10-year flood frequency has a ten percent chance of occurring in any given year, and the 100-year flood frequency has a one percent chance of occurring in any given year.
Flood Fringe	That portion of the floodplain outside of the regulatory floodway.
Flood Plain	Land adjacent to a body of water with ground surface elevations at or below the base flood or the 100-year frequency flood elevation, including detached ponding areas, etc. The floodplain is also known as the <i>Special Flood Hazard Area (SFHA)</i> .
Floodway	The channel and that portion of the floodplain adjacent to a stream or watercourse which is needed to store and convey the anticipated existing and future 100-year frequency flood discharge with no more than a 0.1 foot increase in flood stage due to any loss of flood conveyance or storage and no more than a ten percent increase in velocities.
Freeboard	An increment of height added to the base flood elevation, groundwater table, or 100-year design water surface elevation to provide a factor of safety for uncertainties in calculations, unknown local conditions, wave action, and unpredictable effects.
Hydrograph	A graph showing, for a given location on a stream or conduit, the flow rates with respect to time.

Impervious Surface	That area of property that is covered by materials resulting in a surface highly resistant to water infiltration, such as parking lots, driveways, sidewalks, patios, roofs, roof extensions, and other structures, also including semi-impervious surfaces such as compacted gravel.
Infiltration	Passage or movement of water into the soil surfaces.
Major Drainage System	That portion of a drainage system needed to store and convey flows beyond the capacity of the minor drainage system. Where manmade, it is designed to handle the 100-year frequency runoff event.
Minor Drainage System	That portion of a drainage system designed for the convenience of the public. It consists of street gutters, driveway culverts, storm sewers, small open channels, and swales and, where manmade, is designed to handle the 10-year frequency runoff event. It also consists of cross-road culverts which shall be designed to handle the 30-year frequency event.
Mitigation	Measures necessary to minimize the negative effects which stormwater drainage and development activities might have on the public health, safety and welfare. Examples of mitigation include compensatory storage, soil erosion and sedimentation control, and channel restoration.
Natural	Conditions resulting from physical, chemical, and biological processes without intervention by man.
Overland Flow Path	A design feature of the major stormwater system which carries flows in excess of the minor stormwater system design capacity in an open channel or swale, or as sheet flow or weir flow over a feature designed to withstand the particular erosive forces involved.
Positive Drainage	Provision of overland paths for all areas of a property including depressional areas that may also be drained by storm sewer.
Peak Flow	The maximum rate of flow of water at a given point in a channel or conduit.
Previously Developed	For property to be considered as previously developed it must have been: (a) Developed prior to 1975 and have no known flooding conditions caused by the lack of a stormwater management plan; or

	(b) Developed after 1975, have on file with the County a building permit or site development permit covering the development, and have no known flooding conditions.
Property	A parcel or parcels of real estate.
Redevelopment	Any activity, alteration, or change in land use that is undertaken on previously developed land.
Regulatory Floodway	The channel, including on-stream lakes, and that portion of the flood plain adjacent to a stream or watercourse as designated by the Illinois Department of Natural Resources, Office of Water Resources (IDNR-OWR), which is needed to store and convey the existing and anticipated future 100-year frequency flood discharge with no more than a 0.1 foot increase in stage due to the loss of flood conveyance or storage, and no more than a 10% increase in velocities. To locate the regulatory floodway boundary on any site, the regulatory floodway boundary should be scaled off the regulatory floodway map and located on a site plan, using reference marks common to both maps. Where interpretation is needed to determine the exact location of the regulatory floodway boundary, the IDNR-OWR should be contacted for the interpretation.
Release Rate	The rate at which stormwater runoff flows from the property.
Retention Basin	A facility designed to completely retain a specified amount of stormwater runoff without release except by means of evaporation, infiltration, or emergency bypass.
Riparian Area	Land that borders a waterway and provides habitat for wildlife or vegetation dependant on the proximity of water.
Sedimentation	The process that deposits soils, debris, and other materials either on other ground surfaces or in bodies of water or stormwater drainage systems.
Special Flood Hazard Area (SFHA)	An area having special flood, mudslide or mudflow, or flood related erosion hazards, and which area is shown on an FHBM or FIRM as Zone A, AO, A1-30, AE, A99, AH, VO, V1-30, VE, V, M, or E.
Stormwater Manage-	

ment Plan	A plan, including engineering drawings and supporting calculations, which describes the existing stormwater drainage system, patterns, and environmental features, as well as the drainage system, patterns, and environmental features which are proposed after development of a property.
Stormwater Runoff	The waters derived from snow melt, rain fall, or other precipitation within a tributary drainage basin which are in excess of the infiltration capacity of the soils of that basin.
Storm Sewer	A closed conduit for conveying collected stormwater.
Time of Concentration	Elapsed time for stormwater to flow from the most hydraulically remote point in a drainage basin to a particular point of interest in that watershed.
Urban Runoff Pollutants	Contaminants commonly found in urban runoff which have been shown to adversely affect uses in receiving waterbodies. Pollutants of concern include sediment, heavy metals, petroleum-based organic compounds, nutrients, oxygen demanding organics (BOD), pesticides, salt, and pathogens.
Watershed	All of the land surface area drained by or contributing runoff to the same stream, lake, stormwater facility, or given point.
Wet Basin	A detention basin designed to maintain a permanent pool of water after the temporary storage of stormwater runoff.
Wetland	Areas inundated or saturated by surface water or ground water at a frequency or duration sufficient to support a prevalence of vegetation typically adapted for life in saturated soil conditions.
Wetland Basin	A detention basin designed with all or a portion of its bottom area as a wetland.

300.0 APPLICABILITY

All development applications shall be accompanied by a Site Plan including required drawings, calculations, and supporting data as necessary to ensure that the provisions of this ordinance are met.

Content of the Site Plan shall be determined by the criteria listed in Section 301 and 302.

No site development permit, building permit, or final plat shall be issued or signed until the County has determined that the proposed development, development application, and Stormwater Management Plan meet all applicable requirements of this ordinance.

301.0 APPLICABILITY FOR STORMWATER RUNOFF DETENTION

All developments in unincorporated Kendall County meeting the following criteria shall provide stormwater runoff storage facilities in accordance with this ordinance.

1. The property being developed or redeveloped is a single-family detached residential development with five or more units and having an average lot size less than or equal to 3 acres; or
2. The property being developed or redeveloped is not a single-family detached residential development or is a non-residential land use, excluding agricultural uses, totals three acres or more in size, and results in 45,000 square feet or more of total development or 32,000 square feet or more of impervious area;
3. The property being developed or redeveloped is not a single-family detached residential development or is a non-residential land use, excluding agricultural uses, totals less than three acres in size, and results in an impervious surface area of 25% or more of the development site.

302.0 PLAN SUBMITTAL REQUIREMENTS

1. All development not subject to the criteria of Section 301.0 shall submit a Step 1 Site Plan.
2. Developments subject to the criteria of Section 301.0 and being 20 acres or less in size shall submit a Step 2 Stormwater Management Plan.
3. Developments subject to the criteria of Section 301.0 and being more than 20 acres in size shall submit a Step 3 Stormwater Management Plan.
4. Development proposed in a flood plain, flood fringe, flood way, or SFHA or development on a property having any portion located within a wetland shall submit a Step 3 Stormwater Management Plan.

Submittals shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts of the development on water resources both on-site and downstream, and the effectiveness of the proposed Stormwater Management Plan in managing stormwater runoff.

Drawings or exhibits shall be dimensioned or shall be at a maximum scale of 1 inch = 100 feet. Exhibits may be on more than one drawing for clarity.

The applicant shall certify on the drawings that all clearing, grading, drainage, and construction shall be accomplished in strict conformance with Kendall County Ordinances and the approved Stormwater Management Plan.

302.1 Pre-Submittal Meeting

It is recommended that the petitioner schedule a pre-submittal meeting with the Kendall County Planning, Building, and Zoning Department to review the proposed project, discuss submittal requirements, and discuss questions the petitioner may have. Appendix A includes a permit submittal checklist for use with this Division. This ordinance shall take precedence over the checklist.

302.2 Step 1 Site Plan

The Step 1 Stormwater Management Plan shall provide the following:

1. A written description of the proposed development and the stormwater management practices being employed;
2. A location map or description providing township, range, and nearest roadways to accurately locate the development site;
3. Acreage and zoning of property area;
4. Property area lines and dimensions including rights-of-way, easements, and setback lines;
5. Existing and proposed site conditions including all buildings, roads, impervious surfaces, and ground elevations where site grading is proposed;
6. Proposed limits and restoration of disturbed areas;
7. Existing and proposed drainage features such as culverts, conduits, swales, streams, ponds, wetlands, etc.;
8. Location of subsurface drains and tiles within the development area only;
9. Location of wells, septic systems, water mains, and sanitary sewers;
10. Copies of other permit applications and final permits as required by other jurisdictions and agencies;

302.3 Step 2 Stormwater Management Plan

The Step 2 Stormwater Management Plan shall provide all items from the Step 1 Site Plan in addition to the following:

1. Property topography at one foot contours for the entire property extending to a minimum of one hundred feet beyond the property lines or as necessary to determine off-site impacts of the proposed Stormwater Management Plan;
2. Site contours shall be keyed to a USGS datum and state plane coordinate system;
3. Elevation of all building foundations and indications whether buildings have basements, lookouts, walkouts, or crawl spaces;
4. The property area's location within the major watershed;
5. Sub-watershed boundaries within and across the property area;
6. Soils inventory for the property area;
7. A tile survey within the proposed development area;
8. Delineation of upstream and downstream drainage features and watersheds which affect or are affected by the development including depressional areas and stormwater storage areas;
9. Delineation of proposed stormwater storage facilities, including ponds;
10. Design calculations and plans detailing existing and proposed stormwater runoff, storage, and drainage features;
11. Major and minor drainage system design plans and calculations including delineation of sub drainage areas for all conveyance features;
12. The top of banks and centerline elevations of streams and channels at maximum 100-foot intervals;
13. Cross section data and conveyance calculations for open channel and overland flow paths;
14. Delineation of flood plain, flood way, and base flood elevation and inventory of riparian areas within 100 feet of the property area;
15. Mapping and elevations of historical flooding records as available;
16. Delineation and description of designated conservation areas within 100 feet of the property area;

17. Delineation and inventory of wetlands within 100 feet of the property area;

302.4 Step 3 Stormwater Management Plan

The Step 3 Stormwater Management Plan shall provide all items from the Step 1 Site Plan and Step 2 Stormwater Management Plan in addition to the following:

1. Existing base flood elevation and profile for stream reach affected or modified by the proposed development.
2. Detailed environmental mitigation plans for disturbance of wetlands, riparian, or conservation areas
3. Flow rates and velocities at representative points in the drainage system;
4. A statement by the design engineer concerning the location and capacity of the complete drainage system's provisions for conveying the 100-year storm event runoff.
5. Phasing of project including expected start and completion dates, duration of exposure of disturbed areas, and expected dates for restoration.

303.0 DETERMINATION OF PROPERTY AREA

The following criteria shall be considered when determining the total area of property being developed or redeveloped and for "grandfathering" of previously developed property.

1. The County shall review the proposed total area of the property being developed or redeveloped in order to preclude inappropriate phasing of developments to circumvent the intent of this ordinance.
2. If a portion of the property area was previously developed, then the previously developed property area may be excluded from the total property area.
3. If a previously developed portion of a site is proposed to be redeveloped, it must be included in the total property area.

400.0 STORMWATER MANAGEMENT PLAN

The following division establishes the design features and the design criteria, standards, and methods to be used in developing a Stormwater Management Plan.

401.0 MINIMIZATION OF INCREASES IN RUNOFF VOLUMES AND RATES

In the selection of a stormwater management plan for a particular development, the applicant shall evaluate and implement site design features that most closely meet the goal of no change in runoff rate or volume from pre-development conditions.

The applicant's Stormwater Management Plan submittal shall include evaluations of site design features that are consistent with the following hierarchy:

1. Minimize impervious surfaces on the property and establish best management practices consistent with the needs of the project;
2. Preserve, establish, and/or restore native plantings and natural areas to increase and promote infiltration and evaporation;
3. Preserve natural resource features of the development site, including but not limited to flood plain, wetlands, prairies, and woodlands;
4. Attenuate flows by use of open vegetated swales and natural depressions;
5. Preserve, enhance, and incorporate existing natural stream channels and quality wetlands, stream channels and drainageways;
6. Infiltrate runoff on-site;
7. Provide stormwater retention facilities;
8. Provide stormwater detention facilities; and
9. Construct storm sewers.

402.0 WATER QUALITY AND MULTIPLE USES

In the selection of a stormwater management plan for a particular development, the following water quality and multiple use aspects shall be employed:

1. The stormwater management system shall be designed to minimize adverse water quality impacts downstream and on the property itself.
2. Stormwater conveyance and storage areas shall utilize native plantings to increase infiltration and evaporation.

3. Retention and infiltration of stormwater shall be promoted throughout the property's drainage system to reduce the volume of stormwater runoff and to reduce the quantity of runoff pollutants.
4. Stormwater storage areas shall incorporate design features to capture stormwater runoff pollutants.
5. All flows from the development shall be routed through the stormwater storage areas and receive the stormwater quality benefits of the facility (i.e., low flows shall not be bypassed).
6. Stormwater storage design shall give preference to wet bottom and wetland designs.
7. The drainage system shall incorporate multiple uses where practicable. Uses considered compatible with stormwater management include open space, aesthetics, aquatic habitat, recreation (boating, trails, playing fields), wetlands and water quality mitigation.
8. The applicant should avoid using portions of the property exclusively for stormwater management.

403.0 RELEASE RATES

Drainage systems for properties required to provide stormwater runoff storage facilities shall be designed to control the rate of discharge from the property for the two-year and 100-year critical duration events. The peak rate of discharge shall not cause an increase in flooding or channel instability downstream when considered in aggregate with other developed properties and downstream drainage capacities.

Release rates from a property shall be as follows:

1. The peak discharge from events less than or equal to the two-year event shall not be greater than 0.04 cfs per acre of property drained; and
2. The peak 100-year discharge shall not be greater than 0.15 cfs per acre of property drained.
3. Requests for variance from the above release rates must be presented to and approved by the Kendall County Board. A request for variance shall be accompanied by a hydrologic and hydraulic analysis of the property utilizing the methodologies of Section 407.0. The analysis must demonstrate that the proposed development will not change the runoff rate or volume of flow from the predevelopment conditions under all frequency of rainfall events.

404.0 DETENTION BASIN OUTLET DESIGN

The capacity of the downstream drainage system shall be evaluated to ensure the detention basin outlet design will not exceed this capacity. Stormwater storage outlets shall not discharge directly into existing storm sewers or drain tiles.

Backwater on the outlet structure from the downstream drainage system shall be evaluated and considered in the design of the outlet.

The outlet design shall not require manual intervention or mechanical means to control flow, except for wet basins for maintenance drawdown. Outlets shall be designed to allow for easy maintenance even during high runoff events. Where the outlet used to control discharge is less than 4 inches in diameter, alternative outlet designs shall be utilized, which avoid clogging of the outlet.

405.0 DETENTION STORAGE REQUIREMENTS

The design storage to be provided in a detention basin shall be based on the peak runoff from the 100-year storm event determined through a critical duration analysis. Detention storage shall be computed using hydrograph methods as described in this section.

The function of existing on-site depressional storage shall be preserved or compensated for at a ratio of 1 to 1 independently of storage required for the development.

406.0 DRAINAGE SYSTEM EVALUATION AND DESIGN

The following criteria shall be used in evaluating and designing the drainage system. The underlying objective is to provide capacity to pass the 10-year peak flow in the minor drainage system and an overland flow path for flows in excess of the design capacity to at least the 100-year storm event runoff.

406.1 Design Methodologies

1. For properties up to 20 acres, major and minor drainage systems may be designed using the rational formula.
2. For properties of 20 acres or more, minor drainage systems may be designed using the rational formula.
3. For properties of 20 acres or more, major drainage systems must be designed using runoff hydrograph methods as described in Section 407.0.
4. All detention basins must be designed using runoff hydrograph methods as described in Section 407.0.

406.2 Positive Drainage

1. All areas of the property must be provided an overland flow path that will pass the 100-year flow at a stage at least 2 feet below the lowest structure opening of structures hydraulically connected to the flow path.
2. Overland flow routes up to the 100-year flow level shall be placed in exclusive drainage easements.

406.3 Runoff Characteristics

1. In development areas, determination of ground surface runoff characteristics shall utilize soil types and hydrologic soil classifications one category lower (degraded) than those determined by the soils investigations.
2. Stormwater runoff from a property must exit the property at the point where it exited prior to development.
3. Diversion or transfer of water between watersheds shall be prohibited.

407.0 METHODS FOR GENERATING RUNOFF HYDROGRAPHS

Methods used for generating runoff hydrographs shall be either an appropriate Corps of Engineers HEC model, Soil Conservation Service TR-20, or TR-55 tabular method. The Planning, Building, and Zoning Department Director must approve alternative methods.

Runoff hydrographs shall be developed incorporating the following assumptions of rainfall amounts and antecedent moisture.

407.1 Rainfall

1. Unless a continuous simulation approach to drainage system hydrology is used, all design rainfall events shall be based on the Illinois State Water Survey's Bulletin 71 data and isohyetal or sectional data.
2. The first quartile point rainfall distribution shall be used for the design and analysis of drainage systems with critical durations less than or equal to 12 hours.
3. The third quartile point rainfall distribution shall be used for the design and analysis of detention basins and drainage systems with critical durations greater than 12 and less than or equal to 24 hours.
4. The fourth quartile distribution shall be used in the design and analysis of systems with durations greater than 24 hours.
5. The first, third, and fourth quartile distributions shall be as described by Huff Bulletin 71.
6. The SCS Type II distribution may be used as an alternate to the Huff distributions for use in TR-55 models.

407.2 Antecedent Moisture

Computations of runoff hydrographs that do not rely on a continuous accounting of antecedent moisture conditions shall assume an antecedent moisture condition of two.

408.0 WET DETENTION BASIN DESIGN

Wet detention basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing, and as much as feasible to be available for recreational use. Refer to Section 414.0 for additional requirements.

408.1 Wet Basin Depths

1. Wet basins shall be at least three feet deep, excluding near-shore banks and safety ledges.
2. If fish habitat is to be provided wet basins shall be at least ten feet deep over twenty-five percent of the bottom area to prevent winter freeze-out.

408.2 Wet Basin Shoreline and Slopes

1. The side slopes of wet basins from the normal pool elevation to the safety ledge shall not be steeper than 5 to 1 (horizontal to vertical).
2. Wet basins shall be provided with stabilized shorelines. Methods for stabilization such as deep-rooted vegetation, natural stone, or manufactured products shall be used as approved by the County.
3. A planting schedule shall be provided to the County for review and approval.

408.3 Pool Volume and Elevation

1. The permanent pool volume in a wet basin at normal depth shall be equal to the runoff volume from its watershed for the two-year critical duration storm event.
2. The peak 100-year pool elevation shall be at least two feet below the lowest structure opening of all structures hydraulically connected to the detention basin.

408.4 Inlet and Outlet Orientation

To the extent feasible, the distance between detention inlets and outlets shall be maximized. If possible, they should be at opposite ends of the basin.

409.0 WETLAND AND DRY DETENTION BASIN DESIGN

In addition to the other requirements of this ordinance, wetland and dry basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing and, as much as feasible, to be available for multiple uses.

409.1 Wetland and Dry Basin Drainage

1. Dry basins shall be designed so that the portion of their bottom area that is intended to be dry shall have standing water no longer than seventy-two hours for any runoff event less than or equal to the 100-year event. Underdrains may be used to meet this requirement. Low flow channels are prohibited.
2. Direct connections of detention basin inlets to basin outlets are prohibited.
3. The dry portion of the basin may be planted with either native, deep-rooted vegetation to promote infiltration or with turf grasses.
4. The peak 100-year detention elevation shall not be greater than 4 feet above the bottom of the outlet. If turf grasses are proposed, the basin depth from outlet to high water level shall not exceed 2 feet.
4. A planting schedule shall be provided to the County for review and approval.
5. The peak 100-year detention elevation shall be at least two feet below the lowest structure opening for all structures hydraulically connected to the detention pond.
6. Basin side slopes shall not exceed 4 feet horizontal to 1 foot vertical.

409.2 Velocity Dissipation

1. Velocity dissipation measures shall be incorporated into dry basin designs to minimize erosion at inlets and outlets and to minimize the re-suspension of pollutants and sediments.
2. A stilling basin shall be provided at each major inlet.

409.3 Inlet and Outlet Orientation

1. To the extent feasible, the distance between detention inlets and outlets shall be maximized. If possible, they should be at opposite ends of the basin.
2. There should be no low flow bypass between the inlet and outlet and paved low flow channels shall not be used.

409.4 Sedimentation Basins

A sedimentation basin shall be constructed at each inlet to a wetland to facilitate sediment removal and maintenance.

410.0 DETENTION IN FLOODPLAINS

The placement of detention basins within the floodplain is strongly discouraged because of questions about their reliable operation during flood events. However, the stormwater detention requirements of this ordinance may be fulfilled by providing detention storage within flood fringe areas on the project site provided the following provisions are met.

410.1 Detention in Flood Fringe Areas

1. The placement of a detention basin in a flood fringe area shall require compensatory storage for 1.5 times the volume below the base flood elevation occupied by the detention basin including any berms.
2. The release from the detention storage provided shall still be controlled consistent with the requirements of this ordinance.
3. The applicant shall demonstrate its operation for all streamflow and floodplain backwater conditions.
4. Excavations for compensatory storage along watercourses shall be opposite or adjacent to the area occupied by detention.
5. All floodplain storage lost below the ten-year flood elevation shall be replaced below the ten-year flood elevation. All floodplain storage lost above the existing ten-year flood elevation shall be replaced above the proposed ten-year flood elevation.
6. All compensatory storage excavations shall be constructed to drain freely and openly to the watercourse.

410.2 Detention in Floodways

Detention in floodways is prohibited.

410.3 On-stream Detention

On-stream detention basins are discouraged but allowable if they provide regional public benefits and meet the following requirements:

1. Comply with other provisions of this ordinance with respect to water quality and control of the two-year and 100-year critical duration storm events from the property.
2. The stream being impounded must not be within the regulatory floodplain.

3. Impoundment of the stream as part of on-stream detention shall not:
 - (a) Prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, such as for spawning,
 - (b) Cause or contribute to the degradation of water quality or stream aquatic habitat,
 - (c) Involve any stream channelization or the filling of wetlands,
 - (d) Occur downstream of a wastewater discharge, and
4. Impoundment of the stream as part of on-stream detention shall:
 - (a) Include a design calling for gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin,
 - (b) Require the implementation of an effective non-point source management program throughout the upstream watershed,
 - (c) Comply with Illinois Combined Statutes and the floodplain ordinance of Kendall County.
5. For watersheds larger than one square mile, it is recommended that the applicant use dynamic modeling to demonstrate that the design will not increase stage for any properties upstream or downstream of the property.
6. Further criteria are presented in Division 6 of this ordinance.

411.0 PROTECTION OF WETLANDS AND DEPRESSIONAL STORAGE AREAS

Wetlands and other depressional storage areas shall be protected from damaging modifications and adverse changes in runoff quality and quantity associated with land developments. In addition to the other requirements of this ordinance, the following requirements shall be met for all developments whose drainage flows into wetlands and depressional storage areas:

411.1 Detention in Wetlands and Depressional Storage Areas

1. Existing wetlands shall not be modified for the purposes of stormwater detention unless it is demonstrated that the existing wetland is low in quality and the proposed modifications will maintain or improve its habitat and ability to perform beneficial functions.
2. Existing storage and release rate characteristics of wetlands and other depressional storage areas shall be maintained and the volume of detention storage provided to meet the requirements of this section shall be in addition to this existing storage.

411.2 Sediment Control

The existing wetland shall be protected during construction by appropriate soil erosion and sediment control measures and shall not be filled.

411.3 Alteration of Drainage Patterns

Site drainage patterns shall not be altered to substantially decrease or increase the existing area tributary to the wetland.

411.4 Detention/Sedimentation

All runoff from the development shall be routed through a preliminary detention/sedimentation basin designed to provide a minimum 24-hour hydraulic detention time, before being discharged to the wetland. This basin shall be constructed before property grading begins.

411.5 Vegetated Buffer Strip

A buffer strip of at least 25 feet in width, preferably vegetated with native plant species, shall be maintained or restored around the periphery of the wetland.

412.0 STREET, PARKING LOT, AND CULVERT DRAINAGE

This section sets requirements where streets, parking lots, and culverts are proposed to be used for stormwater detention or conveyance.

412.1 Streets

1. If streets are to be used as part of the minor drainage system, a maximum 3 feet of spread onto the traveled roadway may be allowed and inlet spacing must be sufficient to collect the entire street runoff based on a 10-year storm event.
2. If streets are to be used as part of the major drainage system, ponding depths shall not exceed three inches at the street centerline and shall not remain flooded for more than eight hours for the 100-year event.

412.2 Parking Lots

1. The maximum stormwater ponding depth in any parking area shall not exceed six inches.
2. The maximum duration of ponding in any parking area shall not exceed eight hours.

412.3 Underground Detention

Use of underground detention shall be reviewed and approved on a case by case basis. Underground detention systems shall provide for easy access and low maintenance.

412.4 Culvert Road and Driveway Crossings

1. All culverts, including driveway culverts, shall be sized to convey the minor drainage system using Federal Highway Administration culvert nomographs or more sophisticated backwater models.
2. Sizing of culvert crossings shall consider entrance and exit losses as well as tailwater conditions on the culvert.

413.0 INFILTRATION PRACTICES

1. To effectively reduce runoff volumes, infiltration practices should be located on soils in hydrologic soil groups "A" or "B" as designated by the U.S. Soil Conservation Service.
2. Sites should be designed to maximize the use of vegetated filter strips and swales.
3. Wherever practicable, runoff from impervious surfaces should be directed onto filter strips and swales before being routed to a storm sewer or detention basin.
4. Infiltration basins and trenches designed to recharge groundwater shall not be located within seventy-five feet of a water supply well or a building foundation. For well drained sand and gravel soils this separation shall be extended to 100 feet.
5. A sediment settling basin shall be provided to remove coarse sediment from stormwater flows before they reach infiltration basins or trenches.
6. Stormwater shall not be allowed to stand more than seventy-two hours over eighty percent of a dry basin's bottom area for the maximum design event to be ex-filtrated.
7. The bottom of infiltration facilities shall be a minimum of four feet above seasonally high groundwater and bedrock.
8. Reference the Illinois Urban Drainage Manual for determining feasibility and sizing of infiltration facilities.

414.0 SAFETY CONSIDERATIONS

1. The drainage system components, especially all detention basins, shall be designed to protect the safety of any children or adults coming in contact with the system during runoff events.
2. The use of restrictive fences shall be kept to a minimum and used only as a last resort when no other method is feasible.

414.1 Side Slopes

1. The side slopes of all detention basins at one hundred year capacity shall be a maximum six to one (horizontal to vertical) to prevent accidental falls into the basin and for stability and ease of maintenance.
2. Side slopes of detention basins and open channels shall not be steeper than four to one (horizontal to vertical).
3. Dry detention pond bottom slopes and turf slopes in general shall be a minimum of 2% (fifty to one).

414.2 Safety Ledge

All wet detention basins shall have a level safety ledge at least eight feet in width a maximum of two feet below the normal water depth.

414.3 Velocity

With the exception of existing drainageways being left undisturbed, velocities throughout the surface drainage system shall be controlled to safe levels taking into consideration rates and depths of flow. Velocities shall not exceed the product of velocity, in feet per second, times depth, in feet, equal to four.

414.4 Overflow Structures

1. All stormwater detention basins shall be provided with an overflow structure capable of safely passing excess flows at a stage at least 2 feet below the lowest structure opening for all structures hydraulically connected to the detention basin.
2. The design flow rate of the overflow structure shall be equivalent to the peak 100-year inflow rate based on a critical duration analysis.
3. All detention ponds and overflow structures shall comply with IDNR Dam Safety requirements where applicable.

415.0 MAINTENANCE CONSIDERATIONS

1. The stormwater drainage system shall be designed to minimize and facilitate maintenance.
2. Outlet control structures shall be designed as simply as possible and shall require little or no attention for proper operation. Moveable restrictors to meet draw down times are prohibited.
3. Turfed side slopes shall be designed to allow lawn mowing equipment to easily negotiate them.

4. Wet basins shall be provided with alternate outflows that can be used to completely drain the pool for sediment removal. (Pumping may be considered if drainage by gravity is not feasible.)
5. Pre-sedimentation basins shall be included, where feasible, for localizing sediment deposition and removal.
6. Access for heavy equipment shall be provided and located within an ingress and egress or maintenance easement.

500.0 FLOWS FROM UPSTREAM TRIBUTARY AREAS

Stormwater runoff from areas tributary to the property shall be considered in the design of the property's drainage system. Whenever practicable, flows from upstream areas that are not to be detained should be routed around the basin being provided for the site being developed.

501.0 UPSTREAM AREAS NOT MEETING ORDINANCE REQUIREMENTS

When upstream property tributary to the applicant's property does not meet the stormwater runoff storage and release requirements of this ordinance, regionalized detention on the applicant's property shall be explored by the applicant. The following steps shall be followed.

1. The applicant shall compute the storage volume needed for his property based on the applicant's property area and the release rates and procedures described in Division 4.
2. Areas tributary to the applicant's property, not meeting the storage and release rate requirements of this ordinance, shall be identified.
3. The applicant shall compute the storage volume needed for the areas determined in 501.2 above plus the applicant's property area based on the combined properties and the release rates and procedures described in Division 4.
4. If the tributary areas are not currently developed, a reasonable fully developed land cover, based on anticipated zoning, shall be assumed for the purposes of computing storage.
5. Once the necessary combined storage is computed, the County may choose to pay for increasing the size of the applicant's detention basin to accommodate the regional flows. The applicant's responsibility will then be limited to the storage for his property as computed in 501.1 above.
6. If regional storage is selected by the County then the design produced in 501.3 above shall be implemented.
7. If regional storage is rejected by the County the applicant shall bypass all tributary area flows around the applicant's basin whenever practicable as determined by the County.
8. If the County determines that the applicant may route upstream flows through his basin, the applicant must comply with the requirements of 502.3 and 502.4.
9. If the upstream areas being routed through the applicant's basin are conveyed by drainageways identified on USGS mapping, the applicant must meet the provisions of Section 410.3 for on-stream basins.

502.0 UPSTREAM AREAS MEETING ORDINANCE REQUIREMENTS

When upstream property tributary to the applicant's property meets the storage and release requirements of this ordinance, the upstream flows shall be handled in the following hierarchy:

1. Upstream flows shall be bypassed around the applicant's detention basin, unless the applicant justifies to the County that bypassing of flows is not feasible.
2. Upstream flows shall be routed through the applicant's detention basin if the County determines that this is the only feasible alternative.
3. Storage needed for the applicant's property shall be computed as described in 501.1. However, if the County decides to route tributary area flows through an applicant's basin, the final design stormwater releases shall be based on the combined total of the applicant's property plus tributary areas.

600.0 ADMINISTRATION

This division details the administration aspects of this ordinance, including scheduling and maintenance.

601.0 EARLY COMPLETION OF DETENTION FACILITIES

Soil erosion and sedimentation controls shall be established concurrent with the start of earthwork. Where detention, retention, or other storage areas are to be used as part of the drainage system for a property, they shall be constructed as the first element concurrent with the initial earthwork program.

Any eroded sediment captured in these facilities shall be removed by the applicant before project completion in order to maintain the design volume of the facilities.

602.0 MAINTENANCE RESPONSIBILITY

1. Maintenance of stormwater drainage facilities located on private property shall be the responsibility of the owner of that property.
2. Before a site development permit, building permit, or final plat is issued or signed by the County the applicant shall execute a maintenance agreement with Kendall County guaranteeing that the applicant and all future owners of the property will maintain the property's stormwater drainage system.
3. The maintenance agreement shall also specifically authorize representatives or subcontractors of Kendall County to enter onto the property for the purpose of inspections and maintenance of the drainage system.
4. The maintenance agreement shall include a schedule for regular maintenance of each aspect of the property's stormwater drainage system and shall provide for access to the system for inspection by authorized personnel of Kendall County.
5. The maintenance agreement shall stipulate that if the Kendall County Planning, Building, and Zoning Department notifies the property owner in writing of maintenance problems that require correction, the property owner shall make such corrections within thirty calendar days of such notification.
6. If the corrections are not made within this time period the County may have the necessary work completed and assess the cost to the property owner.
7. Such maintenance agreement shall be recorded with the Recorder of Deeds of Kendall County.
8. Kendall County has the option of requiring a bond to be filed by the property owner for maintenance of the stormwater drainage system.

603.0 INSPECTIONS

603.1 Inspections During Construction

1. A Kendall County Planning, Building, and Zoning Department representative shall conduct periodic inspections and surveys of the work in progress to be certain that the drainage system is being built as designed.
2. If any violations of the provisions or requirements of this ordinance are noted during such inspections, the Kendall County Planning, Building, and Zoning Department shall notify the property owner in writing of the items needing correction.
3. The property owner shall have ten calendar days to make such corrections unless given a specific extension of time in writing by the Kendall County Planning, Building, and Zoning Department.
4. Failure to complete such corrections within the specified time period shall constitute a violation of this ordinance.

603.2 Final Inspection

1. Upon notification by the applicant that the drainage system is completed, a Kendall County Planning, Building, and Zoning Department representative shall conduct a final inspection.
2. If the drainage system is found to contain deficiencies which require correction the Kendall County Planning, Building, and Zoning Department representative shall notify the property owner of the necessary corrections.
3. The property owner shall correct such deficiencies within ten calendar days unless given a specific extension of time in writing by the Kendall County Planning, Building, and Zoning Department.
4. Failure to make necessary corrections within the specified time shall constitute a violation of this ordinance.
5. Upon completion of the drainage system and all noted deficiencies, the petitioner shall perform a site survey and submit as built plans and revised stormwater management calculations to the County. A Registered Professional Engineer shall certify the as-built plans and calculations.
6. The project Letter of Credit for stormwater related facilities shall not be reduced until the as-built plans and calculations have been reviewed and approved by the County.
5. Upon finding that the drainage system and as-builts meets the provisions and requirements of this ordinance the Kendall County Planning, Building, and Zoning

Department shall issue in writing a notice of drainage system completion to the property owner.

603.3 Routine Inspections

1. All privately owned drainage systems may be inspected by representatives of the Kendall County Planning, Building, and Zoning Department.
2. A written report shall be filed of the results of any inspection and a copy sent to the property owner detailing any problems that need correction.

604.0 ENFORCEMENT

The administration and enforcement of this ordinance shall be the responsibility of the Kendall County Planning, Building, and Zoning Department.

605.0 VARIANCES AND APPEALS

1. Where the Planning, Building, and Zoning Department Director finds that extraordinary hardships may result from the strict compliance with this Ordinance, he may, after written application and documentation by the developer, recommend in writing to the Planning, Building, and Zoning Committee variations or exceptions to the regulations. Recommendation may be subject to specific conditions, so that substantial justice may be done and the public interest secured, provided that such variations or exceptions shall not have the effect of nullifying the intent and purpose of this Ordinance.
2. From the Planning, Building, and Zoning Committee, the recommendations shall be communicated to the County Board in writing with reasons therefore. The County Board may approve the variations from these regulations in specific cases, which in their opinion do not affect the general plan or the spirit of the Ordinance.
3. The Planning, Building, and Zoning Department Director shall not recommend variations or exceptions to the regulations of this Ordinance unless he shall make findings based on the evidence presented to him in each specific case, that:
 - (a) Because of the particular physical surroundings, shape, or topographic conditions of the specific property involved a particular hardship to the owner would result as distinguished from a mere inconvenience, if the strict letter of the regulations was carried out.
 - (b) The conditions upon which the request for a variation is based are unique to the property for which the variation is sought and are not applicable, generally, to other property, and have not been created by any person having an interest in the property.
 - (c) The purpose of the variation is not based upon economic feasibility.
 - (d) The granting of the variation will not be detrimental to the public safety, health, or welfare, or injurious to other property or improvements in the locale in which the property is located.

4. All appeals to the Kendall County Planning, Building, and Zoning Department Director decisions regarding the interpretation of this ordinance shall be heard by the Kendall County Planning, Building, and Zoning Committee.

606.0 SEVERABILITY

If any section, clause, provision or portion of this ordinance is judged unconstitutional or invalid by a court of competent jurisdiction, the remainder of this ordinance shall remain in force and not be affected by such judgement.

607.0 PENALTIES

Any person convicted of violating any of the provisions or requirements of this ordinance shall be guilty of a misdemeanor and shall be subject to a fine of not more than One Thousand Dollars (\$1,000.00). Each day the violation continues shall be considered a separate offense.

608.0 EFFECTIVE DATE

This ordinance shall be in full force and effect from and after its passage and approval and publication, as required by law.

Passed by the County Board of Kendall County, Illinois, this ____ day of _____, ____.

Clerk

Lake County Watershed Development Ordinance

INTRODUCTION

This Ordinance is one part of the adopted Lake County Comprehensive Stormwater Management Plan. It sets forth the minimum requirements for the stormwater management aspects of development in Lake County. The Lake County Stormwater Management Commission is the corporate enforcement authority for the Ordinance. Illinois Compiled Statutes Chapter 55, Act 5, Section 5-1062 (55 ILCS 5/5-1062) states, "The purpose of this Section is to allow management and mitigation of the effects of urbanization on stormwater drainage... by consolidating the existing stormwater management framework into a united, countywide structure..." The Lake County Comprehensive Stormwater Management Plan, adopted by Ordinance on June 11, 1990 states, "... that the regulations be uniformly and consistently enforced throughout the County by all agencies." While local conditions may sometimes require extraordinary regulatory measures, the Lake County Stormwater Management Commission (SMC) has determined that uniform and consistent enforcement will be enhanced by municipalities adopting the standards of the Watershed Development Ordinance. In those instances where the requirements of this Ordinance are not stipulated in a municipal ordinance or do not meet the minimum requirements herein, this Ordinance shall prevail. It is recognized that a community has an individual right to enact standards beyond the minimum standards presented in this Ordinance. The SMC has developed a Technical Reference Manual which is a recommended guide for users of this Watershed Development Ordinance (WDO).

ARTICLE I: AUTHORITY AND PURPOSE

A. AUTHORITY

This Ordinance is enacted pursuant to the police powers granted to Lake County by 55 ILCS 5/5-1062 (County) by 65 ILCS 5/1-2-1, 11-12-12, 11-30-8, 11-30-2, 11-31-2, and 615 ILCS 55 & 18g. The administration and enforcement of this Ordinance shall be performed by (a) Certified Communities, within their respective jurisdictions and (b) the Stormwater Management Commission and its agents or employees in all other areas of Lake County.

B. PURPOSE

The purpose of this Ordinance is to establish reasonable rules and regulations for development in order to:

1. Meet the requirements of the Rivers, Lakes and Streams Act, 615 ILCS 5/18g effective November 18, 1987.
2. Prevent additional harm due to periodic flooding including loss of life and property and threats and inconveniences to public health, safety and welfare;
3. Assure that development does not increase flood and drainage hazards to others, or create unstable conditions susceptible to erosion;

ARTICLE I: AUTHORITY AND PURPOSE

4. Create no new financial burden on the taxpayer for flood control projects, repairs to flood damaged public facilities and utilities, and for flood rescue and relief operations;
5. Protect, conserve and promote the orderly development of land and water resources;
6. Protect buildings and improvements to buildings from flood damage to the greatest extent possible;
7. Conserve the natural hydrologic, hydraulic, water quality and other beneficial functions of flood-prone areas, Regulatory Floodplains and wetlands;
8. Prevent additional disruption of the economy and governmental services due to stormwater and flood drainage;
9. Maintain eligibility for the County and its municipalities in the National Flood Insurance Program by equaling or exceeding its requirements and thus make federally subsidized flood insurance available at reduced rates. Comply with the rules and regulations of the National Flood Insurance Program codified as 44 CFR 59-79, as amended.

ARTICLE II: ORDINANCE ENFORCEMENT

- A. In Certified Communities, the appropriate development regulations officer shall be the Enforcement Officer for the Ordinance. In all other areas of Lake County, the SMC Chief Engineer shall be the Enforcement Officer. One of the primary duties of the Enforcement Officer shall be to review all watershed development applications and issue permits for those projects that are in compliance with the provisions of this Ordinance. The Enforcement Officer shall be responsible for the administration and enforcement of the Ordinance.

Included as part of this Ordinance as Appendix E is a delineation of requirements and duties required of and accepted by a community and its designated Enforcement Officer. Certain requirements or duties specified by FEMA and IDNR/OWR in Appendix E relate only to the intergovernmental relationship between a community and FEMA or IDNR/OWR for the purposes of that community obtaining or maintaining eligibility for the National Flood Insurance Program (NFIP) and delegation of state permit authority.

ARTICLE III: COMMUNITY CERTIFICATION

A municipality or the County may be certified by SMC to enforce the provisions of this Ordinance. Upon certification, the community's designated Enforcement Officer shall enforce all provisions of this Ordinance within the community's jurisdiction. The criteria and process for certification follow:

A. **CRITERIA**

1. The community is participating in the regular phase of the National Flood Insurance Program.

ARTICLE III: COMMUNITY CERTIFICATION

2. The community has adopted and is enforcing the provisions of this Ordinance.
3. The community forwards appropriate portions of the Regulatory Floodway Development applications to SMC for transmittal to IDNR/OWR or its designee for concurrent review and approval.
4. The community maintains records and provides SMC with certain portions of these records as described in Appendix E (L).
5. The community will require all engineering information and plans prepared by a Registered Professional Engineer, to be reviewed under the supervision of a Registered Professional Engineer under the employ or contract of the community for conformance with this Ordinance prior to permit issuance.

B. PROCESS

1. Communities desiring certification may submit a letter of intent to petition for Certification.
2. A petition for Standard Certification or for Isolated Wetland Certification shall be submitted to the SMC indicating how the community meets the criteria for certification. A copy of the community's adopted ordinance shall be included with the petition.
3. Within 60 days of receipt of the petition and in conjunction with a scheduled SMC meeting, the staff recommendation shall be presented.
4. The SMC shall approve the petition as submitted, shall approve the petition with conditions or shall deny the petition. A notice of the SMC action shall be submitted to the petitioning community.
5. Certified Communities shall petition for recertification every three (3) years.
6. Within the three (3) year certification period, the SMC Director shall periodically review the community's Ordinance enforcement records and performance and make remedial recommendations to the community, if necessary. Review findings will be used in the assessment of petitions for recertification from Certified Communities.
7. If a Certified Community knowingly or consistently issues permits not in accordance with the Watershed Development Ordinance, or is no longer a participant in the National Flood Insurance Program, the SMC shall after notice and a public hearing held in conjunction with a regularly scheduled SMC meeting, have the authority to rescind the community's certification.
8. The SMC shall rescind a community's certification for the following reasons:
 - a. The community is no longer a participant in the National Flood Insurance Program.

ARTICLE III: COMMUNITY CERTIFICATION

- b. The community adopts a Watershed Development Ordinance or amends its ordinance so that its ordinance is less restrictive than the SMC Watershed Development Ordinance.
9. If the community issues a Regulatory Floodway development permit not in accordance with Article IV, Section C.3. SMC shall rescind the community's authority to administer the IDNR/OWR Regulatory Floodway permit program for Appropriate Uses.
10. Fee-in-lieu-of detention ordinances and procedures used by Certified Communities shall be reviewed and approved by the SMC as part of the regular certification process.
11. To be qualified to act as an Enforcement Officer, the person shall pass the Lake County Enforcement Officer's Exam. Once the exam is available, community Enforcement Officers shall have six (6) months to pass the exam. After this six (6) month period, a community shall be required to have a named Enforcement Officer that has passed the exam, in order to remain certified. If a community Enforcement Officer vacates that position, the person filling the vacancy shall have six (6) months to pass the exam in order for the community to remain certified.
12. Communities with Isolated Wetland Certification authority shall have a Certified Wetland Specialist or Provisional Certified Wetland Specialist either as an employee or contracted to perform wetland related services as specified in the Ordinance. SMC will perform Certified Wetland Specialist duties for communities in the interim period between WDO adoption and certification of those communities desiring Isolated Wetland Certification.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

A. GENERAL

1. Regulated Development

No person, firm, corporation or governmental agency shall commence any development regulated by this Ordinance on any lot or parcel of land without first obtaining a Watershed Development Permit from the Stormwater Management Commission or, if applicable, the Certified Community. A permit shall be issued if the proposed development meets the requirements of this Ordinance or its Certified Community equivalent. A Watershed Development Permit is required for any development, including finalization of a plat, replat, Planned Unit Development (PUD) or Manufactured Home Park site plan, which:

- a. Is located in a Regulatory Floodplain; or
- b. Is located in a flood-prone area with 100-acres of tributary drainage area or more; or
- c. Is located in a depressional storage area with a storage volume of 0.75 acre-feet or more for the base flood; or
- d. Creates a wetland impact within an area defined as Waters of the U.S. or Isolated Waters of Lake County; or
- e. Modifies the flood-prone area of a channel where the tributary drainage area is twenty (20) or more acres; or

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- f. Includes the total land area of an ownership parcel, that results in:
 - (1) more than 1-acre of new impervious surface area; or
 - (2) more than (3) acres of hydrologically disturbed area, unless the total new impervious surface area is less than 0.5 acre; or
 - (3) An impervious surface area ratio of 50 percent or greater, unless the total new impervious surface area is less than 0.5 acre.

The term “new” in this article refers to impervious surface area created after the original effective date of this Ordinance (10/18/92). Redevelopment of previously developed sites shall maintain existing storage volume and shall not increase the rate of runoff from the site. The applicant shall provide supporting data and calculations to the satisfaction of the Enforcement Officer to ensure the site design either provides a watershed benefit or meets the requirements of Article IV, Section B.1.c.(3). New development on partially developed sites shall meet the release rate criteria in Article IV, Section B.1.c.(1) for the new development, if the new development exceeds the thresholds in f. (1) or (2) or (3) above; or

- g. Any public road development resulting in one and one-half (1.5) acres or more of additional impervious surface per mile, for linear or nonlinear projects; or
- h. Any development which hydrologically disturbs 5,000 square feet or more. This development activity shall at a minimum meet the soil erosion and sediment control performance standards of Article IV, Section B.1.j., with associated application requirements. Public road developments are required to meet the soil erosion and sediment control standards only for those projects which require permits according to Article IV, Section A.1.a.,b.,c.,d.,e.,g., above.

2. Exempted Development

All development shall meet the minimum state, federal and local regulations. No development is exempt from the floodplain, floodway, wetland and soil erosion and sediment control provisions of this Ordinance.

Upon review and verification by the Enforcement Officer, that a. or b. or c. below are met, the following are exempt from specific ordinance performance standards:

- a. Annexation agreements, final plats, site development permits or current building permits approved prior to October 18, 1992 if the stormwater management systems are installed, functioning and in compliance with all applicable stormwater regulations then in effect.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- b. Preliminary plats, Annexation Agreements, Final plats, Planned Unit Developments, site development permits or current building permits approved between October 18, 1992 and [August 10, 1999] if the approved plans and designs are in conformance with the pre [August 10, 1999] ordinance provisions. That portion of any preliminary plat, annexation agreement, final plat, planned unit development, site development permit or current building permit which is amended after the effective date of this Ordinance and which affects the stormwater management system is not exempt from the provisions of this Ordinance.
- c. Re-subdivision of commercial or industrial subdivisions identified under a. above, provided that the stormwater management systems are installed and functioning and there is no increase in impervious surface area permitted. Re-subdivision of commercial or industrial subdivisions identified under b. above, provide there is no increase in impervious surface area beyond that which was originally approved.

If eligible under a. or b. or c. above, the applicant may submit a written request to the Enforcement Officer for an exemption from specific performance standards of this Ordinance. The applicant's exemption request shall itemize each Ordinance provision that is requested for exemption.

3. Development Classification

All activities requiring a Watershed Development Permit shall be classified as a minor, major, or public road development. The definition for each classification follows:

a. Minor Development

A minor development is defined as any development that:

- (1) Is not located in a depressional storage area which has a volume larger than 0.75 acre-foot or is not located in any other portion of a Regulatory Floodplain, and
- (2) Does not create a wetland impact of one quarter (1/4) or more acre of Waters of the United States or Isolated Waters of Lake County, and
- (3) Modifies a channel where the tributary drainage area is less than 100-acres, and
- (4) Consists of:
 - (a) Single family detached residential development of less than ten (10) acres; or
 - (b) Single family detached residential development of ten (10) acres or less with a gross density of less than 0.5 unit per acre, and an impervious cover area of less than fifteen (15) percent; or

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (c) Multi family, non-residential and other developments of less than three (3) acres requiring a Watershed Development Permit.

- b. Public Road Development

Any Development activity which takes place in a public right-of-way or part thereof that is administered and funded by a public agency under its respective roadway jurisdiction. Rehabilitative maintenance and in-kind replacement are considered to be a public road development if located in a Regulatory Floodplain. A public road development located within a Regulatory Floodway and which has been approved by the IDOT-Division of Highways, Bureau of Local Roads and Streets is exempt from this Ordinance.

- c. Major Development

A major development is defined as all other development.

- 4. Approvals Prior to Permitting

Prior to the issuance of a Watershed Development Permit, the applicant may request a Conditional Approval or an Earth Change Approval.

- a. Conditional Approval

Conditional Approval of the Regulatory Floodplain and Regulatory Floodway delineation, overland flow path, wetland delineation, runoff volume reduction hierarchy, and the detention and bypass computations for a development may be granted by the Enforcement Officer. The Conditional Approval will be based on conformance with the performance standards, and the submittal of the appropriate application requirements as listed in Article IV, Sections B, C, D, E, and F. A letter will be sent to the applicant stating the results of the review and the conditions placed on any approvals.

- b. Earth Change Approval

If all the performance standards and application requirements in Article IV, Section B, C, D, E, and F have been met, except for obtaining all the required local, state and federal approvals, a request for the commencement of grading activities may be made on a site prior to the issuance of a Watershed Development Permit. The proposed grading activity may commence with written approval from the Enforcement Officer of the earth change approval plan that delineates the activities specifically allowed. The written approval will state the conditions and limitations of the proposed grading activities. No development activity may occur in those portions of the site for which state and federal permits are required, except for IEPA sewer and water extension permits. Earth change approvals may not be granted for any development within a Regulatory Floodplain.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

5. Permit Fees and Application Review Times

A schedule of fees in accordance with the provisions of this Ordinance shall be established by separate resolution of the SMC. A separate fee schedule shall be developed and implemented by Certified Communities. Permit applications shall be reviewed within 30 days of receipt. Amended permit applications shall be reviewed within 60 days of receipt. The Enforcement Officer shall approve, deny or provide remedial recommendations within 60 days. If no action has been taken by the Enforcement Officer within 90 days after receipt of an application, or within a longer time period if requested in writing by the applicant, the application shall be deemed denied.

6. Contiguous Property

In order to preclude inappropriate phasing of developments to circumvent the intent of this Ordinance, when a proposed development activity will occur on a lot or parcel of land that has contiguous lots or parcels of lands owned by the same property owner, then the criteria as defined in this section will be applied to the total land area compiled from aggregate ownership parcels. If this aggregate ownership parcel area is greater than the minimum area requirements defined in Article IV, Section A.1, then a Watershed Development Permit will be required.

7. Permit Extensions and Terminations

Among the causes for terminating a permit during its term or for denying a permit extension include, but are not limited to the following:

- a. Noncompliance with any condition of the permit; or
- b. The Permittee's failure to disclose fully all relevant facts in the application process or the permittee's misrepresentation of any relevant facts at any time; or
- c. If the authorized work is not commenced within three years after issuance of the permit or, if the authorized work is suspended or abandoned, for a period of twelve months after the time of commencing the work, unless an extension has been granted in writing by the Enforcement Officer. The extension should be requested of the Enforcement Officer in writing no sooner than 90 days prior to the termination of the permit.

B. ALL DEVELOPMENT

The following performance standards, application requirements and other provisions apply to all development requiring a permit. Subsequent sections include additional provisions for development in a Regulatory Floodplain, wetlands and public roads.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

1. Performance Standards
 - a. Plats and Site Plans
 - (1) The performance standards for all development (Article IV) shall be considered in site planning and appropriately addressed in the drainage plan component of subdivisions, annexation agreements, preliminary plats, final plats, re-plats, manufactured home parks and Planned Unit Developments (PUD).
 - (2) In addressing Article IV, Section B.1.d “Runoff Volume Reduction Hierarchy” streets, blocks, lots, easements, covenants, parks and other public grounds shall be located and lined out in such a manner as to preserve and utilize natural streams, wetlands, and flood-prone areas whenever possible.
 - (3) Subdivisions, annexation agreements, plats, re-plats, manufactured home parks and PUDs shall show the Base Flood Elevation (BFE) and Regulatory Floodway limits. The plats, re-plats, manufactured home parks, PUD, or engineering plans and studies shall include a signed statement by a Registered Professional Engineer that accounts for changes in the drainage of surface waters in accordance with the Plat Act (765 ILCS 205/2).
 - (4) All plats and subdivisions which border on or include public bodies of water as defined by IDNR/OWR and listed in Appendix F of the Watershed Development Ordinance shall be submitted by the applicant to IDNR/OWR for review and approval.
 - (5) Stormwater management systems shall be functional before building permits are issued for residential and non-residential developments.
 - (6) Soil erosion and sediment control measures and stormwater management systems shall be functional before general construction begins. Where development of a site is to proceed in phases, the soil erosion and sediment control measures and the stormwater management systems needed for each phase shall be functional before the construction of that phase begins.
 - (7) A community's planning commission or corporate authority shall not approve any preliminary PUD or plat of subdivision located inside or outside its corporate limits unless such PUD or Plat is, at a minimum, subject to meeting the performance standards of the Lake County Watershed Development Ordinance.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (8) A community's planning commission or corporate authority shall not approve any final PUD or Plat of subdivision located inside or outside its corporate limits unless such PUD or Plat, at a minimum, meets the performance standards of the Lake County Watershed Development Ordinance.
- (9) Pursuant to State law, a property owner of a parcel being subdivided adjacent to a state or county road right of way shall notify the proper highway authority in writing of the proposed subdivision, and request that the proper highway authority provide, at the cost of the highway authority or otherwise provided by law, the amount of additional capacity in any stormwater detention facility to be constructed in the subdivision for the future availability of the highway authority for meeting stormwater detention requirements of any future public construction on the highway.
- (10) All stormwater management systems shall be located and described within a deed or plat restriction. Stormwater management systems that service a single parcel (or two parcels) of property may be excused from this requirement upon approval of the Enforcement Officer.
- (11) Modifications to a deed or plat restriction for the stormwater management system shall be approved by the Enforcement Officer.

b. Runoff Calculations

- (1) For tributary drainage areas 100-acres or greater, and for the determination of detention and depressional storage requirements, an SMC approved hydrograph-producing runoff calculation method shall be used. Appendix K of this Ordinance may also be used, when appropriate and upon approval of the Enforcement Officer, for determination of detention storage volumes.
- (2) The Rational Method may be used to calculate discharges for areas of less than 100-acres. The Rational Method shall not be used to determine detention or depressional storage requirements.
- (3) Rainfall data as presented in Appendix I of this Ordinance shall be used for rainfall volume, storm distribution, return frequency and event duration.
- (4) Runoff calculations for all off-site drainage area may be based on anticipated future land use conditions or existing land use conditions. Anticipated future land use conditions will be based on future land use and existing storage facilities. Future detention facilities may be used for anticipated future land use conditions if approved by the

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

SMC Chief Engineer or for tributary drainage areas less than 100-acres in a Certified Community, the Enforcement Officer. Existing land use conditions will be based on existing land use and existing storage facilities. For each frequency storm event, runoff calculations will be based on the critical duration, for all durations presented in Appendix I.

- (5) Existing depressional storage volume shall be maintained and the volume of detention storage provided to meet the requirements of this Ordinance shall be in addition to the existing storage.

c. Release Rates and Discharges

- (1) Unless otherwise specified in an SMC adopted Basin Plan or floodplain study, release rates shall not exceed 0.04 cubic feet per second per acre for the 2-year, 24-hour storm event nor 0.15 cubic feet per second per acre for the 100-year, 24-hour storm event. The release rate requirement shall apply to the hydrologically disturbed area of the ownership parcel unless otherwise approved by the Enforcement Officer. The release rate requirements shall only apply to developments listed in Article IV, Section A.1.f., and Article IV, Section A.1.g.
- (2) Watershed specific release rates are tabulated in Appendix J of this Ordinance.
- (3) All concentrated stormwater discharges leaving a site must be conveyed into an existing channel, storm sewer, or overland flow path with adequate downstream stormwater capacity (as defined in Appendix A) and will not result in increased flood and drainage hazard.
- (4) The design of stormwater management systems shall not result in the interbasin transfer of drainage, unless no reasonable alternative exists and there is no legal restraint preventing such transfer.

d. Runoff Volume Reduction Hierarchy

- (1) An applicant shall choose a strategy to meet the release rate requirements that minimizes the increase in runoff volumes and rates from the development and addresses the water quality treatment requirements in Article IV, Section B.1.h., of this Ordinance. The applicant shall use appropriate best management practices as presented in the Technical Reference Manual and the following hierarchy in preparing a drainage plan:
 - (a) Preservation of natural resource features of the development site (e.g. floodplains, wetlands, Isolated Waters of Lake County, prairies and woodlands);

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (b) Preservation of the existing natural streams, channels and drainageways;
 - (c) Minimizing impervious surfaces created at the site (e.g., narrowing road width, minimizing driveway length and width, clustering homes and shared driveways);
 - (d) The use of open vegetated channels to convey stormwater runoff;
 - (e) Preservation of the natural infiltration and storage characteristics of the site (e.g., disconnection of impervious cover and on-lot bioretention facilities);
 - (f) Structural measures that provide water quality and quantity control;
 - (g) Structural measures that provide only quantity control and conveyance.
- e. Detention Facilities
- (1) All stormwater infiltration, retention and detention facilities shall be provided with an emergency overflow structure capable of passing the base flood inflow rate without damages to structures or property.
 - (2) Single pipe outlets shall have a minimum inside diameter on 12 inches. If design release rates call for smaller outlet, a design that minimizes the possibility of clogging shall be used. Minimum outlet restrictor size shall be four (4) inches in diameter provided there is adequate downstream capacity. Detention volume for a development shall be dictated by adherence to the release rates specified in Article IV, Section B.1.c.
 - (3) Stormwater infiltration, retention and detention facilities required to meet a development's discharge requirements shall be designed to by-pass offsite tributary flow from streams and channels unless approved by the Enforcement Officer.
 - (4) Any development involving the construction, modification or removal of a dam as defined in Appendix A per 17 IL Adm. Code 3702 (Rules for Construction of Dams) shall obtain an Illinois Division of Water Resources Dam Safety permit or a letter stating no permit is required prior to the start of such activity. Reference Appendix G for IDNR/OWR Dam Safety permitting guidelines.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (5) Stormwater retention and detention facilities shall not be constructed in a Regulatory Floodplain unless approved by the Enforcement Officer. If a retention or detention facility is constructed in a Regulatory Floodplain, the development must meet the requirements of Article IV, Section C., of this Ordinance.
- (6) On-Stream Detention
 - (a) All on-stream detention shall provide a Detention Volume Safety Factor as follows:
 - (i) The Detention Volume Safety Factor applies to the volume of on-stream detention necessary to meet this Ordinance's site requirements.
 - (ii) The Detention Volume Safety Factor is equal to one (1) plus 0.05 times the ratio of offsite tributary drainage area to on-site tributary drainage area.
 - (iii) The maximum Detention Volume Safety Factor shall be 1.5.
 - (b) No on-stream detention shall be allowed with an off-site to on-site tributary drainage area ratio greater than 10:1 except for development providing a watershed benefit.
 - (c) On-stream detention shall not be permissible if the tributary drainage area is greater than 640-acres except for detention that provides a watershed benefit.
 - (d) The release rate shall be 0.04 cubic feet per second per acre of the total tributary drainage area (on-site and off-site) at the elevation created by impoundment of the on-site 2-year storm volume plus the Detention Volume Safety Factor, and 0.15 cubic feet per second per acre of the total tributary drainage area (on-site and off-site) at the elevation created by impoundment of the on-site 100-year storm volume plus the Detention Volume Safety Factor and the required compensatory storage. The release rate and on-site detention volume shall be calculated using the 24-hour storm event. This release rate calculation shall be used unless other site conditions warrant further analysis and modification from this standard or unless watershed specific release rates have been adopted.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (e) On-stream detention shall provide water quality treatment. One of the following two methods shall be used:
 - (i) A wet detention facility with a minimum permanent pool volume equal to the calculated sediment volume accumulated over a one-year period for the entire upstream watershed and an average normal water depth of at least four feet. The facility shall also have a live storage volume that, at a minimum, equals the Water Quality treatment standards of Article IV, Section B.1.h., of this Ordinance for the development site.
 - (ii) A separate off-line sediment basin with a volume meeting the Water Quality treatment standards of Article IV, Section B.1.h., of this Ordinance for the tributary drainage area to the sediment basin.
 - (f) Impoundment of the stream as part of on-stream detention shall not prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, and shall not cause or contribute to the degradation of water quality or stream aquatic habitat. These fish species may be present or potentially present.
 - (g) Compensatory storage requirements shall be satisfied and shall be in addition to detention volume requirements.
 - (h) No on-stream detention shall be allowed in areas designated as an exceptional functional value wetland.
- (7) The placement of a detention basin in a floodplain area shall require compensatory storage per WDO Article IV, Section C.2.d. The volume of detention storage required to meet the standards of this Ordinance shall be in addition to the floodplain compensatory storage required for the development.
- (8) Impounding berms for stormwater retention and detention facilities shall be designed and constructed to withstand all expected forces, including but not limited to, erosion, pressure and uplift. Impounding berms designed greater than 3 feet in height above existing grade shall be signed and sealed by a Registered Professional Engineer.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- f. Fee-in-lieu of On-Site Stormwater Storage
- (1) The SMC may require, as part of an adopted basin plan or floodplain study, the payment of a fee-in-lieu of on-site stormwater storage to fulfill all or part of the on-site stormwater storage requirement for a development. The adoption of a floodplain study or basin plan is per Appendix E (D) of this Ordinance.
 - (2) The following fee-in-lieu of stormwater storage procedures apply to communities with adopted procedures for requiring and collecting fee-in-lieu of revenues for stormwater storage requirements in this Ordinance:
 - (a) The Enforcement Officer may require, or the applicant may submit, a written request for the payment of a fee-in-lieu of on-site stormwater storage to fulfill all or part of the on-site detention requirement below the detention threshold minimum limit set by this Ordinance Article IV, Section A.1.f. and g. and for compensatory storage requirements for streambank and shoreline restoration fills of less than 200 cubic yards. A request for fee-in-lieu of on-site stormwater storage shall be either rejected or approved within forty five (45) days of the written request unless additional engineering studies are required.
 - (b) Approval of a request for fee-in-lieu of on-site stormwater storage on a development site below the detention threshold in this Ordinance Article IV, Section A.1.f. and g. and for compensatory storage requirements for streambank and shoreline restoration fills of less than 200 cubic yards shall be determined by the Enforcement Officer.
 - (c) Fee-in-lieu of on-site stormwater storage shall be the lesser of: 1) the fee computed for each acre- foot or cubic yard or part thereof of stormwater storage approved in accordance with the procedures and schedules as approved by the SMC for Non-Certified Communities or the community elected board of officials in a Certified Community or 2) the estimated construction cost as approved by the SMC for Non-Certified Communities or the community elected board of officials in a Certified Community of the applicant's proposed and approved on-site stormwater storage, including land costs.
 - (d) A fund will be maintained by the Certified Community or the SMC for Non-Certified Communities for each of the four major Lake County watersheds for the purpose of identifying and controlling all revenues and expenditures resulting from fee-in-lieu of on-site

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

stormwater storage approvals. All fee-in-lieu of on-site stormwater storage revenues received from each watershed shall be deposited in these funds for use within that watershed. A Certified Community may opt to allow SMC to administer fee-in-lieu-of revenues and expenditures through execution of an Intergovernmental Agreement specifying that arrangement.

- (e) The following requirements must be met before a fee-in-lieu of on-site stormwater storage will be approved:
 - (i) The downstream stormwater management system has “adequate downstream stormwater capacity” (see definitions); and
 - (ii) The SMC for Non-Certified Communities or the community elected board of officials in a Certified Community has an adopted fee-in-lieu of stormwater storage program.
- (f) Fee-in-lieu of on-site stormwater storage revenues may be used to plan, design or construct an upgrade to existing or future stormwater management systems if the upgrade is consistent with a basin plan, floodplain study or stormwater system improvement that has been approved by the SMC for Non-Certified Communities or the community elected board of officials in a Certified Community.

g. Stormwater Conveyance Systems

(1) Storm Sewers and Swales

- (a) The 10-year design storm shall be used as a minimum for the design of storm sewers, swales and appurtenances. Storm sewers shall have a minimum diameter of 12 inches with the exception that storm sewers servicing a single parcel may be excused from this requirement upon approval of the Enforcement Officer.
- (b) Development shall not connect to sanitary sewers or existing agricultural stormwater management systems (tiles) as an outflow for the stormwater management system. Field tile systems disturbed during the process of development shall be reconnected by those responsible for their disturbance unless the approved drainage plan includes provisions for these.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (c) All storm sewers shall be located in a public road right-of-way or maintenance easement of sufficient size to maintain or re-construct the sewer.
- (d) All on-site stormwater conveyance systems shall be designed and constructed to withstand the expected velocity of flow from all events up to the base flood without erosion. Stabilization adequate to prevent erosion shall be provided at the inlets and outlets for all pipes transitions and paved channels.
- (e) Swales being used as part of the stormwater management system for a development shall be located within a deed or plat restricted area of sufficient size to maintain or reconstruct the swale.

(2) Streams and Channels

The following items are general performance standards for streams and channels and do not excuse development from meeting all other requirements of this Ordinance.

- (a) Natural streams and channels are to be conserved.
- (b) Removal of streamside (riparian) vegetation shall be limited to one side of the channel.
- (c) Clearing of channel vegetation shall be limited to that which is essential for construction of the channel.
- (d) If a stream or channel meeting the definition of Waters of the United States or Isolated Waters of Lake County is modified, a stream or channel mitigation plan shall be submitted for review and approval to the Enforcement Officer. The plan shall show how the physical characteristics of the modified channel shall meet the existing channel length, cross-section, slope, sinuosity and carrying capacity of the original channel. The plan shall also re-establish vegetation within the channel modification using the Native Plant Guide for Streams and Stormwater Facilities in Northeastern Illinois, NRCS, et al., (as amended) as a minimum standard for the re-vegetation plan.
- (e) All disturbed areas associated with a channel modification shall be seeded or otherwise stabilized immediately according to Article IV, Section B.1.j.1.d.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (f) If channels are modified, an approved and effective means to reduce sedimentation and degradation of downstream water quality must be installed before excavation begins and must be maintained throughout the construction period.
- (g) New or relocated channels shall be built in the dry and all items of construction, including vegetation, shall be completed prior to diversion of water into the new channel.
- (h) Streams and channels shall be expected to withstand all events up to the base flood without increased erosion. The use of armoring of banks using bulkheads, rip-rap and other materials shall be avoided. Armoring shall only be used where erosion cannot be prevented in any other way such as use of vegetation or gradual slopes. Such armoring shall have minimal impact on other properties, and the existing land configuration.
- (i) A minimum maintenance easement of 12-feet from top of bank is required along one side of all channels draining 20 or more acres. All drainage easements shall be accessible to vehicular equipment; however, linear accessibility for vehicular equipment is not required.
- (j) Construction vehicles shall cross streams by the means of existing bridges or culverts. Where an existing crossing is not available, a temporary crossing shall be constructed in which:
 - (i) The approach roads will be 0.5 feet or less above natural grade.
 - (ii) The crossing will allow stream flow to pass without backing up the water above the stream bank vegetation line or above any drainage tile or outfall.
 - (iii) The top of the roadway fill in the channel will be at least 2 feet below the top of the lowest bank. Any fill in the channel shall be non-erosive material, such as rip-rap or gravel.
 - (iv) All disturbed stream banks will be seeded or otherwise stabilized as soon as possible in accordance with Article IV, Section B.1.j.1.d. upon installation and again upon removal of construction crossings.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (v) The access road and temporary crossings will be removed within one year after installation, unless an extension of time is granted by the Enforcement Officer.

(3) Overland Flow Paths

The following items are general performance standards for overland flow paths and do not excuse development from meeting all other requirements of this Ordinance.

- (a) All areas of development must be provided with an overland flow path that will pass the base flood flow without damage to structures or property. If the upstream drainage area is less than 20-acres, the storm sewer pipe and inlet systems sized for the base flood can be constructed in lieu of providing an overland flow path.
- (b) The flow rate for a base flood shall be used to establish overland flow path limits, and it shall include all on-site and off-site tributary areas in accordance with Article IV, Section B.1.b.
- (c) The overland flow path shall be protected from any activity, such as fencing, landscaping, or storage shed placement, which could impair its function. This protection shall be established through a deed or plat restriction.
- (d) For overland flow paths with less than 20-acres tributary drainage area, all structures in parcels containing or adjoining to an overland flow path or other high water level designation shall have a lowest adjacent grade a minimum of one half (0.5) foot above the design high water elevation.
- (e) For overland flow paths with greater than or equal to 20-acres tributary drainage area but less than 100 acres, all structures in parcels containing or adjoining to an overland flow path or other high water level designation shall have a lowest adjacent grade a minimum of one (1.0) foot above the design high water elevation.

h. Water Quality Treatment

- (1) The water quality treatment requirements of this ordinance shall apply to any development within the total land area of the ownership parcel that results in creation of more than 0.5 acres of new impervious area, where "new" is defined in Article IV.A.1.f. of this ordinance.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (2) Prior to discharging to Waters of the United States, Isolated Waters of Lake County or adjoining property, all development shall divert and detain at least the first 0.01 inches of runoff for every 1% of impervious surface for the development with a minimum volume equal to 0.2 inches of runoff (e.g. 20% or less impervious = 0.2", 50% impervious = 0.5", 90% impervious = 0.9"); or provide a similar level of treatment of runoff as approved by the Enforcement Officer and consistent with the Best Management Practices guidance contained in the Technical Reference Manual.

- i. Buffer Areas

- (1) Buffer areas shall be required for all areas defined as either Waters of the United States or Isolated Waters of Lake County. Buffer areas are divided into two types, linear buffers and water body buffers.

Waters of the United States is a defined term (Appendix A) in this Ordinance and refers to areas that are under the jurisdictional authority and regulated by the United States Army Corps of Engineers. Isolated Waters of Lake County are under the jurisdictional authority of this ordinance and is a defined term in Appendix A.

- (a) Linear buffers shall be designated along both sides of all channels meeting the definition of Waters of the United States or Isolated Waters of Lake County. The buffer width shall be determined as follows:
 - (i) When the channel has a watershed greater than 20-acres but less than one square mile, the minimum buffer shall be 50 feet on each side of the channel.
 - (ii) When the channel has a watershed greater than one square mile, the minimum buffer shall be 30 feet on each side of the channel.
 - (iii) Linear high quality aquatic resources and streams with an Index of Biotic Integrity (IBI) greater than 40 shall have a minimum buffer width of 100 feet on each side of the channel. (Initial IBI based on IEPA Illinois Water Quality Report, biannual. A site-specific IBI assessment may override this report.)
- (b) Water body buffers shall encompass all non-linear bodies of water meeting the definition of either Waters of the United States or Isolated Waters of Lake County. The buffer width shall be determined as follows:

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (i) For all water bodies or wetlands with a total surface area greater than one third (1/3) acre but less than one (1) acre, a minimum buffer width of thirty (30) feet shall be established.
 - (ii) For all water bodies or wetlands with a total surface area greater than one (1) acre but less than two and one half (2 ½) acres, a minimum buffer width of forty (40) feet shall be established.
 - (iii) For all water bodies or wetlands with a total surface area greater than two and one half (2½) acres, a minimum buffer width of fifty (50) feet shall be established.
- (2) Non-linear high quality aquatic resources shall have a minimum buffer width of one hundred (100) feet.
- (3) In areas where state or federal threatened and endangered species are present or for an Illinois Natural Area Inventory Site, buffer widths may be modified upon approval of the Enforcement Officer. Any modification requires approval by the Enforcement Officer following consultation with the Illinois Department of Natural Resources or United States Fish and Wildlife Service.
- (4) Buffer areas for water bodies meeting the definition of Waters of the United States or Isolated Waters of Lake County shall extend from the ordinary high water mark. Buffer areas for wetlands shall extend from the edge of the delineated wetland. A property may contain a buffer area that originates from Waters of the United States or Isolated Waters of Lake County on another property.
- (5) Features of the stormwater management system approved by SMC or certified community may be within the buffer area of a development.
- (6) Access through buffer areas shall be provided, when necessary, for maintenance purposes.
- (7) All roadside drainage ditches, existing excavated detention facilities (as of the amended date of this Ordinance, August 10, 1999), borrow pits, quarries and improvements to existing public road developments or alignments are exempt from buffer requirements.
- (8) Stormwater discharges that enter a buffer shall have appropriate energy dissipation measures to prevent erosion and scour.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (9) All buffer areas shall be maintained free from development including disturbance of the soil, dumping or filling, erection of structures and placement of impervious surfaces except as follows:
- (a) A buffer area may be used for passive recreation (e.g., bird watching, walking, jogging, bicycling, horseback riding and picnicking) and it may contain pedestrian, bicycle or equestrian trails.
 - (b) Structures and impervious surfaces (including trails, paths) may occupy a maximum of twenty (20) percent of the buffer surface area provided the runoff from such facilities is diverted away from the Waters of the United States or Isolated Wetlands of Lake County or such runoff is directed to enter the buffer area as unconcentrated flow.
 - (c) Utility maintenance, construction of stormwater facilities and maintenance of stormwater facilities shall be allowed.
 - (d) Boat docks, boathouses and piers shall be allowed and the provisions of (9) (b) above shall apply.
 - (e) Buffer areas hydrologically disturbed by allowing construction or as part of a revegetation plan shall be revegetated using the Native Plant Guide for Streams and Stormwater Facilities in Northeastern Illinois, NRCS, et al., (as amended) as a minimum standard.
- (10) A buffer shall be established between design normal and high water levels around constructed water quality treatment basins to enhance treatment effectiveness.
- (11) Buffer Averaging: The buffer width for a development site may be varied to a minimum of ½ of the buffer width required, upon approval of the Enforcement Officer, provided that the total buffer area required is achieved adjacent to the Waters of the United States or Isolated Waters of Lake County being buffered. The consultation process of the IDNR or U.S. Fish & Wildlife Service may override the ability to average buffer areas upon approval of the Enforcement Officer.
- (12) Preservation of buffer areas shall be provided by deed or plat restrictions.
- (13) The buffer area of a development site may be subtracted from the water quality volume calculation performed for the site.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

j. Soil Erosion and Sediment Control

- (1) Soil erosion and sediment control related measures are required for any land disturbance activity permitted under Article IV, Section A. The following requirements shall be met:
 - (a) Soil disturbance shall be conducted in such a manner as to minimize erosion. Areas of the development site that are not to be graded shall be protected from construction traffic or other disturbance until final seeding is performed. Soil stabilization measures shall consider the time of year, site conditions and the use of temporary or permanent measures.
 - (b) Properties and channels adjoining development sites shall be protected from erosion and sedimentation. At points where concentrated flow leaves a development site, energy dissipation devices shall be placed at discharge locations and along the length of any outfall channel as necessary to provide a non-erosive velocity of flow from the structure to the watercourse so that the natural physical and biological characteristics and functions are maintained and protected.
 - (c) Soil erosion and sediment control features shall be constructed prior to the commencement of hydrologic disturbance of upland areas.
 - (d) Disturbed areas shall be stabilized with temporary or permanent measures within fourteen (14) calendar days following the end of active hydrologic disturbance, or redisturbance, consistent with the following criteria or using an appropriate measure as approved by the Enforcement Officer.
 - (i) Appropriate temporary or permanent stabilization measures shall include seeding, mulching, sodding, and/or non-vegetative measures.
 - (ii) Areas or embankments having slopes greater than or equal to 3H:1V shall be stabilized with staked in place sod, mat or blanket in combination with seeding.
 - (iii) Erosion control blanket shall be required on all interior detention basin side slopes between normal water level and high water level.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (iv) The fourteen (14) day stabilization requirement may be precluded by snow cover or where construction activity will resume within 21 days from when the active hydrologic disturbance ceased, then stabilization measures do not have to be initiated on that portion of the site by the 14th day after construction activity temporarily ceased given that portion of the site has appropriate soil erosion and sediment controls.
- (e) Land disturbance activities in streams shall be avoided, where possible. If disturbance activities are unavoidable, the following requirements shall be met:
 - (i) Where stream construction crossings are necessary, temporary crossings shall be constructed of non-erosive material.
 - (ii) The time and area of disturbance of a stream shall be kept to a minimum. The stream, including bed and banks, shall be restabilized within 48 hours after channel disturbance is completed or interrupted.
- (f) Soil erosion and sediment control measures shall be appropriate with regard to the amount of tributary drainage area as follows:
 - (i) Disturbed areas draining greater than 5000-ft² but less than 1-acre shall, at a minimum, be protected by a filter barrier (including filter fences, straw bales, or equivalent control measures) to control all off-site runoff. Vegetated filter strips, with a minimum width of 25-feet, may be used as an alternative only where runoff in sheet flow is expected.
 - (ii) Disturbed areas draining more than 1 but fewer than 5-acres shall, at a minimum, be protected by a sediment trap or equivalent control measure at a point downslope of the disturbed area.
 - (iii) Disturbed areas draining more than 5-acres, shall, at a minimum, be protected by a sediment basin with a perforated filtered riser pipe or equivalent control measure at a point downslope of the disturbed area.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (iv) Sediment basins shall have both a permanent pool (dead storage) and additional volume (live storage) with each volume equal to the runoff amount of a 2-year, 24-hour event over the on-site hydrologically disturbed tributary drainage area to the sediment basin. 2-year storm runoff volumes versus site runoff curve numbers are shown in Appendix K of this Ordinance. The available sediment volume below normal water level, in addition to the dead storage volume shall be sized to store the estimated sediment load generated from the site over the duration of the construction period. For construction periods exceeding 1-year, the 1-year sediment load and a sediment removal schedule may be submitted.

If the detention basin for the proposed development condition of the site is used for sediment basin, the above volume requirements will be explicitly met. Until the site is finally stabilized, the basin permanent pool of water shall meet the above volume requirements and have a filtered perforated riser protecting the outflow pipe.

- (g) All storm sewers that are or will be functioning during construction shall be protected by an appropriate sediment control measure.
- (h) If dewatering services are used, adjoining properties and discharge locations shall be protected from erosion. Discharges shall be routed through an effective sediment control measure (e.g., sediment trap, sediment basin or other appropriate measure).
- (i) All temporary soil erosion and sediment control measures shall be removed within 30 days after final site stabilization is achieved or after the temporary measures are no longer needed. Trapped sediment and other disturbed soil areas shall be permanently stabilized.
- (j) A stabilized mat of aggregate underlain with filter cloth (or other appropriate measure) shall be located at any point where traffic will be entering or leaving a construction-site to or from a public right-of-way, street, alley or parking area. Any sediment or soil reaching an improved public right-of-way, street, alley or parking area shall be removed by scraping or street cleaning as accumulations warrant and transported to a controlled sediment disposal area.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

The Enforcement Officer may require additional stabilized construction entrance methods.

- (k) Earthen embankments shall be constructed with side slopes no steeper than 3H:1V. Steeper slopes may be constructed with appropriate stabilization as approved by the Enforcement Officer.
- (l) Stormwater conveyance channels, including ditches, swales, and diversions, and the outlet of all channels and pipes shall be designed and constructed to withstand the expected flow velocity from the 10-year frequency storm without erosion. All constructed or modified channels shall be stabilized within 48-hours.
- (m) Temporary diversions shall be constructed as necessary to direct all runoff from hydrologically disturbed areas to the appropriate sediment trap or basin.
- (n) Soil stockpiles shall not be located in a flood-prone area or a designated buffer protecting Waters of the United States or Isolated Waters of Lake County. Soil stockpiles are defined as having greater than 100 yd² of soil and will remain in place for more than 7 days. Soil stockpile locations shall be shown on the soil erosion and sediment control plan and shall have the appropriate measures to prevent erosion of the stockpile.
- (o) Handbooks: Standards and specifications contained in The Illinois Urban Manual, as amended, and the planning procedures sections of the Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control, as amended, are referenced in this Ordinance as guidance for presenting soil erosion and sediment control plan specifications and delineating procedures and methods of operation under site development for soil erosion and sediment control. In the event of conflict between provisions of said manuals and this Ordinance, this Ordinance shall govern.

2. Application Requirements

All the following application requirements shall be submitted when applicable to the development as determined by the Enforcement Officer.

a. Application Requirements for Minor Developments

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (1) Name and legal address of the applicant. Common address and legal description of the site and the parcel identification number where the development will take place. Mailing address of property owner and the signature of the applicant or applicant's agent.
- (2) A general description of the existing and proposed stormwater management system including all discharge points, collection, conveyance, and storage facilities.
- (3) A grading plan showing proposed and existing contours.
- (4) A site drainage plan locating drainage features, overland flow paths, stormwater management system components, flood-prone areas, Regulatory Floodplains, wetlands boundaries, buffer areas, existing or proposed septic systems and wells
- (5) An area drainage plan locating the proposed development in the watershed.
- (6) A description and depiction of measures to be taken to control erosion. (soil erosion and sediment control plan)
- (7) A description of the anticipated dates of initiation and completion of activity.
- (8) Provide an exhibit(s) for review which displays all deed or plat restrictions of record or to be recorded for the stormwater management system.
- (9) The federal, state and local permit requirements of Article IV.B.2.b.(13) and (14) are required when applicable to the development site and Article IV.B.2.b.(9) and (10) shall be required when requested by the Enforcement Officer.
- (10) A wetland submittal if required under Article IV.E. of this ordinance.

b. Application requirements for Major Developments

In addition to the requirements for minor developments, major development applications require the following information:

- (1) Name and legal address of the applicant, and common address of the location where the development will take place, mailing address of the property owner and the signature of the applicant or the applicant's agent.
- (2) A topographic map of the existing conditions of the development site showing the location of all roads, all drainageways, the boundaries of predominate soil types, the boundaries of predominate vegetation, and the location of

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

any drainage easements, detention or retention basins, including their inflow and outflow structures, if any. The map shall also include the location, size, and flowline elevations of all existing storm or combined sewers and other utility lines within the site. The map shall be prepared using a minimum 2-foot contour interval and shall be prepared at an appropriate scale for the type of project and shall include specifications and dimensions of any proposed channel modifications, location and orientation of cross-sections, if any, north arrow, and a graphic or numerical scale. All elevations shall be referenced to National Geodetic Vertical Datum NGVD (1929 adjusted).

- (3) Include cross-section views for the stormwater management system showing existing and proposed conditions including principal dimensions of the work, and existing and proposed elevations, normal water and calculated base flood elevations, and overland flow depth and path.
- (4) A vicinity map shall be included along with the parcel identification numbers of all parcels comprising the proposed development.
- (5) A report describing the hydrologic and hydraulic analysis performed for the project. The report shall include the name of stream or body of water affected, a statement of purpose of proposed activity, and a detailed determination of the runoff for the project site under existing and developed conditions. This includes documentation of the design volumes and rates of the proposed runoff for each portion of the watershed tributary to the stormwater management system and receiving channel and high water elevations. Runoff calculations shall include all discharges entering the site from upstream areas.
- (6) A section in the hydrologic and hydraulic analysis report describing how the Runoff Volume Reduction Hierarchy clauses (as described in Article IV, Section B.1.d.) were evaluated in designing and determining the stormwater management needs of the site.
- (7) For detention facilities, a section in the hydrologic and hydraulic analysis report that includes a plot or tabulation of storage volumes and water surface areas with corresponding water surface elevations, stage-discharge or outlet rating curves, and design hydrographs of inflow and outflow for the 2-year, 24-hour and the 100-year, 24-hour storm events under existing and developed conditions.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (8) A soil erosion and sediment control plan showing all measures appropriate for the development as approved by the Enforcement Officer, to meet the objectives of this Ordinance throughout all phases of construction and permanently after completion of development of the site, including:
- (a) Location and description, including standard details, of all sediment control measures and design specifics of sediment basins and traps, including outlet details. The drainage area tributary to each sediment control measure shall be delineated on the soil erosion and sediment control plan.
 - (b) Location and description of all soil stabilization and erosion control measures, including seeding mixtures and rates, types of sod, method of seedbed preparation, expected seeding dates, type and rate of lime and fertilizer application, kind and quantity of mulching for both temporary and permanent vegetative control measures, and types of non-vegetative stabilization measures.
 - (c) Location and description of all runoff control measures, including diversions, waterways, and outlets.
 - (d) Location and description of methods to prevent tracking of sediment off-site, including construction entrance details, as appropriate.
 - (e) Description of dust and traffic control measures.
 - (f) Locations of stockpiles and description of stabilization methods.
 - (g) Description of off-site fill or borrow volumes, locations, and methods of stabilization.
 - (h) Provisions for maintenance of control measures, including type and frequency of maintenance, easements, and estimates of the cost of maintenance.
 - (i) Identification (name, address, and telephone) of the person(s) or entity which will have legal responsibility for maintenance of erosion control structures and measures during development and after development is completed.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (j) A written narrative description of the proposed phasing (construction sequencing) of development of the site, including stripping and clearing, rough grading and construction, and final grading and landscaping. Phasing should identify the expected date on which clearing will begin, the estimated duration of exposure of cleared areas, and the sequence of installation of temporary sediment control measures (including perimeter controls), clearing and grading, installation of temporary soil stabilization measures, installation of storm drainage, paving streets and parking areas, final grading and the establishment of permanent vegetative cover, and the removal of temporary measures. It shall be the responsibility of the applicant to notify the Enforcement Officer of any significant changes which occur in the site development schedule after the initial soil erosion and sediment control plan has been approved.
 - (k) Bonds: The applicant may be required to file with the Enforcement Officer a faithful performance bond or bonds, letter of credit, or other improvement security satisfactory to the Enforcement Officer in an amount deemed sufficient by the Enforcement Officer to cover all costs of improvement, landscaping, maintenance of improvements and landscaping, and soil erosion and sediment control measures for such period as specified by the Enforcement Officer, and engineering and inspection costs to cover the cost of failure or repair of improvements installed on the site.
- (9) A maintenance plan for the ongoing maintenance of all stormwater management system components including wetlands is required prior to plan approval. The plan shall include:
- (a) Maintenance tasks.
 - (b) The party responsible for performing the maintenance tasks.
 - (c) A description of all permanent public or private access maintenance easements and overland flow paths, and compensatory storage areas.
 - (d) A description of dedicated sources of funding for the required maintenance.
- (10) The Application shall meet the requirements of this Ordinance and shall be certified and sealed by a Registered Professional Engineer.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (11) Public trail and park facility project's which do not involve the placement of structures or fill can be submitted without the certification or seal of a Registered Professional Engineer.
- (12) A description of the anticipated dates of initiation and completion of activity.
- (13) A copy of the Natural Resources Inventory (NRI) shall be submitted by the applicant to the Enforcement Officer, for development that is required to obtain a NRI performed by the Lake County Soil and Water Conservation District pursuant to state statute 70 ILCS 405/22.02a.
- (14) For all development sites requiring a National Pollutant Discharge Elimination System (NPDES) permit, the applicant shall submit a Notice of Intent to the IEPA to comply with the NPDES Permit. The approved soil erosion and sediment control plan created pursuant to the requirements of this Ordinance shall fulfill the plan requirements in the NPDES permit.
- (15) If the soil mapping submitted for the development indicates the presence of the soils listed below, then the applicant shall provide site specific soil mapping performed by a certified soil classifier for the development. No buildings shall be constructed on these soils unless appropriate building methods, such as pilings, caissons or removal and replacement of unsuitable soils, as approved by the Enforcement Officer, are used to provide and protect a suitable building foundation.
 - (a) Soils classified as a hydric soil (USDA/NRCS Soil Classification) in its very poorly drained condition or the following three soil classification in any condition;
 - (i) Houghton Muck (W103)
 - (ii) Houghton Peat (W97)
 - (iii) Peotone Silty Clay Loam (W330)

Development that is exempted from this requirement is any development activity not resulting in the construction of a building.

- (16) A copy of the consultation application to the IDNR/Division of Natural Resource Review and Coordination shall be submitted by the applicant to the Enforcement Officer for development that is required to comply with the consultation process of the Illinois Endangered Species Protection Act [520 ILCS 10/11].

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (17) Subsurface Drainage (Drain Tiles): The applicant shall submit a subsurface drainage inventory. The inventory shall locate existing farm and storm drainage tiles by means of slit trenching and other appropriate methods performed by a qualified subsurface drainage consultant. All existing drain tile lines damaged during the investigation shall be repaired and functional.
- (a) The applicant shall provide a topographical boundary map location these lines showing:
- (i) Location of each slit trench and identified to correspond with the tile investigation report and field staked at no less than 50 foot intervals;
 - (ii) Location of each drain tile with a flow direction arrow, tile size and any connection to adjoining properties; A summary of the tile investigation report showing trench identification number, tile size, material and quality, percentage of the tile filled with water, percentage of restrictions caused by silting, depth of ground cover, and soil texture at grade;
 - (iii) Name, address and phone number of person or firm conducting tile location investigation.
- (b) Information collected during the drainage investigation shall be used to design and develop a stormwater management system that will provide drainage that is appropriate for the development and connecting tile lines on adjoining properties.
- (18) A wetland submittal if required under Article IV.E. of this ordinance.
- c. The applicant shall obtain and provide a copy of an IDNR/OWR Dam Safety Permit or a letter stating that a Dam Safety Permit is not required if the development includes a dam before the applicant requests or obtains a Watershed Development Permit. Reference Appendix G for IDNR/OWR Dam Safety permitting guidelines.
- d. The applicant shall obtain and provide copies of any and all required federal, state and local permits for development in the Regulatory Floodplain before the applicant requests or obtains a Watershed Development Permit. Reference Appendix H for a partial list of permits that may be applicable.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- e. The applicant shall submit the data required to SMC, IDNR/OWR, and FEMA for proposed revisions to the base flood elevation of a Regulatory Floodplain study or relocation of a Regulatory Floodway boundary.
- f. The applicant shall provide, when applicable to the development: an affidavit or documentation to prove where the development was above the Base Flood Elevation (BFE) prior to the effective date of the first Regulatory Floodplain map; certification that the ground elevation existed prior to the effective date of the first Regulatory Floodplain map.

C. REGULATORY FLOODPLAINS AND FLOODWAYS

- 1. Location of Regulatory Floodplain, Base Flood Elevation (BFE) and Regulatory Floodway
 - a. The Regulatory Floodplain is delineated within a development by projecting the BFE onto the site topography.
 - b. The BFE shall be as delineated by the 100-year flood profiles, as indicated on the floodplain studies noted below;
 - (1) SMC Regulatory Floodplain profiles, approved by the SMC for regulatory use after a 60-day public review and comment period and approved by IDNR/OWR and FEMA for SMC regulatory use, as listed in Appendix B; or
 - (2) Should no SMC approved Regulatory Floodplain profile exist for the site, the FEMA Flood Insurance Study and profiles, as listed in Appendix C; or
 - (3) In the case of FEMA delineated "AH Zones" the elevation noted on the map shall be the BFE. In the case of FEMA delineated "AO Zones" the BFE shall be the depth number shown on the map added to the highest adjacent grade, or at least two feet above the highest adjacent grade if no depth number is provided; or
 - (4) When no base flood elevation information exists, the BFE shall be determined by a Registered Professional Engineer using an appropriate model or technique as approved by the SMC or IDNR/OWR. For riverine flood-prone areas with greater than 100-acres of tributary drainage area, non-riverine flood-prone areas with greater than 20-acres of tributary drainage area, and all mapped Special Flood Hazard Areas regardless of drainage area, the BFE determination shall be submitted to SMC for approval prior to issuance of a Watershed Development Permit. The BFE determination for non-riverine depressional floodplains with less than 20-acres of tributary drainage area shall be reviewed and approved by the Enforcement Officer. BFE determinations shall be based on the critical duration event.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (a) Where a channel has a tributary drainage area of 640-acres or more, the above analyses shall be submitted to SMC for approval by IDNR/OWR.
 - (b) For a non-riverine Regulatory Floodplain, the historic flood of record (as determined by the Enforcement Officer according to Article IV, Section C.1.b.4. above) plus three feet may be used for the BFE instead of performing a detailed hydrologic and hydraulic study.
- c. The location of the Regulatory Floodway shall be as delineated on the maps referenced in Appendix C. Where Interpretation is needed to determine the exact location of the Regulatory Floodway boundary, IDNR/OWR should be contacted.
 - d. Nothing contained herein shall prohibit the application of these regulations to land that can be demonstrated by engineering survey to lie within any Regulatory Floodplain. Conversely, any lands (except for those located in a Regulatory Floodway) that can be demonstrated by a topographic survey certified by a Registered Professional Engineer or Registered Land Surveyor to lie beyond the Regulatory Floodplain, and show to the satisfaction of the Enforcement Officer, to have been higher than the BFE as of the effective date of the first floodplain mapping denoting the site to be in a Special Flood Hazard Area, shall not be subject to the regulations of this section.

In the case of a site located in the Regulatory Floodway that is higher than the BFE, it is subject to the regulations of this section until such time as a letter of map revision is received for the IDNR/OWR and FEMA.

2. Performance Standards Applicable to all Regulatory Floodplain Development

The standards of this section apply to all Regulatory Floodplain development except when superseded by more stringent requirements in the subsequent sections.

- a. Modification and disturbance of natural riverine Regulatory Floodplains shall be avoided to protect existing hydrologic and environmental functions. Such disturbances shall be minimized and all negative impacts mitigated as described in a mitigation plan.
- b. No development shall be allowed in the Regulatory Floodplain that shall singularly or cumulatively create a damaging or potentially damaging increase in flood heights or velocity or threat to public health, safety and welfare or impair the natural hydrologic functions of the Regulatory Floodplain or channel.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- c. For all projects involving channel modification, fill, stream maintenance, or levees, the flood carrying capacity of the Regulatory Floodplain shall be maintained.
- d. Compensatory storage is required for all storage lost or displaced in a Regulatory Floodplain due to development.
 - (1) Hydraulically equivalent compensatory storage requirements for fill or structures in a riverine Regulatory Floodplain shall be at least equal to 1.2 times the volume of Regulatory Floodplain storage lost or displaced. Such compensation areas shall be designed to drain freely and openly to the channel and located opposite or adjacent to fill areas. A recorded covenant running with the land is required to prohibit any modification to the compensation area. The Regulatory Floodplain storage volume lost below the existing 10-year frequency flood elevation must be replaced below the proposed 10-year frequency flood elevation. The Regulatory Floodplain storage volume lost above the 10-year existing frequency flood elevation must be replaced above the proposed 10-year frequency elevation.
 - (2) Hydraulically equivalent compensatory storage requirements for fill or structures in a non-riverine Regulatory Floodplain shall be at least equal to 1.0 times the volume of Regulatory Floodplain storage lost or displaced. Non-riverine floodplain storage may be replaced at or below the existing elevation but not below the Normal Water Level.
 - (3) Upon approval of the Enforcement Officer, shorelines or streambanks that have experienced erosion may be restored to their condition as of the effective date of the first FIRM in that community without the need to provide compensatory storage or pay a fee-in-lieu of for the fill used to restore the eroded area according to the following criteria.
 - (a) The restoration fill shall meet existing grades and within riverine areas the current effective regulatory floodplain and regulatory floodway conveyance shall be maintained
 - (b) The amount of eroded property being restored shall be documented and submitted by the applicant as part of the permit process. Proper documentation shall be either field survey information or photo documentation of the erosion that has occurred for the property being restored.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

(c) For rivers, lakes and streams where no floodway has been designated, no documentation of past shoreline erosion is required if the applicant does not exceed 1 cubic yard of fill per lineal foot for a maximum of 200 feet. In this case, the placing of the fill shall not significantly alter the alignment of the shoreline with adjacent properties as determined by the Enforcement Officer. Non-documentable fills are a one-time allowance on a per property basis and all fills exceeding 200 cubic yards shall be regulated as specified in Articles IV.B.1.f. and IV.C.2.d. of this ordinance.

e. Public Health Protection Standards

- (1) No developments in the Regulatory Floodplain shall include locating or storing chemicals, explosives, buoyant materials, animal waste, fertilizers, flammable liquids, pollutants, or other hazardous or toxic materials below the Flood Protection Elevation (FPE).
- (2) New and replacement water supply systems, wells, and sanitary sewer lines may be permitted providing all manholes or other above-ground openings located below the FPE are watertight.
- (3) On-site waste disposal systems shall be designed to avoid inundation by the base flood.

f. Building Protection Requirements

- (1) The lowest floor including basements of all new residential structures shall be elevated up to at least the Flood Protection Elevation (FPE). An attached garage for a new structure must be elevated up to at least $\frac{1}{2}$ of one foot above the base flood elevation (BFE).
 - (a) If placed on compacted fill, the top of the fill for residential structure shall be above the FPE. The top of fill for an attached garage shall be $\frac{1}{2}$ of one foot above the BFE. The fill pad shall be placed at the appropriate elevation and designed to extend a minimum of 10-feet out from the building's designed footprint unless the building is certified by a Registered Structural Engineer to be protected from damages due to hydrostatic pressures. Additionally, the fill pad shall meet 95% of Standard Proctor Density in order to be demonstrated not to settle below the FPE for the residential structure and not below $\frac{1}{2}$ of one foot above the BFE for an attached garage, and to be adequately protected against erosion, scour and differential settlement. Foundation excavations shall not exceed more than

5-feet beyond the foundation footprint. Backfill for the over excavated area does not need to meet the compaction requirements.

- (b) If elevated by means of walls, pilings, or other foundation, the building's supporting structure must be permanently open to flood waters and not subject to damage by hydrostatic pressures of the base flood. The permanent openings shall be no more than one foot above lowest adjacent grade and below the BFE, and consist of a minimum of two openings. The openings must have a total net area of not less than one square inch for every one square foot of enclosed area subject to flooding below the BFE. The foundation and supporting members shall be anchored and aligned in relation to flood flows and adjoining structures so as to minimize exposure to known hydrodynamic forces such as current, waves, ice and floating debris. All areas below the FPE shall be constructed materials resistant to flood damage. The lowest floor (including basement) for the residential structure and all electrical, heating, ventilation, plumbing, and air conditioning equipment and utility meters shall be located at or above the FPE. An attached garage must be elevated to at least $\frac{1}{2}$ of one foot above the BFE. Water and sewer pipes, electrical and telephone lines, submersible pumps and other waterproofed service facilities may be located below FPE. No area less than one foot above the BFE shall be used for storage of items or materials.
- (2) The lowest floor, including basements, of an existing structure with a substantial improvement shall be elevated in order to be not less than one foot above the BFE. The requirements above in Article IV, Section C.2.f.1. a & b shall also apply to this section.
 - (3) The lowest floor including the basements of all new or substantially improved non-residential buildings shall be elevated at least to the FPE in accordance with Article IV, Section C.2.f.1. a & b or be structurally dry flood-proofed to at least the FPE. A non-residential building may be structurally dry flood-proofed (in lieu of elevation) provided that a Registered Professional Engineer or Registered Structural Engineer shall certify that the building has been structurally dry flood-proofed below the FPE and the structure and attendant utility facilities are watertight and capable of resisting the effects of the base flood. The building design shall take into account flood velocities, duration, rate of rise, hydrostatic and hydrodynamic forces, the effects of buoyancy and impacts from debris or ice.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

Flood-proofing measures shall be operable without human intervention and without an outside source of electricity. (Levees, berms, floodwalls and similar works are not considered flood-proofing for the purpose of this subsection.)

- (4) Manufactured homes and recreational vehicles to be installed on a site for more than 180 days, shall be elevated to or above the FPE and shall be anchored to resist flotation, collapse, or lateral movement by being tied down in accordance with the Rules and Regulations for the Illinois Mobile Home Tie-Down Act issued pursuant to 77 Ill. Adm. Code 870.
- (5) Tool sheds, detached garages, and attached garages which are not substantial improvements on an existing single-family platted lot, may be constructed with the lowest floor below the FPE in accordance with the following:
 - (a) The building shall not be used for human habitation.
 - (b) All areas below the BFE shall be constructed with waterproof material. Structures located in a Regulatory Floodway shall be constructed and placed on a building site so as not to block the flow of flood waters and shall also meet the Appropriate Use criteria of Article IV, Section C.3. In addition, all other requirements of this Ordinance must be met.
 - (c) The structure shall be anchored to prevent flotation.
 - (d) Service facilities such as electrical and heating equipment shall be elevated or flood-proofed to the FPE.
 - (e) The building shall be valued at less than \$12,500 (1998 costs) and be no greater than 576 square feet in floor size.
 - (f) The building shall be used only for the storage of vehicles or tools and may not contain other rooms, workshops, greenhouses or similar uses.
- (6) A non-conforming structure damaged by flood, fire, wind or other natural or man-made disaster may be restored unless the damage meets or exceeds fifty percent (50%) of its market value before it was damaged, in which case it shall conform to the above provisions of Article IV, Section C.2.f.(2).

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- g. If the proposed development would result in a change in the mapped Regulatory Floodplain or BFE on a site, the applicant shall submit sufficient data to FEMA and SMC to obtain a Letter of Map Revision (LOMR). Proposed changes to Regulatory Floodplain and Regulatory Floodway delineation and BFE shall be submitted to SMC. IDNR/OWR concurrence is required for changes to the BFE and floodway delineation.
 - h. If the development is located in a public body of water, as defined by IDNR/OWR, a permit must also be received from IDNR/OWR.
 - i. Any work involving construction or modification or removal of a dam or an on-stream structure to impound water shall obtain an Illinois Division of Water Resources Dam Safety Permit or letter indicating a permit is not required prior to the start of development activity. Reference Appendix G for IDNR/OWR Dam Safety Permitting guidelines.
 - j. If flood-proofing construction is required beyond the outside dimensions of an existing habitable, residential or commercial building, the outside perimeter of the flood-proofing construction shall be placed no further than 10-feet from the outside of the building. Compensation of lost storage and conveyance will not be required for flood-proofing activities.
 - k. For public flood control projects, the permitting requirements of Article IV, Section C. will be considered met if the applicant can demonstrate to IDNR/OWR through hydraulic and hydrologic calculation that the proposed project will not singularly or cumulatively result in increased flood heights outside the project right-of-way or easements for all flood events up to and including the base flood event.
3. Additional Performance Standards for the Regulatory Floodway (IDNR/OWR Regulations)

The only development in a Regulatory Floodway which will be allowed are Appropriate Uses which will not cause an increase in flood heights for all flood events up to and including the base flood. Only those Appropriate Uses listed below and in 17 IL Adm. Code Part 3708 will be allowed in the Regulatory Floodway. Appropriate uses do not include the construction or placement of any new structures, fill, building additions, buildings on stilts, fencing (including landscaping or planting designed to act as a fence) and storage of materials except as specifically defined below as an Appropriate Use. If the development is proposed for the Regulatory Floodway portion of the Regulatory Floodplain the following standards apply in addition to the previously stated standards for the Regulatory Floodplain:

- a. Only the construction, modification, repair or replacement of the following Appropriate Uses will be allowed in the Regulatory Floodway:

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (1) Public flood control structures and private improvements relating to the control of drainage, flooding of existing buildings, erosion, water quality or habitat for fish and wildlife;
- (2) Structures or facilities relating to functionally water dependant uses such as facilities and improvements relating to recreational boating and as modifications or additions to existing wastewater treatment facilities;
- (3) Storm and sanitary sewer outfalls;
- (4) Underground and overhead utilities of sufficiently flood-proofed;
- (5) Recreational facilities such as playing fields and trail systems including any related fencing (at least 50% open when viewed from any one direction) built parallel to the direction of flood flows, and including open air pavilions;
- (6) Detached garages, storage sheds, or other non-habitable structures without toilet facilities, accessory to existing buildings that will not block flood flows nor reduce Regulatory Floodway storage.
- (7) Bridges, culverts and associated roadways, sidewalks and railways, necessary for crossing over the Regulatory Floodway or for providing access to other Appropriate Uses in the Regulatory Floodway and any modification thereto;
- (8) Parking Lots
 - (a) Parking Lots (where the existing depth of flooding for the base flood event is less than one foot) and aircraft parking aprons both built at or below ground elevation and any modifications thereto.
 - (b) The depth of flooding can be greater than one (1) foot for parking lots used for short term outdoor recreational use facilities where the applicant agrees to restrict access during overbank flooding events and agrees to accept liability for all damage caused by vehicular access during all overbank flooding events.
- (9) Regulatory Floodway re-grading, without fill, to create a positive non-erosive slope toward a channel.
- (10) Flood-proofing activities to protect previously existing lawful structures including the construction of water-tight window wells, elevating structures, or the construction of flood walls around residential, commercial or industrial principal structures where the outside toe of the floodwall shall be no

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

more than ten (10) feet away from the exterior wall of the existing structure, and, which are not considered to be substantial improvements to the structure.

(11) The replacement, reconstruction or repair of a damaged building, provided that the outside dimension of the building are not increased and, provided that the building is not damaged to 50% or more of the building's market value before it was damaged. When damage is 50% or more, the activity shall conform to Article IV, Section C.2.f.(2).

(12) Modifications to an existing building, which are not substantial improvements, that would not increase the enclosed floor area of the building below the base flood elevation, and which will not block flood flows including but not limited to, fireplaces, bay windows, decks, patios, and second story additions. No enclosed floor areas may be built on stilts.

b. Additions to the above list of Appropriate Uses are not allowed.

c. All Appropriate Uses shall require a permit from the SMC or Certified Community and must be in accordance with all provisions of this Ordinance.

d. Construction of an Appropriate Use will be considered permissible provided that the proposed project meets the following engineering and mitigation criteria and that of Article IV, Sections C.1 and C.2 and is so stated in writing with supporting plans, calculations and data prepared by a Registered Professional Engineer.

(1) All effective Regulatory Floodway conveyance lost due to the development of Appropriate Uses, other than bridge or culvert crossings or on-stream structures or dams, shall be replaced for all flood events up to and including the base flood. In calculating effective Regulatory Floodway conveyance, the following factors shall be taken into consideration:

(a) Regulatory Floodway conveyance,

$$K = (1.486/n) AR^{2/3}$$

where "n" is Manning's roughness coefficient, "A" is the effective area of the cross-section, and "R" is the ratio of the area to the wetted perimeter.

(b) The same Manning's n-value shall be used for both existing and proposed conditions unless a recorded maintenance agreement with a federal, state, or local unit of government can ensure the proposed conditions will be maintained or the land cover changing from a vegetative to a non-vegetative land cover.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (2) Transition sections shall be provided and used in calculations of effective Regulatory Floodway conveyance, in the design of excavations in the Regulatory Floodway, between cross-sections with rapid expansions and contractions, and when meeting the Regulatory Floodway delineation on adjacent properties. The following expansion and contraction ratios shall be used.
 - (a) Water will expand no faster than at a rate of one-foot horizontal for every four-feet of the flooded stream's length.
 - (b) Water will contract no faster than at a rate of one-foot horizontal for every one-foot of the flooded stream's length.
 - (c) Water will not expand or contract faster than one-foot vertical for every ten-feet of flooded stream length.
 - (d) All cross-sections used in the calculations shall be located perpendicular to flood flows.
 - (e) In the design of excavations in the Regulatory Floodway, erosion/scour protection shall be provided on land upstream and downstream of proposed transition sections.
- (3) The development of all Appropriate Uses shall not result in an increase in the average channel or Regulatory Floodway velocities or stage, for all flood events up to and including the base flood event. However, in the case of bridges or culverts or on stream structures built for the purpose of backing up water in the stream during normal or flood flows, velocities may be increased at the structure site if scour, erosion and sedimentation will be avoided by the use of rip-rap or other design measures.
- (4) In the case of on-stream structures built for the purpose of backing up water, an increase in upstream stage when compared to existing conditions for all flood events up to and including the base flood event shall be contained within recorded easements. A permit or letter indicating a permit is not required must be obtained from IDNR/OWR, Dam Safety Section for a Dam Safety permit or waiver for any structure built for the purpose of backing up water in the stream during normal of flood flow.
- (5) General criteria for analysis of flood elevations.
 - (a) The flood profiles, flows and Regulatory Floodway data in the Regulatory Floodway study, referenced in Article IV, Section C.1, must be used for analysis of the base conditions.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

If the study data appears to be in error or conditions have changed, IDNR/OWR shall be contacted for approval and concurrence on the appropriate base conditions data to use.

- (b) If the BFE at the site of the proposed development is affected by backwater from a downstream receiving stream with a larger drainage area, the proposed development shall be shown to meet the requirements of this section for the base elevations of the Regulatory Floodway conditions and conditions with the receiving stream at normal water elevations. Additional receiving stream elevations may be considered for design if appropriate and approved by SMC or IDNR/OWR.
 - (c) If the applicant is informed by IDNR/OWR, local governments, or a private owner that a downstream or upstream restrictive bridge or culvert is scheduled to be removed, reconstructed, modified, or a regional flood control project is scheduled to be built, removed, constructed or modified within the next five years, the proposed development shall be analyzed and shown to meet the requirements of this section for both the existing conditions and the expected flood profile conditions when the bridge, culvert or flood control project is built.
- (6) If the Appropriate Use will result in a change in the Regulatory Floodway location or a change in the BFE the applicant shall submit to SMC the information required to be issued a Conditional Letter of Map Revision (CLOMR) from IDNR/OWR and FEMA. A public notice inviting public comment on the proposed change in the BFE or location in the Regulatory Floodway will be issued by IDNR/OWR or its designee before a CLOMR is issued. The application will not be considered complete until the CLOMR is received. No filling, grading, dredging or excavating shall take place until a conditional approval is issued. No further development activities shall take place until a final Letter of Map Revision (LOMR) is issued by IDNR/OWR and FEMA.
- e. For those circumstances listed below and located in a Regulatory Floodway, the following information shall be submitted to IDNR/OWR or SMC:
 - (1) Analysis of the flood profile due to a proposed bridge, culvert crossings and roadway approaches.
 - (2) An engineer's determination that an existing bridge or culvert crossing or approach road is not a source of flood damage and the analysis indicating the proposed flood profile.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (3) Alternative transition sections and hydraulically equivalent storage.
 - (4) IDNR/OWR will retain permit authority for any IDNR/OWR projects, dams, etc., all other state, federal or SMC projects.
 - (5) SMC will issue permits to local units of government for Regulatory Floodway development.
4. Special Considerations for the Construction of New Bridges or Culvert Crossings and Roadway Approaches or the Reconstruction or Modification of Existing Bridges, Culvert Crossings or Roadway Approaches.
 - a. A proposed new structure shall not result in an increase of upstream flood stages greater than 0.1-foot when compared to the existing conditions for all flood events up to and including the base flood event unless contained within the channel banks, or recorded easements. The evaluation must be submitted to the SMC for review and concurrence before a permit is issued.
 - b. If the proposed development will increase upstream flood stages greater than 0.1-feet, the applicant must contact IDNR/OWR, Dam Safety Section for a Dam Safety Permit or waiver.
 - c. Lost Regulatory Floodway storage must be compensated for per the Regulatory Floodplain performance standards of this Ordinance except that artificially created storage lost or displaced due to a reduction in head loss behind a bridge shall not be required to be replaced, provided no flood damage will be incurred downstream.
 - d. Velocity increases must be mitigated per the Regulatory Floodway performance section of this Ordinance except that in the case of bridges or culverts or on stream structures built for the purpose of backing up water in the stream during normal or flood flows, velocities may be increased at the structure site if scour, erosion and sedimentation will be avoided by the use of appropriate measures.
 - e. For modifications or replacement of existing structures, the existing structure must first be evaluated in accordance with Department of Transportation Rules 92 Ill. Adm. Code Part 708 to determine if the existing structure is a source of flood damage. If the structure is a source of flood damage, the applicant's engineer shall submit justification to allow the damage to continue and evaluate the feasibility of relieving the structure's impact. Modifications or replacement structures shall not increase flood stages compared to the existing condition for all flood events up to and including the base flood event. The evaluation must be submitted to IDNR/OWR or its designee for review and concurrence before a permit is issued.
 - f. If the crossing is proposed over a public body of water, an IDNR/OWR permit must be obtained.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- g. The hydraulic analysis for the backwater caused by the bridge showing the existing condition and proposed regulatory profile must be submitted to IDNR/OWR for concurrence that a CLOMR is not required.

5. Regulatory Floodplains without Regulatory Floodways

The applicant, through SMC, shall obtain approval from IDNR/OWR for all development with a tributary drainage area of 640-acres or more located within the Regulatory Floodplain without a delineated Regulatory Floodway. The development shall not singularly or cumulatively result in an obstruction of flood flows or potential flood damages outside the development due to increased flood heights, velocities, or loss of floodplain storage. The applicant shall meet the requirements of Article IV, Section C of this Ordinance according to the following criteria:

- a. Submit to SMC an engineering study performed by a Registered Professional Engineer which will determine a floodway which meets the definition of a Regulatory Floodway and show that the proposed development will meet the requirements of Article IV, Section C of this Ordinance, or
- b. Submit to SMC an engineering study performed by a Registered Professional Engineer which will determine a base flood elevation and demonstrate that the proposed development will maintain the existing conditions conveyance, will not increase flood velocities, will not increase flood profiles, and will compensate for all lost flood storage at a ratio of 1.2:1 in a manner that is hydraulically equivalent, or
- c. Submit to SMC an engineering study performed by a Registered Professional Engineer which will demonstrate that for a range of flood elevations (which would conservatively exceed the expected 100-year flood elevation) that the proposed development will maintain the existing conditions conveyance, will not increase flood velocities, will not increase flood profiles, and will compensate for all lost flood storage at a ration of 1.2:1 in a manner that is hydraulically equivalent.

6. Application Requirements for Development in the Regulatory Floodplain.

If the development is located in a Regulatory Floodplain, the applicant shall provide the following additional information:

- a. Site location of the property, drawn to scale on the Regulatory Floodway map.
- b. A plan view of the project showing:
 - (1) The Regulatory Floodway limit, Regulatory Floodplain limit and for work in public bodies of water as defined by IDNR/OWR, the navigation channels.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (2) Cross-section views of the project for the impacted reach showing existing and proposed conditions including principal dimensions of the work as shown in plan view, existing and proposed elevations, normal water elevation, 10-year frequency flood elevation, 100-year frequency flood elevation, and graphic or numerical scales (horizontal and vertical).
 - (3) A copy of the Regulatory Floodway map with the project site delineated and marked to reflect any proposed change in the Regulatory Floodway location.
- c. A listing of all local, state and federal permits or approval letters that may be required for this type of development. The applicant shall obtain and provide copies of any and all required federal, state and local permits for development in the Regulatory Floodplain before the applicant requests or obtains a Watershed Development Permit. Reference Appendix H for a partial list of permits that may be applicable.
 - d. Engineering calculations and supporting data showing that the proposed work will meet the performance standards of this Ordinance.
 - e. All changes in grade resulting from any proposed excavation or filling; and existing and proposed Regulatory Floodplain and Regulatory Floodway limits; the location and dimension of all buildings and additions to buildings; and the elevation of the lowest floor (including basement) of all proposed buildings subject to the requirements of this Ordinance.
 - f. Elevation certificates of the lowest floor elevation (including basements and attached garages) or the elevation to which a non-residential building has been flood-proofed using a flood-proofing certificate for all buildings in the Regulatory Floodplain.

D. FLOOD – PRONE AREAS

The standards of this section apply to development located in flood-prone areas with drainage areas less than 640 acres or in depressional storage areas, as specified.

1. Flood-carrying Capacity.

The flood-carrying capacity shall be maintained for channels with flood-prone areas draining a tributary area of 20-acres or more. (Article IV, Section B.1.g)

2. Flood-prone Area Conveyance, Velocities, Flood Profiles, and Flood Storage

For all development within a flood-prone area where the tributary drainage area is 100-acres or more, the applicant shall meet the requirements of Article IV, Sections C.2. e & f of this Ordinance according to the following criteria:

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- a. Submit to SMC an engineering study performed by a Registered Professional Engineer which will determine a floodway which meets the definition of a Regulatory Floodway and show that the proposed development will meet the requirements of Articles IV, Section C, of this Ordinance; or
- b. Submit to SMC an engineering study performed by a Registered Professional Engineer which will determine a base flood elevation and demonstrate that the proposed development will maintain the existing conditions conveyance, will not increase flood velocities, will not increase flood profiles, and will compensate for all lost flood storage at a ratio of 1.2:1 in a manner that is hydraulically equivalent, or
- c. Submit to SMC an engineering study performed by a Registered Professional Engineer which will demonstrate that for a range of flood elevations (which would conservatively exceed the expected 100-year flood elevation) that the proposed development will maintain the existing conditions conveyance, will not increase flood velocities, will not increase flood profiles, and will compensate for all lost flood storage at a ratio of 1.2:1 in a manner that is hydraulically equivalent.

E. WETLAND PROVISIONS

1. Applicability

A Watershed Development Permit is required for any regulated development as defined in Article IV Section A.1, that:

- a. Creates a wetland impact within an area defined as a Waters of the U.S.; or
- b. Creates a wetland impact within an area defined as Isolated Waters of Lake County; or
- c. Occurs in buffer areas adjoining to Waters of the U. S. or Isolated Waters of Lake County.

2. Wetland Permit Submittal Requirements

In addition to all other WDO provisions, wetland permit submittal requirements depend upon whether the development is within Waters of the U. S. or Isolated Waters of Lake County as provided below.

- a. The applicant shall provide a statement of wetland determination as to which wetlands on the development site are Isolated Waters of Lake County or Waters of the U. S. to the U. S. Army Corps of Engineers (Corps) for jurisdictional determination. A copy shall be sent to SMC.
- b. Wetland impacts to Waters of the U. S.: The following information is required:

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (1) Wetland delineation and wetland determination report as specified in Article IV Section E.3 of this ordinance.
 - (2) A U.S. Army Corps permit for the proposed development or a letter from the Corps stating that the proposed development does not require Corps authorization.
 - (3) Buffer Area requirements as specified in Article IV Section B.1.i. of this ordinance.
 - (4) All wetland impacts occurring in Lake County that exceed the mitigation threshold of the Corps regulatory program shall be mitigated for in Lake County at the mitigation ratio specified by the Corps for that development impact.
- c. Wetland impacts to Isolated Waters of Lake County: The following information is required:
- (1) A cover letter signed by a Certified Wetland Specialist or Provisional Certified Wetland Specialist, that provides a clear project purpose and need statement, a description of the proposed activity, area (in acres) of wetland impact and a statement on the permit category to be used as follows:
 - (a) Category-I: Wetland impacts less than or equal to 1 acre and does not impact high quality aquatic resources;
 - (b) Category-II: Wetland impacts greater than 1 acre and less than 2 acres and does not impact high quality aquatic resources;
 - (c) Category-III: Wetland impacts greater than or equal to 2 acres or impacts high quality aquatic resources; and,
 - (d) Category-IV: Wetland impacts for the restoration, creation and enhancement of wetlands provided that there are net gains in aquatic resource function. Category-IV activities include shoreline and streambank erosion restoration described in Article IV. Section C.2.d.3.
 - (2) A completed Watershed Development Permit Application;
 - (3) A delineation of the wetlands consistent with the requirements provided in Article IV Section E.3 of this Ordinance;
 - (4) A statement on the occurrence of any high quality aquatic resource on or adjoining the development;
 - (5) Documentation that the development is in compliance with the Illinois Department of Natural Resource's Endangered Species Consultation Program and the Illinois Natural Areas Preservation Act [520 ILCS 10/11 and 525 ILCS 30/17];

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- (6) Documentation that the development is in compliance with the U. S. Fish and Wildlife Service's consultation program under the Endangered Species Act;
- (7) A mitigation plan meeting the requirements of Article IV.E.4 of this Ordinance;
- (8) A copy of the Natural Resources Information Report (NRI) for development that is required to obtain a NRI performed by the Lake County Soil and Water Conservation District pursuant to state statute 70 ILCS 405/22.02a;
- (9) A narrative of the alternative measures taken to avoid, minimize, or mitigate for wetland impacts to Isolated Waters of Lake County (Category-II requirement only);
- (10) Category-III Wetland Impacts:
 - (a) A narrative of the measures taken, in sequence, to avoid and minimize wetland impacts to Isolated Waters of Lake County before mitigation is considered.
 - (b) Upon concurrence of the Enforcement Officer and the Certified Wetland Specialist or Provisional Wetland Specialist that a watershed development permit application meets the wetland permit submittal requirements of this ordinance, the Enforcement Officer shall issue a Technical Notification to USACE, IDNR, IEPA, USFWS and the SMC requesting comments with respect to the proposed wetland impacts and request comments with 15 working days. The Enforcement Officer shall receive the comments and copies of the comments shall be forwarded to the applicant for response. Full consideration of the comments and applicant's response shall be evaluated by the Enforcement Officer prior to permit issuance.
 - (c) The SMC shall review and issue permits for all interjurisdictional Category III wetland impacts.
- (11) Category-IV Wetland Impacts:
 - (a) A narrative on the benefits to the aquatic environment of the proposed development.
 - (b) Shoreline and streambank erosion restoration that meet the requirements contained in Article IV. Section C.2.d.3 are exempt from submittal requirements contained in this section.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

3. Requirements for Wetland Delineation

- a. The applicant shall identify the boundaries, extent, function, and quality of all wetland areas on the development site and prepare a Wetland Determination Report. The presence and extent of wetland areas shall be determined by, or under supervision of, a Certified Wetland Specialist or Provisional Certified Wetland Specialist using an on-site wetland procedure within three (3) years of the initial permit application date in accordance with the methodology contained in the 1987 Corps of Engineers wetland delineation manual or as otherwise noted below.
- b. Wetland Determination Report

The following are minimum requirements for the Wetland Determination Report:

- (1) A plan showing the exact location of wetlands within the development boundaries. The wetland boundary shall be flagged in the field and surveyed;
- (2) An aerial photograph delineating the wetland and the development boundary;
- (3) A copy of the following maps (most recent) delineating the development boundary:
 - (a) U.S.G.S. quadrangle map;
 - (b) Lake County Wetland Inventory map;
 - (c) FEMA floodplain map;
 - (d) Lake County soil survey; and,
 - (e) Hydrologic Atlas.
- (4) U. S. Army Corps of Engineers data sheets with representative color photographs provided for each data point;
- (5) A written description of the wetland(s) that includes a Floristic Quality Assessment as determined by methodology contained in Swink, F. and G. Wilhelm's Plants of the Chicago Region (1994. 4th Edition, The Morton Arboretum, Lisle, Illinois). Floristic quality assessments shall generally be conducted during the growing season (between May 15 and October 1). Non-growing season assessments may require additional sampling during the growing season to satisfy this requirement;
- (6) The approximate location, extent, and relative quality of off-site wetlands on properties adjoining the development shall be identified by using the first of the following documents or procedures pertaining at the time of development:
 - (a) Site-specific delineation according to the 1987 Federal wetland delineation manual. If such delineation is not available, use Paragraph (b) below.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

(b) Wetlands identified in Lake County Wetland Inventory maps (most current LCWI map).

(7) A report for the development site indicating the presence of cropland wetlands as defined by the National Food Security Act manual (most recent edition).

4. Wetland Mitigation Requirements

- a. Mitigation is required within Lake County for wetland impacts greater than or equal to $\frac{1}{4}$ (0.25) acres to Isolated Waters of Lake County.
- b. Mitigation shall provide for the replacement of the wetland environment lost to development at the following proportional rates (i.e., creation acreage to wetland impact acreage):
 - (1) A minimum of 1.5:1 for wetland impacts under Categories I, II and III that are not high quality aquatic resources, except 1:1 for approved and fully certified wetland mitigation bank credits;
 - (2) A minimum of 3:1 for wetland impacts that are high quality aquatic resources;
 - (3) A minimum of 6:1 for wetland impacts that are forested wetlands as defined in Appendix L.
- c. Mitigated wetlands shall be designed to duplicate or improve the hydrologic and biologic features of the original wetland impacted.
- d. A project mitigation document (PMD) shall be submitted for all mitigation projects in conformance with the U. S. Army Corps of Engineers Chicago District's Mitigation Guidelines and Requirements latest version. The guidelines contain requirements for performance standards, monitoring, and completion standards.
- e. Creation of wetlands for the mitigation of development wetland impacts shall take place only within areas not currently comprised of wetlands or forested areas. Enhancement of farmed wetlands meeting the size criterion in Article IV Section E.5.a. of this ordinance may be used for up to 80% of the mitigation requirement.
- f. Enhancement of existing non-farmed wetlands may be credited at up to 25% of the enhanced wetland acreage completed, provided that the wetland impact acreage created on-site is at a minimum 1:1 ratio.
- g. A five-year wetland mitigation surety for 110% of mitigation cost shall be submitted prior to obtaining a permit.
- h. A wetland mitigation management and monitoring plan indicating the legally responsible parties for long-term operation and maintenance and dedicated funding sources;

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- i. The developer shall provide annual monitoring reports on the status of the constructed mitigation measures. The developer shall undertake all necessary remedial action to bring the area into compliance with the wetland mitigation plan.
- j. Wetland impacts occurring prior to issuance of a WDO permit shall presume the wetland disturbed was a high quality aquatic resource requiring mitigation at a minimum rate of 3:1, except 6:1 for wetland impacts that are forested wetlands as defined in Appendix L.

5. Mitigation Hierarchy

a. Size Requirements:

- (1) If the required mitigation acreage is less than 1.5 acres, mitigation requirements shall follow the mitigation hierarchy 2 through 4 below. If on-site mitigation increases an existing on-site wetland size to greater than or equal to 1.5 acres, the applicant may use mitigation hierarchy 1.
- (2) If the required mitigation acreage is 1.5 acres or greater, mitigation requirements shall follow mitigation hierarchy 1 through 4.

b. Hierarchy – All mitigation shall occur in Lake County. Mitigation shall use the following hierarchy. Allowance to the next lower step is permitted only when justified through sequencing specified in Article IV Section E.2.c.9 and 10 or when the higher step is not available:

- (1) On-site wetland mitigation meeting the requirements of the project mitigation document;
- (2) In the same watershed as wetland impact: A U.S. Army Corps Approved Wetland Mitigation Bank; or a SMC Approved Wetland Mitigation Bank; or Off-site wetland mitigation meeting the requirements of the project mitigation document.
- (3) Outside of the watershed (at double the required mitigation acreage): A U.S. Army Corps Approved Wetland Mitigation Bank; or a SMC Approved Wetland Mitigation Bank; or Off-site wetland mitigation meeting the requirements of the project mitigation document.
- (4) SMC Wetland Restoration Fund.

6. Detention in Isolated Waters of Lake County

Detention shall only be allowed in farmed wetlands currently in farm production or when the existing vegetated wetland acreage is covered by a minimum 85% of one or more of the following species:

- a. reed canary grass (*Phalaris arundinacea*)
- b. purple loosestrife (*Lythrum salicaria*)
- c. common reed (*Phragmites australis*) or
- d. buckthorn (*Rhamnus* spp.)

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

7. Wetland Hydrology:

The following hydrology threshold requirements shall be met by the development activity. If the development activity exceeds the hydrology threshold limits, a wetland impact to Isolated Waters of Lake County shall be assumed, and the mitigation requirements of Article IV Section E.4. of this ordinance shall apply.

The design shall maintain between 80% and 150% of the existing condition storm event runoff volume to the wetland up through the 2 year-24 hour storm event. The design shall meet the total off-site release rate requirements in Article IV, Section B.1.c of this ordinance, or the minimum orifice diameter of four (4) inches of Article IV, Section B.1.e.2 of this ordinance.

F. PUBLIC ROADWAY DEVELOPMENT PERMIT

1. Authority and Enforcement

- a. The SMC shall be responsible for the review, enforcement, and issuance of all Public Road Development Permits.
- b. The performance standards of this Ordinance shall apply to all Public Road Developments. The release rate performance standard of Article IV, Section B.1.c. shall apply only to additional impervious surface areas or in the case of new road construction, the hydrologically disturbed areas. This release rate requirement shall be used unless watershed specific release rates have been adopted or it is determined by the Enforcement Officer that other site conditions, including analysis of adequate downstream capacity, warrant further analysis and modification from this standard. Detention requirements shall be applied only to those projects described in Article IV, Section A.1.g.
- c. The fee-in-lieu of on-site detention option shall be authorized for all public road developments on existing alignments provided the downstream drainage system has adequate stormwater capacity and that it will not result in negative impacts to the drainage system.

2. Application Requirements

- a. A copy of any applicable IDNR/OWR Permit application.
- b. A copy of any applicable U.S. Army Corps of Engineers permit application.
- c. A copy of the proposed Stormwater Management System, including the location and size of all existing and proposed drainage improvements including plan, section, and profile views of storm sewers, field tiles, culverts, channels, and detention areas.

ARTICLE IV: WATERSHED DEVELOPMENT PERMITS

- d. A copy of all calculations supporting the stormwater management system. Materials should be consistent with the submittal requirements of Article IV, Section B.2.b. (5) and the engineering requirements of Article IV, Section B.1.
- e. A Soil erosion and sediment control plan consistent with Article IV, Section B.1.j.
- f. A Wetland Determination Report and Mitigation Plan consistent with Article IV, Section E, if applicable.

G. PERFORMANCE STANDARDS FOR FLOOD TABLE LAND DEVELOPMENT

For all development within the flood table lands, the applicant shall meet the requirements of Article IV, Sections C.2.e.,f.(1), f.(3), f.(4) and f.(5) of this Ordinance.

This requirement applies to new construction only and not to additions or substantial improvements to structures within flood table lands built before the effective date of this Ordinance Amendment (August 10, 1999).

New residential structures built within flood table lands may have the lowest floor below the FPE if structurally dry flood-proofed to at least the flood protection elevation in accordance with Article IV, Section C.2.f.(3) of this Ordinance.

ARTICLE V: VARIANCES AND APPEALS

A. VARIANCES

The Enforcement Officer upon application, after hearing, and subject to the process and standards that follow, may grant variances to the provisions of this Ordinance as will not cause detriment to the public good, safety or welfare nor be contrary to the spirit, purpose and intent of this Ordinance where, by reason of unique and exceptional physical circumstances or condition of a particular property, the literal enforcement of the provisions of this Ordinance would result in an unreasonable hardship.

- 1. In Certified Communities, the Certified Community's Enforcement Officer shall administer the variance provisions.
- 2. In Non-Certified Communities and for Public Road Developments, the SMC Chief Engineer shall administer the variance provisions.
- 3. A public notice will be issued inviting public comment on all proposed variances to major development performance standards. In a Certified Community a copy of the public notice shall be sent a minimum of 30 days before the ruling to the SMC Chief Engineer to allow for SMC comment on the variance being issued.
- 4. Variances shall be granted only upon:
 - a. Showing of good and sufficient cause; and

ARTICLE V: VARIANCES AND APPEALS

- b. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard and water quality; and
 - c. A finding that failure to grant the variance would result in exceptional hardship to the applicant; and
 - d. A finding that the granting of a variance would not result in increased flood heights, additional threats to public safety, or extraordinary public expense, nor create nuisances, cause fraud or victimization of the public, nor conflict with existing local laws or ordinances and that all buildings will be protected by methods that minimize flood damage during the base flood elevation; and
 - e. A finding that the development activity can not be located outside the Regulatory Floodplain; and
 - f. A determination that the activity is not in a Regulatory Floodway. No variances shall be granted to any development located in a Regulatory Floodway. No variance shall be granted pertaining to Articles IV, C.3, IV,C.4, and IV.C.5; and
 - g. The applicant's circumstances are unique and do not represent a general problem; and
 - h. The granting of the variance will not alter the essential character of the area involved including existing stream uses.
5. Upon consideration of the factors noted above and the intent of the Ordinance, the Enforcement Officer may attach such conditions to the granting of a variance deemed necessary to further the purposes and objectives herein.
6. Variances requested in connection with restoration of a historic site or building listed on the National Register of Historical Places or documented as worthy of preservation by the Illinois Historic Preservation Agency may be granted using criteria more permissive than the requirements contained in this Article.
7. The Enforcement Officer shall notify an applicant in writing that a variance from the requirements of Article IV, Section C.2.f. that would lessen the degree of protection to a building will result in increased premium rates for flood insurance up to amounts as high as \$25 for \$100 of insurance coverage, increase the risks to life and property, and require that the applicant will acknowledge in a signed exception to title the assumption of the risks and liability and will pay upon approval of the variance a recording fee above and beyond the usual permit review fee.
8. In a Regulatory Floodplain without a Regulatory Floodway where the tributary drainage area is 640-acres or more, a variance may not be granted that will result in a loss of the Regulatory Floodplain storage of greater than 10% of the existing Regulatory Floodplain storage on the site.

ARTICLE V: VARIANCES AND APPEALS

9. Variances requested in connection with the redevelopment of previously developed sites, that will further the public policy goals of downtown redevelopment and neighborhood revitalization, may be granted a variance provided the variance would not result in an increase in the pre-redevelopment runoff rate or volume and there will exist adequate downstream stormwater capacity. No variance shall be granted pertaining to Article IV, Section C.
10. Due to the unique nature of Public Road Developments occurring in a narrow R.O.W. instead of an expansive tract of land, variances requested in connection with public road developments that will further the public policy of minimizing the condemnation of private or public property may be granted using criteria more permissive than the requirements of Article V, Section A.4 to the minimum extent necessary to achieve the minimal amount of condemnation. No variances shall be granted pertaining to Articles IV.C.3, IV.C.4, and IV.C.5.
11. Written findings shall be made public for all variances and shall be on file with the SMC.

B. APPEALS

1. Any person aggrieved by an ordinance based decision, by a Certified Community's Enforcement Officer may request review thereof by the Certified Community's board of elected officials or the appropriate body.
2. Any person aggrieved by an ordinance based decision, by the SMC Chief Engineer may request review thereof by the SMC Director.
3. Any person aggrieved by an ordinance based decision, by the SMC Director may appeal it to the SMC by written notice filed with the SMC Director within 30 days of the determination.

ARTICLE VI: INSPECTIONS AND ACCESS

Representatives of the SMC and of any federal, state and local unit of government are authorized to enter upon any land or water to inspect development activity and to verify the existing conditions of a development site that is currently under permit review.

- A. Inspection: The Enforcement Officer may inspect site development at any stage in the construction process. Recommended inspection intervals are listed below. For major developments, the Enforcement Officer shall conduct site inspections, at a minimum, at the end of the construction stages 1. and 7. listed below. Construction plans approved by the Enforcement Officer shall be maintained at the site during progress of the work.
 1. Upon completion of installation of sediment and runoff control measures (including perimeter controls and diversions), prior to proceeding with any other earth disturbance or grading,
 2. After stripping and clearing,

ARTICLE VI: INSPECTIONS AND ACCESS

3. After rough grading,
4. After final grading,
5. After seeding and landscaping deadlines,
6. After every seven (7) calendar days or storm event with greater than 0.5-inches of rainfall,
7. After final stabilization and landscaping, prior to removal of sediment controls.

If a wetland mitigation area is constructed as part of the watershed development permit, it is recommended that a Certified Wetland Specialist or Provisional Wetland Specialist at a minimum perform the following inspections:

8. After final grading and before seeding or plant installation.
9. After seeding and plant installation.
10. Annual inspections during the 5-year monitoring and maintenance period.

If stripping, clearing, grading and/or landscaping are to be done in phases or areas, the permittee shall plan for appropriate erosion control measures to be in place after each stage listed above and for each phase of construction.

B. Special Precautions

1. If at any stage of the grading of any development site the Enforcement Officer determines that the nature of the site is such that further work authorized by an existing permit is likely to imperil any property, public way, stream, lake, wetland, or drainage structure, the Enforcement Officer may require, as a condition of allowing the work to be done, that such reasonable special precautions to be taken as is considered advisable to avoid the likelihood of such peril. Special Precautions may include, but shall not be limited to, a more level exposed slope, construction of additional drainage facilities, berms, terracing, compaction, or cribbing, installation of plant materials for erosion control, and recommendations of a licensed soils engineer and/or engineering geologist which may be made requirements for further work.
2. Where the Enforcement Officer determines that storm damage may result or has resulted because the grading on any development site is not complete, work may be stopped and the permittee required to install temporary structures or take such other measures as may be required to protect adjoining property or the public safety. On large developments or where unusual site conditions prevail, the Enforcement Officer may require that the operations be conducted in specific stages so as to insure completion of protective measures or devices prior to the advent of seasonal rains.

ARTICLE VII: PENALTIES AND LEGAL ACTIONS

ARTICLE VII: PENALTIES AND LEGAL ACTIONS

- A. Whenever an Enforcement Officer finds a violation of this Ordinance, or of any permit or order issued pursuant thereto, within their respective jurisdiction, the Enforcement Officer may issue a stop work order on all development activity on the subject property or on the portion of the activity in direct violation of the Ordinance. In every case, the Enforcement Officer shall issue an order that (1) describes the violation (2) specifies the time period for remediation and (3) requires compliance with this Ordinance prior to the completion of the activity in violation.
- B. Failure to comply with any of the requirements of this Ordinance shall constitute a violation, and any person convicted thereof shall be fined not more than five hundred (\$500.00) dollars for each offence. Each day the violation continues shall be considered a separate offence.
- C. The SMC of Certified Community may also take any other legal action necessary to prevent or remedy any violation including appropriate equitable or injunctive relief and, if applicable, an assessment to the violator for the removal, correction, or termination of any adverse effects upon any property resulting from any unauthorized activity for which legal action under this section may have been brought.
- D. SMC or the Certified Community may record a notice of violation on the title to the property at the Lake County Recorder of Deeds Office.
- E. The Enforcement Officer shall inform the owner that any such violation is considered a willful act to increase flood damages and, therefore, may cause coverage by a Standard Flood Insurance Policy to be suspended.

ARTICLE VIII: DISCLAIMER OF LIABILITY

It is recognized that although the degree of flood protection required by this Ordinance is considered reasonable for regulatory purposes and is based on scientific and engineering considerations, on occasions greater floods can and will occur, and flood heights may be increased by man-made or natural causes. These provisions do not imply that land outside the flood-plain areas or that uses permitted within such areas will be free from flooding or flood damages. These provisions shall not create liability on the part of the Stormwater Management Commission nor any Certified Community nor any officer or employee thereof for any claims, damages or liabilities that result from reliance on this Ordinance or any administrative decision lawfully made thereunder.

ARTICLE IX: SEPARABILITY

The provisions of this Ordinance shall be deemed separable and the invalidity of any portion of this Ordinance shall not affect the validity of the remainder.

ARTICLE VII: ABROGATIONS AND GREATER RESTRICTIONS

ARTICLE X: ABROGATION AND GREATER RESTRICTIONS

This Ordinance is not intended to repeal, abrogate or impair any existing easements, covenants, or deed restrictions. Where this Ordinance and other ordinance, easements, covenants, or deed restrictions conflict or overlap, whichever imposes the more stringent restrictions shall prevail. This Ordinance is intended to repeal the original Ordinance or resolution which was adopted to meet the National Flood Insurance Program regulations, but is not intended to repeal the resolution which the community passed in order to establish initial eligibility for the program.

ARTICLE XI: EFFECTIVE DATE

The effective date of this Ordinance shall be October 18, 1992.
Approved as amended by the Lake County Board, July 12, 1994
Approved as amended by the Lake County Board, August 10, 1999
Approved as amended by the Lake County Board, October 10, 2000
Approved as amended by the Lake County Board, August 14, 2001

Official: _____ Date: _____

Attest: _____ Date: _____

APPENDIX A - DEFINITIONS

adequate downstream stormwater capacity: A stormwater management system shall be considered to have adequate downstream stormwater capacity if the system can be shown to accommodate up to and including the 100-year stormwater runoff without increasing property damage to the adjacent property or to a point downstream known to the Enforcement Officer to be a restriction causing significant backwater.

applicant: Any person, firm or governmental agency who owns property or the duly appointed representative that wishes to develop that property and one who executes the necessary forms to procure permit to carry out such development from the SMC or Certified Community.

Appropriate Use: Only uses of the Regulatory Floodway that are permissible and will be considered for permit issuance. The only uses that will be allowed are as specified in Article VI, Section C.3.

base flood: The flood having a one percent probability of being equaled or exceeded in any given year. The base flood is also known as the 100-year frequency flood event. Application of the base flood elevation at any location is as defined in Article IV, Section C.1. of this Ordinance.

Base Flood Elevation (BFE): The elevation delineating the level of flooding resulting from the 100-year flood frequency elevation.

basement: Any area of a building having its floor subgrade (below grade level) on all sides.

basin plan: A study and evaluation of an individual drainage basin's stormwater management and flood control needs.

building: A structure that is principally above ground and is enclosed by walls and a roof. The term includes a gas or liquid storage tank, a manufactured home, mobile home or a prefabricated building. This term also includes recreational vehicles and travel trailers to be installed on a site for more than 180 days.

buffer: An area of predominantly vegetated land to be left open, adjacent to drainageways, wetland, lakes, ponds or other surface waters for the purpose of eliminating or minimizing adverse impacts to such areas.

by-pass: To route tributary drainage area runoff around and not through a stormwater control structure.

Certified Community: A community which has petitioned the SMC and has been found by the SMC to be capable of enforcing an ordinance (or Ordinances) which contain stormwater and Regulatory Floodplain management rules and regulations which are consistent with, or at least as stringent, as these of this Lake County Watershed Development Ordinance.

Certified Wetland Specialist: Persons meeting the minimum requirements of a, b and c, as follows:

- a. Provide a one-page statement of qualifications in the areas noted below. The signed statement will be considered as evidence of qualifications.
- b. Pass the Certified Wetland Specialist Exam.
- c. Completion of a SMC-approved wetland delineation course and meet the requirements of one of the following:

APPENDIX A - DEFINITIONS

1. Registered Professional Wetland Scientist (PWS) from the Society of Wetland Scientists;
2. Minimum of a Bachelor's Degree in an Earth Science or Biologic Science and at least one of the following: Three years (cumulative) full-time experience in the Upper Midwest Region on wetland related projects; or the completion of 100 wetland delineations in the Upper Midwest; or, a minimum of 300 hours spent in field review of wetlands in the Upper Midwest.
3. Six years (cumulative) full-time experience in the Upper Midwest Region on wetlands related projects.

channel: Any river, stream, creek, brook, branch, natural or artificial depression, ponded area, lakes, flowage, slough, ditch, conduit, culvert, gully, ravine, swale, wash, or natural or man-made drainage way, in or into which surface or groundwater flows, either perennially or intermittently.

channel modification: Alteration of a channel by changing the physical dimensions or materials of its bed or banks. Channel modification includes damming, rip-rapping or other armoring, widening, deepening, straightening, relocating and lining and significant removal of bottom or woody vegetation of the channel. Channel modification does not include the clearing of dead or dying vegetation, debris, or trash from the channel.

community: Any municipality, as defined at 65 ILCS 5/1-1-2, or the unincorporated county within Lake County acting as a unit of local government.

compensatory storage: An excavated, hydraulically equivalent volume of storage used to offset the loss of natural flood storage capacity when artificial fill or structures are placed within a Regulatory Floodplain.

conditional approval Regulatory Floodway map change: Pre-construction approval by IDNR/OWR and the Federal Emergency Management Agency of a proposed change to the Regulatory Floodway map and/or BFE. This pre-construction approval, pursuant to this Part, gives assurance to the property owner that once an Appropriate Use is constructed according to permitted plans, the Regulatory Floodway map and/or BFE can be changed, as previously agreed, upon review and acceptance of as built plans.

Conditional Letter of Map Revision (CLOMR): A letter which indicated that the Federal Emergency Management Agency will revise base flood elevations, flood insurance rate zones, flood boundaries or Regulatory Floodway and/or BFE as shown on an effective Flood Hazard Boundary Map or Flood Insurance Rate Map, once the as-built plans are submitted and approved.

control structure: A structure designed to control the rate of flow that passes through the structure, given a specific upstream and downstream water surface elevation.

dam: All obstructions, wall embankments or barriers, together with their abutments and appurtenant works, if any, constructed for the purpose of storing or diverting water or creating a pool. Underground water storage tanks are not included.

damage: Measurable rise in flood heights on buildings currently subject to flooding, flooding of buildings currently not subject to flooding and increases in volume or velocity to the point where the rate of land lost to erosion and scour is substantially increased.

deed or plat restriction: Easements, covenants, deed restricted open spaces, outlots dedicated to a public entity, reserved plat areas, conservation easements, or public road right of ways that contain any part of the stormwater management system of a development.

APPENDIX A - DEFINITIONS

depressional storage areas: Non-riverine depressions where stormwater collects.

design storm: A selected storm event, described in terms of the probability of occurring once within a given number of years, for which stormwater or flood control improvements are designed and built.

detention facility: A man made structure for the temporary storage of stormwater runoff with controlled release during or immediately following a storm.

detention volume safety factor: A multiplication factor applied to a development's detention volume when the detention facility is constructed on-stream.

development: Completion of a final plat, replat, or man-made change to real estate by private or public agencies including:

- A. Construction, reconstruction, repair, or placement of a building or any addition to a building;
- B. Installation of a manufactured home on a site, preparation of a site for a manufactured home, or the placement of a recreational vehicle on a site for more than 180 days;
- C. Drilling, mining, installation of utilities, construction of roads, bridges, or similar projects;
- D. Clearing of land as an adjunct of construction;
- E. Construction or erection of levees, walls, fences, dams, or culverts; channel modification; filling, dredging, grading, excavating, paving, or other alterations of the ground surface; storage of materials; deposit of solid or liquid waste;
- F. Any other activity that might change the direction, height, volume or velocity of flood or surface water, including the drainage of wetlands and removal of vegetation to the extent such that the wetland would no longer meet the criteria of supporting hydrophytic vegetation as defined in this ordinance except that which would be considered appropriate for management purposes.

Development does not include maintenance of existing buildings and facilities such as resurfacing of roadways when the road elevation is not increased, or gardening, plowing, and similar agriculture practices that do not involve filling, grading, or construction of levees. Nor does development include agriculture practices outside of the Regulatory Floodplain involving filling or grading as part of a Natural Resources Conservation Service designed and approved conservation project (i.e., terraces, grass waterways). Additionally, development does not include fence installation, pole placement, drilling or other minor auxiliary construction activity which does not effect stormwater runoff rates or volumes as long as the development activity is not located in a Regulatory Floodplain, wetland or channel.

dominant: For the purpose of this ordinance, a dominant plant species is one that comprises greater than 50% of the total vegetated wetland acreage.

drainage area: The land area above a given point that contributes stormwater to that point.

dry detention facility: A dry detention facility is a detention facility designed to drain completely after temporary storage of stormwater flows and to normally be dry over the majority of its bottom area.

APPENDIX A - DEFINITIONS

elevation certificates: A form published by the Federal Emergency Management Agency that is used to certify the elevation to which a building has been constructed.

emergency overflow: The structure in a stormwater management system designed to protect the system in event of a malfunction of the primary flow structure or a storm event greater than the system design. The emergency overflow capacity initiates at the facility design high water level or base flood elevations.

Enforcement Officer: The SMC Chief Engineer for Non-Certified Communities or a development regulations officer designated by a Certified Community.

erosion: The process whereby soil is removed by flowing water or wave action.

farmed wetland: wetlands that are farmed currently, or have been farmed within 5 years previous to the permit application date, as defined in 7 CFR Part 12 (61 FR 47025).

fee-in-lieu of on-site stormwater storage: A fee assessed to a permit applicant used to contribute to the cost of a basin plan or floodplain study components; or other stormwater system improvements, "in-lieu-of" constructing on-site detention or for compensatory storage requirements for streambank and shoreline restoration fills of less than 200 cubic yards.

FEMA: Federal Emergency Management Agency and its regulations codified as 44 CFR 59-79 effective as of October 1, 1986. This incorporation does not include any later editions or amendments.

flood: A general and temporary condition of partial or complete inundation of normally dry land areas from overflow of inland or tidal waves, or the unusual and rapid accumulation of runoff of surface waters from any source.

flood frequency: A period of years, based on a statistical analysis, during which a flood of a stated magnitude may be expected to be equaled or exceeded.

Flood Insurance Rate Maps (FIRM): A map prepared by the Federal Emergency Management Agency or HUD that depicts the special flood hazard area (SFHA) within a community. This map includes insurance rate zones and Regulatory Floodplains and may or may not depict Regulatory Floodways.

floodplain (regulatory): See Regulatory Floodplain.

floodplain management: An overall program of corrective and preventive measures for avoiding or reducing future flood damage.

floodplain study: A study that has been formally adopted by the SMC that analyzes the hydraulic and hydrologic characteristics of a specific watershed area.

flood-prone area: Any area inundated by the base flood.

Flood Protection Elevation (FPE): The elevation of the base flood elevation plus 2 feet of freeboard.

flood-proofing: Any combination of structural and non-structural additions, changes or adjustments to structures or property which reduce or eliminate flood damage to real estate or improved real property, water and sanitary facilities, structures and their contents.

APPENDIX A - DEFINITIONS

flood-proofing certificates: A form published by the Federal Emergency Management Agency that is used to certify that a building has been designed and constructed to be structurally dry flood-proofed to the flood protection elevation.

flood table land: The land area immediately adjacent to flood-prone areas with greater than 100-acres of tributary drainage area, the elevation of which is greater than the base flood elevation by two (2) feet or less.

floodway (regulatory): See Regulatory Floodway

freeboard: An increment of height added to the base flood elevation to provide a factor of safety for uncertainties in calculations, unknown local conditions, wave actions and unpredictable effects such as those caused by ice or debris jams.

functional assessment: An assessment of a wetlands flood storage, water quality and other beneficial functions.

High-quality aquatic resources (HQAR): Waters of the United States or Isolated Waters of Lake County that are determined to be critical due to their uniqueness, scarcity, function and/or value as defined in Appendix L of this Ordinance.

historic structure: A "Historic Structure" is any structure that is:

- A. Listed individually in the National Register of Historic Places or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register;
- B. Certified or preliminarily determined by the Secretary of the Interior as contributing to the historic district or a district preliminarily determined by the Secretary to qualify as a registered historic district;
- C. Individually listed on the State inventory of historic places by the Illinois Historic Preservation Agency; or
- D. Individually listed on a local inventory of historic places that has been certified by the Illinois Historic Preservation Agency.

hydraulically equivalent compensatory storage: Compensatory storage placed between the proposed normal water elevation and the proposed 100-year flood elevation. All storage lost or displaced below the existing 10-year flood elevation is replaced below the proposed 10-year flood elevation. All storage lost or displaced above the existing 10-year flood elevation is replaced above the proposed 10-year flood elevation.

hydrologic and hydraulic calculations: Engineering analysis which determines expected flood flows and flood elevations based on land characteristics and rainfall events.

hydric soil: A soil that is saturated, flooded, or ponded long enough during the growing season to develop anaerobic conditions in the upper part.

hydrologically disturbed: An area where the land surface has been cleared, grubbed, compacted, or otherwise modified to alter stormwater runoff, volumes, rates, flow direction or inundation duration.

hydrophytic vegetation: Plant life growing in water, soil or on a substrate that is at least periodically deficient in oxygen as a result of excessive water content.

APPENDIX A - DEFINITIONS

IDNR/OWR: Illinois Department of Natural Resources, Office of Water Resources (also IDNR/OWR) previously known as IDOT/DWR.

Illinois Urban Manual: The Natural Resources Conservation Service Illinois Urban Manual. A technical manual designed for urban ecosystem protection and enhancement. This manual contains design guidance for a development site to meet the Watershed Development Ordinance performance standards for soil erosion and sediment control.

impervious surface: Any hard-surfaced, man made area that does not readily absorb or retain water, including but not limited to building roofs, parking and driveway areas, graveled areas, sidewalks and paved recreation areas.

in-kind replacement (culvert): An in-kind culvert replacement has an equivalent cross-sectional area, shape, roughness coefficient, and inlet and outlet elevations; or the replacement may be shown to have an equivalent hydraulic capacity using appropriate engineering calculations.

inspect: To visit, or to review plans, or to oversee a site visit or plan review per generally accepted engineering practices.

Isolated Waters of Lake County: All waters such as lakes, ponds, streams (including intermittent streams), farmed wetlands, and wetlands that are not under U. S. Army Corps of Engineers jurisdiction.

- A. The limits of the Isolated Waters of Lake County extend to the ordinary high water mark or the delineated wetland boundary.
- B. Isolated Waters of Lake County exclude permitted excavations created for such purposes as: stormwater conveyance, detention/retention areas constructed as part of a stormwater management system, recreation, stock watering, irrigation, settling basins or wastewater treatment systems and roadside ditches. Also excluded are areas created by incidental construction grading that are exempt per Article IV Section A.2. of this ordinance.
- C. Compensatory wetland mitigation created to meet the requirements of this Ordinance or Section 404 of the Clean Water Act is not excluded.

lake: A natural or artificial body of water encompassing an area of two (2) or more acres which retains water throughout the year.

Letter of Map Amendment (LOMA): Official determination by FEMA that a specific structure is not in a Special Flood Hazard Area; amends the effective Flood Hazard boundary Map (FHBM) or Flood Insurance Rate Map (FIRM).

Letter of Map Revision (LOMR): Letter issued by FEMA or IDNR/OWR that revises base flood elevations, flood insurance rate zones, flood boundaries or Regulatory Floodways as shown on an effective FHBM or FIRM.

low opening elevation: The elevation at which water could enter a structure through any non-watertight opening such as a doorway threshold, a window sill, or a basement window well.

lowest adjacent grade: The lowest finished grade adjacent to a structure, not including the bottom of window wells.

lowest floor: Lowest floor of the lowest enclosed area, including basement.

APPENDIX A - DEFINITIONS

manufactured home: A structure, transportable in one or more sections, which is built on a permanent chassis and is designated for use with or without a permanent foundation when connected to the required utilities. The term manufactured homes also include park trailers, recreational vehicles and other similar vehicles installed on-site for more than 180 consecutive days.

manufactured home park or subdivision: A parcel (or contiguous parcels) of land divided into two or more manufactured home lots for rent or sale.

mitigation: Measures taken to eliminate or minimize damage from development activities, such as construction in wetlands or Regulatory Floodplain filling, by replacement of the resource.

NGVD: National Geodetic Vertical Datum of 1929.

natural: When used in reference to streams and channels means those streams and channels formed by the existing surface topography of the earth prior to changes made by man. A modified stream and channel which has regained natural characteristics over time as it meanders and reestablishes vegetation may be considered natural.

non-riverine Regulatory Floodplain: Regulatory Floodplains not associated with streams, creeks or rivers, such as isolated depressional storage areas or lakes.

on-stream detention: Any detention facility that has off-site tributary drainage area.

ordinary high water mark: The point on the bank or shore at which the presence and movement of surface waters are continuous so as to leave a distinctive mark, such as by erosion, destruction or prevention of terrestrial vegetation, predominance of aquatic vegetation, or other such recognized characteristics.

overland flow path: An area of land which conveys stormwater for all events up to and including the base flood event. The overland flow path can be estimated using readily available topographic information and shall take into account all on-site and off-site tributary areas in accordance with Article IV, Section B.1.b.(4).

ownership parcel: Any legally described parcel of land. This includes contiguous lots or parcels of land, owned in whole, or in part, by the same property owner.

Parcel Identification Number (PIN): Permanent index number used to identify properties for tax assessment.

pond: A natural or artificial body of water of less than two acres which retains water year round.

Provisional Certified Wetland Specialist: Persons meeting the minimum requirements of a Certified Wetland Specialist, but who have not passed or completed the Certified Wetland Specialist Exam or who have not completed an SMC approved wetland delineator course. The Provisional Certified Wetland Specialist shall have passed the Certified Wetland Specialist Exam and SMC approved wetland delineator course by August 14, 2002 or will lose provisional certification.

public body of water: All open public rivers, streams, and lakes specifically designated by IDNR/OWR in Appendix F of this ordinance that are capable of being navigated by water craft, in whole or in part, for commercial uses and purposes, or which in their natural condition were capable of being improved and made navigable, or that are connected with or discharged their

APPENDIX A - DEFINITIONS

waters into navigable lakes or rivers within, or upon, the borders of the State of Illinois, together with all bayous, sloughs, backwaters, lakes that are open to the main channel or body of water and directly accessible thereto.

public flood control project: A flood control project which will be operated and maintained by a public agency to reduce flood damages to existing buildings, or structures. The project includes a hydrologic and hydraulic study of the existing and proposed conditions of the watershed. Nothing in this definition shall preclude the design, engineering, construction or financing, in whole or in part, of a flood control project by persons or parties who are not public agencies.

public road development: Any development activities which takes place in a public right-of-way or part thereof that is administered and funded, in whole or in part, by a public agency under its respective roadway jurisdiction. Rehabilitative maintenance and in-kind replacement are considered to be a public road development if located in a Regulatory Floodplain. A public road development located within a Regulatory Floodway and which has been approved by the Illinois Department of Transportation, Division of Highways (IDOT/DOH), Bureau of Local Roads and Streets is exempt from the hydraulic analysis requirements off this Ordinance. Individual recreation trail systems being constructed that are not part of another development project and linear railroad development projects shall be considered public road developments with respect to the requirements of this ordinance.

reconstruction: The act of rebuilding a structure.

record drawings: Construction drawings revised to show significant changes made during the construction process, usually based on marked-up prints, drawings and other data furnished by the contractor to the Enforcement Officer.

Registered Professional Engineer: An engineer registered in the State of Illinois, under the Professional Engineer Practice Act of 1989, 225 ILCS 325/1-49.

Regulatory Floodplain: Regulatory Floodplains may be either riverine or non-riverine depressional areas. Floodplain boundaries shall be delineated by projecting the base flood elevation onto the best available topography. A flood-prone area is a Regulatory Floodplain if it meets any of the following descriptions:

- A. Any riverine area inundated by the base flood where there is at least 640 acres of tributary drainage area.
- B. Any non-riverine area with a storage volume of 0.75 acre-foot or more when inundated by the base flood.
- C. Any area indicated as a Special Flood Hazard Area on the FEMA Flood Insurance Rate Map and located with the best available topography to be inundated by the base flood.

Regulatory Floodway: The channel, including on-stream lakes, and that portion of the Regulatory Floodplain adjacent to a stream or channel as designated by the Illinois Department of Natural Resource, Office of Water Resources, which is needed to store and convey the existing and anticipated future 100-year frequency flood discharge with no more that a 0.1 foot increase in stage due to the loss of flood conveyance or storage, and no more than a 10% increase in velocities. The location of the Regulatory Floodway shall be as delineated on the maps listed in Appendix C. Where interpretation is needed to determine the exact location of the Regulatory Floodway boundary, the IDNR/OWR should be contacted for the interpretation.

APPENDIX A - DEFINITIONS

- rehabilitative maintenance (roadway): Rehabilitative maintenance is repair or maintenance that does not increase the traffic lanes and does not involve changes to the roadway elevation.
- repair, remodeling or maintenance: Activities which do not result in any increases in the outside dimensions of a building or any changes to the dimensions of a structure.
- retention facilities: A facility designed to completely retain a specified amount of stormwater runoff without release except by means of evaporation, infiltration or pumping.
- riverine: Relating to, formed by, or resembling a stream (including creeks and rivers).
- roadside ditches: drainage ditches within 25-feet from the edge of the outside travel lane.
- sedimentation: The process that deposit soils, debris, and other materials either on other ground surfaces or in bodies of water or watercourses.
- SMC-approved wetland bank: A wetland mitigation bank approved by SMC that conforms with Appendix M of this ordinance.
- SMC Chief Engineer: A Registered Professional Engineer representing the Lake County Stormwater management Commission as the Enforcement Officer of the Watershed Development Ordinance.
- Special Flood Hazard Area (SFHA): Any area subject to inundation by the base flood from a river, creek, stream, or any other identified channel or ponding and shown on the Regulatory Floodplain map as listed in Appendices B and C.
- stormwater management: A set of actions taken to control stormwater runoff with the objectives of providing controlled surface drainage, flood control and pollutant reduction in runoff.
- Stormwater Management Commission (SMC): The Lake County Stormwater Management Commission established and existing under 55 ILCS 5/5-1062 for the purposes of developing, revising and implementing a countywide stormwater management plan.
- stormwater management system: The collection of natural features and man-made facilities which define the stormwater management for a development.
- stream: A course of running water flowing in a channel (includes creeks and rivers).
- structure: The results of a man-made change to the land constructed on or below the ground, including the construction, reconstruction or placement of a building or any addition to a building; installing a manufactured home on a site; preparing a site for a manufactured home or installing a recreational vehicle on a site for more than 180 days.
- substantial improvement: Any repair, reconstruction or improvement of a structure, the cost of which equals or exceeds 50% of the market value of the structure either, a) before the improvements of repair is started, or b) if the structure has been damaged, and is being restored, before the damage occurred. For the purposes of this definition "substantial improvement" is considered to occur when the first alteration of any wall, ceiling, floor or other structural part of the building commences, whether or not that alteration affects the external dimensions of the structure. The term does not, however, include either 1) any project for improvement of a structure to comply with existing state or local health, sanitary, or safety code specifications which are solely necessary to assure safe living conditions, or 2) any alteration of a structure listed on the National Register of Historic Places or a State Inventory of Historic Places.
- swale: A vegetated channel, ditch or low-lying or depressional tract of land that is periodically inundated by conveying stormwater from one point to another.

APPENDIX A - DEFINITIONS

Technical Reference Manual (TRM): The Lake County Stormwater Management Commission Technical Reference Manual. This manual contains design guidance for a development site to meet the Watershed Development Ordinance performance standards.

transition section: Reaches of the stream or Regulatory Floodway where water flows from a narrow cross-section to a wide cross-section or vice-versa.

water dependent: Structures or facilities relating to the use of, or requiring access to, the water or shoreline. Examples of water dependent uses include but are not limited to pumping facilities, wastewater treatment facilities, facilities and improvements related to recreation boating or commercial shipping.

watershed: The land area above a given point on a channel that contributes stormwater to that point. In Lake County the four major watersheds are officially defined as: the Lake Michigan Watershed, the North Branch of the Chicago River Watershed, the Des Plaines River Watershed, and the Fox River Watershed.

watershed benefit: A decrease in flood damages to structures upstream or downstream of the development site created by installation of the stormwater management system. The benefit must be beyond the benefit provided by meeting the minimum Watershed Development Ordinance standards and TRM guidance.

Watershed Development Permit: A permit established by this ordinance and issued, through the SMC or Certified Communities, prior to the approval of a building permit signifying conformance with provisions of this ordinance.

Waters of the United States: For the purpose of this Ordinance the term Waters of the United States refers to those water bodies and wetland areas that are under the U. S. Army Corps of Engineers jurisdiction.

wet detention facility: A wet detention facility designed to maintain a permanent pool of water after the temporary storage of stormwater runoff.

wetland: Wetlands are land that is inundated or saturated by surface or ground water at a frequency and duration sufficient to support, under normal conditions, a prevalence of vegetation adapted for life in saturated soil conditions (known as hydrophytic vegetation). A wetland is identified based upon the three attributes: 1) hydrology, 2) soils and 3) vegetation as mandated by the current Federal wetland determination methodology.

wetland impact: Isolated Waters of Lake County or Waters of the U. S. that are hydrologically disturbed or otherwise adversely affected by flooding, filling, excavation, or drainage which results from implementation of a development activity.

APPENDIX D

RESERVED

APPENDIX E - ENFORCEMENT OFFICER DUTIES

This Appendix, as a part of this duly adopted Ordinance, delineates requirements or duties required of and accepted by a community and its designated Enforcement Officer. Certain requirements or duties specified by FEMA or IDNR/OWR are for the purposes of that community obtaining or maintaining eligibility for participation in the National Flood Insurance Program and delegation of state permit authority. These certain requirements or duties relate to only to the intergovernmental relationship between a community and FEMA or IDNR/OWR, and they do not and are not intended to create any third party beneficial rights in or for applicants, property owners, or others.

- A. In Certified Communities, the appropriate development regulations officer shall be the Enforcement Officer for this Ordinance. In all other areas of Lake County, the SMC Chief Engineer shall be this Enforcement Officer. One of the primary duties of the Enforcement Officer shall be to review all Watershed Development Applications and issue permits for those projects that are in compliance with the provisions of the Ordinance. The Enforcement Officer shall be responsible for the administration and enforcement of this Ordinance. If the Enforcement Officer is contracted by a Certified Community, then the contract scope shall be comprehensive enough to cover all specified duties herein or the duties shall be shared with a Co-Enforcement Officer who is an Employee of the Certified Community.
- B. The Enforcement Officer shall determine for each development if it is in a Special Flood Hazard Area (SFHA) using the criteria specified in Article IV, Section C.1. of this Ordinance. If a site is in a SFHA, a determination is required as to whether it is in a Regulatory Floodway, or a Regulatory Floodplain on which a detailed study has not been conducted, or a flood-prone area with a tributary drainage area equal to or greater than 640-acres, greater than 100-acres, or greater than 20-acres.
- C. The Enforcement Officer shall ensure that an IDNR/OWR Dam Safety permit is obtained or a letter stating that no Dam Safety permit is required if the development includes a dam before the issuance of a Watershed Development Permit. Reference Appendix G for IDNR/OWR Dam Safety Permitting guidelines.
- D. Adopted Basin Plans and floodplain studies may be the basis for more specific regulations. These additional or more specific regulations will apply only in the specific study area of the Basin Plan or floodplain study and supersede those of this Ordinance only upon amendment to the Watershed Development Ordinance and formal adoption of the basin plan or floodplain study by SMC.
- E. The Enforcement Officer may require deed restrictions, performance bonds or sureties, as-built certification or maintenance guarantees as stipulated in this Ordinance to assure projects are built and maintained according to permitted plans. If such performance bond or sureties or other such adequate security as the Enforcement Officer may approve is required, the amount shall be equal to 110% of the estimated cost to complete construction of the stormwater management system required by the Watershed Development Permit, which estimated probable cost shall be approved by the Enforcement Officer. If a performance bond or surety is required by another community, that includes the cost of the stormwater management system of the development, additional performance bonding or surety shall not be required.
- F. A Registered Professional Engineer in the employ or under contract with SMC or Certified Community shall review any plans, calculations or analyses submitted by a Registered Professional Engineer pursuant to the requirements of this Ordinance.

APPENDIX E - ENFORCEMENT OFFICER DUTIES

- G. Proposed amendments to this Ordinance and appendices must be done in accordance with applicable state or federal law and approved by IDNR/OWR and FEMA.
- H. Prior to the issuance of a Watershed Development Permit, and based on the reliance that the application requirements of Article IV, Section B.2., have been met, the Enforcement Officer shall further ensure that the applicant has obtained and provided copies of any and all required federal, state and local permits for all development in the Regulatory Floodplain. Reference Appendix H for a partial list of permits that may be applicable.
- I. The Enforcement Officer shall inspect (as defined in Appendix A of this Ordinance) all development projects before, during and upon completion of construction to ensure proper elevation of the structure and to ensure compliance with the provisions of this Ordinance. The Enforcement Officer may require a pre-construction meeting as a condition of issuing a permit.
- J. IDNR/OWR or SMC has retained permit review and approval authority over the following:
 - 1. Illinois Department of Natural Resources projects, dams or impoundment structures as defined in Appendix A.
 - 2. All other state, federal, County or local unit of government development located in the Regulatory Floodplain.
 - 3. Determination that an existing bridge or culvert crossing is not a source of flood damage and the analysis indicating the proposed flood profile, per Article IV, Section C.4.
 - 4. An analysis of flood profile as indicated in Article IV, Section C.4.
 - 5. Alternative transition sections and hydraulically equivalent compensatory storage as indicated in Article IV, Section C.3.d.
 - 6. Permit issuance for development within or over Public Waters.
 - 7. Any changes in the Base Flood Elevation or Regulatory Floodway locations.
 - 8. Base Flood Elevation determinations where none now exist.
 - 9. Determination that the development is a public flood control project.
- K. The Enforcement Officer shall submit the data required to SMC, IDNR/OWR, and the Federal Emergency Management Agency (FEMA) for proposed revisions to the Base Flood Elevation of a Regulatory Floodplain study or a relocation of a Regulatory Floodway boundary.

The Enforcement Officer shall submit reports as required for the National Flood Insurance Program.
- L. The adopted Lake County Comprehensive Stormwater Management Plan states the SMC should “maintain a repository of stormwater management data for the county”. Toward that end, the Enforcement Officer shall:

APPENDIX E - ENFORCEMENT OFFICER DUTIES

1. Maintain records of every Watershed Development Permit application, permit, variance, hydrologic and hydraulic data, and enforcement action and shall allow periodic inspections of the records by SMC, FEMA, or IDNR/OWR personnel.
 2. Maintain an Elevation Certificate and flood-proofing certificate file to certify the elevation of the lowest floor (including basement) of a residential or non-residential building or the elevation to which a non-residential building has been flood-proofed, for all buildings constructed in the Regulatory Floodplain.
 3. Maintain for public inspection and provide copies upon request of: base flood data and maps, variance documentation, Conditional Letters of Map Revision, Letters of Map Revision, Letters of Map Amendment, elevation and flood-proofing certificates, other Watershed Development permit related materials, elevation and flood-proofing record drawings for all buildings requiring flood-proofing or constructed subject to the elevation criteria provisions of this Ordinance, and record drawings of the stormwater management system required by this Ordinance for each development.
 4. Copy to SMC, at agreed-upon intervals, but no later than a 5-year period, specified portions of the watershed development permit records.
- M. The Enforcement Officer shall notify adjacent upstream and downstream communities, the SMC, and IDNR/OWR in writing 30 days prior to the issuance of a permit for the alteration or relocation of a channel in a Regulatory Floodplain.

APPENDIX F

PUBLIC BODIES OF WATER IN LAKE COUNTY

The Following public bodies of water were navigable in their natural condition or were improved for navigation and opened to public use. The entire length and surface area in Illinois, including all backwater lakes and sloughs open to the main channel or body of water at normal flows or stages, are open to the public.

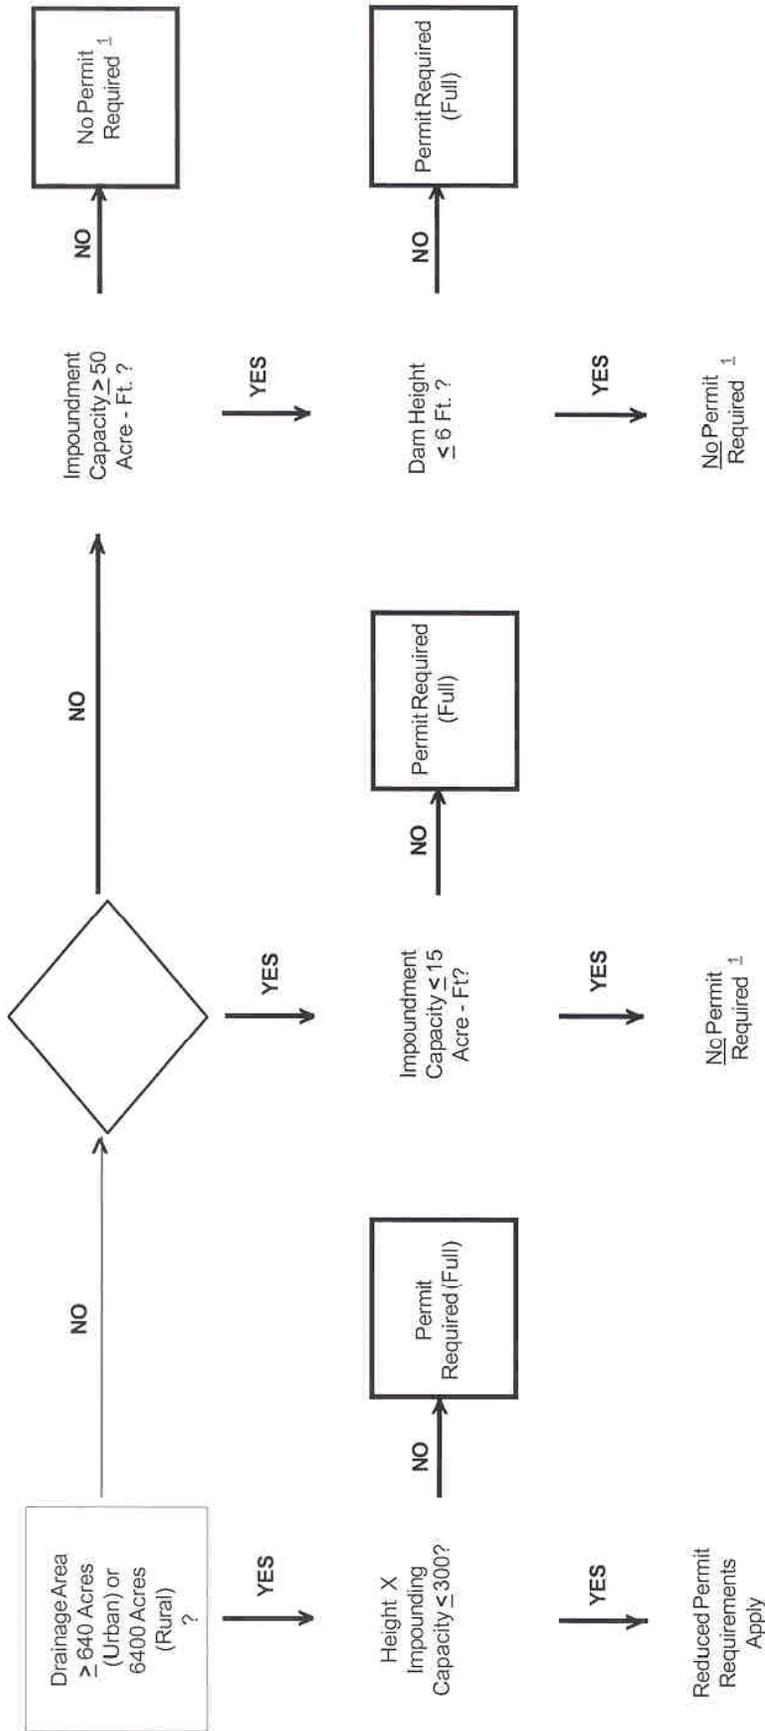

- 1) Lake Michigan
- 2) Fox River (Illinois River Basin)
- 3) Fox Chain-O-Lakes (Lake and McHenry Counties): Bluff Lake, Lake Catherine, Channel Lake, Fox Lake, Grass Lake, Lake Marie, Nippersink Lake, Dunns Lake, Pistakee Lake. Lake Jerilyn, Lac Louette, Redhead Lake;

The following public bodies of water are navigable waters that were dedicated to public use. This list is incomplete. It is believed there are numerous channels and slips in subdivisions on the margins of public bodies of water which have been dedicated by plat. Additional channels and slips have been dedicated by common law.

- 1) Petite Lake, Spring Lake and connecting channels between Bluff Lake and Fox Lake in Lake County.

APPENDIX G IDOT/DWR DAM SAFETY PERMITTING GUIDELINES

CLASS III, SMALL SIZE DAMS

REDUCED PERMIT REQUIREMENTS

- a) a completed "Application for Permit" form,
- b) construction plans and documents that are sealed, signed and dated by an engineer or other qualified personnel,
- c) information describing the downstream flood plain for a distance of two miles,
- d) calculations for the reservoir's 100-year flood pool elevation,
- e) proof of flooding rights (fee simple ownership or flood easement) of all lands within the reservoir's,

- f) right of access authorization for the State to inspect the dam site and immediate vicinity before, during and after construction for the life of the dam and its appurtenances, and
- g) agreement to submit record ("as-built") plans and specifications upon completion of the project.

¹ Unless known potential exists downstream for flood related structural damage which would result from dam failure.

APPENDIX H

PARTIAL LIST OF PERMITS REQUIRED (WHEN APPLICABLE) FOR DEVELOPMENT IN LAKE COUNTY

United States Army Corps of Engineers

Illinois Department of Natural Resources, Office of Water Resources

Illinois Department of Natural Resources, Department of Natural Heritage

Illinois Department of Transportation, Division of Highways, District 1

Illinois Environmental Protection Agency

Lake County Soil and Water Conservation District

Lake County Health Department

Lake County Division of Transportation

Community / County Building Permits

Illinois Historical Preservation Agency

United States Fish and Wildlife Service

*Multiplication Factor - Average ratios of X-hour/24-hour rainfall for Illinois, 1989 Bulletin 70.

**6 County - A multiplicative factor is not available for these storm events. Therefore, the 6-county Bulletin 70 data is used for regulatory studies.

HUFF RAINFALL DISTRIBUTIONS

The Huff quartiles represent the typical rainfall distribution for 4 different storm duration ranges. The First quartile applies to storms less than or equal to 6 hours long. Second is for storms greater than 6 hours and less than or equal to 12 while the third Huff quartile is for storms greater than 12 hours and less than or equal to 24 hours. Fourth quartile storms apply to storm durations greater than 24 hours.

APPENDIX L
HIGH-QUALITY AQUATIC RESOURCES

The following are descriptions of high-quality aquatic resources:

1. Advanced Identification (ADID) sites: Aquatic sites that have been identified by the U. S. Army Corps of Engineers, Chicago District and U.S. Environmental Protection Agency (U. S. Environmental Protection Agency. 1992. Advanced Identification (ADID) Study, Lake County, Illinois. Chicago, Illinois) or latest ADID study.
2. Bog: A low nutrient peatland, usually in a glacial depression, that is acidic in the surface stratum and often dominated at least in part by the genus *Sphagnum*.
3. Ephemeral pool: A seasonally inundated depression within a forested wetland or upland community, usually located on a moraine, glacial outwash plain, or in an area shallow to bedrock; also known locally as a “vernal pool.” These areas may not be permanently vegetated.
4. Fen: A peatland, herbaceous (including calcareous floating mats) or wooded, with calcareous groundwater flow.
5. Forested wetland: A wetland dominated by native woody vegetation by at least one of the following species or genera: *Carya* spp., *Cephalanthus occidentalis*, *Cornus alternifolia*, *Fraxinus nigra*, *Juglans cinerea*, and *Quercus* spp.
6. Sedge meadow: A wetland dominated by at least one of the following genera: *Carex*, *Calamagrostis*, *Cladium*, *Deschampsia*, *Eleocharis*, *Rhynchospora*, *Scleria*, or *Eriophorum*.
7. Seep: A wetland, herbaceous or wooded, with saturated soil or inundation resulting from the diffuse flow of groundwater to the surface stratum.
8. Streams shown on the most recent USGS quadrangle map as a perennial (solid blue line) or intermittent (dashed blue line) that are not determined to be a Waters of the U. S. If a site specific Index of Biological Integrity (IBI) assessment is lower than 35, this stream reach shall not be considered a HQAR.
9. Streamside marsh: An Isolated Waters of Lake County wetland that is within a 10-year riverine floodplain and dominated by herbaceous species.
10. Wet prairie: A wetland dominated by native graminoid species with a diverse indigenous forb component that is seasonally saturated and/or temporarily inundated.
11. Wetlands supporting Federal or Illinois endangered or threatened species: For current state-listed species, reference Illinois Endangered Species Protection Board’s “Checklist of Endangered and Threatened Animals and Plants of Illinois” and/or contact the Illinois Department of Natural Resources. For Federally-listed species, reference the U.S. Fish and Wildlife Service’s “Endangered and Threatened Wildlife and Plants” list (latest edition) and/or contact the U.S. Fish and Wildlife Service.
12. Wetlands with a Floristic Quality Index of 20 or greater or a mean C-value of 3.5 or greater: Reference Plants of the Chicago Region (F. Swink and G. Wilhelm, 4th edition, Indianapolis: Indiana Academy of Science, 1994).
13. Wetlands that are within a designated Illinois Natural Areas Inventory Site (INAI).

APPENDIX M - LCSMC APPROVED WETLAND MITIGATION BANKING REQUIREMENTS

SECTION 1. PURPOSE

This appendix includes the criteria for establishing, owning and operating wetland mitigation banks. It further sets out the criteria for authorizing applicants (e.g., individuals, corporations, units of government) to withdraw credits from a mitigation bank to offset unavoidable wetland impacts that would result from the applicant's proposed activity.

SECTION 2. GOALS

Mitigation banks are a form of regional mitigation, which encourage the development of large-scale wetland complexes that can be professionally managed and maintained in perpetuity for the benefit of the general public. The consolidation of multiple small mitigation projects allows for economies of scale in planning, implementation, and maintenance, and can produce wetlands of greater value because of their size and a high level of commitment to long-term management. The expected benefits include water quality management, wildlife habitat restoration and creation, flood control, conservation of biological diversity, education, recreation, and aesthetics. Further, this action will reduce administrative costs and delays in issuing permits for proposed activities that qualify for use of a mitigation bank.

Mitigation banking is intended to be a means of creating or restoring wetlands and generating bank credits in advance of the filling of wetlands for specific projects. As an interim measure, and as a way to encourage the initial development and implementation of banks, the sale of bank credits and the issuance of permits prior to the generation of bank credits at the bank site shall be allowed under conditions described elsewhere in this document.

SECTION 3. DEFINITIONS

1. Creation. Conversion of a non-wetland site into a wetland site by excavation, diking and flooding, or conversion of a deepwater site by filling.
2. Credit Certification. A formal determination by the SMC that mitigation bank credits have been generated. Certified credits result from fully meeting all certification standards (see Section 15, Mitigation Bank Credits and Certification Standards). Conditionally certified credits are those credits that are based on reasonable progress towards becoming certified credits. Uncertified credits are those credits that are based on full approval of the bank charter, and initial construction of the bank, including demonstration of wetland hydrology and planting. A maximum of 30% of the total potential credits may be sold upon approval of bank charter alone. An additional 20% of the total credits may be sold upon the demonstration of wetland hydrology. Upon completion of the approved planting plan, an additional 20% of the total credits may be sold. Using this formula, 70% of the total credits available from the bank may be sold as uncertified credits.
3. Reserved
4. Designated Service Area. The designated service area of an SMC-approved mitigation bank is Lake County.
5. Enhancement. Altering the physical characteristics of an existing wetland such that it permanently improves one or more specific wetland functions and values. Because impacts associated with individual projects that propose to use bank credits will, in virtually all cases, be permanent, only enhancement that results in permanent improvement of a wetland's functions and values will generate credits.
6. Growing Season. The period between May 1 and October 10. This growing season definition is for the purposes of this appendix alone, and is used to establish performance periods for determining compliance with revegetation standards. It does not establish the growing season for purposes of wetland delineation.
7. Ledger. Document to be used in the accounting of credits and debits. The ledger will be maintained by the bank sponsor and reviewed by the SMC.
8. Management. Actions taken within mitigation bank wetlands to establish and maintain desired habitat conditions. Representative management actions include water level manipulations, herbiciding, mechanical plant removal, and prescribed burning.

APPENDIX M - LCSMC APPROVED WETLAND MITIGATION BANKING REQUIREMENTS

9. Mitigation Bank. A system of accounting for wetland loss and compensation, which can include one or more wetland mitigation sites. The minimum acreage requirements in this ordinance shall apply to each site.

10. Mitigation Bank Charter. A written document which contains specifications pertaining to establishment, operation and maintenance of a wetland mitigation bank, codification of the goals, objectives, procedures of the bank, and incorporating the relevant terms and conditions of this ordinance. Principal types of banking charters are a legally binding agreement or a Watershed Development Permit.

11. Mitigation Bank Credits. The unit of measure of bank credit will be acres by wetland type.

12. Reserved

13. Mitigation Bank Site. The geographic location of created, restored, and enhanced wetlands, which serve as the physical resource used to generate bank credits.

14. Monitoring. A specific program of data collection which documents the physical, chemical, and biological characteristics of the mitigation bank wetlands, for the purpose of determining compliance with performance standards contained in the mitigation bank charter.

15. Phased mitigation bank. The construction of a mitigation bank in discrete steps, as authorized or agreed to in advance by the SMC. The bank prospectus must clearly describe each phase of the bank, and list the order in which the phases would be constructed.

16. Reserved

17. Prospectus. A preliminary plan for a wetland mitigation bank prepared by a prospective sponsor and submitted for consideration to SMC.

18. Restoration. Re-establishing wetland conditions in areas that were wetland in historical times, but which have been modified such that they are now considered non-wetland. Restoration converts previous wetland sites back to functional wetlands.

19. Site Development Plan. A plan for each bank site that identifies all actions that will be undertaken to generate bank credits. Representative elements of the site development plan include plans for site grading, revegetation, erosion control, structures, management, and monitoring.

20. Sponsor. The legally responsible individual or entity, proposing establishment of a wetland mitigation bank.

21. Reserved

22. Reserved

23. Wetland mitigation. Replacement of wetlands, and wetlands functions and values, for the purposes of compensating for wetland impacts. The replacement of the wetland functions and values is generally accomplished through wetland restoration, creation, and enhancement.

SECTION 4, RESERVED

SECTION 5. CONSIDERATIONS IN ESTABLISHMENT AND USE OF MITIGATION BANKS

Charters of mitigation banks, mitigation sites, and associated wetland credits shall be subject to approval by the SMC. Every mitigation bank shall have as its primary purpose the creation, restoration, enhancement, and long-term protection and maintenance of wetland resources. All existing property rights remain in effect.

In all cases of a proposed bank, the SMC will issue a public notice describing the project. The public comment period for submittal of relevant comments on the bank prospectus will be a minimum of 30 days. The watershed development permit that is needed in order to construct, restore, or enhance wetlands on the bank site will follow normal permit processing procedures.

APPENDIX M - LCSMC APPROVED WETLAND MITIGATION BANKING REQUIREMENTS

Operation and maintenance procedures approved by the SMC shall be employed to maintain the wetland resources in the bank in as high a qualitative state as is technically practicable. Management of the mitigation bank shall be based on a monitoring plan approved by the SMC. Monitoring shall include, but shall not necessarily be limited to, monitoring of the water, soil and plants comprising the wetland assets of the bank. The bank sponsor shall strive to manage the assets to provide multiple wetland benefits such as water quality management, flood control, biological conservation, and educational and recreational opportunities. In general, mitigation banks should be planned and designed such that little or no management or maintenance other than prescribed burning is necessary once the plant communities are established.

SECTION 6. GENERAL GUIDELINES

Using normal review procedures prescribed by this ordinance, the SMC will conduct project evaluations and will determine the level of mitigation required, and whether a project is eligible to use a mitigation bank.

1. Ideally, mitigation banks should be a way of restoring and creating wetlands in advance of development projects that result in wetland losses. However, to promote the establishment of mitigation banks, this ordinance provides for limited, incremental sales of uncertified credits, and for the issuance of watershed development permits based on uncertified credits according to the guidelines found in SECTION 16, MITIGATION BANK CREDIT SALES. This provision is considered necessary to increase the economic viability of mitigation banks. Because the development plan for any given bank site may require the sale of a minimum number of credits before wetlands may be restored or constructed, it is recognized that a temporary deficit of wetlands may result. To address this possibility, the SMC will require a higher mitigation ratio for the use of uncertified and conditionally certified credit, and for funds to be maintained in an appropriate financial security to ensure construction of the bank's wetlands. This ordinance also limits the number of credits that can be sold prior to construction, and prior to conditional certification. It also establishes a maximum amount of time that may elapse before pre-construction credit sales are converted to conditionally certified or fully certified credits.
2. Emphasis will be on the replacement of wetland acreage and type. Therefore, the preferred method of generating wetland bank credits will be the restoration of former wetlands or the creation of new wetlands, which will result in a net gain in wetland acreage on the bank site. Permanent wetland enhancement as a means of generating bank credits can be performed as specified in Section 14, Establishing Credits. Appropriate functional value assessment methodologies and credit ratios will be determined for each site by the SMC.
3. Mitigation banks generally shall be held to a higher standard of performance than conventional wetland mitigation sites. These standards are detailed in Section 19, PERFORMANCE STANDARDS.
4. Permit applications for wetland impacts to high quality aquatic resources generally will not be considered for mitigation banking, until the applicant has shown compliance with the avoidance and minimization requirements of this ordinance.
5. The mitigation bank, once established, must be dedicated to maintaining the wetland functions and values to the exclusion of other conflicting uses, as determined by the SMC.

MITIGATION BANK ESTABLISHMENT

SECTION 7. SITE SELECTION CRITERIA

The bank site will be reviewed with respect to the following site selection criteria. Failure to meet any of these criteria may be, depending on circumstances, grounds for rejection of a bank site. The site shall:

1. Be owned and/or under the full control of the bank;
2. Contain a majority of drained or hydrologically modified hydric soils, recognizing that restoration of former wetlands is a preferred form of mitigation;
3. Have no high quality aquatic resources that would be adversely affected by the construction or restoration work.

APPENDIX M - LCSMC APPROVED WETLAND MITIGATION BANKING REQUIREMENTS

4. Contain adequate perimeter upland areas to buffer the wetlands from potentially incompatible land uses on adjacent parcels and meet the buffer requirements of this ordinance;
5. Be so situated that adequate hydrology can be ensured (e.g., be located on a floodplain or possess a high groundwater table);
6. Be proximate or adjacent to public land holdings so as to create contiguous, large-scale habitat areas;
7. Be part of an adopted or accepted open space plan, watershed plan, conservancy district, protected riparian corridor, or other local or regional conservation land use plan. This criterion has been established in order to help implement local and regional conservation plans, and to ensure maximum consistency and compatibility with future surrounding land uses;
8. Contain no known hazardous waste, which must be confirmed by an environmental assessment conducted by a qualified person or firm.
9. Have a minimum size of 10 acres or 5 acres if within the Lake Michigan Watershed.

SECTION 8. BANK OWNERSHIP

A mitigation bank may be either publicly or privately owned. The bank may be incorporated as for-profit or not-for-profit. If the bank is incorporated, it must be incorporated in the State of Illinois. Publicly owned refers to ownership of the bank site by any federal, state, regional or local unit of government.

All land, including associated uplands, which are part of the mitigation bank shall be protected in perpetuity from future development by an appropriate deed or plat restriction. This deed or plat restriction must be recorded with the Lake County Recorder of Deeds Office, attached to the abstract of title, with a certified copy of the registration provided to the SMC prior to the SMC authorizing the bank. The mitigation bank charter should also identify the entity responsible for the ownership and long-term management of the site. In addition, the bank sponsor is responsible for securing adequate funds for the operation and maintenance of the bank during its operational life, as well as for long-term management of the site. Bank sponsors are strongly encouraged to establish agreements for long-term management with public or private conservation organizations.

Transfer or sale of the mitigation bank may occur to a party willing and financially able to abide by the terms and conditions of the Mitigation Bank Charter entered into by the SMC and the bank owner. Any such transfer must be approved by the SMC.

SECTION 9. INITIAL PLANNING

The individual or entity proposing to sponsor establishment of a mitigation bank will initially hold informal discussions with the SMC. The purpose of these discussions will be to acquaint the sponsor with the legal, regulatory, and ecological background relevant to banking and to provide procedural guidance to the prospective applicant.

During this discussion the prospective bank sponsor will be informed that a formal request for the establishment of a bank must be made to the SMC. The formal request will include a prospectus and a watershed development permit application, if required. The bank sponsor and the SMC shall develop an authorizing document for the bank that shall be signed by all parties. The authorizing document should outline the responsibilities of the bank sponsor, and contain the necessary information outlined in this ordinance governing the operation of the bank.

SECTION 10. PROSPECTUS DEVELOPMENT

The purpose of the prospectus is to provide sufficient information to allow the SMC to determine if the general considerations and site evaluation criteria outlined in this ordinance are likely to be met if the proposed bank is established. It is understood that the prospectus will become the basis of the mitigation bank charter. The prospectus should contain:

1. The bank location and size;

APPENDIX M - LCSMC APPROVED WETLAND MITIGATION BANKING REQUIREMENTS

2. A delineation of any wetlands or other jurisdictional areas that may exist at the proposed bank location;
3. The type of real estate interest in bank property;
4. A legal description of the property;
5. The type of bank (i.e., single client, general use, market oriented, etc.);
6. The method of credit production (i.e., restoration, creation, enhancement) the number of proposed credits by each method, and the rationale for crediting;
7. A statement as to compliance with this document;
8. A general site plan showing the location of all existing and proposed wetland and upland habitats, roads, trails, structures, utilities, and any other existing or proposed site improvements;
9. An outline of management and maintenance responsibilities;
10. A preliminary construction plan and schedule of completion, preliminary planting plan, and preliminary administrative, management, monitoring, and financial plans, and;
11. A charter of incorporation for the mitigation bank, if appropriate.

SECTION 11. FINANCIAL ASSURANCES

The bank sponsor is responsible for securing sufficient funds or other financial assurances to cover contingency actions in the event of bank default or failure. In addition, the bank sponsor is responsible for securing adequate funding to monitor and maintain the bank throughout its operational life, and to make provision for long-term management through financial assurances or through agreements with land management organizations or agencies. Total funding requirements should reflect realistic cost estimates for monitoring, long-term maintenance, contingency and remedial actions. Financial assurances may be in the form of performance bonds, irrevocable letters of credit, irrevocable trusts, escrow accounts, casualty insurance or other approved sureties. Such assurances may be phased out or reduced once it has been demonstrated that the bank is functionally mature and/or self-sustaining in accordance with the approved performance standards. The financial plan must demonstrate that the bank and its wetlands can be maintained in perpetuity whether through continual ownership or by conveyance to a public or private agency that will assume the responsibilities of the bank.

SECTION 12. MITIGATION BANK APPLICATION PROCESS

The sponsor must submit a watershed development permit application and a prospectus for the initial development of the bank. Upon receipt of these items the SMC shall begin a public interest review on the prospectus with input from government agencies and the general public. The public will be notified of all proposed banks by a public notice issued by the SMC for a 30-day comment period. Copies of all comments received during the public notice comment period will be given to the bank sponsor. Full consideration will be given to all comments received in evaluating the bank proposal. The bank sponsor and the SMC shall develop an authorizing document for the bank. The authorizing document should outline the responsibilities of the bank sponsor, and contain the necessary information outlined in this ordinance governing the operation of the bank. Additionally, the details of the bank sponsor's responsibilities shall be noted in any watershed development permit in which the permittee's mitigation responsibilities are met through the use of the mitigation bank.

SMC shall make a site inspection of the bank area. A written response to the banking prospectus indicating the prospective bank's feasibility would then be prepared by the SMC based upon observations made during the site visit. An indication of feasibility in the letter should be interpreted as general acceptability of conceptual bank plans and either probable issuance of a watershed development permit, or probable signatory approval of a Mitigation Bank Charter upon completion of detailed plans.

The formal request to the SMC for establishment of a bank shall include:

APPENDIX M - LCSMC APPROVED WETLAND MITIGATION BANKING REQUIREMENTS

1. A watershed development permit application to conduct the proposed work that is necessary to establish the bank.
2. A copy of the previously described prospectus; and
3. A plan that details the goals, objectives, and success criteria for creating wetlands, including wetland types and their respective acreages.

SECTION 13. DETAILED PLANNING STAGE

This is the final planning stage leading to issuance of a watershed development permit for authorization, implementation and operation of a bank. The preparation of detailed plans should be closely coordinated with the SMC and other local authorities as appropriate.

Each mitigation bank shall have a site development plan that must be approved by the SMC. This plan shall identify and incorporate the following, to the extent practicable and appropriate:

1. Diverse aquatic and supporting landscapes (e.g., shallow open water, riparian wetlands, deep and shallow marshes, floodplain forests, wet meadows and prairies, upland buffers, etc.), which are interrelated, one to the other, so as to maximize wetland functions and values;
2. Diverse wildlife habitats and associated edge conditions;
3. Associated upland buffer areas contiguous to the wetlands to protect the wetlands from potential adverse effects of adjacent land uses, specifying the width and area of all such zones;
4. Wetland functions which will be created or enhanced by maximizing vegetative diversity and abundance, structuring specific wildlife habitats, optimizing wetland hydrology, and providing public access;
5. Species native to the area;
6. The use of native soils on the site;
7. The means for establishing the appropriate hydrology, and;
8. The mitigation bank shall be designed to be as self-sufficient as possible and minimize maintenance.

BANK OPERATION

SECTION 14. ESTABLISHING MITIGATION BANK CREDITS

The units of wetland credit shall be acres of wetland.

Mitigation bank credits shall be generated as wetlands are created, restored, or enhanced on the bank site, resulting in an increase in wetland acreage and/or quality on the bank site. Banking credits may be generated as follows: Full credit will be given for wetland creation from upland and for restoration of former wetlands. Partial credit (25% of the enhanced wetland acreage) can be given for permanent enhancement (e.g., re-establishment of hydrology) of degraded wetlands. A maximum of 30% of the total potential credits generated by the bank may consist of enhanced wetlands or enhanced uplands.

SECTION 15. CREDIT CERTIFICATION

Mitigation bank credits shall be certifiable by the SMC when the bank credits conform to the criteria outlined in Section 19, PERFORMANCE STANDARDS . Credits may be certifiable at any time, but the standards for certification shall be met no later than five years from the date of planting unless otherwise specified in the bank charter and approved by the SMC . After the second full growing season following creation or restoration of wetlands, the SMC may conditionally certify the credits of the bank based on reasonable progress toward achieving the performance standards. Conditional certification shall be based on degree of conformance with the standards for conditional certification in Section 21 , and on any interim corrective measures recommended by the SMC.

APPENDIX M - LCSMC APPROVED WETLAND MITIGATION BANKING REQUIREMENTS

At the end of five years, if any of the above conditions are not met, the authorized agent of the bank shall submit a plan to the SMC outlining corrective measures to be taken based on the ecological conditions of the site. Management activities shall continue until the standards are met, as verified by the SMC.

Certain types of enhancement of existing wetland can be an acceptable way of generating credits if the enhancement actions are scientifically sound and result in a substantial, measurable, and permanent increase in the level of wetland function. The types of enhancement that will be acceptable include the following:

1. Restoration of wetland hydrology at sites that have been significantly modified through tile drainage or ditch drainage;
2. Restoration of diverse native plant communities where the original plant community has been totally destroyed, and the site is currently farmed or has revegetated with aggressive and/or exotic species such as reed canarygrass, cattails, purple loosestrife, phragmites, buckthorn or other species. Restoration goals would include the removal of the exotic or aggressive species, and the introduction and establishment of a diverse assemblage of native species appropriate for the site considering geographic location, soils, hydrology, and other factors. Selective removal of exotic species in otherwise healthy native plant communities will normally not be considered eligible for credit.
3. Restoration of deep marsh habitat through shallow impoundment, where the purpose is to create hemimarsch conditions suitable for nesting by target wetland bird species of concern. This approach is appropriate at sites that have been significantly altered through partial drainage, and consist largely of dense monotypic stands of cattails or other aggressive species. It is not appropriate for sites that have existing biodiversity or habitat values that would be adversely affected by the proposed actions or where the level of benefit would be minimal.

The prospectus must specifically state which aspects of wetland function would be increased as a result of the enhancement actions, the level to which they would be increased, and the scientific basis for expecting the increase. It must also include a narrative description of how the enhancement would be accomplished, a schedule of completion, explicit performance standards, and performance milestones for enhancement actions to be carried out over an extended period of time.

Performance standards for enhancement work will be approved as part of the watershed development permit. Actions such as the restoration of hydrology can be implemented in a very short time, and can be measured through immediate water level responses. Plant community restoration is a lengthier process, requiring sustained effort over a period of time. In such cases, interim performance milestones may be established, and credits resulting from such work would be included in the final 30% increment of credit released from the bank.

Credit ratios will be determined based on specific circumstances for each bank. Restoration of a historic wetland area or creation of a wetland from an upland area would receive a credit ratio of 100%. Actions that restore a very degraded wetland to a high degree of function, such as restoring normal hydrology to a drained wetland, or restoring a high level of species diversity to a monotypic plant community, shall receive credit at a maximum ratio of 25% of the credit values awarded to restored or created wetlands.

The wetland mitigation bank shall meet the buffer requirements of this ordinance. All high quality aquatic resources existing on the mitigation bank site shall, at a minimum, meet the buffer requirements for high quality aquatic resources, all other existing enhanced, created or restored wetland areas shall, at a minimum, meet the standard buffer requirements of this ordinance. The inclusion of upland and deepwater environments within a wetland mitigation bank may be inadvertent (i.e., due to topographic reasons and real estate considerations) or planned (i.e., to realize or enhance certain wetland functions). In the latter case, upland areas may be either naturally occurring or be artificially created and, depending on their basic purpose, may occur along the periphery of the bank or be dispersed throughout. Enhanced upland areas or enhanced wetland edges used to meet the buffer requirements of this ordinance for the mitigation bank shall be credited at 25% of the enhanced acreage completed. Created or restored wetland edges used to meet the buffer requirements of this ordinance for the mitigation bank shall be credited at 75% of the acreage created or restored.

APPENDIX M - LCSMC APPROVED WETLAND MITIGATION BANKING REQUIREMENTS

Conditional certification will allow for a reduction of the posted financial security to a level sufficient to assure full certification. Corrective measures will be approved by the SMC prior to implementation. These measures should ensure that the mitigation standard is met at the end of the five-year management period from the day the planting is completed.

During construction of the mitigation wetlands, qualified personnel must make periodic inspections of the site to ensure that soil erosion control measures are employed and functioning properly. Inspection reports shall be submitted to the SMC on a monthly basis.

SECTION 16. MITIGATION BANK CREDIT SALES

Upon authorization of the mitigation bank, through a watershed development permit, the sale of wetland credits and the creation or restoration of wetlands and buffers may commence. The mitigation bank credits may be sold for mitigation purposes in accordance with the following conditions:

1. Certified credits and conditionally certified credits may be sold provided that adequate funds, as approved by the SMC, are established through an escrow account, performance bond, irrevocable letter of credit, or other financial surety for the generation of certified credits and long-term maintenance of the bank site;
2. If an approved bank has only uncertified credits, then those uncertified credits may be sold for mitigation purposes, provided that adequate funds, as approved by the SMC, are established through an escrow account, performance bond, irrevocable letter of credit or other financial surety for the generation of credits and long-term maintenance of the required bank site.
3. The SMC has sole authority to determine the number of credits available for withdrawal from the mitigation bank.
4. All mitigation bank credit sales shall require prior approval by the SMC to confirm credit availability and compliance with all other provisions of this ordinance.

In every event, the mitigation bank sponsor shall establish in a performance bond, escrow account, irrevocable letter of credit or other financial surety, adequate funds to ensure the construction, planting, and long-term monitoring, management, and maintenance of the mitigation bank wetlands and associated uplands. The amount of the financial surety shall be based upon the calculated per acre cost of completing the approved plan, including grading and planting of the site. Cost estimates for the construction and/or planting and maintenance for all restored, created or enhanced wetlands in the bank must be presented. A proposed schedule of release of the financial surety following completion of specific tasks associated with the establishment of the bank must also be submitted for approval. Construction estimates shall include an estimate of the cubic yards of earth to be moved during the grading of the site, as well as an estimated cost per cubic yard for the earthwork.

The interest on all such escrow accounts may be used by the bank sponsor for monitoring, management, and maintenance purposes only. The financial sureties must be maintained until all credits have been certified and sold or the SMC has determined the mitigation bank is self-sustaining. The amount of the financial surety will be reviewed annually based on the results of the monitoring report.

For all mitigation banks, credit sales may commence upon approval of the bank's charter. A maximum of 30% of the total potential credits may be sold prior to construction, based on approval of the bank's charter and the posting of adequate financial surety. Upon acceptance by the SMC that appropriate wetland hydrology has been demonstrated throughout all proposed wetlands at the site, an additional 20% of the total credits may be sold. Upon acceptance by the SMC that the site has been planted according to the approved plan, and after wetland hydrology has been demonstrated, another 20% of the total credits may be sold. The final 30% of the total credits may be sold upon full certification.

Incremental demonstration of wetland hydrology, and incremental planting of the site may also be awarded credit. For example; piezometer data from a 50-acre wetland restoration area shows that 37 acres of the planned wetland meets the wetland hydrology criterion of the 1987 Federal Wetland Delineation manual.

APPENDIX M - LCSMC APPROVED WETLAND MITIGATION BANKING REQUIREMENTS

These 37 acres represent 74% of the proposed wetland area. By applying this 74% factor to the allowable 20% increment of credits awarded for demonstrating wetland hydrology, the allowable increment of new

credits for the bank would equal 14.8% of the proposed wetland on the site ($0.74 \times .20 = 0.148$, or 14.8%). The same method would be used for calculating credits due to incremental planting. In the event that the bank sponsor sells more than the number of credits approved by the SMC, the SMC reserves the right to deduct the amount of the oversale from the total potential credits available from the bank. These credits will not be restored, even if future development of the bank results in the certification of additional credit sales.

No watershed development permits will be granted to applicants proposing to use a mitigation bank unless credits are available in the bank, as specified in this ordinance.

The initial physical and biological improvements at the bank site (including, but not limited to, grading, planting, and restoration of wetland hydrology) must be completed no later than the end of the (third full growing season following the sale of the first mitigation bank credit).

The bank sponsor shall keep a ledger of all available credits, whether purchased or unpurchased, and of all credits sold or otherwise debited including individual sale prices. This ledger shall be made available to the SMC upon request. In addition, the bank sponsor must provide the SMC an updated ledger containing a list of all transactions, including sale prices at a given bank to date at the conclusion of every credit sale.

SECTION 17. MONITORING, MANAGEMENT, AND REPORTING

Monitoring shall occur for a period of five years from the date of the completion of the approved planting plan. Management shall proceed on a continuing basis from the completion of planting through the end of the monitoring period. Management shall proceed as needed to reconcile current conditions with functional goals. Any required remedial measures will be based on information contained in monitoring reports and/or from SMC site inspections.

The monitoring results of the mitigation bank shall be provided to the SMC on an annual basis during the monitoring period. Following this, no report shall be required, but the SMC shall retain the right to inspect the mitigation bank as deemed appropriate. The SMC shall hold on file copies of any reports. The SMC will establish an annual compliance monitoring schedule that assures that all mitigation bank sites are inspected for compliance with the approved bank plan.

The mitigation bank sponsor shall be responsible for all monitoring, management, and reporting. However, the work may be done by bank employees, subcontractors, or public or private organizations.

The operational life of a bank shall consist of the period during which the terms and conditions of the mitigation bank charter are in effect. With the exception of arrangements for the long-term management and protection in perpetuity of the wetlands and/or other aquatic resources and associated uplands, the operational life of a mitigation bank terminates at the point when;

1. Wetland mitigation credits have been exhausted or banking activity is voluntarily terminated with written notice from the bank sponsor to the SMC, or;
2. The SMC has determined that the debited bank is functionally mature and/or self-sustaining to the degree specified in the mitigation bank charter and associated documents, including the performance standards outlined in this ordinance.

SECTION 18. LOSS OF BANK CHARTER

Should a bank not meet the terms of its charter, for whatever reason, the SMC shall inform the bank sponsor and shall specify a reasonable period of time in which to comply. Should any modifications to the charter be required, recommended changes shall be approved by the SMC. Continued non-performance of the bank shall result in revocation of the charter and forfeiture of financial securities.

APPENDIX M - LCSMC APPROVED WETLAND MITIGATION BANKING REQUIREMENTS

SECTION 19. PERFORMANCE STANDARDS

The following performance standards are established to ensure that mitigation banks create wetlands, which compare favorably with moderate to high quality natural wetlands with respect to diversity, abundance and distribution of plant species, and also to ensure that the created wetlands exhibit the hydrologic regimes of natural wetlands. These standards will be used to measure the performance of mitigation banks unless otherwise stated in the mitigation bank charter. The bank sponsor may propose other standards if native plant restoration is not the primary goal of the mitigation bank. For example, wildlife habitat enhancement goals may require the development of alternative standards based on habitat structure such as the interspersions of open water and cattails, or the seasonal establishment of mud flats. Justification for alternative standards must be provided in the bank prospectus. The SMC retains approval authority for any performance standards proposed which are different from those contained in this ordinance .

Species composition: Species selected for the planting shall be native to Lake County (ref. Swink and Wilhelm, *Plants of the Chicago Region*, 1994), and shall be appropriate for the hydrologic zone to be planted. A minimum number of native perennial species proposed for establishment must be present within each plant community to meet certification standards, as follows:

Marsh- minimum of 15 native perennial species

Sedge meadow/wet prairie- minimum of 35 native perennial species

Mesic Prairie (buffer)- minimum of 25 native perennial species

In addition, at least 50% of the required minimum number of species must occur at a 10% frequency or greater.

Species dominance: The following dominance standards are for wetland mitigation banking purposes only. Dominance shall be determined by calculating importance values, with at least two parameters, frequency and cover, used to calculate species importance. Cattails (*Typha* spp.), reed canary grass (*Phalaris arundinacea*) and non-native species shall cumulatively comprise not more than 5% of the total dominance measure for each community for which credit is granted.

The native perennial species within each wetland plant community shall represent at least 80% of the total dominance measure.

Wetland hydrology: Wetland hydrology must be independently demonstrated within each wetland for which credit is sought from data gathered from piezometers placed throughout the bank site. Piezometer placement must be approved by the SMC prior to approval of the bank.

Conditional certification: Credits shall be conditionally certified not sooner than the second full growing season after planting, based upon achieving the following standards:

75% of the minimum number of native perennial species required for full certification shall be present in each plant community

The total of native perennial species within each plant community shall represent at least 15% of the total dominance measure.

**PEORIA COUNTY, ILLINOIS
EROSION, SEDIMENT, AND STORM WATER
CONTROL ORDINANCE**

Section 7.5-61. DEFINITIONS

[For the purposes of this article, the following words, terms and phrases shall have the meanings respectively ascribed to them in this section, unless the context clearly indicates otherwise.]

Adjacent lands: At a minimum is an area within fifty (50) feet of the project area, and includes all surrounding land that may either impact a site, or be impacted by potential soil erosion, sediment and/or storm water run-off as a result of land disturbing activities conducted on a site.

Appeals Board: The Erosion, Sediment and Storm Water Control Appeals Board.

Areas of concentrated flow or bodies of water: Any area where water may accumulate or flow, whether continual or as the result of a storm event, including but not limited to lakes, rivers, streams, creeks, ponds, ditches, swales, gullies, ravines, street gutters and other similar features.

Commission: The Tri-County Regional Planning Commission.

Control Measure: Any proposed temporary or permanent measures to be installed to control erosion, sediment and storm water run-off from a project area.

County: The County of Peoria, Illinois.

Department: The Peoria County Department of Planning and Zoning.

Development: The division of a parcel of land into two or more parcels; the construction, reconstruction, conversion, structural alteration, relocation, or enlargement of any structure; any mining, excavation, landfill, or land disturbance; and any use or extension of the use of land.

Disturbed Area: Any area of land on which the pre-development ground surface will be affected or altered by the development activities. This includes but is not limited to grading, clearing, stock piling, tracking and other similar activities.

Drainage area: From any point where water leaves the site, it is the land over which water flows toward the point.

Erosion Control Administrator: The person appointed by the Peoria County Board to administer this ordinance.

Flood Insurance Rate Maps (FIRM): Maps prepared by the Federal Emergency Management Agency (FEMA) that depict the special flood hazard areas (SFHA) within a community. These maps include insurance rate zones and floodplains and may or may not depict floodways.

Five year frequency storm event: The storm event rainfall depth during a 24 hour period which is exceeded, on the average, once every five (5) years.

Institutional use: A religious, or public use, such as a church, library, public or private school, hospital, or government owned or operated building, structure, or land used for public purpose.

Land disturbing activity: Any change in land, which may result in soil erosion from water or wind and the movement of sediments into State or County waters or on to lands in the County, or a change in the amount and/or intensity of storm water run-off, including but not limited to, the covering with an impervious surface, stockpiling, clearing, grading, excavating, rehabilitating, transporting, depositing or filling of land.

Normal agricultural practices: Activities associated with the preparation and tilling of land for the purposes of growing crops, or raising livestock, which may include, but are not limited to, the construction of conservation measures, plowing, disking, and cultivating.

Perimeter Control: Any control measure installed between the down slope side of the disturbed area and the property line and/or between the down slope side of the disturbed area and any area of concentrated flow.

Preproject condition: A condition that impacts erosion, sediment, or storm water run-off characteristics of a site prior to start of construction activity. The pre-project condition shall be based on the predominant land use for the past five (5) years. For example, if a site has been cropland for four (4) of the past five (5) years and in grass just prior to development, the land use would be cropland for the pre-project condition.

Project: Any development involving modification to land which involves a land disturbing activity.

Regional storm water management system: A system which is designed, constructed and maintained to provide storm water control for multiple land owners.

Road: Any right-of-way that has been improved for the purposes of providing a surface for vehicular traffic, including any Federal, State, County, township, and municipal controlled facilities.

Single family dwelling: A building designed for or occupied by one family.

Site: The lot or parcel on which the project is to be developed.

Site Specific plan: A general erosion and sediment control permit required for projects where slope is greater than ten percent (10%) and/or the site contains areas of concentrated flow or bodies of water. Slope shall be determined by the maximum slope indicated on the site according to the USDA Soil Survey or topographic survey as prepared by an Illinois Registered Surveyor.

Standards: The Illinois Environmental Protection Agency's Illinois Urban Manual, A Technical Manual Designed for Urban Ecosystem Protection and Enhancement published in 1995 and Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control published in 1988 by the Urban Committee of the Association of Illinois Soil and Water Conservation Districts now in effect, or as hereafter amended which is incorporated by reference herein, the Peoria County standards for Stormwater Design Analyses, found at Appendix "A" of this article, and the erosion and sediment control criteria and specifications found in Appendix "B" of this ordinance.

Standard plan: A general erosion and sediment control permit for projects where slope is less than ten percent (10%) and there are no areas of concentrated flow or bodies of water on or immediately adjacent to the site. Slope shall be determined by the maximum slope indicated on the site according to the USDA Soil Survey or topographic survey as prepared by an Illinois Registered Surveyor.

Substantial completion: The point at which all exterior work is completed and the site can be used for the use intended.

Twenty-five year frequency storm event: The storm event rainfall depth during a twenty-four (24) hour period which is exceeded, on the average, once every twenty-five (25) years.

Two-family dwelling: A building designed for or occupied by two families.

Two year frequency storm event: The storm event rainfall depth during a 24 hour period which is exceeded, on the average, once every two (2) years.

Utility Service Line: The means by which utility service is provided to service users, such as electric, telephone, television cable; gas, water and sewer pipes.

Working day: Shall not include Saturday, Sunday or any holiday when the Peoria County Courthouse is closed.

Section 7.5-62. APPLICABILITY OF ARTICLE

This article shall apply to:

1. All projects within the boundaries and jurisdiction of the County. No land surface shall be disturbed unless an erosion and sediment control permit, or an erosion, sediment and storm water control permit has first been issued for that project, except as follows:
 - a. Land disturbing activities which do not involve the construction of any new single or two-family dwellings and for which the disturbed area is less than 5,000 square feet;
 - b. Normal agricultural practices; or
 - c. Routine maintenance of roads, access ways and utility service lines.

The Erosion Control Administrator reserves the right to require any non-agricultural, construction development activity, regardless of disturbed area or type of activity, to comply with this article if it is determined to be the cause of or a contributor to an existing or potential erosion, sediment, or storm water impact.
2. Any land within the boundaries and jurisdiction of the County on which there is located a permanent storm water control measure, which was installed pursuant to this ordinance.

Section 7.5-63. STANDARDS FOR DESIGN AND MAINTENANCE OF CONTROL MEASURES FOR SOIL EROSION, SEDIMENT AND STORM WATER

(a) EROSION AND SEDIMENT CONTROL MEASURES. All control measures required under this ordinance shall conform to the design criteria, standards, and specifications provided in the applicable standards now in effect or as hereafter amended. All control measures installed shall be sufficient to prevent sediment from leaving the permit site during a five (5)-year frequency storm event. Measures shall be taken to prevent sediment from leaving the site. When sediment does leave the site, the owner, developer or contractor shall remove the sediment within four hours or by no later than the end of the workday. For example, installing a rock construction drive, or cleaning tires could be used to minimize tracking of sediment onto public roads.

(b) PERMANENT STORM WATER CONTROL MEASURES. All storm water controls shall be designed so that the peak discharge rate from the permitted area resulting from the two-year and twenty-five year frequency storm events for the postproject condition do not exceed the corresponding storm event peak discharges for the preproject condition. Evaluation of submitted plans shall be based on the Storm Water Design Analysis Standards in Appendix "A" at the end of this article.

(c) **REGIONAL STORM WATER CONTROL SYSTEMS.** To allow for the beneficial development and maintenance of regional storm water management systems, where they are available and they are appropriate, an applicant may submit a design dependent on such a system. The applicant shall submit documentation of the approval for the use of the regional storm water management facility from the governmental agency having jurisdiction over it. The applicant shall submit evidence showing that there will be no adverse flooding impact to any receiving stream between the point of discharge and the regional storm water facility. If the applicant is approved to use the regional storm water management system, the applicant may request exemption from the requirements in this section for permanent on site storm water controls from the Erosion Control Administrator. Such exemption shall not apply to any temporary storm water control measures required by this article.

Section 7.5-64. MAINTENANCE OF CONTROL MEASURES

(a) **EROSION, SEDIMENT, AND TEMPORARY STORM WATER CONTROL MEASURES.** On-site sediment control measures shall be constructed and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

Sediment control measures and temporary storm water control measures are to be maintained so they are operating effectively until permanent ground surface protection and permanent storm water control measures are established in a manner specified in the applicable permit issued pursuant to this article.

Fully functioning temporary sediment control measures (including, but not limited to perimeter sediment controls) shall remain in place until the ground is stabilized with permanent ground cover. The intent of the article is to keep the sites protected at all times until the ground is permanently stabilized. In cases where it is not practical to leave the temporary sediment control measures in place prior to establishing permanent ground cover (for example, when control measures need to be removed in order to grade the area or install pavement or sod), an exception will be made only if one of the conditions listed below will be met. In no way does adhering to one of the conditions below relieve the owner of responsibility to clean-up or repair any damages caused from sediment or storm water run-off leaving the site.

1. Permanent ground cover shall be established with pavement, aggregate or sod within three days of the removal of sediment barriers.
2. Permanent vegetation shall be established by seeding with anchored mulch within three days of removal of sediment barriers during the spring or fall seeding periods. However, on project areas with slopes not exceeding five (5%) percent, permanent vegetation shall be established by seeding within three days of the removal of sediment barriers during the spring or fall seeding periods. Summer seeding is acceptable on project areas which shall be watered. This does not apply to concentrated flow areas.

(b) **ADDITIONAL CONTROL MEASURES.** The Erosion Control Administrator may require additional control measures pursuant to the Standards if determined as necessary after site inspection and prior to issuing the permit.

Section 7.5-65. GENERAL EROSION AND SEDIMENT CONTROL PERMITS

Before commencing any project involving construction of any new single or two-family dwelling or commencing any project with an area of 5,000 square feet or greater, the owner of the land, or his representative, shall be required to file an application for a General Erosion and Sediment Control Permit, as either a Standard Plan or a Site Specific plan, except as otherwise provided in Section 7.5-62 and Section 7.5-66.

(1) APPLICATION. The applicant shall file the application with the Department on forms provided by the Department. The fee for a Standard plan application shall be in the amount of \$150.00 for each permit, and the fee for a Site Specific plan application shall be \$200.00 for each permit. However, no fee shall be required for any project the purpose of which is agricultural, or initiated by a local unit of government. There shall be no refund of any fees paid and no application shall be accepted for filing unless the fee has been paid in full.

(2) APPLICATION REVIEW. Review of a General Erosion and Sediment Control Permit application shall be limited to verifying that the required information and permit fee have been provided and that it meets the standards. The Erosion Control Administrator shall issue or deny an application by: a) approving the permit for a standard plan within two (2) working days of the filing of a completed application; or b) initiate the review process for a site-specific plan and approve the same within five (5) working days of the filing of a complete application. If the permit is denied, it shall be returned to the applicant with a written explanation of its denial. The application shall be deemed approved if no response is made within the time frames provided above.

(3) DURATION. The general erosion and sediment control permit shall be issued for a period not exceeding two (2) years.

(4) CONTENT OF GENERAL EROSION AND SEDIMENT CONTROL PERMIT. The General Erosion and Sediment Control permit shall contain at a minimum the following general conditions:

- a. That written approval be obtained from the Erosion Control Administrator prior to making any modification to the erosion and sediment control plan as set forth in the application; and
- b. That all control measures identified in the application shall be installed; and
- c. That all control measures shall be maintained during construction; and
- d. Such other conditions as the Erosion Control Administrator deems appropriate to ensure compliance with the specific requirements and intent of this article.

(5) PERMANENT GROUND SURFACE COVER. Under all circumstances, temporary control measures shall be maintained in accordance with Section 7.5-64. Without exception, all disturbed areas must have permanent ground cover within six months of project completion, or within six months of occupancy, whichever comes first.

Section 7.5-66. EROSION, SEDIMENT, AND STORM WATER CONTROL PERMITS

Before commencing any commercial, institutional, multi-family or industrial project with an area of more than one-half (1/2) acre; or a project requiring subdivision approval by a unit of local government with an area of more than one-half (1/2) acre, the owner of the land, or his representative, shall be required to file an application for an Erosion, Sediment, and Storm Water Control Permit.

(1) APPLICATION. The applicant shall file the application with the Department on forms provided by the Department. The applicant shall supply the number of copies of application documents as provided in the application. Each application shall be accompanied by the following information:

- a. Existing site conditions map. A map of existing site conditions on a scale, of at least one inch equals one hundred (100) feet, showing the project area and immediately adjacent areas and the locations of the following site information:
 1. Site boundaries and adjacent lands which accurately identify site location;
 2. Lakes, streams, wetlands, channels, ditches, and other water courses on and immediately adjacent to the site;
 3. Floodways and/or Zone A of the Floodplain as determined on the Flood Insurance Rate Map (FIRM), and indicating the map panel number;
 4. All off-site drainage onto or through the project site;
 5. Location and dimensions of storm water management components on or adjacent to site;
 6. Locations and dimensions of structures, roads, highways, easements and paved areas; and
 7. Site topography: show contours at vertical intervals as follows:
 - (i) Slope of six per cent (6%) or less, two-foot interval.
 - (ii) Slope of over six per cent(6%) but less than fifteen per cent(15%), five-foot interval.
 - (iii) Slope of over fifteen per cent, (15%) ten- or twenty-foot intervals.
- b. Plan of final site conditions. A plan of final site conditions drawn to the same scale as the existing site map submitted pursuant to subsection (1) a, and which includes information to accurately depict post-construction appearance of site, e.g., paved areas, building, landscaping, and other changes to the site, along with other predominate site features, e.g., open areas, bodies of water.
- c. Sediment and Erosion control practices. A site construction plan including:
 1. Locations and dimensions of all proposed land disturbing activities;
 2. Locations and dimensions of all temporary soil and aggregate stockpiles;
 3. Location, dimension and construction details of all construction site management control measures necessary to meet the requirements of this article and including proposed revegetation of disturbed areas;

4. Statement regarding provisions for maintenance and maintenance requirements of the construction site management control measures during construction;
- d. Storm water management plans and controls. Design calculations and information related to the permanent storm water management system for any project with a net increase of impervious area greater than one-half (1/2) of an acre. For the purposes of this section, the net increase is the cumulative change since the implementation of this article, April 1, 1996. For example, in year 1, a commercial site increases the parking lot by 20,000 square feet. In year 2, the same commercial site adds a building with an area of 20,000 square feet. In year 1, no permanent storm water control measures (or calculations) are required by the ordinance. In year 2, storm water calculations shall be submitted and shall be based on the total increase of 40,000 square feet of impervious area. The following information shall also be provided by the applicant:
1. A map showing the drainage area boundaries, including off-site drainage areas that drain into or onto the site;
 2. Location and identification of soil types for all drainage areas;
 3. Location and identification of vegetative cover for all drainage areas;
 4. Run-off curve number calculations for both pre-and post-project conditions for all each drainage area;
 5. Time of concentration calculations for both pre-and post-project conditions for each drainage area, and include a map showing hydraulic flow lengths used;
 6. Peak flow-rate calculations for 2 year and 25 year storms for both pre-and post-project conditions;
 7. Design calculations for detention basin outlets for both 2 year and 25 year storms, include stage-storage table and discharge rating curve data or outflow calculations (refer to optional form in Appendix A);
 8. Location dimensions, and construction details of proposed detention basins and outlets;
 9. Detention volume calculations;
 10. Summary of peak flow-rates for pre-, post- and proposed conditions with detention showing that the requirements of the ordinance are met (refer to optional form in Appendix A); and
- e. Schedule or sequence of development or installation of the elements of the site management control measures proposed above.
- f. A detailed estimate of quantities and estimated costs, prepared by a registered professional engineer, of all control measures required under this section.
- g. A plan of the continued management and maintenance of such permanent control measures.

- h. Application fee. An application fee shall be submitted at the time of application. The fee shall be in the amount of seventy-five dollars (\$75.00) per acre with a minimum fee of five hundred dollars (\$500.00) and a maximum fee of \$3,000.00. However, no fee shall be required for any project the purpose of which is agricultural.

A fractional acre shall be rounded to the nearest whole acre. There shall be no refund of any fees paid and no application shall be accepted for filing unless the fee has been paid in full.

(2) APPLICATION REVIEW. Within five (5) working days of submittal of the application, the Erosion Control Administrator shall respond in writing to the sediment and erosion control practices portion. Within twenty (20) working days of submittal of the application, the Erosion Control Administrator shall respond to the storm water management plans and control portion of the application by either issuing a permit, issuing a request for additional information, or issuing a statement denying the permit with an explanation of cause. The application shall be deemed approved if no response is made within the time frames stipulated above.

(3) FINANCIAL SECURITY AGREEMENT. Before any Erosion, Sediment and Storm Water Control Permit is issued, the applicant shall deliver to the Erosion Control Administrator a surety bond, irrevocable letter of credit or executed escrow agreement in the name of Peoria County for one hundred percent (100%) of the applicant's engineer's estimated cost for all control measures required under this section. If the control measures are necessitated by construction which is also subject to Chapter 20 of The Peoria County Code, the applicant may submit one surety bond, irrevocable letter of credit or executed escrow agreement to cover one hundred percent (100%) of both the Control Measures required pursuant to this section and the improvements governed by Chapter 20, Section 20-24. A signed contractor's bid that meets the specifications of the engineer's estimate for the work can be used to establish the amount of security required, if such estimate is accepted by the Erosion Control Administrator.

(4) DURATION. The Erosion, Sediment and Storm Water Control Permit shall be issued for a period not exceeding two years.

(5) PERMIT CONDITIONS. The Erosion, Sediment and Storm Water Control Permit shall contain at a minimum the following general conditions:

- a. That written approval be obtained from the Erosion Control Administrator prior to making any modification to the approved erosion and sediment control plan as set forth in the permit;
- b. That all control measures required in the permit shall be installed;
- c. That all control measures shall be maintained during construction;
- d. Such other conditions as the Erosion Control Administrator deems appropriate.

(6) PERMANENT GROUND SURFACE COVER. Without exception, all disturbed areas must have permanent ground cover within six months of project completion, or within six months of occupancy, whichever comes first.

(7) FINAL INSPECTION; NOTICE OF PERMANENT STORM WATER CONTROL MEASURES. Within fourteen (14) days after completion of construction, the applicant shall notify the Erosion Control Administrator that the permanent storm water control measures are ready for final inspection. If the inspection shows that the control measures and maintenance plan comply with the Standards in Appendix “A” of this article, the Erosion Control Administrator shall issue a Notice of Permanent Storm Water Control Measures. The owner shall record the Notice with the Peoria County Recorder of Deeds within fifteen (15) days after the Notice is issued.

Section 7.5-67, MAINTENANCE OF PERMANENT STORM WATER CONTROL MEASURES.

Anyone owning property with a permanent storm water control measure existing thereon and installed pursuant to this ordinance shall maintain the control measure so that it functions in compliance with the Standards.

Section 7.5-68 ENFORCEMENT AND STOP WORK ORDER FEE.

This chapter shall be administered and enforced by the Erosion Control Administrator, who shall make or cause to be made, periodic inspections of all work authorized by permits issued in accordance with this ordinance to insure that said construction is in compliance with the provisions of the same; he shall make or cause to be made, investigations of violations of this chapter and shall cause any violations to be corrected.

Any permit issued pursuant to this ordinance shall be revoked by the Erosion Control Administrator when he finds from personal inspection or from competent evidence that the rules, regulations or standards under which said permit was issued are being violated. To defray costs of administering stop work orders posted by the field inspectors as a result of a violation of any of the terms of the ordinance, a fee of one hundred fifty dollars (\$150.00) plus ten dollars (\$10.00) per day that violation exists per stop work order will be charged.

Section 7.5-69. PENALTY.

The violation of any of the terms of the ordinance shall constitute an offense punishable by a fine not to exceed five hundred dollars (\$500.00), with each day the violation remains uncorrected constituting a separate offense. Such fine is in addition to any other remedy provided by law.

Section 7.5-70. APPEALS BOARD.

The Appeals Board shall consider and decide upon appeals of any decision, order, or requirement of the Erosion Control Administrator made pursuant to this article.

- (1). The Appeals Board is hereby authorized to be established. Said Appeals Board shall consist of five (5) members. Each County Board Chairman of the counties adopting this ordinance shall appoint one member, the Soil & Water Conservation Districts shall collectively appoint one member, and the Chairman of the Tri-County Regional Planning Commission shall appoint one member. The members shall be: professional engineers, licensed architects, licensed landscape architects, landscape contractors, earthmoving contractors, home builders, or citizens who have extensive experience in control of storm water and soil erosion. The five (5) members on the first Appeals Board shall draw lots to establish terms of 1, 2, 3, 4, and 5 years, respectively. Thereafter, as terms expire, each appointment shall be for five (5) years.
- (2). The chairman of the Appeals Board shall be elected at the beginning of each calendar year from among the members by a majority of the members.
- (3). All decisions of the Appeals Board must receive the support of a majority of its members. A majority of the members of the Appeals Board shall constitute a quorum for the transaction of business; and all questions, which shall arise at meetings, shall be determined by the votes of the majority of members present. The Appeals Board shall keep minutes of its proceedings showing the vote of each member upon every question or if absent or failing to vote, indicating such facts, and shall keep records of its examinations and other official actions. Every rule, and every order, requirement, decision, or determination of the Appeals Board shall immediately be filed in the office of the Board and shall be a public record. The concurring vote of three (3) members of Appeals Board shall be necessary to reverse any order, requirement, decision or determination of the Erosion Control Administrator. The Appeals Board shall adopt its own rules of procedure not in conflict with State law or this chapter.

Section 7.5-71. APPEALS TO APPEALS BOARD.

Any person directly aggrieved by any decision, order, requirement, or determination of the Erosion Control Administrator made pursuant to this article shall have the right to appeal such action to the Appeals Board. Such appeal shall be made within thirty-five (35) days from the date of the action appealed from, shall be filed in writing, and shall include a short, concise statement of why the action is being appealed. The fee for such an appeal shall be forty-five dollars (\$45.00) payable to the Commission and is due with the application. In addition, the person filing the appeal shall pay all required publication costs associated with the appeal.

Upon receipt of a notice of appeal, the Commission shall set a date for a public hearing before the Appeals Board. Such public hearing shall commence not sooner than fifteen (15) days nor more than thirty (30) days after the date of receipt of the notice of appeal. At least fifteen (15) days notice of the time and place of such hearing shall be published in a newspaper of general circulation in the County. The Appeals Board shall decide the appeal within seven (7) days after the conclusion of the public hearing. The Appeals Board may affirm, modify or reverse any appealed action.

Section 7.5-72. APPEALS TO COURT.

Appeals from the Appeals Board shall be made in conformity with the provisions of the Illinois Administrative Review Act, 735 ILCS 5/3-101 et seq. Copies of any orders or proceedings ordered by the appellant shall be furnished to him at his own cost.

Section 7.5-73. EFFECTIVE DATE.

Upon adoption by the Peoria County Board, these amendments shall be in full force and effect on April 1, 1996.

ST. CLAIR COUNTY
SOIL AND WATER CONSERVATION
DISTRICT ORDINANCE
FOR
STORMWATER MANAGEMENT
AND
EROSION CONTROL

CHAPTER 1 OVERVIEW

Section 1.0 - Purpose

The purpose of this Ordinance is to diminish threats to public health and safety, to protect property, to prevent damage to the environment, and to promote public welfare by guiding, regulating and controlling the design, construction, use and maintenance of any new development or redevelopment or other activity which disturbs or breaks the topsoil or otherwise results in the movement of earth and/or changes in the stormwater drainage pattern and/or stormwater flows from that which would have occurred if the land had been left in its natural state. This stormwater runoff and resulting soil erosion could result in an inundation that damages properties, the erosion and destabilization of downstream channels, and the pollution of valuable stream and lake resources. Because development and redevelopment of land causes increases in stormwater runoff quantity and rate and can cause impairment of water quality and loss of valuable topsoil, this Ordinance regulates these activities to minimize adverse impacts to these vital natural resources. This Ordinance is adopted to accomplish the following objectives:

- (a) To assure that development or redevelopment does not increase drainage or flood hazards, or create unstable conditions susceptible to soil erosion;
- (b) To protect new buildings and major improvements to buildings from flood damage due to increased stormwater runoff and soil erosion;
- (c) To protect human life and health from the hazards of increased flooding and soil erosion on a watershed basis;
- (d) To lessen the burden on the taxpayer for flood control projects, repairs to flood-damaged public facilities and utilities, correction of channel erosion problems, and flood rescue and relief operations caused by stormwater runoff and soil erosion from development and redevelopment;
- (e) To protect, conserve, and promote the orderly development of land and soil, water, air, animal, and plant resources;
- (f) To preserve the natural hydrologic and hydraulic functions of watercourses and flood plains and to protect water quality and aquatic habitats;
- (g) To preserve the natural characteristics of stream corridors in order to manage flood and stormwater impacts, improve water and groundwater quality, reduce soil erosion, protect aquatic and riparian habitat, maintain quality forest resources, provide recreational opportunities, provide aesthetic benefits, and enhance community and economic development.
- (h) To encourage and approve new and innovative approaches that decrease impervious surfaces, increase absorption, and reduce the need for retention basins and stormwater handling structures.

Section 1.1 - Findings

The St. Clair County Soil and Water Conservation District hereby finds as follows:

- (a) The soil types found in St. Clair County, Illinois are susceptible to erosion and, if left unprotected, could cause severe loss of soil with resultant damage to property, public safety, and the environment;

- (b) The topography of St. Clair County, Illinois contains areas with steep slopes upon which, if clearing of trees and/or inappropriate construction takes place, could result in severe erosion and slope stability problems which could result in damage to property;
- (c) Excessive quantities of soil may erode from areas undergoing development for certain land use changes, including but not limited to, the construction of dwelling units, commercial buildings and industrial plants, the building of roads and highways, the modification of stream channels and drainage ways, and the creation of recreational facilities;
- (d) The washing, blowing, and deposition of eroded soil across and upon roadways endangers the health and safety of users thereof, by decreasing vision and reducing traction of road vehicles;
- (e) Soil erosion necessitates the costly repairing of gullies, washed-out fills, and embankments;
- (f) Sediment from soil erosion tends to clog sewers and ditches and to pollute and silt rivers, streams, lakes, sinkholes, wetlands, and reservoirs;
- (g) Sediment limits the use of water and waterways for most beneficial purposes, promotes the growth of undesirable aquatic weeds, destroys fish and other desirable aquatic life, and is costly and difficult to remove; and
- (h) Sediment deposition reduces the channel capacity of watercourses and the storage capacity of floodplains and natural depressions, resulting in increased risk to public health and safety from flooding.

Section 1.2 - Authority

This Ordinance is enacted by the St. Clair County Soil and Conservation District in accordance with the Soil and Water Conservation Districts Act as found at 70 ILCS 405/1 et al and specifically pursuant to the authority specified in Section 23 of that Act entitled "Adoption of land-use regulations" and codified at 70 ILCS 405/23.

Section 1.3 - Applicability

Except as otherwise provided in this Ordinance, no person shall commence any development or redevelopment activities without first obtaining a Stormwater Management and Erosion Control Permit from the Soil and Water Conservation District Office. This Ordinance shall apply to all development and redevelopment in St. Clair County, Illinois as set forth herein:

- (a) Any development or redevelopment that will include an area that will meet or exceed ten thousand (10,000) square feet of total impervious surface (i.e., streets, roof, patio or parking area or any combination thereof) or that involves one acre or more of land;
- (b) Any land disturbing activity (i.e., clearing, grading, stripping, excavating, filling, or any combination thereof) that will affect an area that will meet or exceed ten thousand (10,000) square feet;
- (c) Any land disturbing activity if the activity is located within 25 feet of any channel as defined in this Ordinance including but not limited to any river, lake, pond, stream, sinkhole, or wetland;
- (d) Any land disturbing activity on the sloping side of the slope disturbance line;

Section 1.4 - Exemptions

Being exempt from this Ordinance does not eliminate the requirement of obtaining approval for individual sediment and erosion control site plans from the appropriate local jurisdiction. A Stormwater Management and Erosion Control Permit shall not be required for the following:

- (a) Any development, redevelopment, or other activity not falling within the specifications set forth in Section 1.3 of this Ordinance.
- (b) Soil disturbing activities associated with agricultural crop production including the implementation of conservation measures specified in a Farm Conservation Plan approved by the Soil and Water Conservation District. For the purposes of this Ordinance, levees, berms, and channel modification are considered stormwater appurtenances and are not agricultural use of land. Any man-made changes to agricultural land, other than activities associated with growing agricultural crops, installing and maintaining conservation practices, or best management practices constructed to reduce erosion or control stormwater runoff on agricultural land, are not considered agricultural use of land for purposes of this Ordinance and are not exempt from the applicability provision specified in Section 1.3 of this Ordinance.
- (c) The maintenance of any existing stormwater drainage/detention component or structure or any existing soil erosion/sediment control component or structure, including dredging, levee restoration, tree removal, or other function which maintains original or appropriate design capacities.
- (d) Development that has been approved by the appropriate authority through the preliminary plat stage before the date of approval of this Ordinance.

Section 1.5 - Responsibility

- (a) The applicant shall not be relieved of responsibility for damage to persons or property otherwise imposed by law. The applicant shall be entitled to a letter from the District certifying compliance with the provisions of its permit upon proof of compliance being established and confirmed. The St. Clair County Soil and Water Conservation District, St. Clair County, municipalities adopting a resolution making this Ordinance applicable within their jurisdictions, and their respective officers and agents shall be immune from liability for any damage, caused or allegedly caused by:
 - (1) the issuance of a Stormwater Management and Erosion Control Permit under this Ordinance,
 - (2) compliance with the provisions of that Stormwater Management and Erosion Control Permit or conditions attached to it by the Permit Reviewer or the Soil and Water Conservation District,
 - (3) failure of the District to observe or recognize hazardous or unsightly conditions, (4) failure of the District to recommend denial or to deny a Stormwater Management and Erosion Control Permit, or (5) granting or denying exemptions from the Stormwater Management and Erosion Control Permit requirements of this Ordinance.
- (b) Upon receipt of the notification of the completion of the requirements of the Stormwater Management and Erosion Control Permit from the Applicant as required by this Ordinance, the District shall within 30 days notify the Applicant of any non-compliance issues or shall issue a letter certifying compliance with the permit and the Ordinance. If no letter is issued within 30 days of receiving the notification, the project will be deemed properly completed.

Section 1.6 - Other Relevant Permitting

Applicants may seek required Federal, State, and Local permits concurrently with the application for the Stormwater Management and Erosion Control Permit. The applicant shall be solely responsible for acquiring other necessary permits. These other permits may include but are not limited to:

- (a) permits in accordance with Section 404 of the Clean Water Act, 33 U.S.C. Section 1251, including any joint permit application requirements (i.e. Floodway Construction Permit from DNR);
- (b) any permits required under Section 10 of the Rivers and Harbors Act, 33 U.S.C. Section 426;
- (c) permits required by the Illinois Department of Natural Resources ("DNR"), Office of Water Resources in accordance with the Rivers, Lakes and Streams Act, 615 ILCS 5/18, 23, 23(a) and 29(a), and consistent with any applicable regulations including those found at 17 Ill. Adm. Code Parts 3700, 3702, and 3704;
- (d) any permits required by the Farmland Preservation Act, 505 ILCS 75/6;
- (e) any permits that may be required by the Illinois Environmental Protection Act (415 ILCS 5/12 et al) and any regulations adopted thereunder including any permits that may be required under the National Pollutant Discharge Elimination System Permit (NPDES) through the Illinois Environmental Protection Agency, Division of Water Pollution Control, 415 ILCS 5/12(f); and
- (f) any permits required by any other applicable stormwater discharge laws that may be adopted. Compliance with all applicable local ordinances and codes shall also be required.

Section 1.7 - Separability/Severability

The provisions and Sections of this Ordinance shall be deemed to be severable in accordance with the following:

- (a) If any Court of competent jurisdiction shall adjudge any provision of this ordinance to be invalid, such judgment shall not affect the validity of any other provision of this Ordinance.
- (b) If any Court of competent jurisdiction shall adjudge the application of this Ordinance or any provision thereof to be invalid or inapplicable to a particular parcel of land, a particular structure, or a particular development, such judgment shall not affect the application of said provision to any other land, structure, or development.

Section 1.8 - Non-conforming Uses

Non-conforming structures and uses shall not be replaced or enlarged in any manner unless such replacement or enlargement conforms to the requirements of this Ordinance and has been approved by the local government having jurisdiction. Prior development not conforming to the standards of this Ordinance, while developed under the standards of the time, may have inadequate detention/retention capabilities and may be significantly contributing to current stormwater runoff problems. Remediation of these existing problems is encouraged through joint efforts on the part of government and private owners and developers.

Section 1.9 - Violations

- (a) Consistent with Sections 1.3 and 7.2 of this Ordinance, it shall be unlawful for any person to undertake any development without first securing a Stormwater Management and Erosion Control Permit in accordance with this Ordinance.
- (b) It shall be unlawful for any person to violate any provision of this Ordinance or any condition of any Stormwater Management and Erosion Control Permit issued pursuant to this Ordinance.
- (c) Injunctive relief is specifically authorized for enforcement of the provisions of this Ordinance.

CHAPTER 2 DEFINITIONS

Section 2.0 - Definitions

For the purposes of this Ordinance certain terms are defined and set forth below:

2.1 - Adverse Impacts: Any negative impact on plant, soil, air or water resources affecting their beneficial uses including recreation, aesthetics, aquatic habitat, quality, and quantity.

2.2 - Applicant: Any person, business entity, governmental agency, or other entity who executes the necessary forms to procure official approval of a Stormwater Management and Erosion Control Permit to carry out construction of a new development or redevelopment or to engage in any land clearing activities as defined in subsection (b) of Section 1.3 of this Ordinance in St. Clair County.

2.3 - Base Flood Elevation: The elevation in relation to mean sea level of the crest of the base or 100 year frequency flood event. The elevation at all locations delineating the level of flooding resulting from the 100-year frequency flood event, which has a one (1) percent chance of occurring in any given year.

2.4 - Board: The St. Clair County Soil and Water Conservation District Board which may also be referred to as the District Board.

2.5 - Building Permit: A permit that authorizes the construction, erection, or alteration of a structure or building and the related ground and surface preparation prior to and after completion of construction, erection or alteration of a structure or building which is issued by the local government having jurisdiction for the construction, erection or alteration of a structure or building.

2.6 - Bypass Flows: Stormwater runoff from upstream properties that are tributary to a property's drainage system but not under its control.

2.7 - Certify or Certification: Formally attesting that specific inspections and tests were performed, and that such inspections and tests comply with the applicable requirements of this Ordinance.

2.8 - Channel: Any defined river, stream, creek, brook, branch, natural or artificial depression, ponded area, on-stream lake or impoundment, karst area (sinkhole), flowage, slough, ditch, conduit, culvert, gully, ravine, wash, or natural or manmade drainage way, which has a definite bed and bank or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.

2.9 - Channel Modification: Alteration of a channel by changing the physical dimensions or materials of its bed or banks. Channel modification includes damming, rip-rapping (or other armoring), filling, widening, deepening, straightening, relocating, lining, and significant removal of bottom or woody rooted vegetation. Channel modification does not include the clearing of unnatural debris or removal of trash.

2.10 - Clearing: Any activity which removes the natural vegetative ground cover.

2.11 - Compensatory Storage: An artificial excavation which provides a hydraulically equivalent volume of storage within the floodplain, used to balance the loss of natural flood storage capacity when fill or structure are placed within the floodplain.

2.12 - Conduit: Any channel, pipe, sewer or culvert used for the conveyance or movement of water, whether open or closed.

2.13 - Cubic Yard: A one yard by one yard by one yard (1x1x1) amount of material in excavation and/or fill.

2.14 - Detention Basin: A facility constructed or modified to provide for the temporary storage of stormwater runoff and the controlled release by gravity of this runoff at a prescribed rate during and after a flood or storm.

2.15 - Detention Time: The amount of time stormwater is held within a detention basin.

2.16 - Development: Any man-made change to real estate or property, including:

- (a) the division or subdivision of any tract or parcel of property;
- (b) construction, alteration, reconstruction or placement of a building or structure or any addition to a building or structure;
- (c) installation of a manufactured home on a site, preparing a site for a manufactured home, or installing a travel trailer on a site for more than 180 days per year;
- (d) construction of roads, bridges, or similar projects;
- (e) redevelopment of a site;
- (f) filling, dredging, grading, clearing, excavating, paving or other non-agricultural alterations of a ground surface;
- (g) storage of materials or deposit of solid or liquid waste;
- (h) any other activity that might alter the magnitude, frequency, direction, or velocity of stormwater flows from a property.

2.17 - District: The St. Clair County Soil and Water Conservation District.

2.18 - Drainage Plan: A plan, including engineering drawings and supporting calculations, which describes the existing stormwater drainage system and environmental features, including topography, and which describes proposed alterations or changes to the drainage system and environment of a property including any proposed grading.

2.19 - Dry Basin: A detention basin designed to drain after temporary storage of stormwater flows and to normally be dry over much of its bottom area.

2.20 - Erosion: The general process whereby soil or earth is moved by rainfall, flowing water, wind or wave action.

2.21 - Excavation: Any act by which organic matter, earth, sand, gravel, rock or any other similar material, is cut into, dug, quarried, uncovered, removed, displaced, relocated or bulldozed and shall include the conditions resulting from such actions.

2.22 - Excess Stormwater Runoff: The volume and rate of flow of stormwater discharged from a new development or redevelopment which is or will be in excess of that volume and rate which existed before development or redevelopment.

2.23 - Existing Grade: The vertical elevation of the existing ground surface prior to excavation or filling.

2.24 - Fill: Any act by which organic matter, earth, sand, gravel, rock, or any other material, is deposited, placed, replaced, pushed, dumped, pulled, transported or moved by man to a new location and shall include the resulting conditions.

2.25 - Final Grade: The vertical elevation of the ground surface after grading work is completed in accordance with the engineering plans.

2.26 - Flood Fringe: That area as designated by the Federal Emergency Management Agency (FEMA) as that portion of the floodplain outside of the floodway. This area is subject to inundation from the base flood but conveys little or no flow.

2.27 - Flood Hazard Boundary Map (FHBM): A very generalized map prepared by the Federal Emergency Management Agency (FEMA) which shows only where floodplains are located based on very basic data. FHBM's do not include base flood elevations.

2.28 - Flood Insurance Rate Map (FIRM): A map prepared by the Federal Emergency Management Agency (FEMA) that depicts the special flood hazard area (SFHA) within a community. This map includes insurance rate zones and regulatory floodplains and may or may not depict regulatory floodways.

2.29 - Floodplain: That land adjacent to a body of water with ground surface elevations at or below the base flood or the 100-year frequency flood elevation which is subject to inundation. The floodplain as designated by the Federal Emergency Management Agency (FEMA) is also known as the Special Flood Hazard Area (SFHA) and is generally identified on the Flood Insurance Rate Map (FIRM), Flood Boundary and Floodway Map, or the Flood Hazard Boundary Map (FHBM) of the community. This area is the collective combination of the regulatory floodway and the flood fringe.

2.30 - Floodway: The channel and that portion of the floodplain, including on-stream lakes, adjacent to a stream or watercourse which is needed to store and convey the anticipated existing and future 100-year frequency flood discharge with no more than a 0.1 foot increase in stage due to any loss of flood conveyance or storage and no more than a ten percent (10%) increase in average velocities. Floodway are designated by FEMA on some Flood Insurance Rate Maps and Flood Boundary and Floodway maps. However, there are floodways on all streams whether mapped by FEMA or not.

2.31 - Grading: The excavation or fill or any combination thereof and shall include the conditions resulting from any excavation or fill.

2.32 - Hydrograph: A graph showing for a given location on a stream or conduit, the flow rate with respect to time.

2.33 - Hydrograph Method: This method estimates runoff volume and runoff hydrographs for the point of interest by generating hydrographs for individual sub-areas, combining them, and routing them through stream lengths and reservoir structures. Factors such as rainfall amount and distribution, runoff curve number, time of concentration, and travel time are included.

2.34 - Impervious Surface: That area of property that is covered by materials other than soil and vegetation and that has no intended capacity to absorb stormwater, such as parking lots, driveways, sidewalks, patios, tennis courts, roofs and other structures.

2.35 - Infiltration: The passage or movement of water into the soil surfaces.

2.36 - Loess Soil or Loess: A sediment, commonly non-stratified and unconsolidated, composed predominately of silt sized particles with accessory clay and sand.

2.37 - Lot: An individual platted parcel in an approved subdivision.

2.38 - Major Drainage System: That portion of a drainage system needed to store and convey flows beyond the capacity of the minor drainage system.

2.39 - Minor Drainage System: That portion of a drainage system designed for the convenience of the public. It consists of street gutters, storm sewers, small open channels, and swales and, where man-made, is to be designed to handle the 10-year runoff event.

2.40 - Mitigation: When the prescribed controls are not sufficient and additional measures are required to offset the development, including those measures necessary to minimize the negative effects which stormwater drainage and development activities might have on the public health, safety and welfare. Examples of mitigation include, but are not limited to compensatory storage, soil erosion and sedimentation control, and channel restoration.

2.41 - Modified Rational Method: As described in the Illinois Department of Transportation "Drainage Manual" this method is based on the principal that the maximum rate of runoff from a given drainage area occurs at that point in time when all parts of the watershed are contributing to the flow. The rainfall generating the peak flow is assumed to be of uniform intensity for the entire watershed with a rainfall duration equal to the time of concentration.

2.42 - Natural: Conditions resulting from physical, chemical, and biological processes without intervention by man.

2.43 - Natural Drainage: Channels formed in the existing surface topography of the earth prior to changes being made by unnatural causes.

2.44 - One Hundred-Year Event: A rainfall, runoff, or flood event having a one percent chance of occurring in any given year. A 24 hour storm duration is assumed unless otherwise noted.

2.45 - Parcel: All contiguous land in one ownership.

2.46 - Peak Flow: The maximum rate of flow of water at a given point in a channel or conduit.

2.47 - Permittee: Any person to whom a Stormwater Management and Erosion Control Permit is issued.

2.48 - Person: Any individual, business entity, or other entity, public or private, the State of Illinois and its agencies or political subdivisions, the United States of America, and its agencies or political subdivisions, and any agent, servant, officer or employee of any of the foregoing.

2.49 - Positive Drainage: Provision for overland paths for all areas of a property including depressional areas that may also be drained by storm sewer.

2.50 - Prime Farmland: Land that is best suited to food, feed, forage, fiber and oilseed crops. It may be cropland, pasture, woodland, or other land, but it is not urban and built up land or water areas. It is either used for food or fiber or is available for those uses. The soil qualities, growing season and moisture supply are those needed for a well managed soil to economically produce a sustained high yield of crops. Prime farmland produces the highest yields with minimum inputs of energy and economic resources, and farming it results in the least damage to the environment.

2.51 - Property: A parcel of real estate.

2.52 - Redevelopment: Any man-made change to property as described in Section 2.16 of this Ordinance that is being made to property already having man-made changes.

2.53 - Retention Basin: A facility designed to completely retain a specified amount of stormwater runoff without release except by means of evaporation, infiltration, emergency bypass or pumping.

2.54 - Sedimentation: The process that deposits soils, debris, and other materials either on other ground surfaces or in bodies of water or stormwater drainage systems.

2.55 - Site: A parcel of land, or a contiguous combination of parcels of land, where grading is performed as a single unified operation.

2.56 - Sinkhole, (Karst Areas): Land surface depression or blind valley which may or may not have surface openings to cavernous underground areas and are the result of water movement through silts and jointed limestone. These conditions make such areas unstable and susceptible to subsidence and surface collapse. Fractures in the limestone may channel runoff water to public or private water supplies, making those sources especially susceptible to groundwater contamination.

2.57 - Slope Disturbance Line: The line which delineates relatively level building areas from areas where slopes exceed eight percent (8%) and where special precautions must be taken for development, re-development, or other land disturbing activities.

2.58 - Stormwater Drainage System: All means, natural and man-made, used for conveying stormwater to, through or from a drainage area to the point of final outlet from a property. This system includes but is not limited to any of the following: conduits and appurtenance features, canals, channels, ditches, streams, culverts, streets, storm sewers, detention basins, swales and pumping stations.

2.59 - Stormwater Management and Erosion Control Permit (or SMEC Permit): The Permit required by this Ordinance before commencement of any development, re-development, or land disturbing activities as described in Section 1.3 of this Ordinance, which is issued by the St. Clair County Soil and Water Conservation District.

2.60 - Stormwater Runoff: The waters derived from melting snow or rain falling within a tributary drainage basin which are in excess of the infiltration capacity of the soils of that basin, which flow over the surface of the ground or are collected in channels or conduits.

2.61 - Storm Sewer: A closed conduit for conveying collected stormwater.

2.62 - Stream: Any river, creek, brook, branch, flowage, ravine, or natural or man-made drainage way which has a definite bed and banks or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.

2.63 - Stripping: Any activity which removes the vegetative surface cover, including tree removal, by spraying or clearing, and the storage or removal of top soil.

2.64 - Ten-Year Event: A runoff, rainfall, or flood event having a ten percent (10%) chance of occurring in any given year. A 24-hour storm duration is assumed unless otherwise noted.

2.65 - Time of Concentration: The elapsed time for stormwater to flow from the most hydraulically remote point in a drainage basin to a particular point of interest in that watershed.

2.66 - Tributary Watershed: All of the land surface area that contributes runoff to a given point.

2.67 - Two-Year Event: A runoff, rainfall, or flood event having a fifty percent (50%) chance of occurring in any given year. A 24-hour storm duration is assumed unless otherwise noted.

2.68 - Vacant: Land on which there are no structures or only structures which are secondary to the use or maintenance of the land itself.

2.69 - Watershed: All land area drained by, or contributing water to, the same stream, creek, ditch, lake, marsh, stormwater facility, groundwater or depressional area.

2.70 - Wet Basin: A detention basin designed to maintain a permanent pool of water after the temporary storage of stormwater runoff.

2.71 - Wetlands: Defined by regulation as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." For general, but not inclusive locations of designated wetlands refer to mapping prepared jointly by the Fish and Wildlife Service, a division of the U.S. Department of Interior and the Office of Resource Conservation, a division of the Illinois Department of Natural Resources or the National Wetlands Inventory Mapping, 1987. The applicant may be required to provide a field investigation by a qualified wetland delineator.

2.72 - FEMA: Federal Emergency Management Agency

CHAPTER 3 PERMIT PROCEDURES

Section 3.0 - Application for Permit

Application for a Stormwater Management and Erosion Control Permit shall be made by the owner of the property or his authorized agent to the Soil and Water Conservation District on a form furnished for that purpose. Each application shall bear the name(s) and addresses of the owner(s) or developer(s) of the site, the contractor(s) and of any consulting firm retained by the applicant together with the name of the applicant's principal contact at such firm, and shall be accompanied by a filing fee. Each application shall

include certification that any land clearing, construction, or development involving the movement of earth shall be in accordance with the plans approved upon issuance of the permit. Application fees shall be paid in accordance a fee schedule approved by 2/3 vote of the Board.

Section 3.1 - Bond Required

- (a) The applicant for a Stormwater Management and Erosion Control Permit shall be required to file with the District, a performance bond, letter of credit, cash escrow, or other improvement security obtained for the development showing an amount sufficient to cover the costs of soil erosion and sediment control measures and landscaping as required by this Ordinance and any permit issued thereunder for not less than one year with a renewal provision. The bond or other security devise shall be released when the Certificate of Completion is issued.
- (b) No specific or separate bond is required under this Ordinance if the Applicant submits a copy of a general performance bond for the entire development that meets the general requirements of this Section and demonstrates coverage of all improvements required by this Ordinance.
- (c) The Bond shall conform to the following requirements:
 - (1) The surety company issuing the bond shall be licensed by the Illinois Department of Insurance pursuant to the Illinois Insurance Code, 215 ILCS 5/1 et. seq.
 - (2) The bond must guarantee that the Permittee will comply with the issued permit and will meet all permit conditions.
 - (3) The surety will become liable on the bond obligation (or cash escrow will be forfeited) when, during the term of the bond, the Permittee fails to perform as guaranteed by the bond. The Permittee fails to perform when:
 - (A) He abandons the project;
 - (B) He is adjudicated bankrupt;
 - (C) He fails to comply with the terms of the stormwater management and erosion control permit;
 - (D) He fails to perform work as ordered to do so by written notice of the District or by a court of competent jurisdiction; or
 - (4) The sum of the bond shall be one hundred percent (100%) of the cost estimate certified by a Professional Engineer or other soil and water conservation professional or by providing a detailed bid proposal or in some cases a contractor's estimate using objective criteria with cost estimates based upon the types and sizes of development, size of retention basins needed, cost to develop and implement stormwater management techniques as specified in the permit, the acreage of the project, and any other criteria deemed appropriate by the Board. Any cost estimates submitted as part of the permit application shall be reviewed and relied upon to the extent that they accurately reflect reasonable and customary costs for like items and work.

- (5) The bond must be issued for the time it will take to complete the development project and shall be for a term of at least one year and must not be cancelable during the term. The bond shall be renewed if the development activity is not completed within the year.
- (6) The bond shall be on the form provided in Appendix D herein except as provided in subsection (b) of this Section.
- (7) Any payments made under the bond will be placed in a special fund designated by the Board.
- (8) The District shall release the surety if, after the surety becomes liable on the bond, the permittee or another person provides immediate compliance with the permit no later than 30 days after notice is sent from the District.
- (9) After required work has been completed, the District shall refund any unspent money which was paid to the District by the surety.

Section 3.2 - Review and Approval of Permit Applications

- (a) The District Permit Reviewer will review each application for a Stormwater Management and Erosion Control Permit to determine its conformance with the provisions of this Ordinance. The Permit Reviewer may also refer any application to any other local government or public agency within whose jurisdiction the site is located for review and comment.
- (b) Within Thirty (30) days after receiving an application, the District Permit Reviewer shall in writing:
 - (1) Approve the permit application if it is found to be in conformance with the provisions of this Ordinance, and issue the permit;
 - (2) Approve the permit application subject to such reasonable conditions as may be necessary to secure substantially the objectives of this Ordinance, and issue the permit subject to these conditions;
 - (3) Disapprove the permit application, indicating the deficiencies and the procedure for submitting a revised application and/or submission; or
 - (4) Request an additional 30 days for review because of the nature and complexity of the proposed project and the application.
- (c) Failure of the District to act on an original or revised application within thirty (30) days of receipt shall authorize the applicant to proceed in accordance with the permit application and attachments as filed and in compliance with the provisions of this Ordinance, unless such time is extended by agreement between the District and the applicant. If the District has not acted on a permit application within 60 days of receipt, the permit shall be deemed granted consistent with the application and the provisions of this Ordinance. If there is a conflict between the provisions of this Ordinance and the permit application, the Ordinance shall prevail.
- (d) Pending preparation and approval of a revised permit, development activities may be allowed to proceed in accordance with an approved permit or in accordance with such agreed to conditions established by the District.

Section 3.3 - Expiration of Permit

Every Stormwater and Erosion Control Permit shall expire and become null and void if the work authorized by such permit has not been commenced and actively pursued within **one hundred and eighty (180) days**, or if not completed by a date which shall be specified in the permit, except that the District Permit Reviewer may, if the permittee presents satisfactory evidence that unusual difficulties have prevented work being commenced or completed within the specified time limits, grant a reasonable extension of time if written application is made before the expiration date of the permit. The District may require modification of the erosion control plan to prevent any increase in erosion or off-site sediment runoff resulting from any extension.

Section 3.4 - Appeals to the Soil and Water Conservation District Board

- (a) The applicant may appeal the decision of the District Permit Reviewer to the District Board. Upon receipt of an Appeal, the Board shall schedule and hold a public hearing, after giving fifteen (15) days notice thereof. The Board shall render a decision by the next Board meeting or within thirty (30) days after the hearing, whichever is greater.
- (b) Factors to be considered on appeal include, but need not be limited to, the effects of the proposed development activities on the surface water flow to tributary and downstream lands, any comprehensive watershed management plans, or the use of any retention facilities; possible saturation of fill and unsupported cuts by water, both natural and domestic; runoff surface waters that produce erosion and silting of drainage ways; nature and type of soil or rock which when disturbed by the proposed development activities may create earth movement and produce slopes that cannot be landscaped; and excessive and unnecessary scarring of the natural landscape through grading or removal of vegetation.

Section 3.5 - Amendment of Permit

Major amendments to the Stormwater Management and Erosion Control Permit shall be submitted to the District Permit Reviewer and shall be processed and approved or disapproved in the same manner as the original permit. Field modification of a minor nature may be authorized in writing by the District Inspector to the permittee.

Section 3.6 - Exceptions Allowed

The Soil and Water Conservation District Board of Directors may, by vote of at least 4 members voting in person or by proxy, authorize exceptions to any of the requirements and regulations set forth in this Ordinance in accordance with the following requirements:

- (a) Application for exception shall be made by a Verified Petition for Exception from the Applicant for a Stormwater Management and Erosion Control Permit, stating fully the grounds of the Petition and the facts relied upon by the Applicant. Such Petition shall be filed with the Permit Application.
- (b) In order for the Verified Petition for Exception to be granted, the Soil and Water Conservation District Board must find that all of the following facts exist with respect to the land referred to in the Petition:

- (1) That the land is of such shape or size or is affected by such physical conditions or is subject to such title limitations of record, that it is impossible or impractical for the Applicant to comply with all of the requirements of this Ordinance;
 - (2) That the exception is necessary for the preservation and enjoyment of a substantial property right of the Applicant; and
 - (3) That the granting of the exception will not be detrimental or injurious to the public welfare, environment, or to other property in the vicinity of the subject property.
- (c) Each Verified Petition for Exception shall be reviewed by the Permit Reviewer of the Soil and Water Conservation District. The Permit Reviewer shall make written recommendations upon review of the application. These written recommendations shall be filed with the Board within 30 days of receiving an application that includes a Verified Petition for Exception. The Board shall review such recommendations prior to granting or denying any requested exceptions.
- (d) The Board shall hold a public hearing on each Verified Petition for Exception within forty-five (45) calendar days of receiving the recommendations of the Permit Reviewer or at the next regularly scheduled Board Meeting, whichever is sooner. The next regularly scheduled Board Meeting shall be considered to be one that occurs at least one week after receiving the Permit Reviewer recommendations. No later than the next Board Meeting or thirty (30) calendar days after the public hearing, whichever is later, the Board shall either approve the Petition for Exception with the exceptions and conditions it deems necessary and appropriate or it shall disapprove the Petition for Exception or it shall take such other action as appropriate. Failure of the Board to act as described herein shall constitute approval of the Verified Petition for Exception. Failure of the Board to have a quorum at a particular meeting (after the public hearing) shall not be considered the next regularly scheduled meeting for purposes of granting a Verified Petition for Exception since no vote on the issue can be taken. A Petitioner may agree to continuances of these deadlines.

Section 3.7 - Retention of Permit Application and Attachments

Plans, specifications, and reports for all site developments shall be retained in original form or on microfilm by the District.

CHAPTER 4 STORMWATER MANAGEMENT AND EROSION CONTROL PERMIT REQUIREMENTS

Section 4.0 - Stormwater Drainage and Detention Plan Requirements

Each applicant shall submit complete information as specified in this Chapter of the Ordinance to ensure that the provisions of this Ordinance are met. The submittal shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts and benefits of the development on water resources both on-site and off-site, and the effectiveness of the proposed drainage plan in managing stormwater runoff. The applicant shall certify on the drawings that all clearing, grading, drainage, and construction shall be accomplished in strict conformance with the drainage plan. The information required in this Chapter of the Ordinance shall be submitted for both existing and proposed property conditions for all developments and redevelopments subject to this Ordinance.

Section 4.1 - Drainage Plan Requirements/Topographic Survey

The Drainage Plan shall include a topographic survey of the property at two-foot (2) contours of all areas to be disturbed unless otherwise specified or approved by the Municipal Engineer of the Municipality where the property is or by the County Engineer if not within any Municipality. The plan map shall be keyed to a consistent datum specified by the St. Clair County Soil and Water Conservation District. If the mapping is compiled using a digital format and the Global Positioning System (GPS), the applicant will provide both paper and digital copies including GPS points.

Section 4.2 - Mapping and Descriptions

The Drainage Plan shall include an existing drainage and proposed drainage plan for the property and one hundred(100) feet surrounding the property at a scale of not more than one hundred (100) feet to one (1) inch, and shall include the following information:

- (a) property boundary, dimensions, and approximate acreage;
- (b) building setback lines;
- (c) all existing and proposed structures and sizes;
- (d) area in square feet of existing and proposed impervious surface;
- (e) all existing, or proposed easements and covenants;
- (f) all existing, abandoned, or proposed water or monitoring well head locations;
- (g) all sanitary or combined sewer lines and septic systems;
- (h) the banks and centerline of streams and channels;
- (i) shoreline of lakes, ponds, and detention basins with normal water level elevation;
- (j) farm drains and tiles, if available or known;
- (k) soils classifications;
- (l) location, size and slope of stormwater conduits and drainage swales;
- (m) depressional storage areas;
- (n) detention facilities showing inlet and outlet control facilities;
- (o) roads, streets and associated stormwater inlets including finished grades;
- (p) base flood elevation, floodplain, and regulatory floodway;
- (q) basis of design for the final drainage network components.

- (r) a statement giving any applicable engineering assumptions and calculations;
- (s) a vicinity map showing the relationship of the site to its general surroundings at a scale of not less than two thousand (2,000) feet to one (1) inch (1:24,000)
- (t) title, scale, north arrow, legend, seal of Licensed Professional Engineer, date, and name of person preparing plans.
- (u) cross-section data for open channel flow paths and designated overland flow paths;
- (v) direction of storm flows;
- (w) flow rates and velocities at critical points in the drainage system;
- (x) a statement by the design engineer of the drainage system's provision for handling events greater than the 100-year, 24 hour runoff; and
- (y) a statement of certification of all drainage plans, calculations, and supporting data by a Licensed Professional Engineer.

Section 4.3 - Environmental Features

A depiction of environmental features of the property and immediate vicinity shall be included in the permit application including the following:

- (a) the estimated limits of designated regulatory and non-regulatory wetland areas;
- (b) the location and limits of sinkholes (karst areas);
- (c) the location of tree clusters, tree lines, and areas of serious tree density and the identification and location of trees with unique characteristics in areas where land disturbance will take place;
- (d) any designated natural areas and prime farmland; and
- (e) any proposed environmental mitigation features.

Section 4.4 - Minimization of Increases in Runoff Volumes and Rates

In the selection of a drainage plan for a development or redevelopment, the applicant shall evaluate and implement site design features which minimize the increase in runoff volumes and rates from the site. The applicant's drainage plan submittal shall include evaluations of site design features which are consistent with the following hierarchy:

- (a) preservation of regulatory floodplains, flood prone areas and wetland areas;
- (b) minimization of impervious surfaces on the property, consistent with the needs of the project including the use of innovative materials;
- (c) attenuation of flows by use of open vegetated swales and natural depressions that preserve the existing natural stream channel;

- (d) infiltration of runoff on-site;
- (e) providing stormwater retention structures;
- (f) providing wet or wetland detention structures;
- (g) providing dry detention structures; and
- (h) construction of storm sewers.

Section 4.5 - Water Quality

The drainage system of the development or redevelopment shall be designed to minimize adverse surface and groundwater quality impacts off-site and on the property itself. Detention basins shall incorporate design features to capture stormwater runoff pollutants. In particular, designers shall give preference to wet bottom and wetland type designs and all flows from the development shall be routed through the basin (i.e. low flows shall not be bypassed). Detention of stormwater shall be promoted throughout the property's drainage system to reduce the volume of stormwater runoff and to reduce the quantity of runoff pollutants.

Section 4.6 - Multiple Uses / Green Space / Protection of Trees

- (a) The drainage system should incorporate multiple uses where practicable. Uses considered compatible with stormwater management include but are not limited to open space, aesthetics, swales, aquatic habitat, recreation (boating, fishing, trails, playing fields), wetlands and water quality mitigation areas.
- (b) Municipalities that adopt this Ordinance by Resolution are encouraged to incorporate such compatible areas into any existing or future green space requirements.
- (c) Developers and owners are encouraged to incorporate "tree friendly" practices including protection of trees, especially the preservation of well-established trees and the properly routing of trucks and other larger vehicles so as not to run over or park where tree roots are.

Section 4.7 - Rainfall

Unless a continuous simulation approach to drainage system hydrology is used, all design rainfall events shall be based on the Illinois State Water Survey's Circular 172 and 173 (See Appendix). The first quartile point rainfall distribution shall be used for the design and analysis of detention basins and conveyance systems with critical durations less than 6 hours. The second quartile point rainfall distribution shall be used for the design and analysis of detention basins and conveyance systems with critical durations of 6.1 hours to 12 hours. The third quartile point rainfall distribution shall be used for the design and analysis of detention basins and conveyance systems with critical durations greater from 12.1 hours to 24 hours. The fourth quartile distribution shall be used in the design and analysis of detention basins and conveyance systems with durations greater than 24-hours. The quartile distributions are presented in Table 3 of Circular 173. Refer to Table 1 of Circular 172 for rainfall depth based on rainfall duration and frequency. The NRCS Type II distribution may be used as an alternate to the distributions in Circular 173.

Section 4.8 - Release Rates

- (a) The drainage system for developments or redevelopments shall be designed to control the peak rate of discharge from the property for the two year, 24-hour storm event and for the 100-year, 24-hour storm event to levels which will not cause an increase in flooding or channel instability downstream when considered in aggregate with other developed properties and downstream drainage capacities. This shall include consideration of the timing of the peak discharge on the receiving stream when such information is developed or available.
- (b) Until watershed specific information is readily available, release rates shall be as follows:
 - (1) Until watershed specific information is available, the drainage and stormwater management system shall be designed to limit peak discharge leaving the site to no more than .04 cfs/acre [or .06 cfs/acre] at a 2 year, 24-hour storm event and .15 cfs/acre [or .20 cfs/acre] at a 100 year, 24-hour storm event. ("cfs" stands for cubic feet per second). Acceptable release rates may vary from the standards specified herein as hydrologic models are completed per watershed. This data shall be made available by the District.
 - (2) In lieu of the release rate standards specified in subsection (b)(1) of this Section, the applicant may opt to do a complete hydrologic analysis in order to evaluate the effect of the proposed land use change on the overall discharge leaving a sub-drainage basin. In using this option, the applicant shall use the following event programs (or the equivalent as approved by the Soil and Water Conservation District Permit Reviewer): TR-20, TR-55, HEC-1, or HEC-HMS. If the development is under 2 acres or the impervious surface of the development is under 1 acre, the Rational Method may be used. If any of these options are chosen, the applicant must demonstrate that the post-development discharge from the site shall not exceed the pre-development discharge from the site. Stormwater storage shall start at the 2 year, 24-hour rainfall event. If the Permit Reviewer determines that such a demonstration has not been made, the applicant shall comply with subsection (a) of this Section.
- (c) As timing of peak discharge on the receiving stream is vitally important for flood protection, detailed hydrologic models of the entire watershed of St. Clair County shall be developed by the District. These models and the information within the models, when developed, shall be utilized for determining pre-development and post-development runoff from a proposed development site instead of utilizing release rates as specified in subsection (b) of this Section.

Section 4.9 - Detention Basin Outlet Design

Backwater on the outlet structure from the downstream drainage system shall be addressed by the applicant in designing the outlet.

Section 4.10 - Detention Storage Requirements

The minimum design storage to be provided in the detention basin shall be based on the runoff difference before and after development from the 100-year, 24-hour event. All detention basin storage shall be computed using Hydrograph Methods utilizing reservoir routing (also called modified puls or level pool) or by means of an equivalent method. Major and minor conveyance systems as well as detention basins shall be designed as specified in this Section of the Ordinance.

Section 4.11 - Drainage System Design and Evaluation

The following criteria shall be used in evaluating existing conditions and designing the drainage system. The design shall provide capacity to pass the 2-year, 24-hour peak flow in the minor drainage system and an overload flow path for flows in excess of the design capacity. The stormwater systems shall not result in the interbasin transfer of drainage unless no other practicable alternative exists.

Section 4.12 - Positive Drainage

Whenever practicable, all developments must be provided an overland flow path that will pass the 100-year, 24-hour flow at a stage at least one (1) foot below the lowest foundation grade in the vicinity of the flow path. Overland flow paths designed to handle flows in excess of the minor drainage system capacity shall be provided drainage easements. Street ponding and flow depths shall not exceed curb heights.

Section 4.13 - Antecedent Moisture

Computations of runoff hydrographs which do not rely on a continuous accounting of antecedent moisture conditions shall use antecedent moisture condition II (normal) as a minimum.

Section 4.14 - Wet Detention Basin Design and Depth

Wet detention basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing, and as much as feasible to be available for recreational use. Wet basins shall be at least three feet deep, excluding near-shore banks and safety ledges. If fish habitat is to be provided, said basins shall be at least eight (8) feet deep for over twenty-five (25%) percent of the bottom area to prevent winterkill.

Section 4.15 - Wet Basin Shoreline Slopes

The side slopes of wet basins at the normal pool elevation shall not be steeper than a three-to-one ratio (3:1 or 3 feet horizontal to 1 foot vertical). It is recommended that aquatic vegetation be established around the perimeter to provide protection from shoreline erosion.

Section 4.16 - Permanent Pool Volume

The permanent pool volume in a wet basin at normal depth shall be equal to the runoff volume from its watershed for the 2-year, 24-hour event as a minimum.

Section 4.17 - Wet Basin Inlet and Outlet Orientation

The distance between detention inlets and outlets shall be maximized. Inlets and outlets shall be at opposite ends of the basin providing that the orientation does not create undue hardship based on topography or other natural constraints. Designers are encouraged to use baffles or berms in the basin bottom to prevent short circuiting. There shall be no low flow bypass between the inlet and outlet. Paved low flow channels shall not be used. The minimum flow length shall be ten (10) feet with a recommended minimum ratio of two-to-one (2:1) length to width.

Section 4.18 - Dry Detention Basin Design

In addition to the other requirements of this Ordinance, dry basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing and as much as feasible to be available for multiple uses.

Section 4.19 - Dry Basin Drainage

Dry basins shall be designed so that eighty percent (80%) of their bottom area shall have standing water no longer than seventy-two (72) hours for any runoff event less than the 100-year, 24-hour event. Grading plans shall clearly distinguish the wet portion of the basin bottom. Underdrains directed to the outlet may be used to accomplish this requirement.

Section 4.20 - Velocity Dissipation

Velocity dissipation measures shall be incorporated into dry basin designs to minimize erosion at inlets and outlets and to minimize re-suspension of sediment.

Section 4.21 - Dry Basin Inlet and Outlet Orientation

Dry basin inlet and outlet orientation shall be the same as that specified in Section 4.17 of this Ordinance.

Section 4.22 - Temporary Stilling / Sedimentation Basin

A stilling / sedimentation basin shall be constructed at each major inlet to a dry basin during construction. The volume of the basin shall be a minimum of 500 cubic feet per acre of impervious surface in the drainage area. Side slopes shall be no steeper than a three feet to one foot ratio and basin depths shall be a minimum of three feet in order to minimize re-suspension of sediment and pollutants.

Section 4.23 - Existing Depressional Areas

Existing depressional storage volume will be maintained and the volume of detention storage provided to meet the requirements of this Ordinance shall be in addition to existing storage.

Section 4.24 - Minimum Detention Outlet Size

Where a single pipe outlet or orifice plate is to be used to control discharge, it shall have a minimum diameter of twelve (12) inches. If this minimum orifice size permits release rates greater than those specified in this Section, and regional detention is not a practical alternative, outlets, structures such as perforated risers, or flow control orifices shall be used.

Section 4.25 - Detention in Flood Plains

The placement of detention basins within the flood plain is strongly discouraged because of questions about their reliable operation during flood events. However, the stormwater detention requirements of this Ordinance may be fulfilled by providing detention storage within flood fringe areas on the project site provided the following provisions in this Chapter are met as well and compliance with Section 1.6 of this Ordinance is shown.

Section 4.26 - Detention in Flood Fringe Areas

The placement of a detention basin in a flood fringe area shall require compensatory storage for 1.5 times the volume below the base flood elevation occupied by the detention basin including any berms. The applicant shall demonstrate its operation for all stream-flow and floodplain backwater conditions. Excavations for compensatory storage along watercourses shall be opposite or adjacent to the area occupied by detention. All floodplain storage lost below the existing ten-year flood elevation shall be replaced below the existing ten-year elevation. All flood plain storage lost above the existing ten-year flood elevation shall be replaced above the existing ten-year flood elevation. All compensatory storage excavations shall be constructed to drain freely and openly to the watercourse and to comply with Section 1.6 of this Ordinance.

Section 4.27 - Detention on Prime Farmland

The placement of detention basins shall avoid the utilization of prime farmland whenever feasible. All detention basin construction shall examine potential impacts to adjacent agricultural land and shall address measures that will be implemented to eliminate such impacts.

Section 4.28 - Detention in Floodways

Detention basins shall not be placed in the floodway. Not all floodways are mapped. If the drainage area of the waterway at the proposed construction location is one square mile or greater, the applicant shall contact the Illinois Department of Natural Resources, Office of Water Resources for a determination as to State permit requirements.

Section 4.29 - On-Stream Detention

On-stream detention basins are discouraged but allowable if they provide regional public benefits and if they meet the other provisions of this Ordinance with respect to water quality and control of the two-year and 100-year, 24-hour events from the property. If on-stream detention is used in watersheds larger than one square mile, the applicant will use hydrographic modeling to demonstrate that the design will not increase the water level for any properties upstream or downstream of the property.

- (a) Impoundment of the stream as part of on-stream detention SHALL:
 - (1) require the implementation of an effective non-point source management program throughout the upstream watershed which shall include as a minimum:
 - (a) Best Management Practices (BMPs) for runoff reduction consistent with all reference documents listed in the appendix and in Section 4.49 of this Ordinance; and
 - (b) Two year, 24-hour detention / sedimentation basins for all development consistent with the provisions of this Ordinance.
 - (2) include a design calling for gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin; and
 - (3) comply with all applicable provisions of this Ordinance.
- (b) Impoundment of the stream as part of on-stream detention SHALL NOT:

- (1) prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, such as for spawning;
- (2) cause or contribute to the degradation of water quality or stream aquatic habitat;
- (3) involve any stream channelization or the filling of wetlands;
- (4) occur downstream of a wastewater discharge;
- (5) contribute to the duration or flood frequency of any adjacent land.

Section 4.30 - Drainage Into and Detention In Wetlands, Rivers, Streams, Lakes, Ponds, and Depressional Storage Areas

Wetlands, rivers, streams, lakes, ponds and depressional storage areas shall be protected from damaging modifications and adverse changes in runoff quality and quantity associated with land development. In addition to the other requirements of this Ordinance, the following requirements shall be met for all developments whose drainage flows into wetlands, rivers, lakes, ponds or depressional storage areas:

- (a) Existing wetlands, rivers, streams, lakes, ponds or depressional storage areas shall not be modified for the purposes of stormwater detention unless it is demonstrated that the proposed modifications will maintain or improve the habitat and ability to perform beneficial functions and is in compliance with Section 1.6 of this Ordinance.
- (b) Existing storage and release rate characteristics of wetlands, rivers, streams, lakes, ponds or depressional storage areas shall be maintained and the volume of detention storage provided to meet the requirements of this Section shall be in addition to this existing storage.
- (c) Existing wetlands, rivers, lakes, ponds, or depressional storage areas shall be protected during all phases of development and as further regulated in this Ordinance. Filling in wetland areas is discouraged and no wetland area shall be filled without obtaining appropriate permits under the Clean Water Act.
- (d) Site drainage patterns shall not be altered to substantially decrease or increase the existing area tributary to the wetlands, rivers, streams, lakes, ponds or depressional storage areas.
- (e) All runoff from the development shall be routed through a preliminary detention sedimentation basin designed to capture the two-year, 24-hour event and hold it for at least 24-hours, before being discharged to the wetland, river, lake, pond, or depressional storage area. This basin shall be constructed before property grading begins and shall be maintained throughout the construction process. In addition, the drainage hierarchy defined in Section 4.4 should be followed to minimize runoff volumes and rates being discharged to the wetland, river, stream, lake, pond, or depressional storage area and as further regulated in this Ordinance.
- (f) A buffer strip of at least 25 feet in width, preferably vegetated with native plant species, shall be constructed or restored around the periphery of a wetland, river, stream, lake, pond or depressional storage area.

Section 4.31 - Loess Soils

Care must be taken to avoid open flow discharges of stormwater over silt (loess) soils due to high potential for erosion. Most of the soils in St. Clair are loess.

Section 4.32 - Sinkholes, Karst Area

The following requirements apply to developments or redevelopments where sinkholes are determined to be present:

- (a) A stormwater detention basin shall not be placed in or over a sink-hole;
- (b) Stormwater detention basins shall not be located closer than one hundred (100) feet from the rim of a sinkhole;
- (c) The outflow from a stormwater detention basin, channel, ditch or any stormwater runoff generated as a result of a development or redevelopment shall not empty into or be directed or redirected by any means into or through any sinkhole; and
- (d) If, after review of the stormwater drainage plan, the District Permit Reviewer determines that more detailed information is required, a sinkhole evaluation shall be required. A sinkhole evaluation which addresses the geologic, engineering, and environmental factors resulting from a development or redevelopment shall then be performed by a professional with experience and expertise in karst topography. The results of the evaluation shall be certified by a professional engineer with adequate knowledge and experience in the field of erosion, sediment control, and soils or by a Certified Professional in Erosion and Sediment Control. This evaluation shall be the responsibility of the applicant and performed at no cost to the St. Clair County Soil and Water Conservation District. After a review of this evaluation, the District Permit Reviewer may either approve or disapprove the drainage plan as submitted.
- (e) Whenever a new sinkhole appears or whenever it becomes apparent that a sinkhole has not yet been identified on St. Clair County resource maps, it shall be reported to the Soil and Water Conservation District.

Section 4.33 - Street Detention, Parking Lot Detention, and Culvert Drainage

The following standards shall be complied with:

- (a) Street Detention: If streets are to be used as part of the minor or major drainage system, ponding depths shall not exceed curb heights and shall not remain flooded for more than eight (8) hours for any event less than or equal to the 100-year, 24-hour event.
- (b) Parking Lot Detention: The maximum stormwater ponding depth in any parking area shall not exceed six (6) inches for more than four (4) hours.
- (b)Culvert, Road and Driveway Crossings: Sizing of culvert crossings shall be determined by giving consideration to entrance and exit losses as well as tailwater conditions on the culvert.

Section 4.34 - Infiltration Practices

To effectively reduce runoff volumes, infiltration practices including basins, trenches, and porous pavement shall be located in hydrologic soil groups "A" and "B" as designated by the U.S.D.A. Natural Resources Conservation Service. Infiltration basins and trenches designed to re-charge groundwater shall not be located within seventy-five (75) feet of a water-supply well or building foundation. A sediment settling basin shall be provided to remove coarse sediment from stormwater flows before they reach infiltration basins or trenches. Stormwater shall not be allowed to stand more than seventy-two hours over eighty percent of the dry basin's bottom area for the maximum design event to be ex-filtrated. The bottom of infiltration basins or trenches shall be a minimum of four feet above the seasonally high groundwater and bedrock level. Engineering calculations demonstrating infiltration rates shall be included with the application.

Section 4.35 - Vegetated Filter Strips and Swales

To effectively filter stormwater pollutants and promote infiltration of runoff, sites should be designed to maximize the use of vegetated filter strips and swales. Whenever practicable, runoff from impervious surfaces should be directed onto filter strips and swales comprised of native grasses and forbs before being routed to a storm sewer or detention basin.

Section 4.36 - Safety Considerations

The drainage system components, especially all detention basins, shall be designed to protect the safety of any children or adults coming in contact with the system during runoff events.

Section 4.37 - Side Slopes

The side slopes of all detention basins at 100-year, 24-hour capacity shall be as level as practicable to prevent accidental falls into the basin and for stability and ease of maintenance. Side slopes of detention basins and open channels shall not be steeper than a three-to-one ratio (3:1) horizontal to vertical.

Section 4.38 - Safety Ledge

All wet detention basins shall have a level safety ledge at least four feet in width located two and a half to three feet below the normal water depth.

Section 4.39 - Velocity

Velocities shall be controlled to safe levels taking into consideration rates and depths of flow. Velocities throughout the surface drainage system shall not exceed permissible velocities as described in Chapter 7 of the USDA NRCS Engineering Field Manual. (See Appendix). Generally, these maximum velocities will be less than four feet per second.

Section 4.40 - Overflow Structures

All stormwater detention basins shall be provided with an overflow structure capable of safely passing excess flows at a stage at least one foot below the lowest foundation grade in the vicinity of the detention basin. The design flow rate of the overflow structure shall be equivalent to the 100-year, 24-hour inflow rate.

Section 4.41 - Maintenance Considerations / Protection of Trees

The stormwater drainage system shall be designed to minimize and facilitate maintenance. Turfed side slopes shall be designed to allow lawnmowing equipment to easily negotiate them. Wet basins shall be provided with alternate outflows which can be used to completely drain the pool for sediment removal. Pumping may be considered if drainage by gravity is not feasible. Pre-sedimentation basins shall be included, where feasible, for localizing sediment deposition and removal. Site access for heavy equipment shall be provided. Vehicles and heavy equipment shall not run over the roots of established trees.

Section 4.42 -Accommodating Flows From Upstream Tributary Areas

Stormwater runoff from areas tributary to the property shall be considered in the design of the property's drainage system. Whenever practicable, flows from upstream areas that are not to be detained shall be routed around the basin being provided for the site being developed.

Section 4.43 - Upstream Areas Not Meeting Ordinance Requirements

As it is likely that there are upstream areas tributary to the applicant's property that do not meet the storage and release rates of this Ordinance, regionalized detention on the applicant's property shall be reasonably explored by the applicant and the results shall be reported to the District in the permit application and shall be supplied to the municipality having jurisdiction over the property or to the County if no municipality has jurisdiction.

- (a) In such a case, the following steps shall be followed:
 - (1) The applicant shall compute the storage volume needed for his property using the release rates of Section 4.8 of this Ordinance.
 - (2) The applicant shall identify and describe areas tributary to the applicant's property that do not meet the storage and release rate requirements of this Ordinance.
 - (3) Using the areas determined above in subsections (a)(1) and (2) of this Section plus the applicant's property area, the applicant shall compute the total storage needed for the combined properties.
 - (4) Allowable release rates shall also be computed using the combined property areas. Storage shall be computed as described in Section 4.8 of this Ordinance. If tributary areas are not developed, a reasonable developed land cover based on local zoning shall be used for the purposes of computing storage.
- (b) Once the necessary combined storage is computed, any municipality having jurisdiction over the property or the Soil and Water Conservation District Board may choose to pay for over-sizing the applicant's detention basin to accommodate the regional flows. The applicant's responsibility shall be limited to the storage for his property as computed in accordance with this Ordinance. If regional storage is selected by any municipality, the County, or the District, then the design to be implemented shall comply with all of the provisions of this Ordinance. If regional storage is rejected after due consideration, the applicant shall bypass all tributary area flows around the applicant's basin whenever practicable. If the applicant must route upstream flows through his

basin and the upstream areas exceed one square mile in size, the applicant must meet the provision of Section 4.29 for on-stream basins.

Section 4.44 - Upstream Areas Meeting Ordinance Requirements

When there are upstream areas tributary to the applicant's property that meet the storage and release rate requirements of this Ordinance that are tributary to the applicant's property, the upstream flows may be by-passed around the applicant's detention basin if this is the only practicable alternative. Storage needed for the applicant's property shall be computed as described in Section 4.8 of this Ordinance. However, if the District or the municipality having jurisdiction over the property, decides to route tributary area flows through an applicant's basin, the final design of stormwater releases shall be based on the combined total of the applicant's property plus tributary areas. It must be shown that at no time will the runoff rate from the applicant's property exceed the allowable release rate for his/her property alone.

Section 4.45 - Early Completion of Detention Facilities

Where detention, retention, or depressional storage areas are to be used as part of the drainage system for a property, they shall be constructed as the first element of the initial earthwork program. Any eroded sediment captured in these facilities shall be removed by the applicant on a regular basis and before project completion in order to maintain the design volume of the facilities.

Section 4.46 - Fee in Lieu of Detention

- (a) In watersheds where detailed hydrologic modeling has been completed and regional detention facilities have been identified and analyzed, a fee in lieu of detention may be allowed. Determination of fees to be paid in lieu of detention shall be based on projected development costs of the facility including engineering and design cost and land acquisition but in no case shall fees in lieu of detention be less than described in subsections (b) and (c) of this Section.
- (b) In instances where regional benefits and economies of scale can be achieved, it will be permissible for adjacent properties to utilize a common regional detention basin. Applicants shall have the option of paying a fee of \$10,000 for each acre-foot of detention required so that the District can build regional facilities, or they can jointly build the necessary facilities themselves.
- (c) The \$10,000 fee for each acre foot is based on the value of \$10,000 in the year 2001. Said fee may be increased by the District from time to time based on inflation as determined by the Consumer Price Index so that this amount will increase over time. In lieu of using the Consumer Price Index, an amount of not more than two percent per year may be used to increase the fee.

Section 4.47 - Soil Erosion and Sediment Control

It is the objective of this Ordinance to control soil erosion and sedimentation caused by development activities, including clearing, grading, stripping, excavating, and filling of land in St. Clair County, Illinois. Measures taken to control soil erosion and off-site sediment runoff shall be adequate to assure that sediment is not transported from the site by a storm event of ten-year, 24-hour frequency or less. The following principles shall apply to all development or redevelopment activities within St. Clair County and to the preparation of the submissions required under this Ordinance:

- (a) Development or redevelopment shall be related to the topography and soils of the site so as to create the least potential for erosion. Areas of steep slopes greater than eight percent (8%) where

high cuts and fills may be required are to be avoided wherever possible, and natural contours should be followed as closely as possible.

- (b) Natural vegetation shall be retained and protected wherever possible. Areas immediately adjacent to natural watercourses, lakes, ponds, sink-holes, and wetlands are to be left undisturbed wherever possible. Temporary crossings of watercourses, when permitted, must include appropriate stabilization measures.
- (c) Special precautions shall be taken to prevent damages resultant from any necessary development activity within or adjacent to any channel or wetland. Preventive measures shall reflect the sensitivity of these areas to erosion and sedimentation.
- (d) The smallest practical area of land should be exposed for the shortest practical time during development.
- (e) Sediment basins or traps, filter barriers, diversions, and any other appropriate sediment or runoff control measures shall be installed prior to site clearing and grading and maintained to remove sediment from runoff waters from land undergoing development.
- (f) The selection of erosion and sediment control measures shall be based on assessment of the probable frequency of climatic and other events likely to contribute to erosion, and on evaluation of the risks, costs, and benefits involved.
- (g) In the design of erosion control facilities and practices, aesthetics and the requirements of continuing maintenance must be considered.
- (h) Provision shall be made to accommodate the increased runoff caused by changed soil and surface conditions during and after development. Drainage ways should be designed so that their final gradients and the resultant velocities and rates of discharge will not create additional erosion on site or downstream.
- (i) Permanent vegetation and structures shall be installed and functional as soon as practical during development.
- (j) Those areas being converted from agricultural purposes to other land uses shall be vegetated with an appropriate protective cover prior to development.
- (k) All waste generated as a result of site development activity shall be properly disposed of and shall be prevented from being carried off the site by either wind or water. No waste materials may be burned. Landscape waste may be burned by proper use of an Illinois EPA permitted air curtain destructor.
- (l) Measures shall be implemented at all construction sites in order to prevent sediment from being tracked onto public or private roadways and to control fugitive dust from traveling off-site.
- (m) All temporary soil erosion and sediment control practices shall be maintained to function as intended until the contributing drainage area has been permanently stabilized at which time they shall be removed.

Section 4.48 - Erosion and Sediment Control Plan Requirements

Each applicant shall submit sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts of the development related to erosion both on-site and off-site, and the effectiveness of the proposed erosion and sediment control plan in reducing sediment loss. The applicant shall certify on the drawings that all clearing, grading, drainage, excavation, and construction shall be accomplished in strict conformance with the erosion and sediment control plan. The following information shall be submitted for both existing and proposed property conditions:

- (a) Mapping and Descriptions as specified in Section 4.2 of this Ordinance.
- (b) Existing and proposed erosion and sediment control features of the property and immediate vicinity including:
 - (1) Location and description of the erosion and sediment control measures to be employed during construction;
 - (2) Location of the slope disturbance line;
 - (3) For any structures proposed to be located on the slope side of the slope disturbance line, the map shall include the limits of disturbance including tree removal, erosion and sediment control measures during construction, cross-section view of any proposed cut or fill, erosion and sediment control measures during construction, details of method(s) proposed for providing slope stability, permanent stormwater control measures, and permanent erosion and sediment control measures all being certified by a registered professional engineer with adequate knowledge and experience in the field of erosion, sediment control, and soils, or by a Certified Professional in Erosion and Sediment Control;
 - (4) The predominant soil types on the site, their location, and their limitations for the proposed use as defined by the U.S.D.A. Natural Resources Conservation Service;
 - (5) The proposed use of the site, including present and planned development, areas of clearing, stripping, grading, excavation and filling; proposed contours, finished grades, and street profiles; the stormwater plan; types and locations of utilities, areas and acreage proposed to be paved, sodded or seeded, vegetatively stabilized, or left undisturbed; and the location of well-established and unique trees and tree lines or tree clusters;
 - (6) The erosion and sediment control plan showing all measures necessary to meet the requirements of this Ordinance throughout all phases of construction and those remaining permanently after completion of the development of the site, including:
 - (A) Location and description, including standard details, of all sediment control measures, runoff control measures, including diversions, waterways and outlets, and design specifics of sediment basins and traps including outlet details;
 - (B) Location and description of all soil stabilization and erosion control measures, including seeding mixtures and rates, types of

sod, method of seedbed preparation, expected seeding dates, type and rate of lime and fertilizer application, kind and quantity of mulching for both temporary and permanent vegetative control measures, and types of non-vegetative stabilization measures;

- (C) Location and description of methods to prevent tracking of sediment off-site including construction entrance details, as appropriate;
- (D) Description of dust and traffic control measures;
- (E) Locations of stockpiles and description of stabilization methods;
- (F) Location of off-site fill or borrow volumes, locations and methods of stabilization;
- (G) Provisions for maintenance of control measures, including type and frequency of maintenance, easements, and estimates of the cost of maintenance; and
- (H) The proposed phasing of development of the site, including stripping and clearing, rough grading and construction, and final grading and landscaping. Phasing should identify the expected date on which clearing will begin, the estimated duration of exposure of cleared area, and the sequence of installation of temporary sediment control measures (including perimeter controls), installation of stormwater drainage, paving streets and parking areas, final grading and the establishment of permanent vegetative cover, and the removal of temporary measures. It shall be the responsibility of the applicant to notify the Permit Reviewer of any significant changes which occur in the site development schedule after the initial erosion and sediment control plan has been approved.

Section 4.49 - Design and Operation Standards and Requirements / Technical Handbooks

The preparation of soil erosion and sediment control plans shall follow the principles outlined in the "Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control", excepting Chapter Six published by the Urban Committee of the Association of Illinois Soil and Water Conservation Districts. (See Appendix). The design criteria, standards, and methods shall be prepared in accordance with the requirements of this Ordinance and the standards and specifications contained in "Illinois Urban Manual" (A Technical Manual Designed for Urban Ecosystem Protection and Enhancement), prepared for the Illinois Environmental Protection Agency by the U.S.D.A. Natural Resources Conservation Service, which standards and methods are hereby incorporated into this Ordinance by reference. In the event of conflict between the provisions of said manuals and of this Ordinance, this Ordinance shall govern.

Section 4.50 - Erosion and Sediment Control Design Requirements

Developments or redevelopments shall also meet the following:

- (a) Control measures shall be constructed to control runoff from the property so that to the extent possible sediment is retained on-site.
- (b) Temporary on-site control measures required shall be constructed and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.
- (c) Disturbed areas shall be stabilized with permanent measures within seven calendar days following the end of active disturbance, or re-disturbance consistent with the following criteria:
 - (1) Appropriate permanent stabilization measures shall include seeding, mulching, sodding, with non-vegetative measures as a last resort.
 - (2) Areas having slopes greater than eight percent (8%) shall be stabilized with sod, mat, or blanket in combination with seeding or an equivalent, as approved by the Permit Reviewer.
- (d) All temporary and permanent erosion and sediment control practices must be maintained and repaired as needed to assure effective performance of their intended function.
- (e) All temporary erosion and sediment control measures shall be disposed of in a proper manner within thirty (30) days after final site stabilization is achieved with permanent approved soil stabilization measures. Trapped sediment and other disturbed soils resulting from the disposition of temporary measures shall be permanently stabilized to prevent further erosion and sedimentation.
- (f) Site Development Requirements include on-site sediment control measures, as specified by the following criteria and shall be constructed as specified in the handbooks referenced in Section 4.49 of this Ordinance, and shall be functional prior to initiating clearing, grading, stripping, excavating or filling activities on the site.
 - (1) For developments or redevelopments less than or equal to one acre in total area, filter barriers (including filter fences, straw bales, or equivalent control measures) shall be constructed to control all on-site runoff. Vegetated filter strips, with a minimum width of twenty-five (25) feet, may be used as an alternative only where runoff in sheet flow is expected.
 - (2) For developments or re-developments more than one acre but less than five acres, a sediment trap or equivalent control measure shall be constructed at the downslope point of the disturbed area.
 - (3) For developments or redevelopments greater than or equal to five acres, a sediment basin or equivalent control measure shall be constructed at the downslope point of the disturbed area.
 - (4) Sediment basin and sediment trap designs shall provide for both "dry" detention and "wet" detention sediment storage. The detention storage shall be composed of equal volumes of "wet" detention storage and "dry" detention storage and each

shall be sized as regulated in this Ordinance. The release rate of the basin shall be that rate as regulated in Chapter 3.0. The elevation of the outlet structure shall be placed such that it only drains the dry detention storage.

- (5) The sediment storage shall be sized to store the estimated sediment load generated from the site over the duration of the construction period with a minimum storage equivalent to the volume or sediment generated in one year. For construction periods exceeding one year, the one year sediment load and a sediment removal schedule may be substituted.
 - (6) The alteration of sinkholes by filling, grading or excavation is prohibited, including an area within twenty-five (25) feet from the rim.
 - (7) To the extent possible and as otherwise regulated in this Ordinance, all native trees eight inches in diameter and larger shall be protected for their present and future value for erosion protection and other environmental benefits. Trees that have been selected for preservation shall be marked prior to the beginning of any clearing, grading, stripping, excavation, or filling of the site. A "No" construction zone shall be established and marked at the perimeter of the drip-line of each tree which is to be preserved. Planting of trees for erosion control is also encouraged.
- (g) Stormwater conveyance channels, including ditches, swales, and diversions, and the outlets of all channels and pipes shall be designed and constructed as regulated in this Ordinance. All constructed or modified channels shall be stabilized within 48 hours, consistent with the following standards and as required in the handbooks referenced in Section 4.49 of this Ordinance:
- (1) For grades up to four percent (4%), seeding in combination with mulch, erosion blanket, or an equivalent control measure approved by the Permit Reviewer shall be applied. Sod or erosion blanket or mat shall be applied to the bottom of the channel.
 - (2) For grades of four to eight percent (4% to 8%), sod or an equivalent control measure shall be applied in the channel.
 - (3) For grades greater than eight percent (8%), rock, rip-rap, or an equivalent control measure shall be applied over filter fabric or other type of soil protection as approved by the Permit Reviewer, or the grade shall be effectively reduced using drop structures.
- (h) Land disturbance activities in stream channels shall be avoided, where possible. If disturbance activities are unavoidable, the following requirements shall be met.
- (1) Construction vehicles shall be kept out of the stream channel to the maximum extent practicable. Where construction crossings are necessary, temporary crossings shall be constructed of non-erosive material, such as rip-rap or gravel.
 - (2) The time and area of disturbance of stream channels shall be kept to a minimum. The stream channel, including bed and banks, shall be stabilized within 48 hours after channel disturbance is completed, interrupted, or stopped.

- (3) Whenever channel relocation is necessary, the new channel shall be constructed under dry conditions and fully stabilized before flow is diverted, incorporating meanders, pool and riffle sequence, and riparian planting.
- (i) Storm sewer inlets and culverts shall be protected by sediment traps or filter barriers meeting accepted design standards and specifications.
- (j) Soil storage piles containing more than ten cubic yards of material shall not be located with a downslope drainage length of less than twenty-five (25) feet to a roadway, drainage channel, or sinkhole. Filter barriers, including straw bales, filter fence, or an equivalent approved by the Permit Reviewer, shall be installed immediately on the downslope side of the piles.
- (k) If dewatering devices are used, discharge locations shall be protected from erosion. All pumped discharges shall be routed through appropriately designed sediment traps or basins, or their equivalent and shall not be deposited into a sinkhole.
- (l) Each site shall have graveled (or equivalent) all weather entrance roads, access drives, and parking areas of sufficient length and width to prevent sediment from being tracked onto public or private roadways. Any sediment reaching a public or private road shall be removed by shoveling or street cleaning (not flushing) before the end of each workday and transported to a controlled sediment disposal area.

Section 4.51 - Maintenance of Control Measures

All soil erosion and sediment control measures necessary to meet the requirements of this Ordinance shall be maintained periodically by the Permittee and/or subsequent land owners during the period of land disturbance and development of the site in a satisfactory manner to ensure adequate performance. Subsequent land owners includes individual lot owners within a permitted development even when an individual lot is under an acre or does not meet the applicability requirements of this Ordinance. The Permittee shall be responsible to ensure that all provisions of the permit are complied with for all lots in any subdivision or development project during all land disturbing activities and development even when other owners, builders, or entities may be engaging in the development and land disturbing activities. This may be achieved by placing covenants on the deeds including for the care of common areas.

Chapter 5 - Long-Term Maintenance Responsibility

Section 5.0 - Long-Term Maintenance Responsibility

- (a) Developers shall provide for maintenance of engineered stormwater controls including stormwater retention or detention basins and other erosion control and stormwater management structures by setting up a home owner's association with appropriate covenants and deed restrictions or by providing a binding contract for the purpose of maintenance or by petitioning the Soil and Water Conservation District for an election to set up a watershed subdistrict. If the Developer is the only owner of the property to be in the subdistrict, his vote alone shall be considered a majority of property owners for purposes of referendum vote.

- (b) At such time as the District has authority to provide funding for long-term maintenance through tax revenues or some other source, it may waive (or reinstate) the requirement in subsection (a) of this Section by 2/3 vote of the Board at a regularly scheduled meeting.
- (c) The District may as an alternative to subsection (a) of this Section create an alternative perpetual-type fund for purposes of long-term maintenance of structural measures whereby an up front payment would be made by the permit applicant to the District to be used to cover future expenses for long-term maintenance costs of structures developed for stormwater management and erosion and sediment control by 2/3 vote. Public notice shall be given at least 30 days prior to a vote on this issue.

Chapter 6 Inspections

Section 6.0 - Inspections

- (a) The Soil and Water Conservation District Inspector and/or an inspector from the County or the respective municipalities adopting this Ordinance by Resolution within their jurisdictions may make inspections at any time to determine compliance with an issued permit and this Ordinance and may either approve that portion of the work completed or shall notify the permittee wherein the work fails to comply with the Stormwater Management and Erosion Control Permit as approved. Copies of all issued permits shall be kept on site during progress of work. Inspectors may but are not required to inspect at each stage of development but shall spot check development activities in the County.
- (b) In order to obtain inspections and to ensure compliance with this Ordinance, the permittee shall notify the District Inspector or the appropriate County or Municipal Inspector within two (2) working days of the completion of the construction stages specified below:
 - (1) Prior to any grading (including stripping and clearing);
 - (2) Upon completion of installation of the stormwater drainage and erosion and sediment control measures (including perimeter controls and diversions), prior to proceeding with any other earth disturbance or grading;
 - (3) After rough grading and temporary seeding;
 - (4) After final grading;
 - (5) After final stabilization and landscaping, prior to removal of sediment controls.
- (c) The District shall set up a self-certification process for developers so as to reduce the need for regular inspections at each stage of development and may set up a pre-construction meeting with each or any developer as needed.

Section 6.1 - Special Precautions

If at any stage of the grading of any development site, a District Inspector determines by inspection that the nature of the site is such that further work authorized by an existing permit is likely to imperil any property, public way, stream, lake, wetland, or drainage structure, a District Inspector may require, as a condition of allowing the work to continue, that such reasonable special precautions to be taken as is considered advisable to avoid the likelihood of such peril. "Special precautions" may include, but shall not be limited to, a more level exposed slope, construction of additional drainage facilities, berms,

terracing, compaction, or cribbing, installation of plant materials for erosion control, and obtaining and following recommendations of registered professional engineer with adequate knowledge and experience in the field of erosion, sediment control, and soils or by a Certified Professional in Erosion and Sediment Control for further work.

Section 6.2 - Work Stoppage

Whenever it appears that storm damage may result because the grading on any development site is not complete, work may be stopped by written order of the District Inspector and the permittee shall be required to install temporary structures or take such other measures as may be required to protect adjoining property or the public safety. On large developments or where unusual site conditions prevail, a District Inspector may specify the time of starting grading and time of completion or may require that the operations be conducted in specific stages so as to ensure completion of protective measures or devices prior to the advent of seasonal rains.

Chapter 7 ENFORCEMENT

Section 7.0 - Strict Enforcement

The terms of this Ordinance and the terms of any Stormwater Management and Erosion Control Permit issued pursuant to this Ordinance shall be strictly enforced either administratively by the District as set forth herein or by the filing of a civil or criminal case for the purpose of enforcing this Ordinance. Nothing in this Ordinance abridges the rights of affected private parties to sue for injunctive relief and damages. Enforcement shall include the seeking of injunctive relief which is specifically authorized herein and in accordance with 55 ILCS 5/5-12017 or such enforcement may include the bringing of criminal charges. The District may seek enforcement by referring any case to the St. Clair County State's Attorney, the Illinois Attorney General, or by hiring its own Counsel for the purpose of enforcement.

Section 7.1 - Stop-Work Orders and Revocation of Permits

In the event any person holding a permit issued pursuant to this Ordinance violates the terms of the permit, or carries on site development in such a manner as to materially adversely affect the health, welfare, environment, or safety of persons residing or working in the neighborhood of the development site or so as to be materially detrimental to the public welfare or injurious to property or improvements in the neighborhood, the District may suspend or revoke the Stormwater Management and Erosion Control Permit as follows:

- (a) Suspension of a permit shall be by a written Stop Work Order issued by the District Inspector and delivered to the permittee or his agent or the person performing the work. The Stop Work Order shall become effective immediately, shall state the specific violations cited, and shall state the conditions under which work may be resumed. A Stop Work Order shall remain in effect until the next regularly scheduled meeting of the District Board at which time it shall be taken up for discussion at the request of the permittee and may be overruled or modified by 2/3 vote of the Board members present.
- (b) No permit shall be revoked until a hearing is held by the District Board. Written notice of such hearing shall be served on the permittee, either personally or by registered mail, at least seven (7) days prior to the date set for the hearing and shall state:

- (1) The grounds for complaint or reasons for suspension or revocation, in clear and concise language; and
 - (2) The time and place where such hearing will be held.
- (c) At such hearing, the permittee may be represented by an attorney and shall be given an opportunity to be heard and may call witnesses and present evidence on his behalf. At the conclusion of the hearing the District Board shall determine whether the permit shall be revoked (and may take the matter under advisement until the next regularly scheduled Board meeting).

Section 7.2 - Violations and Penalties

- (a) No person shall construct, enlarge, alter, repair or maintain any grading, excavation or fill, or cause the same to be done, contrary to or in violation of any provisions of this Ordinance. Any person violating any of the provisions of this Ordinance shall be deemed guilty of a misdemeanor, and each day during which any violation of any of the provisions of this Ordinance is committed, continued, or permitted shall constitute a separate offense.
- (b) Upon civil finding of violation or upon criminal conviction of any violation of this Ordinance or of any provision of an issued permit, such person shall be liable for a fine up to the maximum authorized by criminal law or in the case of civil enforcement, of not more than Five Thousand Dollars (\$5000.00) for each offense. Each day constitutes a separate offense.
- (c) In addition to any other penalty authorized by this Section, any person found to be in violation of any provision of this Ordinance or any permit issued pursuant to this Ordinance shall be required to restore the site to the condition existing prior to commission of the violation, or to bear the expense of such restoration.

Effective Date

This Ordinance shall be in full force and effect from and after its passage and approval by referenda vote of 3/4 of the property owners voting in the referendum election as required by law and approved thereafter by a majority of the Soil and Water Conservation District Board.

Passed by Referendum vote and adopted by the St. Clair County Soil and Water Conservation District, this _____ day of _____, 2002.

TAZEWELL COUNTY, ILLINOIS
EROSION, SEDIMENT AND STORM WATER
CONTROL ORDINANCE

Revisions Approved: March 27, 1996
Implementation Date: April 15, 1996

Revision 1 (Fees): March 1, 2000

**TAZEWELL COUNTY, ILLINOIS
EROSION, SEDIMENT AND STORM WATER
CONTROL ORDINANCE**

Sec. 7-7-1. DEFINITIONS

"Adjacent lands": Surrounding land that may either impact a site, or be impacted by potential soil erosion, sediment and/or storm water run-off as a result of land disturbing activities conducted on a site, and at a minimum is an area within fifty (50) feet of the site.

"Appeals Board": The Erosion, Sediment and Storm Water Control Appeals Board.

"Areas of concentrated flow or bodies of water": Any area where water may accumulate or flow, whether continual or as the result of a storm event, including but not limited to lakes, rivers, streams, creeks, ponds, ditches, swales, gullies, ravines, street gutters and other similar features.

"Commission": The Tri-County Regional Planning Commission

"Control measure": Any proposed temporary or permanent measures to be installed to control erosion, sediment and storm water run-off from a project area.

"County": The County of Tazewell, Illinois.

"Department": The Tazewell County Planning and Zoning Department.

"Development": The division of a parcel of land into two or more parcels; the construction, reconstruction, conversion, structural alteration, relocation, or enlargement of any structure; any mining, excavation, landfill, or land disturbance; and any use or extension of the use of land.

"Disturbed Area": Any area of land on which the pre-development ground surface will be affected or altered by the development activities. This includes but is not limited to grading, clearing, stock piling, tracking and other similar activities.

"Erosion Control Administrator": The person appointed by the Tazewell County Board to administer this ordinance.

"Five year frequency storm event": The storm event rainfall depth during a twenty-four (24) hour period which is exceeded, on the average, once every five (5) years.

"Flood Insurance Rate Maps (FIRM)": Maps prepared by the federal emergency management agency (FEMA) that depict the special flood hazard areas (SFHA) within a community. These maps include insurance rate zones and floodplains any may or may not depict floodways.

"Institutional use": A religious, or public use, such as a church, library, public or private school, hospital, or government owner or operated building, structure or land use for public purpose.

"Land disturbing activity": Any change in land, which may result in soil erosion from water or wind and the movement of sediments into state or County waters or onto lands in the County, or a change in the amount and/or intensity of storm water run-off, including but not limited to, the covering with an impervious surface, stockpiling, clearing, grading, excavating, rehabilitating, transporting, depositing or filling of land.

"Normal agricultural practices": Activities associated with the preparation and tilling of land for the purposes of growing crops, or raising livestock, which may include, but are not limited to, the construction of conservation measures, plowing, disking and cultivating.

"Perimeter Control": Any control measure installed between the down slope side of the disturbed area and the property line and/or between the down slope side of the disturbed area and any area of concentrated flow.

"Pre-project condition": A condition that may impact erosion, sediment, or storm water run-off characteristics of a site prior to start of construction activity. The pre-project condition shall be based on the predominant land use for the past five (5) years. For example, if a site has been cropland for four (4) of the past five (5) years, and in grass just prior to development, the land use would be cropland for the pre-project condition.

"Project": Any development involving modification to land which involves a land disturbing activity.

"Regional storm water management system": A system which is designed, constructed, and maintained to provide storm water control for multiple land owners.

"Road": Any right-of-way that has been improved for the purposes of providing a surface for vehicular traffic, including any federal, state, county, township, and municipal controlled facilities.

"Single family dwelling": A building designed for or occupied by one family.

"Site": The lot or parcel on which the project is to be developed.

"Site Specific plan": A general erosion and sediment control permit required for projects where slope is greater than 10% and/or the site contains areas of concentrated flow or bodies of water. Slope shall be determined by the maximum slope indicated on the site according to the USDA Soil Survey or topographic survey as prepared by an Illinois Registered Surveyor.

"Standards": The Illinois Environmental Protection Agency's Illinois Urban Manual, A Technical Manual designed for Urban Ecosystem Protection and Enhancement published in 1995 and Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control published in 1988 by the Urban Committee of the Association of Illinois Soil and Water Conservation District now in effect or as hereafter amended, which is incorporated by reference herein, and the Tazewell County standards for Stormwater Design Analysis, found at Appendix "A" of this article, and the erosion and sediment control criteria and specifications found in Appendix "B" of this ordinance.

"Standard plan": A general erosion and sediment control permit for projects where slope is less than 10%, and there are no areas of concentrated flows or bodies of water on or water on or immediately adjacent to the site. Slope shall be determined by the maximum slope indicated on the site according to the USDA Soil Survey or topographic survey as prepared by an Illinois Registered Surveyor.

"Substantial completion": The point at which all exterior work is completed and the site can be used for the use intended.

"Twenty-five year frequency storm event": The storm event rainfall depth during a twenty-four (24) hour period which is exceeded, on the average, once every twenty-five (25) years.

"Two-family dwelling": A building designed for or occupied by two families.

"Two year frequency storm event": The storm event rainfall depth during a twenty-four (24) hour period which is exceeded, on the average, once every two (2) years.

"Utility Service Line" Means by which utility service is provided to service users, such as electric, telephone and television cable, or gas, water and sewer pipes.

"Working day": Shall not include Saturday, Sunday or any holiday when the Tazewell County Offices are closed.

Sec. 7-7-2. APPLICABILITY OF ARTICLE

This article shall apply to:

1. All projects within the boundaries and jurisdiction of the County. No land surface shall be disturbed unless an erosion and sediment control permit, or an erosion sediment and storm water control permit, has first been issued for that project, except as follows:
 - a. Land disturbing activities which do not involve the construction of any new single or two-family dwellings, and for which the disturbed area is less than 5,000 square feet;
 - b. Normal agricultural practices; or
 - c. Routine maintenance of roads and utility service lines.
 - d. Tazewell County Road Departments

The Erosion Control Administrator reserves the right to require any non-agricultural, construction development activity, regardless of disturbed area or type of activity, to comply with this ordinance if it is determined to be the cause of, or a contributor to an existing or potential erosion, sediment, or storm water impact.

2. Any land within the boundaries and jurisdiction of the County on which there is located a permanent storm water control measure which was installed pursuant to this ordinance.

Sec. 7-7-3. STANDARDS FOR DESIGN AND MAINTENANCE OF CONTROL MEASURES FOR SOIL EROSION, SEDIMENT AND STORM WATER

(a) EROSION AND SEDIMENT CONTROL MEASURES

All control measures required under this ordinance shall conform to the design criteria, standards, and specifications provided in the applicable standards, referenced in Appendix B, now in effect or as hereafter amended. All control measures installed shall be sufficient to prevent sediment from leaving the permit site during a 5-year frequency storm event. Measures shall be taken to prevent sediment from leaving the site. When sediment does leave the site, the owner, developer or contractor shall remove the sediment within four (4) hours, or by no later than the end of the work day. For example, installing a rock construction drive, or cleaning tires could be used to minimize tracking of sediment onto public roads.

(b) PERMANENT STORM WATER CONTROL MEASURES

All storm water controls shall be designed so that the peak discharge rate from the permitted area resulting from the 2-year and 25-year frequency storm events for the post-project condition do not exceed the corresponding storm event peak discharges for the pre-project condition. Evaluation of submitted plans shall be based on the Stormwater Design Analyses Standards in Appendix "A", at the end of this ordinance.

(c) REGIONAL STORM WATER CONTROL SYSTEMS

To allow for the beneficial development and maintenance of regional storm water management systems, where they are available and they are appropriate, an applicant may submit a design dependent on such a system. The applicant may submit documentation of the approval for the use of the regional storm water management facility from the governmental agency having jurisdiction over it. The applicant shall submit evidence showing that there will be no adverse flooding impact to any receiving stream between the point of discharge and the regional storm water facility. If the applicant is approved to use the regional storm water management system, the applicant may request exemption from the requirements in this section for permanent on site storm water controls from the Erosion Control Administrator. Such exemption shall not apply to any temporary storm water control measures required by this ordinance.

Sec. 7-7-4. MAINTENANCE OF CONTROL MEASURES

(a) EROSION, SEDIMENT, AND TEMPORARY STORM WATER CONTROL MEASURES

On-site sediment control measures shall be constructed and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

Sediment control measures and temporary storm water control measures are to be maintained so they are operating effectively until permanent ground surface protection and permanent storm water control measures are established in a manner specified in the applicable permit issued pursuant to this ordinance.

Fully functioning temporary sediment control measures (including but not limited to perimeter sediment controls) shall remain in place until the ground is stabilized with permanent ground cover. The intent of the article is to keep the sites protected at all times until the ground is permanently stabilized. In cases where it is not practical to leave the temporary sediment control measures in place prior to establishing permanent ground cover (for example when control measures need to be removed in order to grade the area or install pavement or sod) an exception will be made only if one of the conditions listed below will be met. In no way does adhering to one of the conditions below relieve the owner of responsibility to clean-up or repair any damages caused from sediment or storm water run-off leaving the site.

1. Permanent ground cover shall be established with pavement, aggregate or sod within three (3) days of the removal of sediment barriers.
2. Permanent vegetation shall be established by seeding with anchored mulch within three (3) days of removal of sediment barriers during the spring or fall seeding periods. However, on project areas with sloped not exceeding five (5) percent, permanent vegetation shall be established by seeding within three (3) days of the removal of sediment barriers during the spring or fall seeding periods. Summer seeding is acceptable on project areas which shall be watered. This does not apply to concentrated flow areas.

(b) **ADDITIONAL CONTROL MEASURES**

The Erosion Control Administrator may require additional control measures pursuant to the Standards if determined as necessary after site inspection, and prior to issuing the permit.

Sec. 7-7-5. GENERAL EROSION AND SEDIMENT CONTROL PERMITS

Before commencing any project involving construction of any new single or two-family dwelling or commencing any project with an area of 5,000 square feet or greater, the owner of the land, or his representative, shall be required to file an application for a General Erosion and Sediment Control Permit, as either a Standard or Site Specific plan, except as otherwise provided in Section 7-7-2 and 7-7-6.

(1) APPLICATION

The applicant shall file the application with the Department on forms provided by the Department. The fee for a Standard plan application shall be in the amount of \$100.00 for each permit, and the fee for a Site Specific plan application shall be \$175.00 for each permit. However, no fee shall be required for any project the purpose of which is agricultural, or initiated by a local unit of government. There shall be no refund of any fees paid and no application shall be accepted for filing unless the fee has been paid in full.

(2) APPLICATION REVIEW

Review of a General Erosion and Sediment Control Permit application shall be limited to verifying that the required information and permit fee have been provided and that it meets the standards. The Erosion Control Administrator shall issue or deny an application by: a) approving the permit for a standard plan within two (2) working days of the filing of a complete application; or b) initiate the review process for a site specific plan and approve the same within five (5) working days of the filing of a complete application. If the permit is denied, it shall be returned to the applicant with a written explanation of its denial. The application shall be deemed approved if no response is made within the time frames provided above.

(3) DURATION

The general erosion and sediment control permit shall be issued for a period not exceeding two (2) years.

(4) CONTENT OF GENERAL EROSION AND SEDIMENT CONTROL PERMIT

The General Erosion Control permit shall contain at a minimum the following general conditions:

1. That written approval be obtained from the Erosion Control Administrator prior to making any modification to the erosion and sediment control plan as set forth in the application; and
2. That all control measures identified in the application shall be installed; and
3. That all control measures shall be maintained during construction; and
4. Such other conditions as the Erosion Control Administrator deems appropriate to ensure compliance with the specific requirements and the intent of this ordinance.

(5) PERMANENT GROUND SURFACE COVER

Under all circumstances, temporary control measures shall be maintained in accordance with Section 7-7-4. Without exception, all disturbed areas must have permanent ground cover within six months of project completion, or within six months of occupancy, whichever comes first.

Sec. 7-7-6. EROSION, SEDIMENT, AND STORM WATER CONTROL PERMITS

Before commencing any commercial, institutional, multi-family or industrial or industrial project with an area of more than one-half (½) acre; or a project requiring subdivision approval by a unit of local government with an area of more than one-half (½) acre, the owner of the land, or his representative, shall be required to file an application for an Erosion, Sediment, and Storm Water Control Permit.

(1) APPLICATION

The applicant shall file the application with the Department on forms provided by the Department. The applicant shall supply the number of copies of application documents as provided in the application. Each application shall be accompanied by the following information:

- a. Existing site conditions map. A map of existing site conditions on a scale of at least one- inch equals one hundred (100) feet, showing the site and immediately adjacent areas and the locations of the following site information:
 1. Site boundaries and adjacent lands which accurately identify site location;
 2. Lakes, streams, wetlands, channels, ditches, and other water courses on and immediately adjacent to the site;
 3. Floodways and/or Zone A of the Floodplain as determined on the Flood Insurance Rate Map (FIRM), and indicating the map panel number;
 4. All off-site drainage onto or through the project site;
 5. Location and dimensions of storm water management systems on or adjacent to site;
 6. Locations and dimensions of structures, roads, highways, easements and paved areas; and
 7. Site topography: show contours at vertical intervals as follows:
 - (a) Slope of six (6) percent or less, two (2) foot intervals.
 - (b) Slope of over six (6) percent but less than fifteen (15) per cent, five (5) foot intervals.
 - (c) Slope of over fifteen (15) percent, ten (10) or twenty (20) foot intervals.
- b. Plan of final site conditions. A plan of final site conditions drawn to the same scale as the existing site map submitted pursuant to Section 7-7-6(1)a, and which includes information to accurately depict post-construction appearance of site, e.g., paved areas, buildings, landscaping, and other changes to the site, along with other predominate site features, e.g., open areas, bodies of water.
- c. Sediment and Erosion control practices. A site construction plan including:
 1. Locations and dimensions of all proposed land disturbing activities;
 2. Locations and dimensions of all temporary soil and aggregate stockpiles;
 3. Location, dimensions and construction details of all construction site management control measures necessary to meet the requirements of this ordinance, and including proposed revegetation of disturbed areas;

4. Statement regarding provisions for maintenance and maintenance requirements of the construction site management control measures during construction;
- d. Storm water management plans and controls. Design calculations and information related to the permanent storm water management system for any project with a net increase of impervious area greater than one-half ($\frac{1}{2}$) of an acre. For the purposes of this section, the net increase is the cumulative change since the implementation of this ordinance, April 15, 1996. For example, in year 1, a commercial site increases the parking lot by 20,000 square feet. In year 2, the same commercial site adds a building with an area of 20,000 square feet. In year 1, no permanent storm water control measures (or calculations) are required by the ordinance. In year 2, storm water calculations shall be submitted and shall be based on the total increase of 40,000 square feet of impervious area. The following information shall also be provided by the applicant:
 1. A map showing the drainage area divides, including off-site drainage areas that drain into the site.
 2. Location and identification of soil types for entire watershed;
 3. Location and identification of vegetative cover for entire watershed;
 4. Run-off curve number calculations for both pre- and post-project conditions for all subwatersheds;
 5. Time of concentration calculations for both pre- and post-project conditions for all subwatersheds, and include a map showing hydraulic flow lengths used;
 6. Peak flow-rate calculations for 2 year and 25 year storms for both pre- and post-project conditions;
 7. Design calculations for detention basin outlets for both 2 year and 25 year storms, include stage-storage table and discharge rating curve data or outflow calculations (refer to optional form in Appendix A);
 8. Location dimensions, and construction details of proposed detention basins and outlets;
 9. Detention volume calculations;
 10. Summary of peak flow-rates for pre-, post- and proposed conditions with detention showing that the requirements of the ordinance are met (refer to optional form in Appendix A); and
 - e. Schedule or sequence of development or installation of the elements of the site management control measures proposed above.
 - f. A detailed estimate of quantities and estimated costs, prepared by a registered professional engineer, of all control measures required under this section.
 - g. A plan of the continued management and maintenance of such permanent control measures.
 - h. Application fee. An application fee shall be submitted at the time of application. The fee shall be in the amount of \$75.00 per acre with a minimum fee of \$300.00 and a maximum fee of \$3,000.00. However, no fee shall be required for any project the purpose of which is agricultural.

A fractional acre shall be rounded to the nearest whole acre. There shall be no refund of any fees paid and no application shall be accepted for filing unless the fee has been paid in full.

(2) APPLICATION REVIEW

Within five (5) working days of submittal of the application, the Erosion Control Administrator shall respond in writing to the sediment and erosion control practices portion. Within twenty (20) working days the Erosion Control Administrator shall respond to the storm water management plans and control portion of the application by either issuing a permit, issuing a request for additional information, or issuing a statement denying the permit with an explanation of cause. The application shall be deemed approved if no response is made within the time frames stipulated above.

(3) FINANCIAL SECURITY AGREEMENT

Before any Erosion Sediment and Storm Water Control Permit is issued, the applicant shall deliver to the Erosion Control Administrator a surety bond, irrevocable letter of credit, or executed escrow agreement in the name of Tazewell County for one hundred (100) percent of the applicant's engineer's estimated cost for all control measures required under this section. If the control measures are necessitated by construction which is also subject to Title 7, Chapter 2 of The Tazewell County Code, the applicant may submit one surety bond, irrevocable letter of credit, or executed escrow agreement to cover one hundred (100) percent of both the Control Measures required pursuant to this section and the improvements governed by Title 7, Chapter 2, Section 41(d). A signed contractor's bid that meets the specifications of the engineer's estimate for the work can be used to establish the amount of security required, if such estimate is accepted by the Erosion Control Administrator.

(4) DURATION

The Erosion Sediment and Storm Water Control Permit shall be issued for a period not exceeding two years.

(5) PERMIT CONDITIONS

The Erosion Sediment and Storm Water Control Permit shall contain at a minimum the following general conditions:

- a. The written approval shall be obtained from the Erosion Control Administrator prior to making any modification to the approved erosion and sediment control plan as set forth in the permit;
- b. That all control measures required in the permit shall be installed;
- c. That all control measures shall be maintained during construction;
- d. Such other conditions as the Erosion Control Administrator deems appropriate.

(6) PERMANENT GROUND SURFACE COVER

Without exception, all disturbed areas must have permanent ground cover within six months of project completion, or within six (6) months of occupancy, whichever comes first.

(7) FINAL INSPECTION-NOTICE OF PERMANENT STORM WATER CONTROL MEASURES

Within fourteen (14) days after completion of construction, the applicant may notify the Erosion Control Administrator that the permanent storm water control measures are ready for final inspection. If the inspection shows that the control measures and maintenance plan comply with the Standards in Appendix "A", the Erosion Control Administrator shall issue a Notice of Permanent Storm Water Control Measures. The owner shall record the Notice with the Tazewell County Recorder of Deeds within fifteen (15) days after the Notice is issued.

Sec. 7-7-7. MAINTENANCE OF PERMANENT STORM WATER CONTROL MEASURES

Anyone owning property with a permanent storm water control measure existing thereon and installed pursuant to this ordinance, shall maintain the control measures so that it functions in compliance with the Standards.

Sec. 7-7-8. ENFORCEMENT AND STOP WORK ORDER FEE

This chapter shall be administered and enforced by the Erosion Control Administrator, who shall make or cause to be made, periodic inspections of all work authorized by permits issued in accordance with this ordinance to insure that said construction is in compliance with the provisions of the same; he shall make or cause to be made, investigations of violations of this chapter and shall cause any violations to be corrected.

Any permit issued pursuant to this ordinance shall be revoked by the Erosion Control Administrator when he finds from personal inspection or from competent evidence that the rules, regulations, or standards under which said permit was issued are being violated. To defray costs of administering stop work orders posted by the field inspectors as a result of a violation of any of the terms of this ordinance, a fee of one hundred and fifty dollars (\$150.00) per violation will be charged and an additional ten dollars (\$10.00) will be charged per day as the violation exists.

Sec. 7-7-9. PENALTY

The violation of any of the terms of the ordinance shall constitute an offense punishable by a fine not to exceed five hundred dollars (\$500.00), with each day the violation remains uncorrected constituting a separate offense. Such fine is in addition to any other remedy provided by law.

Sec. 7-7-10. APPEALS BOARD

The Appeals Board shall consider and decide upon appeals of any decision, order, or requirement of the Erosion Control Administrator made pursuant to this ordinance.

- (1) The Appeals Board is hereby authorized to be established. Said Appeals Board shall consist of 5 members. Each County Board Chairman of the counties adopting this ordinance shall appoint one member, the Soil & Water Conservation Districts shall collectively appoint one member, and the Chairman of the Tri-County Regional Planning Commission shall appoint one member. The members shall be: professional engineers, licensed architects, licensed landscape architects, landscape contractors, earthmoving contractors, home builders, or citizens who have extensive experience in control of storm water and soil erosion. The 5 members on the first Appeals Board shall draw lots to establish terms of 1, 2, 3, 4, and 5 years, respectively. Thereafter, as terms expire, each appointment shall be for 5 years.
- (2) The Chairman of the Appeals Board shall be elected at the beginning of each calendar year from among the members by a majority of the members.
- (3) All decisions of the Appeals Board must receive the support of a majority of its members. A majority of the members of the Appeals Board shall constitute a quorum for the transaction of business; and all questions which shall arise at meetings shall be determined by the votes of the majority of members present. The Appeals Board shall keep minutes of its proceedings showing the vote of each member upon every question or if absent or failing to vote, indicating such facts, and shall keep records of its examinations and other official actions. Every rule, and every order, requirement, decision, or determination of the Appeals Board shall

immediately be filed in the office of the Board and shall be a public record. The concurring vote of three (3) members of Appeals Board shall be necessary to reverse any order, requirement, decision or determination of the Erosion Control Administrator. The Appeals Board shall adopt its own rules of procedure not in conflict with state law or this chapter.

Sec. 7-7-11. APPEALS TO APPEALS BOARD

Any person directly aggrieved by any decision, order, requirement, or determination of the Erosion Control Administrator made pursuant to this ordinance shall have the right to appeal such action to the Appeals Board. Such appeal shall be made within thirty-five (35) days from the date of the action appealed from, shall be filed in writing, and shall include a short, concise statement of why the action is being appealed. The fee for such an appeal shall be \$45.00 payable to the Commission and is due with the application. In addition, the person filing the appeal shall pay all required publication costs associated with the appeal.

Upon receipt of a notice of appeal, the Commission shall set a date for a public hearing before the Appeals Board. Such public hearing shall commence not sooner than 15 days nor more than 30 days after the date of receipt of the notice of appeal. At least 15 days notice of the time and place of such hearing shall be published in a newspaper of general circulation in the County. The Appeals Board shall decide the appeal within seven (7) days after the conclusion of the public hearing. The Appeals Board may affirm, modify or reverse any appealed action.

Sec. 7-7-12. APPEALS TO COURT

Appeals from the Appeals Board shall be made in conformity with the provisions of the Illinois Administrative Review Act, 735 ILCS 5/3-101 et seq. Copies of any orders or proceedings ordered by the appellant shall be furnished to him at his own cost.

The provisions and sections of this ordinance shall be deemed separable and the invalidity of any portion of this chapter shall not affect the validity of the remainder.

Upon adoption by the Tazewell County Board, this ordinance shall be in full force and effective on April 15, 1996.

WOODFORD COUNTY, ILLINOIS
EROSION, SEDIMENT AND STORM WATER
CONTROL ORDINANCE

Adopted: April 9, 1996
Effective: April 15, 1996

**WOODFORD COUNTY, ILLINOIS
EROSION, SEDIMENT, AND STORM WATER
CONTROL ORDINANCE**

Sec. 7.5-61. DEFINITIONS

[For the purposes of this article, the following words, terms and phrases shall have the meanings respectively ascribed to them in this section, unless the context clearly indicates otherwise.]

Adjacent lands: Surrounding land that may either impact a site, or be impacted by potential soil erosion, sediment and/or storm water run-off as a result of land disturbing activities conducted on a site and at a minimum is an area within fifty (50) feet of the site.

Appeals Board: The Erosion, Sediment and Storm Water Control Appeals Board.

Areas of concentrated flow or bodies of water: Any area where water may accumulate or flow, whether continual or as the result of a storm event, including but not limited to lakes, rivers, streams, creeks, ponds, ditches, swales, gullies, ravines, street gutters and other similar features.

Commission: The Tri-County Regional Planning Commission.

Control Measure: Any proposed temporary or permanent measures to be installed to control erosion, sediment and storm water run-off from a project area.

County: The County of Woodford, Illinois.

Department: The Woodford County Department Zoning.

Development: The division of a parcel of land into two or more parcels; the construction, reconstruction, conversion, structural alteration, relocation, or enlargement of any structure; any mining, excavation, landfill, or land disturbance; and any use or extension of the use of land.

Disturbed Area: Any area of land on which the pre-development ground surface will be affected or altered by the development activities. This includes but is not limited to grading, clearing, stock piling, tracking and other similar activities.

Erosion Control Administrator: The person appointed by the Woodford County Board to administer this ordinance.

Woodford County, Illinois
Erosion, Sediment & Storm Water Control Ordinance

Flood Insurance Rate Maps (FIRM): Maps prepared by the federal emergency management agency (FEMA) that depict the special flood hazard areas (SFHA) within a community. These maps include insurance rate zones and floodplains and may or may not depict floodways.

Five year frequency storm event: The storm event rainfall depth during a 24 hour period which is exceeded, on the average, once every five (5) years.

Institutional use: A religious, or public use, such as a church, library, public or private school, hospital, or government owned or operated building, structure, or land used for public purpose.

Land disturbing activity: Any change in land, which may result in soil erosion from water or wind and the movement of sediments into State or County waters or on to lands in the County, or a change in the amount and/or intensity of storm water run-off, including but not limited to, the covering with an impervious surface, stockpiling, clearing, grading, excavating, rehabilitating, transporting, depositing or filling of land.

Normal agricultural practices: Activities associated with the preparation and tilling of land for the purposes of growing crops, or raising livestock, which may include, but are not limited to, the construction of conservation measures, plowing, disking, and cultivating.

Perimeter Control: Any control measure installed between the down slope side of the disturbed area and the property line and/or between the down slope side of the disturbed area and any area of concentrated flow.

Preproject condition: A condition that may impact erosion, sediment, or storm water run-off characteristics of a site prior to start of construction activity. The pre-project condition shall be based on the predominant land use for the past five years. For example, if a site has been cropland for four of the past five years and in grass just prior to development, the land use would be cropland for the pre-project condition.

Project: Any development involving modification to land which involves a land disturbing activity.

Regional storm water management system: A system which is designed, constructed and maintained to provide storm water control for multiple land owners.

Road: Any right-of-way that has been improved for the purposes of providing a surface for vehicular traffic, including any federal, state, county, township, and municipal controlled facilities.

Woodford County, Illinois
Erosion, Sediment & Storm Water Control Ordinance

Single family dwelling: A building designed for or occupied by one family.

Site: The lot or parcel on which the project is to be developed.

Site Specific plan: A general erosion and sediment control permit required for projects where slope is greater than 10% and/or the site contains areas of concentrated flow or bodies of water. Slope shall be determined by the maximum slope indicated on the site according to the USDA Soil Survey or topographic survey as prepared by an Illinois Registered Surveyor.

Standards: The Illinois Environmental Protection Agency's Illinois Urban Manual, A Technical Manual Designed for Urban Ecosystem Protection and Enhancement published in 1995 and Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control published in 1988 by the Urban Committee of the Association of Illinois Soil and Water Conservation Districts now in effect, or as hereafter amended which is incorporated by reference herein, ~~and~~ the Woodford County standards for Stormwater Design Analyses, found at Appendix "A" of this article, and the erosion and sediment control criteria and specifications found in Appendix "B" of this ordinance.

Standard plan: A general erosion and sediment control permit for projects where slope is less than 10% and there are no areas of concentrated flow or bodies of water on or immediately adjacent to the site. Slope shall be determined by the maximum slope indicated on the site according to the USDA Soil Survey or topographic survey as prepared by an Illinois Registered Surveyor.

Substantial completion: The point at which all exterior work is completed and the site can be used for the use intended.

Twenty-five year frequency storm event: The storm event rainfall depth during a 24 hour period which is exceeded, on the average, once every twenty-five (25) years.

Two-family dwelling: A building designed for or occupied by two families.

Two year frequency storm event: The storm event rainfall depth during a 24 hour period which is exceeded, on the average, once every two (2) years.

Utility Service Line: The means by which utility service is provided to service users, such as electric, telephone, television cable; gas, water and sewer pipes.

Working day: Shall not include Saturday, Sunday or any holiday when the Woodford County Courthouse is closed.

Sec. 7.5-62. APPLICABILITY OF ARTICLE

This article shall apply to:

1. All projects within the boundaries and jurisdiction of the County. No land surface shall be disturbed unless an erosion and sediment control permit, or an erosion, sediment and storm water control permit has first been issued for that project, except as follows:
 - a. Land disturbing activities which do not involve the construction of any new single or two-family dwellings and for which the disturbed area is less than 5,000 square feet;
 - b. Normal agricultural practices; or
 - c. Routine maintenance of roads, access ways and utility service lines.

The Erosion Control Administrator reserves the right to require any non-agricultural, construction development activity, regardless of disturbed area or type of activity, to comply with this article if it is determined to be the cause of or a contributor to an existing or potential erosion, sediment, or storm water impact.

2. Any land within the boundaries and jurisdiction of the County on which there is located a permanent storm water control measure, which was installed pursuant to this ordinance.

Sec. 7.5-63. STANDARDS FOR DESIGN AND MAINTENANCE OF CONTROL MEASURES FOR SOIL EROSION, SEDIMENT AND STORM WATER

(a) EROSION AND SEDIMENT CONTROL MEASURES. All control measures required under this ordinance shall conform to the design criteria, standards, and specifications provided in the applicable standards now in effect or as hereafter amended. All control measures installed shall be sufficient to prevent sediment from leaving the permit site during a 5-year frequency storm event. Measures shall be taken to prevent sediment from leaving the site. When sediment does leave the site, the owner, developer or contractor shall remove the sediment within four hours or by no later than the end of the workday. For example, installing a rock construction drive, or cleaning tires could be used to minimize tracking of sediment onto public roads.

(b) PERMANENT STORM WATER CONTROL MEASURES. All storm water controls shall be designed so that the peak discharge rate from the permitted area resulting from the two-year and twenty-five year frequency storm events for the postproject condition do not exceed the corresponding storm event peak discharges for the preproject condition. Evaluation of submitted plans shall be based on the Storm Water Design Analysis Standards in Appendix "A" at the end of this article.

(c) REGIONAL STORM WATER CONTROL SYSTEMS. To allow for the beneficial development and maintenance of regional storm water management systems, where they are available and they are appropriate, an applicant may submit a design dependent on such a system. The applicant shall submit documentation of the approval for the use of the regional storm water management facility from the governmental agency having jurisdiction over it. The applicant shall submit evidence showing that there will be no adverse flooding impact to any receiving stream between the point of discharge and the regional storm water facility. If the applicant is approved to use the regional storm water management system, the applicant may request exemption from the requirements in this section for permanent on site storm water controls from the Erosion Control Administrator. Such exemption shall not apply to any temporary storm water control measures required by this article.

Sec. 7.5-64. MAINTENANCE OF CONTROL MEASURES

(a) EROSION, SEDIMENT, AND TEMPORARY STORM WATER CONTROL MEASURES. On-site sediment control measures shall be constructed and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

Sediment control measures and temporary storm water control measures are to be maintained so they are operating effectively until permanent ground surface protection and permanent storm water control measures are established in a manner specified in the applicable permit issued pursuant to this article.

Fully functioning temporary sediment control measures (including, but not limited to perimeter sediment controls) shall remain in place until the ground is stabilized with permanent ground cover. The intent of the article is to keep the sites protected at all times until the ground is permanently stabilized. In cases where it is not practical to leave the temporary sediment control measures in place prior to establishing permanent ground cover (for example, when control measures need to be removed in order to grade the area or install pavement or sod), an exception will be made only if one of the conditions listed below will be met. In no way does adhering to one of the conditions below relieve the owner of responsibility to clean-up or repair any damages caused from sediment or storm water run-off leaving the site.

Woodford County, Illinois
Erosion, Sediment & Storm Water Control Ordinance

1. Permanent ground cover shall be established with pavement, aggregate or sod within three days of the removal of sediment barriers.
2. Permanent vegetation shall be established by seeding with anchored mulch within three days of removal of sediment barriers during the spring or fall seeding periods. However, on project areas with slopes not exceeding five (5%) percent, permanent vegetation shall be established by seeding within three days of the removal of sediment barriers during the spring or fall seeding periods. Summer seeding is acceptable on project areas which shall be watered. This does not apply to concentrated flow areas.

(b) ADDITIONAL CONTROL MEASURES. The Erosion Control Administrator may require additional control measures pursuant to the Standards if determined as necessary after site inspection and prior to issuing the permit.

Sec. 7.5-65. GENERAL EROSION AND SEDIMENT CONTROL PERMITS

Before commencing any project involving construction of any new single or two-family dwelling or commencing any project with an area of 5,000 square feet or greater, the owner of the land, or his representative, shall be required to file an application for a General Erosion and Sediment Control Permit, as either a Standard Plan or a Site Specific plan, except as otherwise provided in Section 7.5-62 and Section 7.5-66.

(1) APPLICATION. The applicant shall file the application with the Department on forms provided by the Department. The fee for a Standard plan application shall be in the amount of \$100.00 for each permit, and the fee for a Site Specific plan application shall be \$150.00 for each permit. However, no fee shall be required for any project the purpose of which is agricultural, or initiated by a local unit of government. There shall be no refund of any fees paid and no application shall be accepted for filing unless the fee has been paid in full.

(2) APPLICATION REVIEW. Review of a General Erosion and Sediment Control Permit application shall be limited to verifying that the required information and permit fee have been provided and that it meets the standards. The Erosion Control Administrator shall issue or deny an application by: a) approving the permit for a standard plan within two (2) working days of the filing of a completed application; or b) initiate the review process for a site-specific plan and approve the same within five (5) working days of the filing of a complete application. If the permit is denied, it shall be returned to the applicant with a written explanation of its denial. The application shall be deemed approved if no response is made within the time frames provided above.

(3) DURATION. The general erosion and sediment control permit shall be issued for a period not exceeding two (2) years.

(4) CONTENT OF GENERAL EROSION AND SEDIMENT CONTROL

PERMIT. The General Erosion and Sediment Control permit shall contain at a minimum the following general conditions:

- a. That written approval be obtained from the Erosion Control Administrator prior to making any modification to the erosion and sediment control plan as set forth in the application; and
- b. That all control measures identified in the application shall be installed; and
- c. That all control measures shall be maintained during construction; and
- d. Such other conditions as the Erosion Control Administrator deems appropriate to ensure compliance with the specific requirements and intent of this article.

(5) PERMANENT GROUND SURFACE COVER. Under all circumstances, temporary control measures shall be maintained in accordance with Section 7.5-64. Without exception, all disturbed areas must have permanent ground cover within six months of project completion, or within six months of occupancy, whichever comes first.

Sec. 7.5-66. EROSION, SEDIMENT, AND STORM WATER CONTROL PERMITS

Before commencing any commercial, institutional, multi-family or industrial project with an area of more than one-half (1/2) acre; or a project requiring subdivision approval by a unit of local government with an area of more than one-half (1/2) acre, the owner of the land, or his representative, shall be required to file an application for an Erosion, Sediment, and Storm Water Control Permit.

(1) APPLICATION. The applicant shall file the application with the Department on forms provided by the Department. The applicant shall supply the number of copies of application documents as provided in the application. Each application shall be accompanied by the following information:

- a. Existing site conditions map. A map of existing site conditions on a scale, of at least one inch equals one hundred (100) feet, showing the site and immediately adjacent areas and the locations of the following site information:
 1. Site boundaries and adjacent lands which accurately identify site location;
 2. Lakes, streams, wetlands, channels, ditches, and other water courses on and immediately adjacent to the site;
 3. Floodways and/or Zone A of the Floodplain as determined on the Flood Insurance Rate Map (FIRM), and indicating the map panel number;
 4. All off-site drainage onto or through the project site;
 5. Location and dimensions of storm water management components on or adjacent to site;
 6. Locations and dimensions of structures, roads, highways, easements and paved areas; and

Woodford County, Illinois
Erosion, Sediment & Storm Water Control Ordinance

7. Site topography: show contours at vertical intervals as follows:
 - (I) Slope of six (6) per cent or less, two-foot interval.
 - (II) Slope of over six (6) per cent but less than fifteen (15) per cent, five-foot interval.
 - (III) Slope of over fifteen (15) per cent, ten- or twenty-foot intervals.

- b. Plan of final site conditions. A plan of final site conditions drawn to the same scale as the existing site map submitted pursuant to subsection (1)a, and which includes information to accurately depict post-construction appearance of site, e.g., paved areas, building, landscaping, and other changes to the site, along with other predominate site features, e.g., open areas, bodies of water.

- c. Sediment and Erosion control practices. A site construction plan including:
 1. Locations and dimensions of all proposed land disturbing activities;
 2. Locations and dimensions of all temporary soil and aggregate stockpiles;
 3. Location, dimension and construction details of all construction site management control measures necessary to meet the requirements of this article and including proposed revegetation of disturbed areas;
 4. Statement regarding provisions for maintenance and maintenance requirements of the construction site management control measures during construction;

- d. Storm water management plans and controls. Design calculations and information related to the permanent storm water management system for any project with a net increase of impervious area greater than one-half (1/2) of an acre. For the purposes of this section, the net increase is the cumulative change since the implementation of this article, April 15, 1996. For example, in year 1, a commercial site increases the parking lot by 20,000 square feet. In year 2, the same commercial site adds a building with an area of 20,000 square feet. In year 1, no permanent storm water control measures (or calculations) are required by the ordinance. In year 2, storm water calculations shall be submitted and shall be based on the total increase of 40,000 square feet of impervious area. The following information shall also be provided by the applicant:
 1. A map showing the drainage area divides, including off-site drainage areas that drain into the site;
 2. Location and identification of soil types for entire watershed;
 3. Location and identification of vegetative cover for entire watershed;

Woodford County, Illinois
Erosion, Sediment & Storm Water Control Ordinance

4. Run-off curve number calculations for both pre- and post-project conditions for all subwatersheds;
 5. Time of concentration calculations for both pre-and post-project conditions for all subwatersheds, and include a map showing hydraulic flow lengths used;
 6. Peak flow-rate calculations for 2 year and 25 year storms for both pre-and post-project conditions;
 7. Design calculations for detention basin outlets for both 2 year and 25 year storms, include stage-storage table and discharge rating curve data or outflow calculations (refer to optional form in Appendix A);
 8. Location dimensions, and construction details of proposed detention basins and outlets;
 9. Detention volume calculations;
 10. Summary of peak flow-rates for pre-, post- and proposed conditions with detention showing that the requirements of the ordinance are met (refer to optional form in Appendix A); and
- e. Schedule or sequence of development or installation of the elements of the site management control measures proposed above.
 - f. A detailed estimate of quantities and estimated costs, prepared by a registered professional engineer, of all control measures required under this section.
 - g. A plan of the continued management and maintenance of such permanent control measures.
 - h. Application fee. An application fee shall be submitted at the time of application. The fee shall be in the amount of twenty-five dollars (\$25.00) per acre with a minimum fee of one hundred dollars (\$100) and a maximum fee of \$2,000.00. However, no fee shall be required for any project the purpose of which is agricultural.

A fractional acre shall be rounded to the nearest whole acre. There shall be no refund of any fees paid and no application shall be accepted for filing unless the fee has been paid in full.

(2) APPLICATION REVIEW. Within five (5) working days of submittal of the application, the Erosion Control Administrator shall respond in writing to the sediment and

Woodford County, Illinois
Erosion, Sediment & Storm Water Control Ordinance

erosion control practices portion. Within twenty (20) working days of submittal of the application, the Erosion Control Administrator shall respond to the storm water management plans and control portion of the application by either issuing a permit, issuing a request for additional information, or issuing a statement denying the permit with an explanation of cause. The application shall be deemed approved if no response is made within the time frames stipulated above.

(3) FINANCIAL SECURITY AGREEMENT. Before any Erosion, Sediment and Storm Water Control Permit is issued, the applicant shall deliver to the Erosion Control Administrator a surety bond, irrevocable letter of credit or executed escrow agreement in the name of Woodford County for one hundred (100) percent of the applicant's engineer's estimated cost for all control measures required under this section. If the control measures are necessitated by construction which is also subject to Chapter 20 of The Woodford County Code, the applicant may submit one surety bond, irrevocable letter of credit or executed escrow agreement to cover one hundred (100) percent of both the Control Measures required pursuant to this section and the improvements governed by Chapter 20, Section 20-24. A signed contractor's bid that meets the specifications of the engineer's estimate for the work can be used to establish the amount of security required, if such estimate is accepted by the Erosion Control Administrator.

(4) DURATION. The Erosion, Sediment and Storm Water Control Permit shall be issued for a period not exceeding two years.

(5) PERMIT CONDITIONS. The Erosion, Sediment and Storm Water Control Permit shall contain at a minimum the following general conditions:

- a. That written approval be obtained from the Erosion Control Administrator prior to making any modification to the approved erosion and sediment control plan as set forth in the permit;
- b. That all control measures required in the permit shall be installed;
- c. That all control measures shall be maintained during construction;
- d. Such other conditions as the Erosion Control Administrator deems appropriate.

(6) PERMANENT GROUND SURFACE COVER. Without exception, all disturbed areas must have permanent ground cover within six months of project completion, or within six months of occupancy, whichever comes first.

(7) FINAL INSPECTION; NOTICE OF PERMANENT STORM WATER CONTROL MEASURES. Within fourteen (14) days after completion of construction, the applicant shall notify the Erosion Control Administrator that the permanent storm water control measures are ready for final inspection. If the inspection shows that the control measures and maintenance plan comply with the Standards in Appendix "A" of this article, the Erosion Control Administrator shall issue a Notice of Permanent Storm Water Control Measures. The owner

Woodford County, Illinois
Erosion, Sediment & Storm Water Control Ordinance

shall record the Notice with the Woodford County Recorder of Deeds within fifteen (15) days after the Notice is issued.

Sec. 7.5-67, MAINTENANCE OF PERMANENT STORM WATER CONTROL MEASURES.

Anyone owning property with a permanent storm water control measure existing thereon and installed pursuant to this ordinance shall maintain the control measure so that it functions in compliance with the Standards.

Sec. 7.5-68 ENFORCEMENT AND STOP WORK ORDER FEE.

This chapter shall be administered and enforced by the Erosion Control Administrator, who shall make or cause to be made, periodic inspections of all work authorized by permits issued in accordance with this ordinance to insure that said construction is in compliance with the provisions of the same; he shall make or cause to be made, investigations of violations of this chapter and shall cause any violations to be corrected.

Any permit issued pursuant to this ordinance shall be revoked by the Erosion Control Administrator when he finds from personal inspection or from competent evidence that the rules, regulations or standards under which said permit was issued are being violated. To defray costs of administering stop work orders posted by the field inspectors as a result of a violation of any of the terms of the ordinance, a fee of one hundred dollars (\$100) per stop work order will be charged.

Sec. 7.5-69. PENALTY.

The violation of any of the terms of the ordinance shall constitute an offense punishable by a fine not to exceed five hundred dollars (\$500.00), with each day the violation remains uncorrected constituting a separate offense. Such fine is in addition to any other remedy provided by law.

Sec. 7.5-70. APPEALS BOARD.

The Appeals Board shall consider and decide upon appeals of any decision, order, or requirement of the Erosion Control Administrator made pursuant to this article.

- (1) The Appeals Board is hereby authorized to be established. Said Appeals Board shall consist of 5 members. Each County Board Chairman of the counties adopting this ordinance shall appoint one member, the Soil & Water Conservation Districts shall collectively appoint one member, and the Chairman of the Tri-County Regional Planning Commission shall appoint one

Woodford County, Illinois
Erosion, Sediment & Storm Water Control Ordinance

member. The members shall be: professional engineers, licensed architects, licensed landscape architects, landscape contractors, earthmoving contractors, home builders, or citizens who have extensive experience in control of storm water and soil erosion. The 5 members on the first Appeals Board shall draw lots to establish terms of 1, 2, 3, 4, and 5 years, respectively. Thereafter, as terms expire, each appointment shall be for 5 years.

The chairman of the Appeals Board shall be elected at the beginning of each calendar year from among the members by a majority of the members.

All decisions of the Appeals Board must receive the support of a majority of its members. A majority of the members of the Appeals Board shall constitute a quorum for the transaction of business; and all questions, which shall arise at meetings, shall be determined by the votes of the majority of members present. The Appeals Board shall keep minutes of its proceedings showing the vote of each member upon every question or if absent or failing to vote, indicating such facts, and shall keep records of its examinations and other official actions. Every rule, and every order, requirement, decision, or determination of the Appeals Board shall immediately be filed in the office of the Board and shall be a public record. The concurring vote of three (3) members of Appeals Board shall be necessary to reverse any order, requirement, decision or determination of the Erosion Control Administrator. The Appeals Board shall adopt its own rules of procedure not in conflict with State law or this chapter.

Sec. 7.5-71. APPEALS TO APPEALS BOARD.

Any person directly aggrieved by any decision, order, requirement, or determination of the Erosion Control Administrator made pursuant to this article shall have the right to appeal such action to the Appeals Board. Such appeal shall be made within thirty-five (35) days from the date of the action appealed from, shall be filed in writing, and shall include a short, concise statement of why the action is being appealed. The fee for such an appeal shall be \$45.00 payable to the Commission and is due with the application. In addition, the person filing the appeal shall pay all required publication costs associated with the appeal.

Upon receipt of a notice of appeal, the Commission shall set a date for a public hearing before the Appeals Board. Such public hearing shall commence not sooner than 15 days nor more than 30 days after the date of receipt of the notice of appeal. At least 15 days notice of the time and place of such hearing shall be published in a newspaper of general circulation in the County. The Appeals Board shall decide the appeal within seven (7) days after the conclusion of the public hearing. The Appeals Board may affirm, modify or reverse any appealed action.

Sec. 7.5-72. APPEALS TO COURT.

Woodford County, Illinois
Erosion, Sediment & Storm Water Control Ordinance

Appeals from the Appeals Board shall be made in conformity with the provisions of the Illinois Administrative Review Act, 735 ILCS 5/3-101 et. seq. Copies of any orders or proceedings ordered by the appellant shall be furnished to him at his own cost.

Sec. 7.5-73. EFFECTIVE DATE.

Upon adoption by the Woodford County Board, these amendments shall be in full force and effect on April 15, 1996.

City of Belvidere
Section 151.45. Erosion and sediment control requirements
excerpted from
Chapter 151 Subdivisions Ordinance
Article III. Improvement, Reservation and Design Requirements

Sec. 151.45. Erosion and sediment control requirements.

The following abbreviations or acronyms will be used in this section: The City Of Belvidere will henceforth be the city; the Belvidere Department of Public Works will be BDPW; the Belvidere Building Department will be BBD; and the Boone County Soil and Water Conservation District will be BCSWCD.

Handbooks adopted by reference. The standards and specifications contained in the latest editions of the "Illinois Urban Manual - A Technical Manual for Urban Ecosystem Protection and Enhancement" and the "Procedures and Standards for Urban Soil Erosion and Sedimentation Control," commonly known as the green book, are hereby incorporated into this section and made a part hereof by reference for the purpose of delineating procedures and methods of operation under site development and erosion and sediment control plans.

(a) *Objective.* It is the objective of this section to control soil erosion and sediment caused by development activities, including clearing, grading, striping, excavating, and filling of land in the city. Measures taken to control soil erosion and offsite sediment runoff shall be adequate to assure that sediment is not transported from the site by a storm event of ten-year frequency or less. The following principles shall apply to all regulated development activities within the city and to the preparation of the submissions required of this section:

- (1) Plan the development to fit the particular topography, soils, drainage patterns, and natural vegetation of the site.
- (2) Preserve and protect areas of natural vegetation on the site.
- (3) Take special precautions to prevent damages which could result from development activity adjacent to watercourses, lakes, and wetlands.
- (4) Minimize the extent and duration of the area exposed at one time.
- (5) Apply temporary erosion control practices as soon as possible to stabilize exposed soils and prevent on-site damage.
- (6) Install sediment basins or traps, filter barriers, diversions, and perimeter control prior to site clearing and grading to protect disturbed areas from off-site and on-site runoff, and to prevent sediment damage to areas located downslope of the development site.
- (7) Keep runoff velocities low and provide for retention of runoff on the site.
- (8) Provide measures to prevent sediment from being tracked onto public or private roadways.

- (9) Implement final grading and install permanent vegetation on disturbed areas as soon as possible.
- (10) Implement through inspection, maintenance and follow-up program.

(b) *Site development.* Except as otherwise provided in this section, no person shall commence or perform any clearing, grading, stripping, excavating, or filling of land which meets the following provisions without having first obtaining approval for a complete set of construction plans, including a detailed erosion and sediment control plan from the BDPW and BCSWCD.

- (1) Any land disturbing activity (i.e., clearing, grading, stripping, excavation, fill or any combination thereof) that will affect an area in excess of 5,000 square feet.
- (2) Any land disturbing activity that will affect an area in excess of 500 square feet if the activity is within 100 feet of a lake, pond, stream, or wetland; or
- (3) Excavation, fill, or any combination thereof that will exceed 100 cubic yards.
- (4) The BPWD and/or the BBD, in consultation with the BCSWCD, reserves the right to require any non-agricultural, construction development activity, regardless of disturbed area or type of activity, to comply with this section if it is determined to be the cause of or a contributor to an existing or potential erosion, sediment, or stormwater impact.
 - a. Erosion and sediment control planning for individual home sites may utilize an erosion and sediment control planning "kit" provided by the BCSWCD.

(5) Exceptions:

- a. Agricultural use of land, including the implementation of conservation measures included in a farm conservation plan approved by the Boone County Soil and Water Conservation District (BCSWCD), and including the construction of agricultural structures;
- b. Installation, renovation, or replacement of a septic system to serve an existing dwelling or structure.

(c) *Application for approval of an erosion and sediment control plan.* Shall be made by the owner of the property or his/her authorized agent to the BDPW. Each application shall bear the name(s) and address(es) of the owner or developer of the site and of any consulting firm retained by the applicant together with the name of the applicant's principal contact at such firm, and shall be accompanied by a filing fee as indicated in the fee schedule on file at the BPWD. Each application shall require the signature of a licensed professional engineer as an assurance that the development will take place in accordance with the approved plans. Each application shall include certification that any land clearing, construction, or development involving the movement of earth shall be in accordance with the plans approved upon issuance of the permit.

- (1) *Submissions:* Each application for an approved erosion and sediment control plan shall be accompanied by the following information:

- a. Name and address of applicant, common address and legal description of the site where the development will take place, mailing address of property owner and the signature of the applicant or the applicant's agent.
- b. A vicinity map in sufficient detail to enable easy location in the field of the site for which the plan approval is sought, and including the boundary line and approximate acreage of the site, and a legend and scale. The legend shall describe or explain any and all map symbols, abbreviations, or acronyms used on the map.

The BPWD or BBD, in consultation with the BCSWCD, may waive specific requirements for the content of submissions upon finding that the information submitted is sufficient to show that the work will comply with the objectives and principles of this section.

- (c) A development plan of the site showing:
 1. Existing topography of the site and adjacent land within approximately 100 feet of the boundaries, drawn at no greater than two-foot contour intervals and clearly portraying the conformation and drainage pattern of the area. All topographic information drawn or shown on any map shall represent elevations acquired from site specific survey work, not a reproduction of United States Geologic Survey topographic maps or similar product. The scale of such maps shall not exceed one inch of map distance equaling 100 feet of ground distance. All elevations shall be referenced to National Geodetic Vertical Datum (NGVD) 1929 adjusted.
 2. The location of existing buildings, structures, utilities, streams, lakes, floodplains, wetlands, and depressions, drainage facilities, vegetative cover, paved areas, and other significant natural or man-made features on the site and adjacent land within 100 feet of the boundary.
 3. A general description of the predominant soil types on the site, their location, and their limitations for the proposed use. Such data shall be taken from the USDA Soil Survey of Boone County and/or the criteria established by local ordinance. The applicant may utilize a Natural Resource Information (NRI) report prepared by the Boone County Soil and Water Conservation District (BCSWCD) for this information.
 4. Proposed use of the site, including present development and planned utilization; areas of clearing, stripping, grading, excavation, and filling; proposed contours, finished grades, and street profiles; provisions for storm drainage, including storm sewers, swales, detention basins, and any other measures to control the rate of runoff, with a drainage area map indications of flow directions, and computations; kinds and locations of utilities; and areas and acreage proposed to be paved, covered, sodded or seeded, vegetatively stabilized, or left undisturbed. Any map

used to portray this information shall be prepared at the same scale as the topographic map referenced above.

- d. An erosion and sediment control plan, including a narrative, shall be submitted showing all measures necessary to meet the objectives of this section throughout all phases of construction. The development of a soil erosion and sediment control plan shall follow the requirements of this section and the procedures in the latest edition of the "Illinois Procedures and Standards for Urban Soil Erosion and Sediment Control" (commonly known as the green book), which is hereby incorporated into this section by reference. The BDPW, in consultation with the BCSWCD, may waive specific requirements for the content of submissions upon finding that the information submitted is sufficient to show that the work will comply with the objectives and principles of this section. Permanent erosion and sediment control features needed at the completion of any development site shall be included in the submittal. The submitted erosion and sediment control plan shall include:
1. Location and description, including standard details, of all sediment control measures and design specifics of sediment basins and traps, including outlet details.
 2. Location and description of all soil stabilization and erosion control measures, including seeding mixtures and rates, types of sod, method of seedbed preparation (type and extent of tillage, weed control, planting equipment, etc.), expected seeding dates, type, method and rate of lime and fertilizer application (soil fertility testing required), kind and quantity of mulching for both temporary and permanent vegetative control measures, and types of nonvegetative stabilization measures.
 3. Location and description of all runoff control measures, including diversions, waterways, and outlets.
 4. Location and description of methods to prevent tracking of sediment offsite, including construction entrance details, as appropriate.
 5. Description of dust and traffic control measures.
 6. Locations of stockpiles and description of stabilization methods.
 7. Description of offsite fill or borrow volumes, locations, and methods of stabilization.
 8. Provisions for maintenance of control measures, including type and frequency of maintenance, easements, and estimates of the cost of maintenance.

9. Identification (name, address, and telephone) of the person(s) or entity which will have legal responsibility for maintenance of erosion control structures and measures during development and after development is completed.
- e. The proposed phasing of development of the site, shall include stripping and clearing, rough grading, and construction, and final grading and landscaping. Phasing shall identify the expected date on which clearing will begin, the estimated duration of exposure of cleared areas, and the sequence of installation of temporary sediment control measures (including perimeter controls), clearing and grading, installation of storm drainage, paving streets and parking areas, final grading and the establishment of permanent vegetative cover, and the removal of temporary measures. It shall be the responsibility of the applicant to notify the city's public works department and/or their authorized review agent of any changes which occur in the site development schedule after the initial erosion and sediment control plan has been approved.

(d) *Bonds.* The applicant is required to file with the city a performance bond, letter of credit, or other improvement security satisfactory to the city's attorney in an amount deemed sufficient by the BDPW to cover all costs of improvements, landscaping, maintenance of improvements and landscaping, and soil erosion and sediment control measures for such period as specified by the city, and engineering and inspection costs to cover the cost of failure or repair of improvements installed on the site.

(e) *Review and approval.* Each application for an approved erosion and sediment control plan shall be reviewed and acted upon according to the following procedures:

- (1) As a condition of this section the BDPW shall require the applicant or designated agent to consult with the BCSWCD on soil erosion and sediment control plans. The applicant shall submit all required items to the district the same day that the application is made to BDPW.

The BCSWCD shall:

- a. Review the applicants soil erosion and sediment control plans and provide written evaluation to the BDPW regarding the adequacy (effectiveness) to address the provisions of this section. The BCSWCD shall retain the services of a certified professional in erosion and sediment control (CPESC) to perform the services outlined in this section. The BCSWCD may assess a fee to be paid by the applicant for performing these services.
- b. Attend a preconstruction meeting with the applicant or designated agent to review implementation of erosion and sediment control plans.
- c. Conduct on-site inspections during the active construction phases of land development projects to determine whether site development is in compliance with the approved erosion and sediment control plans, and determine adjustments needed to the approved plans. After construction has been completed, determine whether permanent site stabilization has been achieved and identify operation and maintenance needs.

- d. Prepare correspondence as needed regarding the effectiveness (or corrective measures needed) or adequacy of soil erosion and sediment control measures.
 - e. Consult with land developers, consultants, and contractors concerning the design criteria, installation and maintenance procedures and other information regarding conservation practices recommended under the provisions of this section.
- (2) The BDPW shall:
- a. After review of the application and required submissions if it is found to be in conformance with the provisions of this section, approve the erosion and sediment control plan.
 - b. Approve the erosion and sediment control plan subject to such reasonable conditions as may be necessary to secure substantially the objectives of this section, and issue the approval subject to these conditions; or
 - c. Disapprove the erosion and sediment control plan, indicating the deficiencies and the procedure for submitting a revised application and/or submission.
- (3) No approval for an erosion and sediment control plan shall be issued for an intended development site unless one or more of the following have been obtained:
- a. The development, including but not limited to subdivisions and planned unit development, has been approved by the city where applicable; or
 - b. Such permit is accompanied by or combined with a valid building permit issued by the city building inspector; or
 - c. The proposed earth moving is coordinated with any overall development program previously approved by the city for the area in which the site is situated; and
 - d. All relevant federal and state permits including, but not limited to: NPDES, 404, 401, NRI's, etc.) have been received for the portion of the site subject to soil disturbance;
 - e. Expiration of permit/appeals process.
- (f) *Design and operation standards and requirements.*
- (1) All clearing, grading, stripping, excavating, and filling which is subject to the approval requirements of this section shall be subject to the applicable standards and requirements set forth and/or referenced in this section.
- (2) Responsibility. The permittee shall not be relieved of responsibility for damage to persons or property otherwise imposed by law, and the city or its officers or agents, including the directors and staff of the BCSWCD will not be made liable for such damage, by:

- a. The issuance of a permit under this section;
 - b. Compliance with the provisions of that permit or with conditions attached to it by the city;
 - c. Failure of the city officials to observe or recognize hazardous or unsightly conditions;
 - d. Failure of the city officials to recommend denial of or to deny a permit; or
 - e. Exemptions from the permit requirements of this section.
- (3) Site design requirements. Practice standards and specifications for measures outlined in the soil erosion and sediment control plan shall follow criteria in the latest edition of the "Illinois Urban Manual: A Technical Manual Designed for Urban Ecosystem Protection and Enhancement", which is hereby incorporated into this section by reference.

The BDPW, in consultation with the BCSWCD, may waive specific requirements upon finding that the objectives and principles of this section have been met.

Onsite sediment control measures, as specified by the following criteria, shall be constructed and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

- a. For disturbed areas draining less than one acre, filter barriers (including filter fences (heavy duty fabric only) or equivalent control measures shall be constructed to control all offsite runoff as specified in the referenced handbooks. Vegetated filter strips, with a minimum width of 35 feet, may be used as an alternative only where runoff is expected to be sheet flow (vegetated filter strips must be established prior to land disturbing activities).
- b. Filter barriers are appropriate sediment control measures for small drainage areas where concentrated flow is not present or expected.
- c. For disturbed areas draining more than one but less than five acres, a sediment trap or equivalent control measure shall be constructed at the downslope point(s) of the disturbed area(s). Sediment barriers such as silt fences are ineffective and unreliable in such situations. In particular, they are subject to undercutting and blowout due to high water velocities.
- d. For disturbed areas draining more than five acres, a sediment basin or equivalent control measure shall be constructed at the downslope point(s) of the disturbed area(s).
- e. Sediment basins and sediment traps designs shall provide for both detention storage and sediment storage. The detention storage shall be composed of equal volumes of "wet" detention storage and "dry" detention storage and each shall be sized for 25-year, 24-hour runoff from the site under maximum runoff conditions during construction. The release

rate of the basin shall be that rate required to achieve minimum detention times of at least ten hours. The elevation of the outlet structure shall be placed such that it only drains the dry detention storage.

- f. The sediment storage shall be sized to store the estimated sediment load generated from the site over the duration of the construction period with a minimum storage equivalent to the volume of sediment generated in one year. For construction periods exceeding one year, the one-year sediment load and a sediment removal schedule may be substituted.
- (4) Stormwater conveyance channels, including ditches, swales, and diversions, and the outlets of all channels and pipes shall be designed to withstand the expected flow velocity from the 100-year frequency storm without erosion. All constructed or modified channels shall be stabilized within 48 hours, consistent with the following standards:
- a. For grades up to four percent, seeding in combination with mulch, erosion blanket, or an equivalent control measure shall be applied. Sod or erosion blanket or mat shall be applied to the bottom of the channel.
 - b. For grades of four to eight percent, sod or an equivalent control measure shall be applied in the channel.
 - c. For grades greater than eight percent, rock, riprap, or an equivalent control measure shall be applied, or the grade shall be effectively reduced using drop structures.
- (5) Disturbed areas shall be stabilized with temporary or permanent measures within ten days following the end of active disturbance, or redisturbance, consistent with the following criteria:
- a. Temporary or permanent stabilization measures shall include seeding, mulching, sodding, and/or non-vegetative measures.
 - b. Areas having slopes greater than 12 percent shall be stabilized with sod, mat or blanket in combination with seeding. The use of any stabilization mat, blanket, or sod shall require the implementation of approved standards and specifications for installation procedures.
 - c. Whenever channel relocation is necessary, the new channel shall be constructed in the dry and be fully stabilized before flow is diverted.
- (6) Storm sewer inlets and culverts shall be protected by sediment traps or filter barriers meeting accepted design standards and specifications.
- (7) Soil storage piles containing more than ten cubic yards of material shall not be located with a downslope drainage length of less than 25 feet to a roadway or drainage channel. Filter barriers, including silt fence, or equivalent, shall be installed immediately around the perimeter of the soil storage pile(s).

- (8) If dewatering devices are used, discharge locations shall be protected from erosion. All pumped discharges including discharge water from basement sump pumps, shall be routed through appropriately designed sediment traps or basins or equivalent.
- (9) Each site shall have graveled (or equivalent) entrance roads, access drives, and parking areas of sufficient length and width to prevent sediment from being tracked onto public or private roadways. Any sediment reaching a public or private roadway shall be removed by shoveling or street cleaning (not flushing with water) before the end of each workday and transported to a controlled sediment disposal area.
- (10) All temporary and permanent erosion and sediment control practices shall be maintained and repaired as needed to assure effective performance of their intended function.
- (11) All temporary erosion and sediment control measures shall be disposed of within 30 days of final site stabilization is achieved with permanent soil stabilization measures. Trapped sediment and other disturbed soils resulting from the disposition of temporary measures shall be permanently stabilized to prevent further erosion and sedimentation.

(g) *Maintenance of control measures.* All soil erosion and sediment control measures installed to meet the requirements of this section shall be maintained by the applicant or subsequent land owner during the period of land disturbance and development of the site in a satisfactory manner to ensure adequate performance. The applicant or the contractor responsible for maintaining the erosion and sediment control practices shall inspect all such practices at least once every seven days or immediately following a precipitation event equal to or exceeding 1/2 inch of rainfall in a 24-hour period of time.

(h) *Inspections.* The BCSWCD shall make inspections as hereinafter required and shall either approve that portion of the work completed or shall notify the permittee wherein the work fails to comply with the site development or erosion and sediment control plan as approved. Plans for grading, stripping, excavating, and filling work bearing the stamp of approval of the city and BCSWCD shall be maintained at the site during progress of the work. In order to obtain inspections and to ensure compliance with the approved erosion and sediment control plan, the grading or building permit, and this section, the permittee shall notify the city and the BCSWCD within two (2) working days of the completion of the construction stages specified below:

- (1) Upon completion of installation of sediment and runoff control measures (including perimeter controls and diversions), prior to proceeding with any other earth disturbance or grading;
- (2) After stripping and clearing;
- (3) After rough grading;
- (4) After final grading;
- (5) After seeding and landscaping deadlines; and
- (6) After final stabilization and landscaping, prior to the removal of temporary sediment controls.

If stripping, clearing, grading, and/or landscaping are to be done in phases or areas, the permittee shall give notice and request inspection at the completion of each of the above work stages in each phase or area. If an inspection is not made and notification of the results given within five working days after notice is received by the city from the permittee, the permittee may continue work at his/her own risk, without presuming acceptance by the city. Notification of the results of the inspection shall be given in writing at the site. A duplicate copy shall be kept by the enforcing agency and/or the BCSWCD.

(i) *Special precautions.*

(1) If at any stage of the grading of any development site the city determines by inspection that the nature of the site is such that further work authorized by an existing permit is likely to imperil any property, public way, stream, lake, wetland, or drainage structure, the city may require, as a condition of allowing the work to be done, that such reasonable special precautions to be taken as are considered advisable to avoid the likelihood of such peril. "Special precautions" may include, but are not limited to, a more level exposed slope, construction of additional drainage facilities, berms, terracing, compaction, or cribbing, installation of plant materials for erosion control, and recommendations of a registered soils engineer, certified professional erosion and sediment control specialist, or licensed professional geologist which may be made requirements for further work.

(2) Where it appears that storm damage may result because the grading on any development site is not complete, work may be stopped and the permittee required to install temporary structures or take such other measures as may be required to protect adjoining property or the public safety. On large developments or where unusual site conditions prevail, the city may specify the time of starting grading or completion of, or may require that the operations be conducted in specific stages so as to insure completion of protective measures or devices prior to the advent of seasonal rains.

(j) *Amendments of plans.* Major amendments of the site development or erosion and sediment control plans shall be submitted to the BDPW and BCSWCD and shall be processed and approved or disapproved in the same manner as the original plans. Field modifications of a minor nature may be authorized by the BCSWCD by written authorization to the permittee.

(k) *Enforcement.*

(1) Stop-work order. In the event any person holding an approved erosion and sediment control plan pursuant to this section violates the terms of such approval, or carries on site development in such a manner as to materially, adversely affect health, welfare, or safety of persons residing or working in the neighborhood of the development site or so as to be materially detrimental to the public welfare or injurious to property or improvements in the neighborhood, the BPWD or BBD may suspend or revoke approved construction activity including, but not limited to: building permits, grading activity, road construction, or other construction related activities until such time that the approved erosion and sediment control plan is satisfactorily implemented and/or maintained.

- (2) Enforcement of violations of an approved plan shall be by a written stop-work order issued by the BDPW or the BBD and delivered to the permittee or his/her agent or the person performing the work. The stop-work order shall be effective immediately, shall state the specific violations cited, and shall state the conditions under which work may be resumed. Failure to follow an approved erosion and sediment control plan may be just cause to permanently suspend or revoked authorized construction activity or building permit until a hearing is held by the city's public works committee. Written notice of such hearing shall be served on the permittee, either personally or by registered mail at least five days prior to the date set for the hearing, and shall state:
- a. The grounds for complaint or reasons for suspension or revocation, in clear and concise language; and
 - b. The time when and place where such hearing will be held.

At such hearing, the permittee shall be given an opportunity to be heard and may call witnesses and present evidence on his or her behalf. At the conclusion of the hearing the public works committee shall determine whether the approved plan shall be suspended or revoked.

- (3) Violations and penalties. No person shall construct, enlarge, alter, repair, or maintain any grading, excavation or fill, or cause the same to be done, contrary to or in violation of any terms of this section. Any person violating any of the provisions of this section shall be deemed guilty of a misdemeanor, and each day during which any violation of any of the provisions of this section is committed, continued, or permitted shall constitute a separate offense. Upon conviction of any such violation, such person, partnership, or corporation shall be punished by a fine of not more than \$500.00 for each offense. In addition to any other penalty authorized by this section, any person, partnership, or corporation convicted of violating any of the provisions of this section shall be required to restore the site to the condition existing prior to the commission of the violation, or to bear the expense of such restoration.

(Code 1982, § 151.45; Ord. No. 788F, § 1, 5-17-93; Ord. No. 273G, § 1, 1-4-99)

Soil Erosion and Sediment Control Plan Review Boone County Soil and Water Conservation District

The applicant agrees to the following conditions:

- 1) Submit all required information identified on the Erosion and Sediment Control Checklist or this ordinance.
- 2) Pay the applicable fee.
- 3) Notify representatives of the BCSWCD of the preconstruction meeting
- 4) Allow representatives of the BCSWCD the right to conduct on-site investigations throughout all active construction phases to determine whether erosion and sediment control practices are in compliance with the plan.
- 5) Upon commencement of earthwork or construction activity, the applicant will accurately document site inspections of erosion and sediment control practices, noting date and time of inspection, condition of all practices, and a description of any needed maintenance of practices.
- 6) Comply with the BCSWCD's written and verbal recommendations regarding: a) the erosion and sediment control plan or changes or corrections made thereto; b) installation and maintenance requirements.
- 7) If any changes occur to the plans, schedules, etc., the applicant shall be responsible for notifying the BCSWCD.

Erosion and Sediment Control Plan Checklist

The soil erosion and sediment control plan consists of a detailed drawing or set of drawings that identify the type and location of specific erosion and sediment control practices. An erosion and sediment control plan also includes a written narrative that describes the procedures, practices, standards, schedule, and methods of implementing the practices detailed on the maps or drawings as well as who is responsible for the implementation and maintenance of the practices. All details, plans, drawings, maps, methods and procedures shall be completed according to the ordinance in effect at the time of submittal. *(For development activity that is limited to construction of a single home, building, small commercial building or other non-agricultural construction activity, the applicant may utilize an erosion and sediment control planning kit provided by the BCSWCD.)*

An erosion and sediment control plan will not be accepted for review until all of the following information is submitted for each phase of any regulated land disturbance activity:

I. Information detailed on scaled drawings or site maps:

A. Existing site conditions and natural resources present, including:

- A vicinity map.
- Site boundaries and adjacent lands which accurately identify site location
- The location of all buildings, structures, roads, and utilities or utility easements, streams, lakes, floodplains, wetlands, depressions, drainage facilities (including grassed waterways, gullies or similar feature), vegetative cover, paved areas, and other significant natural, or man-made features on the site **and** such features located on adjacent land within 100 feet of the site boundaries.
- Show the limits of expected grading activity.
- Existing topography; drainage patterns; sub-watershed boundaries; critical erosion areas; and the location, size, type, and condition of any subsurface drainage tiles.
- Predominant soils or soil types as depicted by USDA-NRCS Soil Survey Map data.
- The location and dimension of any existing or planned onsite wastewater treatment systems (septic systems).
- A map legend that includes north arrow, scale, and description of all symbols, abbreviations, and acronyms detailed or used on the drawings or maps submitted.

B. Detailed erosion and sediment control plan, including:

- The location or placement of all permanent and temporary erosion and sediment control practices. Topographic and soils data are essential details. The practices need to be detailed on a map that includes topographic contours or, the topographic contours and drainage data shall be included on a mylar at the same scale as the map detailing the erosion and sediment control practices.
- Detailed drawings, installation or construction plans for all permanent and temporary erosion and sediment control practices. (these may be included as part of the accompanying narrative)
- The location and dimension of all temporary soil and aggregate stockpiles.
- The grading plan for the site area, showing all areas to be disturbed.
- Final site conditions, including: an accurate description of final grade (topographic depiction at a 1 to 2 foot contour interval); location, dimension, cross-sections and elevations of all (temporary and permanent stormwater management facilities (including sediment basins), plus all inlet and outlet locations; surface flow direction, including sheet flow and concentrated flow direction.

II. Information detailed in the narrative:

A. Narrative description, including standards and specifications, for all erosion and sediment control practices detailed on the erosion and sediment control plan, including:

- A brief narrative describing the number of planned construction phases. Include the expected length of time needed to complete each phase (number of weeks and days); the expected date that construction activity will begin; etc.
- A narrative description of all temporary and permanent erosion and sediment control practices planned for the site, and the appropriate installation and maintenance requirements for each practice. The appropriate information for most erosion and sediment control practices is found in the standards and specifications found in *section four* of the Illinois Urban Manual.

Include a specific reference to each detailed drawing or installation scheme (usually taken from the Illinois Urban Manual) for each erosion and sediment control practice identified in the erosion and sediment control plan. Any practices that are not referenced to the Illinois Urban Manual or local approved handbooks need to be explained and illustrated with detailed drawings.

- A narrative describing temporary and permanent seeding information, including: rates, species, planting dates, fertilization, and other relevant information.
- A narrative description detailing the methods and practices used to permanently stabilize the site after all construction is complete.
- Detailed calculations for design of temporary sediment basins.
- Stormwater runoff calculation, include pre-development and post-development calculations. Will the development site cause an increase in peak runoff rates? If applicable, will the increase cause streambank erosion or channel degradation downstream? Describe the strategy to control stormwater runoff.

B. **Implementation and maintenance schedule:**

- A schedule detailing when, how, and by whom the erosion and sediment control practices will be implemented.
- A narrative description of the inspection and maintenance schedule for all erosion and sediment control practices. This description shall indicate who is responsible for periodic inspection and maintenance of these practices.
- A complete cost estimate for implementing the erosion and sediment control plan including: erosion and sediment control materials; seeding establishment (both temporary and permanent seeding); installation costs; routine maintenance and inspection costs; etc. A detailed inventory listing the type and quantity of materials needed to implement the plan must accompany the cost estimate.

C. **Critical Areas, including:**

- A brief narrative describing any on-site or off-site areas that are sensitive to the effects of erosion or sedimentation. Such areas may include, but are not limited to: adjacent or onsite existing residential areas; slopes that exceed 8 percent in grade; slopes longer than 200 feet; waterways, streams, wetlands, or similar feature; side hill seeps, etc.

FEE SCHEDULE

Fee is based on acreage of the site

Base Fee: \$75 (One acre or less)

*Round acres to nearest whole number 160+ acres = 3\$ for each additional acre

ARTICLE I

Authority and Purpose; Other Relevant Permitting; Applicability; Exemptions; Exceptions; and Separability:

Section 10 - Authority and Purpose: This ordinance is enacted pursuant to the police powers granted to the Village of Carbon Cliff, Illinois, by the Illinois Compiled Statutes, 65 ILCS 5/1-2-1, 5/11-12-12, 5/11/30-2, and 5/11/31-2.

The purpose of this ordinance is to diminish threats to public health and safety, protect property, prevent damage to the environment and promote public welfare by guiding, regulating, and controlling the design, construction, use, and maintenance of any new development or redevelopment or other activity which disturbs or breaks the topsoil or otherwise results in the movement of earth and/or changes the stormwater drainage pattern and/or stormwater flows from that which would have occurred if the land had been left in its natural state. This stormwater runoff and resulting soil erosion could result in the inundation of damageable properties, the erosion and destabilization of downstream channels, and the pollution of valuable stream and lake resources. One cause of increases in stormwater runoff quantity or rate and impairment of quality, and loss of valuable topsoil is the new development or redevelopment of the land. This ordinance regulates these activities to minimize adverse impacts.

This ordinance is adopted to accomplish the following objectives:

- a.) To assure that new development or redevelopment does not increase the drainage or flood hazards, or create unstable conditions susceptible to soil erosion;
- b.) To protect new buildings and major improvements to buildings from flood damage due to increased stormwater runoff and soil erosion;
- c.) To protect human life and health from the hazards of increased flooding and soil erosion on a watershed basis;
- d.) To lessen the burden on the taxpayer for flood control projects, repairs to flood-damaged public facilities and utilities, correction of channel erosion problems, and flood rescue and relief operations caused by stormwater runoff and soil erosion quantities from new development or redevelopment;
- e.) To protect, conserve, and promote the orderly development of land and soil, water, air, animal, and plant resources;
- f.) To preserve the natural hydrologic and hydraulic functions of watercourses, wetlands and flood plains for protecting water quality, and enhance stormwater management and aquatic habitats;
- g.) To preserve the natural characteristics of stream corridors in order to manage flood and stormwater impacts, improve water and groundwater quality, reduce soil

erosion, protect aquatic and riparian habitat, maintain quality forest resources, provide recreational opportunities, provide aesthetic benefits, enhance community and economic development.

Section 11 - Other Relevant Permitting: Before a Development Permit under this ordinance becomes effective, all required Federal, State, and Local permits will have been received for the site subject to new development or redevelopment. The acquisition of these permits shall be the sole responsibility of the applicant. These may include but are not limited to Section 404 of the Clean Waters Act; Section 106 of the National Historic Preservation Act; Section 10 of the Rivers and Harbors Act; or permitting required by the Illinois Department of Natural Resources, Office of Water Resources in accordance with the Rivers, Lakes and Streams Act, 615 ILCS; the Soil and Water Conservation Districts Act, 70 ILCS; the Farmland Preservation Act, 505 ILCS; the Illinois Groundwater Protection Act, 415 ILCS; and the National Pollutant Discharge Elimination System Permit (NPDES) and Section 401 of the Clean Water Act thru the Illinois Environmental Protection Agency, Division of Water Pollution Control; and the Threatened and Endangered Species Act, 16 USC 1531 ET. SEQ. Compliance is also required with but not limited to the Zoning Ordinance of the Village of Carbon Cliff, Illinois, and the Uniform Building Code, most recent edition adopted by the Village, Chapter on Excavation and Grading.

Section 12 - Applicability: This ordinance shall apply to all new development or redevelopment in the Village. Except as otherwise provided in this ordinance, no person, firm or corporation, public or private, the State of Illinois and its agencies or political subdivisions, the United States of America, and its agencies or political subdivisions, any agent, servant, officer or employee of any of the foregoing which meets the following provisions or is otherwise exempted in this ordinance, shall not commence any development activities without first having obtained a development permit from the Zoning Officer.

12.01 - Any new development or redevelopment that will include an area that will meet or exceed ten thousand (10,000) square feet of total impervious surface (i.e., streets, roof, patio or parking area or any combination thereof); or

12.02 - Any land disturbing activity (i.e., clearing, grading, stripping, excavation, fill, or any combination thereof) that will affect an area that will meet or exceed ten thousand (10,000) square feet or that will exceed 100 cubic yards; or

12.03 - Any land disturbing activity greater than 500 square feet if the activity is within 100 feet of a river, lake, pond, stream, abandoned mine, or wetland; and is done in conjunction with sub sections 12.01 or 12.02; or

12.04 - Any land disturbing activity on the sloping side of the slope disturbance line and is in conjunction with sections 12.01, 12.02, or 12.03; or

12.05 - Any tree cutting or mechanized land clearing where the tree, native to Northwestern Illinois, is in excess of eight (8) inches in diameter and is done in conjunction with Article I, Sections 12.01, 12.02, 12.03 or 12.04.

12.06 - The construction of one single family dwelling that is not constructed as part of a residential development shall not be subject to the provisions of this ordinance regarding permanent stormwater control measures.

12.07 – The Village in consultation with the Rock Island County Soil and Water Conservation District (RISWCD), reserves the right to require any non-agricultural, construction development activity, regardless of disturbed area or type of activity, to comply with this ordinance if it is determined to be the cause of or a contributor to an existing or potential erosion, sediment, or stormwater impact.

- a.) Soil erosion and sediment control planning for individual home sites may utilize a soil erosion and sediment control planning “kit” provided by the Rock Island County Soil and Water Conservation District.

Section 13 - Exemptions: A development permit shall not be required for the following:

- a.) Any new development, redevelopment or other activity falling below the minimum standards as set forth in Article I, Section 12.
- b.) The agricultural use of land, including the implementation of conservation measures included in a farm conservation plan approved by the Natural Resources Conservation Service, and including the construction of agricultural structures.
- c.) The maintenance of any existing stormwater drainage/detention component or structure or any existing soil erosion/sediment control component or structure; including dredging, levee restoration, tree removal or other function which maintains the original design capacities of the above.
- d.) The construction of, improvements to, or the maintenance of any street, road, highway or interstate highway performed by any unit of government whose powers grant such authority.

Section 14 - Variances: The Board of Appeals, after a public hearing, may determine and vary the requirements and regulations of this ordinance in harmony with its general purpose and intent, where the Board of Appeals make written findings of fact in accordance with the standards herein after prescribed and further, find that there are practical difficulties or particular hardships in the way of carrying out the strict letter of requirements and regulations of this ordinance.

14.01 - Application for variance shall be made by a verified petition of the applicant for a development permit, stating fully the grounds of the petition and the facts relied upon by the applicant. Such petition shall be filed with the development permit application. Each application for a variance shall be made in writing and filed with the Zoning Officer. The Zoning Officer and the Village Engineer will review and transmit recommendations to the Board of Appeals, which shall review such recommendations prior to granting or denying the variance.

14.02 – Standards for variance. The Board of Appeals shall not vary the requirements and regulations of this ordinance, as authorized in this section, unless there is evidence presented to it in each specific case:

14.021 - The land is of such shape or size or is affected by such physical conditions or is subject to such title limitations of record, that it is impossible or impractical for the applicant to comply with all of the requirements of this ordinance;

14.022 - The variance is necessary for the preservation and enjoyment of a substantial property right of the applicant; and

14.023 - The granting of the variance will not be detrimental to the public welfare, environment or injurious to other property in the vicinity of the subject's property.

14.03 - The Board of Appeals shall hold a public hearing on each application for variance, in accordance with Article XV subsection 157.022 of the Village of Carbon Cliff Zoning Ordinance. Within thirty (30) days after the public hearing, the Board of Appeals shall either approve the site development permit application with the variances and conditions it deems necessary or it shall disapprove such development permit application and variance application or it shall take other such action as appropriate.

Section 15 - Responsibility: The applicant shall not be relieved of responsibility for damage to persons or property otherwise imposed by law, and the Village or its officers or agents, including the directors and staff of the Rock Island County SWCD will not be made liable for such damage, by (1) the issuance of a development permit under this ordinance, (2) compliance with the provisions of that development permit or conditions attached to it by the Zoning Officer (3) failure of the Village of Carbon Cliff Officials to observe or recognize hazardous or unsightly conditions, (4) failure of the Village officials to recommend denial or to deny a development permit, or (5) exemptions from development permit requirements of this ordinance.

Article II - Definitions:

Section 20 - Definitions: For the purposes of this ordinance certain terms are defined and set forth below:

20.01 - Abandoned Mine: An abandoned mine is a large excavation in the earth that is no longer being used. These conditions make such areas unstable and susceptible to subsidence and surface collapse. Subsurface excavations and fractures in the bedrock may channel runoff water to public or private water supplies, making those sources especially susceptible to groundwater contamination.

20.02 - Adverse Impacts: Any negative impact on plant, soil, air or water resources affecting their beneficial uses including recreation, aesthetics, aquatic habitat, quality, and quantity.

20.03 - Applicant: Any person, firm, or governmental agency who executes the necessary forms to procure official approval of a development or permit to carry out construction of a new development or re-development from the Village of Carbon Cliff, Illinois.

20.04 - Base Flood Elevation: The elevation at all locations delineating the level of flooding resulting from the 100-year frequency flood event, which has a one percent (1%) probability of being equaled or exceeded in any given year. The base flood elevation at any location is defined in Article III, Section 38.03. of Ordinance No. 85-35, The Village of Carbon Cliff Zoning Ordinance.

20.05 – Board of Appeals: “ Board of Appeals” shall mean the Zoning Board of Appeals of the Village of Carbon Cliff, Illinois, with the jurisdiction as set forth in Article XV, Section 152, of ordinance No. 85-35, “Village of Carbon Cliff Zoning Ordinance.”

20.06 – Building Official: Is the officer or other designated authority charged with the administration and enforcement of the Uniform Building Code for the Village of Carbon Cliff, Illinois.

20.07 - Building Permit: A permit issued by the Village of Carbon Cliff, Illinois, for the construction, erection or alteration of a structure or building and the related ground and surface preparation prior to and after completion of construction, erection or alteration of a structure or building.

20.08 - Bypass Flows: Stormwater runoff from upstream properties tributary to a property's drainage system but not under its control.

20.09 - Certify or Certification: Formally attesting that the specific inspections and tests were performed, and that such inspections and tests comply with the applicable requirements of this ordinance.

20.10 - Channel: Any defined river, stream, creek, brook, branch, natural or artificial depression, ponded area, on-stream lake or impoundment, abandoned mine, flowage, slough, ditch, conduit, culvert, gully, ravine, wash, or natural or manmade drainageway, which has a definite bed and bank or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.

20.11 - Channel Modification: Alteration of a channel by changing the physical dimensions or materials of its bed or banks. Channel modification includes damming, riprapping (or other armoring), filling, widening, deepening, straightening, relocating, lining, and significant removal of bottom or woody rooted vegetation. Channel modification does not include the man-made clearing of debris or removal of trash.

20.12 - Clearing: Any activity, which removes the natural vegetative ground cover.

20.13 - Compensatory Storage: An artificially excavated, hydraulically equivalent volume of storage within the floodplain used to balance the loss of natural flood storage capacity when fill or structure are placed within the floodplain.

20.14 - Conduit: Any channel, pipe, sewer or culvert used for the conveyance or movement of water, whether open or closed.

20.15 – County: County of Rock Island, Illinois.

20.16 - Cubic Yard: A one- (1) yard by one (1) yard by one (1) yard amount of material in excavation and/or fill.

20.17 - Detention Basin: A facility constructed or modified to provide for the temporary storage of stormwater runoff and the controlled release by gravity of this runoff at a prescribed rate during and after a flood or storm.

20.18 - Detention Time: The amount of time stormwater is held within a detention basin.

20.19 - Development: Any manmade change to real estate or property, including:

- a.) The division or subdivision of any duly recorded parcel of property;
- b.) Construction, reconstruction or placement of a building or any addition to a building valued at more than one thousand dollars (\$1,000);
- c.) Installation of a manufactured home on a site, preparing a site for a manufactured home, or installing a travel trailer on a site for more than 180 days per year;
- d.) Construction of roads, bridges, or similar projects;
- e.) Redevelopment of a site;
- f.) Filling, dredging, grading, clearing, excavating, paving drilling, mining or other non-agricultural alterations of a ground surface;
- g.) Storage of materials or deposit of solid or liquid waste;
- h.) Any other activity that might alter the magnitude, frequency, direction, or velocity of stormwater flows from a property.

20.20 - Drainage Plan: A plan, including engineering drawings and supporting calculations, which describes the existing stormwater drainage system and environmental features, including grading, as well as proposed alterations or changes to the drainage system and environment of a property.

20.21 - Dry Basin: A detention basin designed to drain after temporary storage of stormwater flows and to normally be dry over much of its bottom area.

20.22 - Erosion: The general process whereby soil or earth is moved by rainfall, flowing water, wind or wave action.

20.23 - Excavation: Any act by which organic matter, earth, sand, gravel, rock or any other similar material, is cut into, dug, quarried, uncovered, removed, displaced, re-located or bulldozed and shall include the conditions resulting from such actions.

20.24 - Excess Stormwater Runoff: The volume and rate of flow of stormwater discharged from a new development or re-development, which is or will be in excess of that volume and rate which existed before development or re-development.

20.25 - Existing Grade: The vertical location of the existing ground surface prior to excavation or filling.

20.26 - Fill: Any act by which earth, sand, gravel, rock, or any other material, is deposited, placed, replaced, pushed, dumped, pulled, transported or moved by man to a new location and shall include the conditions resulting therefrom.

20.27 - Final Grade: The vertical location of the ground surface after grading work is completed in accordance with the engineering plans.

20.28 - Flood Fringe: That area as designated by the Federal Emergency Management Agency (FEMA) on either side of the floodway. This area is subject to inundation from the base flood but conveys little or no flow.

20.29 - Flood Hazard Boundary Map (FHBM): A very generalized map prepared by the Federal Emergency Management Agency (FEMA) which shows only where floodplains are located based on very basic data. FHBM's do not include base flood elevations.

20.30 - Flood Insurance Rate Map (FIRM): A map prepared by the Federal Emergency Management Agency (FEMA) that depicts the special flood hazard area (SFHA) within a community. This map includes insurance rate zones and regulatory floodplains and may or may not depict regulatory floodways.

20.31 - Floodplain: That land adjacent to a body of water with ground surface elevations at or below the base flood or the 100-year frequency flood elevation which is subject to inundation. The floodplain as designated by the Federal Emergency Management Agency (FEMA) is also known as the Special Flood Hazard Area (SFHA). This area is the collective combination of the regulatory floodway and the flood fringe.

20.32 - Floodway: The channel and that portion of the floodplain, including on-stream lakes, adjacent to a stream or watercourse which is needed to store and convey the anticipated existing and future 100-year frequency flood discharge with no more than a 0.1 foot increase in stage due to any loss of flood conveyance or storage and no more than a ten percent (10%) increase in velocities.

20.33 - Grading: The excavation or fill or any combination thereof and shall include the conditions resulting from any excavation or fill.

20.34 - Hydrograph: A graph showing for a given location on a stream or conduit, the flow rate with respect to time.

20.35 - Hydrograph Method: This method estimates runoff volume and runoff hydrographs for the point of interest by generating hydrographs for individual subareas, combining them, and

routing them through stream lengths and reservoir structures. Factors such as rainfall amount and distribution, runoff curve number, time of concentration, and travel time are included.

20.36 - Impervious Surface: That area of property that is covered by materials other than soil and vegetation and that has no intended capacity to absorb stormwater, such as parking lots, driveways, sidewalks, patios, tennis courts, roofs and other structures.

20.37 - Infiltration: The passage or movement of water into the soil surfaces.

20.38 - Loessal Soil: A sediment, commonly non-stratified and unconsolidated, composed predominately of silt sized particles with accessory clay and sand.

20.39 - Lot: An individual platted parcel in an approved subdivision.

20.40 - Major Drainage System: That portion of a drainage system needed to store and convey flows beyond the capacity of the minor drainage system.

20.41 - Minor Drainage System: That portion of a drainage system designed for the convenience of the public. It consists of street gutters, storm sewers, small open channels, and swales and, where manmade, is to be designed to handle the 10-year runoff event.

20.42 - Mitigation: Mitigation is when the prescribed controls are not sufficient and additional measures are required to offset the development, including those measures necessary to minimize the negative effects which stormwater drainage and development activities might have on the public health, safety and welfare. Examples of mitigation include, but are not limited to compensatory storage, soil erosion and sedimentation control, and channel restoration.

20.43 - Natural: Conditions resulting from physical, chemical, and biological processes without intervention by man.

20.44 - Natural Drainage: Channels formed in the existing surface topography of the earth prior to changes made by unnatural causes.

20.45 - One Hundred-Year Event: A rainfall, runoff, or flood event having a one percent (1%) probability of equaled or exceeded in any given year. A 24-hour storm duration is assumed unless otherwise noted.

20.46 - Parcel: All contiguous land in one ownership.

20.47 - Peak Flow: The maximum rate of flow of water at a given point in a channel or conduit.

20.48 - Permittee: Any person to whom a building permit or a development permit is issued.

20.49 - Person: Any individual, firm or corporation, public or private, the State of Illinois and its agencies or political subdivisions, the United States of America, and its agencies or political subdivisions, and any agent, servant, officer or employee of any of the foregoing.

20.50 - Plan Commission: Plan Commission shall mean the Plan Commission of the Village of Carbon Cliff, Illinois, as created and with the jurisdiction as set forth in Article XV, Section 153, of ordinance No. 85-35, "Village of Carbon Cliff Zoning Ordinance."

20.51 - Positive Drainage: Provision for overland paths for all areas of a property including depressional areas that may also be drained by storm sewer.

20.52 - Prime Farmland: Prime farmland is land that is best suited to food, feed, forage, fiber and oilseed crops. It may be cropland, pasture, woodland, or other land, but it is not urban and built up land or water areas. It is either used for food or fiber or is available for those uses. The soil qualities, growing season and moisture supply are those needed for a well-managed soil to economically produce a sustained high yield of crops. Prime farmland produces the highest yields with minimum inputs of energy and economic resources, and farming it results in the least damage to the environment.

20.53 - Property: A parcel of real estate.

20.54 - Retention Basin: A facility designed to completely retain a specified amount of stormwater runoff without release except by means of evaporation, infiltration, emergency bypass or pumping.

20.55 – Rock Island County SWCD/RICSWCD: Rock Island County Soil & Water Conservation District.

20.56 - Sedimentation: The process that deposits soils, debris, and other materials either on other ground surfaces or in bodies of water or stormwater drainage systems.

20.57 - Site: A parcel of land, or a contiguous combination thereof, where grading work is performed as a single unified operation.

20.58 - Slope Disturbance Line: The line which delineates relatively level building areas from areas where slopes exceed 7 percent (7%) and where special precautions must be taken.

20.59 - Stormwater Drainage System: All means, natural and manmade, used for conducting stormwater to, through or from a drainage area to the point of final outlet from a property. The stormwater drainage system includes but is not limited to any of the following: conduits and appurtenance features, canals, channels, ditches, streams, culverts, streets, storm sewers, detention basins, swales and pumping stations.

20.60 - Stormwater Runoff: The waters derived from melting snow or rain falling within a tributary drainage basin which are in excess of the infiltration capacity of the soils of that basin, which flow over the surface of the ground or are collected in channels or conduits.

20.61 - Storm Sewer: A closed conduit for conveying collected stormwater.

20.62 - Stream: Any river, creek, brook, branch, flowage, ravine, or natural or man-made drainageway which has a definite bed and banks or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.

20.63 - Stripping: Any activity which removes the vegetative surface cover including tree removal, by spraying or clearing, and storage or removal of topsoil.

20.64 – Ten-Year Event: A runoff, rainfall, or flood event having a ten percent (10%) chance of occurring in any given year. A 24 hour storm duration is assumed unless otherwise note.

20.65 - Time of Concentration: The elapsed time for stormwater to flow from the most hydraulically remote point in a drainage basin to a particular point of interest in that watershed.

20.66 - Tributary Watershed: All of the land surface area that contributes runoff to a given point.

20.67 – Two-Year Event: A runoff, rainfall, or flood event having a fifty percent (50%) chance of occurring in any given year. A 24-hour storm duration is assumed unless otherwise noted.

20.68 - Vacant: Land on which there are no structures or only structures which are secondary to the use or maintenance of the land itself.

20.69 – Village: Village of Carbon Cliff, Illinois.

20.70 – Village Attorney: Attorney for the Village of Carbon Cliff, Illinois.

20.71 – Village Engineer: Engineer for the Village of Carbon Cliff, Illinois.

20.72 - Watershed: All land area drained by, or contributing water to, the same stream, creek, ditch, lake, marsh, stormwater facility, groundwater or depressional area.

20.73 - Wet Basin: A detention basin designed to maintain a permanent pool of water after the temporary storage of stormwater runoff.

20.74 - Wetlands: Wetlands are defined by regulation as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." For general, but not inclusive locations of designated wetlands refer to mapping prepared jointly by the U.S. Department of Interior, Fish and Wildlife Service and the Illinois Department of Natural Resources, Office of Resource Conservation; National Wetlands Inventory Mapping, 1987. More specific wetland information is published in the Rock River Wetlands Special Area Management Plan, by the Bi-State Regional Commission in cooperation with the Natural Resources Conservation Service (NRCS), the US Fish and Wildlife Service and the US Army Corps of Engineers. The applicant may be required to provide a field investigation by a qualified wetland delineator.

20.75 – Zoning Officer: Zoning Officer for the Village of Carbon Cliff, Illinois, with the powers and duties as set forth in Article XV, Section 151, of Ordinance No. 85-35, "Village of Carbon Cliff Zoning Ordinance."

Article III- Stormwater Drainage and Detention:

Section 30 - Drainage Plan Submittal Requirements: Each applicant shall submit the following information, to ensure that the provisions of this ordinance are met. The submittal shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts and benefits of the development on water resources both on-site and off-site, and the effectiveness of the proposed drainage plan in managing stormwater runoff, and meet the provisions of Article I, Section 11. The applicant shall certify on the drawings that all clearing, grading, drainage, and construction shall be accomplished in strict conformance with the drainage plan. The following information shall be submitted for both existing and proposed property conditions for all new developments or re-developments that meet or exceed the minimum requirements of Article I, Section 12.

30.01 - Drainage Plan Requirements: A topographic survey of the property at two-foot (2) contours unless otherwise specified or approved by the Village Engineer. The plan map shall be keyed to a consistent datum specified by the Village. If the mapping is compiled using a digital format and the Global Positioning System (GPS), the applicant will provide both paper and digital copies including GPS points.

30.011 - Mapping and Descriptions: An existing drainage and proposed drainage plan for the property and one hundred (100) feet surrounding the property at a scale of not more than one hundred (100) feet to one (1) inch, and including the following: Unless otherwise specified by the Village Engineer

- a.) Property boundary, dimensions, and approximate acreage;
- b.) Building setback lines;
- c.) All existing and proposed structures and sizes;
- d.) Square feet of existing and proposed impervious surface;
- e.) All existing, or proposed easements;
- f.) All existing, abandoned, or proposed water or monitoring wellhead locations;
- g.) All sanitary or combined sewer lines and septic systems;
- h.) The banks and centerline of streams and channels;
- i.) Shoreline of lakes, ponds, and detention basins with normal water level elevation;
- j.) Farm drains and tiles;
- k.) Soils classifications;

- l.) Location, size and slope of stormwater conduits and drainage swales;
- m.) Depressional storage areas;
- n.) Detention facilities;
- o.) Roads, streets and associated stormwater inlets including finished grades;
- p.) Base flood elevation, flood fringe, and regulatory floodway;
- q.) Basis of design for the final drainage network components;
- r.) A statement giving any applicable engineering assumptions and calculations;
- s.) A vicinity map showing the relationship of the site to its general surroundings at a scale of not less than two thousand (2,000) feet to one (1) inch (1:24,000);
- t.) Title, scale, north arrow, legend, seal of Licensed Professional Engineer, date, and name of person preparing plans;
- u.) Cross-section data for open channel flow paths and designated overland flow paths;
- v.) Direction of storm flows;
- w.) Flow rates and velocities at critical points in the drainage system;
- x.) A statement by the design engineer of the drainage system's provision for handling events greater than the 100 year, 24 hour runoff;
- y.) A statement of certification of all drainage plans, calculations, and supporting data by a Licensed Professional Engineer;
- z.) Abandoned mine location and type; and
- aa.) Subwatershed boundaries within the property.

30.012 - Environmental Features: A depiction of environmental features of the property and immediate vicinity including the following:

- a.) The limits of designated regulatory and non-regulatory wetland areas;
- b.) The location and limits of abandoned mining activity;
- c.) The location of trees greater than eight (8) inches in diameter;
- d.) Any designated natural areas, prime farmland; and

- e.) Any proposed environmental mitigation features.

Section 31 - Minimization of Increases in Runoff Volumes and Rates: In the selection of a drainage plan for a new development or redevelopment, the applicant shall evaluate and implement site design features which minimize the increase in runoff volumes and rates from the site and addresses the water quality treatment requirements of this ordinance. The applicant's drainage plan submittal shall include evaluations of site design features which are consistent with the following hierarchy:

- a.) Preservation of regulatory floodplains, flood prone and wetland areas;
- b.) Minimize impervious surfaces on the property, consistent with the needs of the project;
- c.) Attenuate flows by use of open vegetated swales and natural depressions and preserves the existing natural stream channel;
- d.) Infiltration of runoff on-site;
- e.) Provide stormwater retention structures;
- f.) Provide wet or wetland detention structures;
- g.) Provide dry detention structures; and
- h.) Construct storm sewers.

Section 32 - Water Quality and Multiple Uses: The drainage system should be designed to minimize adverse surface and groundwater quality impacts off-site and on the property itself. Detention basins shall incorporate design features to capture stormwater runoff pollutants. In particular, designers shall give preference to wet bottom and wetland type designs and all flows from the development shall be routed through the basin (i.e. low flows shall not be bypassed). Detention of stormwater shall be promoted throughout the property's drainage system to reduce the volume of stormwater runoff and to reduce the quantity of runoff pollutants.

The drainage system should incorporate multiple uses where practicable. Uses considered compatible with stormwater management include open space, aesthetics, aquatic habitat, recreation (boating, fishing, trails, playing fields), wetlands and water quality mitigation.

Section 33 - Design Criteria, Standards, and Methods:

33.01 - Release Rates: The drainage system for new developments or redevelopments shall be designed to control the peak rate of discharge from the property for the 2 year, 24 hour and 100 year, 24 hour events to pre project levels which will not cause an increase in flooding or channel instability downstream when considered in aggregate with other developed properties and downstream drainage capacities. The peak discharge rate from events less than or equal to the 2

year, 24 hour event and the peak discharge rate for the 100-year, 24 hour event shall be determined by the Village Engineer.

33.011 - Detention Basin Outlet Design: Backwater on the outlet structure from the downstream drainage system shall be addressed when designing the outlet.

33.02 - Detention Storage Requirements: The design maximum storage to be provided in the detention basin shall be based on the runoff from the runoff difference before and after development from the 100 year, 24 hour event. All detention basin storage shall be computed using Hydrograph Methods utilizing reservoir routing (also called modified pulse or level pool) or equivalent method as described in Section 33.04.

33.03 - Drainage System Design and Evaluation: The following criteria should be used in evaluating and designing the drainage system. The design will provide capacity to pass the 10 year, 24 hour peak flow in the minor drainage system and an overload flow path for flows in excess of the design capacity. Whenever practicable, the stormwater systems shall not result in the interbasin transfer of drainage unless no other alternative exists.

33.031 - Design Methodologies: Major and minor conveyance systems for areas up to 10 acres, may be designed using the Rational Formula. The Rational Formula may also be used in sizing the minor drainage system for larger sites up to 100 acres. Runoff hydrograph methods as described in Section 33.04 must be used for major drainage system design for all systems with greater than 10 acres of drainage area and for the design of all detention basins.

33.032 - Positive Drainage: Whenever practicable, all developments must be provided an overland flow path that will pass the 100 year, 24 hour flow at a stage at least one (1) foot below the lowest foundation grade in the vicinity of the flow path. Overland flow paths designed to handle flows in excess of the minor drainage system capacity shall be provided drainage easements. Street ponding and flow depths shall not exceed curb heights.

33.04 - Methods for generating runoff hydrographs: Runoff hydrographs shall be developed incorporating the following assumptions of rainfall amounts and antecedent moisture.

33.041 - Rainfall: Unless a continuous simulation approach to drainage system hydrology is used, all design rainfall events shall be based on the Illinois State Water Survey's Bulletin 70. The first quartile point rainfall distribution shall be used for the design and analysis of conveyance systems with critical durations less than or equal to 12 hours. The third quartile point rainfall distribution shall be used for the design and analysis of detention basins and conveyance system with critical durations greater than 12 and less than or equal to 24 hours. The fourth quartile distribution shall be used in the design and analysis of systems with durations greater than 24 hours. The first, third, and fourth quartile distributions described by Huff are presented in Table 37 of Bulletin 70. Refer to Table 13 of Bulletin 70 for rainfall depth, duration, and frequency. The NRCS Type II distribution may be used as an alternate to the Huff distributions.

33.042 - Antecedent Moisture: Computations of runoff hydrographs, which do not rely on a continuous accounting of antecedent moisture conditions, shall use wet antecedent moisture condition as a minimum.

33.05 - Agriculture Tiles and Sanitary Sewers: Connections to sanitary sewers or existing agricultural stormwater management system (tiles) shall not be permitted for new developments. However, in exceptional circumstances and with the approval of the Village Engineer, connections to existing agricultural stormwater management systems may be allowed if the applicant demonstrates that the existing system, has adequate hydraulic capacity, and structural integrity. Additionally, development meeting the criteria in Section 33 shall either obtain a maintenance agreement or deed or plat restriction covering the entire downstream drain tile in accordance to be determined of this ordinance before a connection to that system is permitted. Field tile systems disturbed during the process of land development must be reconnected by those responsible for their disturbance unless the approved drainage plan incorporates the tiles in the land development design.

33.06 - Wet Detention Basin Design: Wet detention basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing, and as much as feasible to be available for recreational use.

33.061 - Wet Basin Depths: Wet basins shall be at least three feet deep, excluding near-shore banks and safety ledges. If fish habitat is to be provided they shall be at least ten (10) feet deep over twenty-five (25%) percent of the bottom area to prevent winterkill.

33.062 - Wet Basin Shoreline Slopes: The side slopes of wet basins at the normal pool elevation shall not be steeper than five to one (5 to 1 horizontal to vertical). It is recommended that native aquatic vegetation be established around the perimeter to provide protection from shoreline erosion.

33.063 - Permanent Pool Volume: The permanent pool volume in a wet basin at normal depth shall be equal to the runoff volume from its watershed for the 2 year, 24-hour event as a minimum.

33.064 - Wet Basin Inlet and Outlet Orientation: The distance between detention inlets and outlets shall be maximized. Inlets and outlets shall be at opposite ends of the basin providing that the orientation does not create undue hardship based on topography or other natural constraints. Designers are encouraged to use baffles or berms in the basin bottom to prevent short-circuiting. There shall be no low flow bypass between the inlet and outlet. Paved low flow channels shall not be used. The minimum flow length shall be ten (10) feet with a recommended minimum ratio of two to one (2:1) for width.

33.07 - Dry Detention Basin Design: In addition to the other requirements of this ordinance, dry basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing and as much as feasible to be available for multiple uses.

33.071 - Dry Basin Drainage: Dry basins shall be designed so that eighty percent (80%) of their bottom area shall have standing water no longer than seventy-two (72) hours for any runoff event less than the 100-year, 24 hour event. Grading plans shall clearly distinguish the wet portion of the basin bottom. Underdrains directed to the outlet may be used to accomplish this requirement.

33.072 - Velocity Dissipation: Velocity dissipation measures shall be incorporated into dry basin designs to minimize erosion at inlets and outlets and to minimize resuspension of pollutants.

33.073 - Dry Basin Inlet and Outlet Orientation: Shall be the same as Article III, Section 33.064.

33.074 - Temporary Sediment Trap: A sediment trap shall be constructed at each major inlet to a dry basin during construction. The temporary sediment trap should be designed in accordance with criteria in the Illinois Urban Manual.

33.08 - Existing Depressional Areas: Existing depressional storage volume will be maintained and the volume of detention storage provided to meet the requirements of this ordinance shall be in addition to existing storage.

33.09 - Minimum Detention Outlet Size: Where a single pipe outlet or orifice plate is to be used to control discharge, it shall have a minimum diameter of twelve (12) inches. If design release rates call for smaller outlets, a design that minimizes the possibility of clogging shall be used. Minimum outlet restrictor size shall be 4" provided there is adequate downstream capacity. Detention volumes for a development shall be dictated by adherence to the release rates specified in Section 33.01.

33.10 - Detention in Flood Plains: The placement of detention basins within the flood plain is strongly discouraged because of questions about their reliable operation during flood events. However, the stormwater detention requirements of this ordinance may be fulfilled by providing detention storage within flood fringe areas on the project site provided the following provisions are met as well as compliance with Article I, Section 11.

33.1001 - Detention in Flood Fringe Areas: The placement of a detention basin in a flood fringe area shall require compensatory storage for 1.5 times the volume below the base flood elevation occupied by the detention basin including any berms. The release from the detention storage provided shall still be controlled consistent with the requirements of this section. The applicant shall demonstrate its operation for all stream-flow and flood plain backwater conditions. Excavations for compensatory storage along watercourses shall be opposite or adjacent to the area occupied by detention. All flood plain storage lost below the existing ten-year flood elevation shall be replaced below the existing ten-year elevation. All flood plain storage lost above the existing ten-year flood elevation shall be replaced above the existing ten-year flood elevation. All compensatory storage excavations shall be constructed to drain freely and openly to the watercourse and comply with Article I, Section 11.

33.1002 - Detention on Prime Farmland: The placement of detention basins shall avoid the utilization of prime farmland. All detention basin construction shall examine potential impacts to adjacent agricultural land and shall address measures that will be implemented to eliminate such impacts and comply with Article I, Section 11.

33.1003 - Detention in Floodways: Detention basins shall be placed in the floodway only in accordance with Article III, Section 33.1004.

33.1004 - On-Stream Detention: On-stream detention basins are discouraged but allowable if they provide regional public benefits and if they meet the other provisions of this ordinance with respect to water quality and control of the 2 year and 100 year, 24 hour events from the property. Further

criteria are presented in Article III, Section 34 of this ordinance. If on-stream detention is used in watersheds larger than one square mile, the applicant will use hydrographic modeling to demonstrate that the design will not increase the water level for any properties upstream or downstream of the property. Also, impoundment of the stream as part of on-stream detention:

- a.) Shall not prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, such as for spawning;
- b.) Shall not cause or contribute to the degradation of water quality or stream aquatic habitat;
- c.) Shall include a design calling for gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin;
- d.) Shall not involve any stream channelization or the filling of wetlands;
- e.) Shall require the implementation of an effective non-point source management program throughout the upstream watershed which shall include as a minimum: runoff reduction "Best Management Practices" (BMP's) consistent with Article III, Section 31; 2 year, 24 hour detention / sedimentation basins for all development consistent with Article III, Section 33.074;
- f.) Shall not occur downstream of a wastewater discharge;
- g.) Shall not contribute to the duration or flood frequency of any adjacent land, and
- h.) Shall comply with Article I, Section 11.

33.11 - Drainage Into Wetlands, Rivers, Streams, Lakes, Ponds, and Depressional Storage Areas: Wetlands, lakes, ponds and depressional storage areas shall be protected from damaging modifications and adverse changes in runoff quality and quantity associated with land developments. In addition to the other requirements of this ordinance, the following requirements shall be met for all developments whose drainage flows into wetlands, rivers, lakes, ponds or depressional storage areas:

33.1101 -Detention in Wetlands, Rivers, Streams, Lakes, Ponds or Depressional Storage Areas: Existing wetlands, rivers, lakes, ponds or depressional storage areas shall not be modified for the purposes of stormwater detention unless it is demonstrated that the proposed modifications will maintain or improve its habitat and ability to perform beneficial functions and shall comply with Article I, Section 11. Existing storage and release rate characteristics of wetlands, rivers, lakes, ponds or depressional storage areas shall be maintained and the volume of detention storage provided to meet the requirements of this section shall be in addition to this existing storage.

33.1102 - Sediment Control: The existing wetlands, rivers, lakes, ponds, or depressional storage areas shall be protected during construction and as further regulated in Article IV of this ordinance, and shall not be filled.

33.1103 - Alteration of Drainage Patterns: Site drainage patterns shall not be altered to substantially decrease or increase the existing area tributary to wetlands, rivers, lakes, ponds or depressional storage areas. Drainage patterns shall not be altered by development to direct runoff offsite to other than natural drainage outlets existing prior to development.

33.1104 - Detention/Sedimentation: All runoff from the development shall be routed through a preliminary detention/sedimentation basin designed to capture the two-year, 24-hour event and hold it for at least 24 hours, before being discharged to the wetland, river, lake, pond, or depressional storage area. This basin shall be constructed before property grading begins and shall be maintained throughout the construction process. In addition, the drainage hierarchy defined in Article III, Section 30 should be followed to minimize runoff volumes and rates being discharged to the wetland, river, stream, lake, pond, or depressional storage area and as further regulated in Article II and Article IV of this ordinance.

33.1105 - Vegetated Buffer Strip: A buffer strip of at least 25 feet in width, preferably vegetated with native plant species, shall be maintained or restored around the periphery of a wetland, river, stream, lake, pond or depressional storage area.

33.1106 - Loessal Soils: Care must be taken to avoid open flow discharges of stormwater over silt (Loessal) soils due to high potential for erosion.

33.1107 - Abandoned Mines: The following requirements apply for new developments or re-developments where abandoned mines are determined to be present:

- a.) A stormwater detention basin shall not be placed in or over an abandoned mine;
- b.) Stormwater detention basins shall not be located closer than one hundred (100) feet from the opening of an abandoned mine;
- c.) The outflow from a stormwater detention basin, channel, ditch or any stormwater runoff generated as a result of a new development or redevelopment shall not empty into or be directed, redirected by any means into or through any abandoned mine;
- d.) If, after the review of the stormwater drainage plan, the Village Engineer may determine that more detailed information is required, a abandoned mine evaluation may be required. A abandoned mine evaluation which addresses the geologic, engineering and environmental factors resulting from a new development or redevelopment be performed by a professional with experience and expertise in abandoned mine topography, whom shall certify the results of the evaluation. This evaluation shall be the responsibility of the applicant and performed at no cost to the Village. After a review of this evaluation and with the consultation of the Rock Island Soil and Water Conservation District, the Village Engineer may either approve or disapprove the drainage plan as submitted;
- e.) Whenever an abandoned mine is discovered or it becomes apparent that the abandoned mine has not yet been identified, it shall be reported to the Rock Island Soil and Water Conservation District; and

f.) Shall comply with Article I, Section 11.

33.12 - Street Detention, Parking Lot Detention, and Culvert Drainage:

33.1201 - Street Detention: If streets are to be used as part of the minor or major drainage system, ponding depths shall not exceed curb heights and shall not remain flooded for more than eight (8) hours for any event less than or equal to the 100 year, 24 hour event.

33.1203 - Parking Lot Detention: The maximum stormwater ponding depth in any parking area shall not exceed six (6) inches for more than four (4) hours.

33.1203 - Culvert, Road and Driveway Crossings: Sizing of culvert crossings shall consider entrance and exit losses as well as tailwater conditions on the culvert.

33.13 - Infiltration Practices: To effectively reduce runoff volumes, infiltration practices including basins, trenches, and porous pavement and shall follow criteria in the Illinois Urban Manual with Article I, Section 11. An appropriate sediment control device shall be provided to remove coarse sediment from stormwater flows before they reach infiltration basins or trenches. Stormwater shall not be allowed to stand more than seventy-two hours over eighty percent of the dry basin's bottom area for the maximum design event to be ex-filtrated. The bottom of infiltration basins or trenches shall be a minimum of three feet above the seasonally high groundwater and bedrock level. Engineering calculations demonstrating infiltration rates shall be included with the application.

33.1301 - Vegetated Filter Strips and Swales: To effectively filter stormwater pollutants and promote infiltration of runoff, sites should be designed to maximize the use of vegetated filter strips and swales, shall be designed to follow criteria in the Illinois Urban Manual. Whenever practicable, runoff from impervious surfaces should be directed onto filter trips and swales comprised of native grasses and forbs before being routed to a storm sewer or detention basin.

33.14 - Safety Considerations: The drainage system components, especially all detention basins, shall be designed to protect the safety of any children or adults coming in contact with the system during runoff events and shall comply with Article I, Section 11.

33.1401 - Side Slopes: The side slopes of all detention basins at 100 year, 24 hour capacity shall be as level as practicable to prevent accidental falls into the basin and for stability and ease of maintenance. Side slopes of detention basins and open channels shall not be steeper than three (3) to one (1) (horizontal to vertical).

33.1402 - Safety Ledge: All wet detention basins shall have a level safety ledge at least four feet in width 2.5 to 3 feet below the normal water depth.

33.1403 - Velocity: Velocities throughout the surface drainage system shall be controlled to safe levels taking into consideration rates and depths of flow.

33.1404 - Overflow Structures: All stormwater detention basins shall be provided with an overflow structure capable of safely passing excess flows at a stage at least one foot below the

lowest foundation grade in the vicinity of the detention basin. The design flow rate of the overflow structure shall be equivalent to the 100 year, 24-hour inflow rate.

33.15 - Maintenance Considerations: The stormwater drainage system shall be designed to minimize and facilitate maintenance. Turfed side slopes shall be designed to allow lawn-mowing equipment to easily negotiate them. Wet basins shall be provided with alternate outflows, which can be used to completely drain the pool for sediment removal. Pumping may be considered if drainage by gravity is not feasible. Pre-sedimentation basins shall be included, where feasible, for localizing sediment deposition and removal. Site access for heavy equipment shall be provided. Use of native vegetation is strongly encouraged to reduce maintenance, increase wildlife habitat, and to provide other benefits.

33.1501 - A maintenance plan for the ongoing maintenance of all stormwater management system components including wetlands is required prior to plan approval. The plan shall include:

- a.) Maintenance tasks;
- b.) The party responsible for performing the maintenance tasks;
- c.) A description of all permanent public or private access maintenance easements and overland flow paths, and compensatory storage areas; and
- d.) A description of dedicated sources of funding for the required maintenance.

Section 34 - Accommodating Flows From Upstream Tributary Areas: Stormwater runoff from areas tributary to the property shall be considered in the design of the property's drainage system. Whenever practicable, flows from upstream areas that are not to be detained should be routed around the basin being provided for the site being developed.

34.01 - Upstream Areas Not meeting Ordinance Requirements: When there are areas not meeting the storage and release rates of this ordinance, tributary to the applicant's property, regionalized detention on the applicant's property shall be explored by the applicant. The following steps shall be followed:

- a.) The applicant shall compute the storage volume needed for his property using the release rates of Article III, Section 33, the applicant's property area, and the procedures described in Article III, Section 32;
- b.) Areas tributary to the applicant's property, not meeting the storage and release rate requirements of this ordinance, shall be identified; and
- c.) Using the areas determined above plus the applicant's property area, total storage needed for the combined properties shall be computed.

Allowable release rates shall be computed using the combined property areas. Storage shall be computed as described in Article III, Section 33. If tributary areas are not developed, a reasonable

fully developed land cover, based on local zoning, shall be used for the purposes of computing storage.

Once the necessary combined storage is computed the Village may choose to pay for over-sizing the applicant's detention basin to accommodate the regional flows. The applicant's responsibility will be limited to the storage for his property as computed above. If regional storage is selected by the Village then the design produced in Article III, Section 32 shall be implemented. If regional storage is rejected by the Village the applicant shall bypass all tributary area flows around the applicant's basin whenever practicable. If the applicant must route upstream flows through his basin and the upstream areas exceed one-square mile in size, the applicant must meet the provision of Section 33.1004 for on-stream basins.

34.02 - Upstream Areas Meeting Ordinance Requirements: When there are areas which meet the storage and release rate requirements of this ordinance, tributary to the applicant's property, the upstream flows shall be bypassed around the applicant's detention basin if this is the only practicable alternative. Storage needed for the applicant's property shall be computed as described in Article III, Section 34.01. However, if the Village decides to route tributary area flows through an applicant's basin, the final design stormwater releases shall be based on the combined total of the applicant's property plus tributary areas. It must be shown that at no time will the runoff rate from the applicant's property exceed the allowable release rate for his/her property alone.

Section 35 - Early Completion of Detention Facilities: Where detention, retention, or depressional storage areas are to be used as part of the drainage system for a property, they shall be constructed as the first element of the initial earthwork program. Any eroded sediment captured in these facilities shall be removed by the applicant on a regular basis and before project completion in order to maintain the design volume of the facilities.

Section 36 - Fee in Lieu of Detention: All new development or redevelopment not exceeding fifteen thousand (15,000) square feet of impervious surface may pay a fee of \$10,000 for each acre-foot of detention which would be required under this ordinance rather than installing detention facilities on the property, unless specifically directed to do otherwise by the Zoning Officer. The Village, also shall have the option of requiring a fee of \$10,000 for each acre-foot of detention needed in lieu of the applicant building a basin on-site provided a new development or redevelopment project exceeds fifteen thousand (15,000) square feet of impervious surface, provided the property will discharge stormwater to the Village storm drainage system, if applicable.

In instances where regional benefits and economies of scale can be achieved, it will be permissible for adjacent properties to utilize a common regional detention basin. Applicants shall have the option of paying a fee of \$10,000 for each acre-foot of detention required so that the Village can build regional facilities or the applicants can jointly build the necessary facilities themselves.

Article IV - SOIL EROSION AND SEDIMENT CONTROL:

Section 40 - Findings: The Village hereby finds that:

- a.) The soil types found in the Village Illinois are susceptible to erosion and if left unprotected could cause severe loss of soil with resultant damage to property;
- b.) The topography of the Village contains areas with steep slopes upon which, if clearing of trees and/or inappropriate construction takes place, could result in severe erosion and slope stability problems, which could result in damage to property;
- c.) Excessive quantities of soil may erode from areas undergoing development for certain non-agricultural uses including but not limited to the construction of dwelling units, commercial buildings and industrial plants, the building of roads and highways, the modification of stream channels and drainageways, and the creation of recreational facilities;
- d.) The washing, blowing, and falling of eroded soil across and upon roadways endangers the health and safety of users thereof, by decreasing vision and reducing traction of road vehicles;
- e.) Soil erosion necessitates the costly repairing of gullies, washed out fills, and embankments;
- f.) Sediment from soil erosion clogs drainage systems and pollutes rivers, streams, lakes, wetlands, and reservoirs;
- g.) Sediment limits the use of water and waterways for most beneficial purposes, promotes the growth of undesirable aquatic weeds, destroys fish and other desirable aquatic life, and is costly and difficult to remove; and
- h.) Sediment reduces the channel capacity of waterways and the storage capacity of flood plains and natural depressions, resulting in increased chances of flooding at risk to public health and safety.

Section - 41 - General Principles: It is the objective of this ordinance to control soil erosion and sedimentation caused by development activities, including clearing, grading, stripping, excavating, and filling of land, in the Village. Measures taken to control soil erosion and off-site sediment runoff shall be adequate to assure that sediment is not transported from the site by a storm event of ten-year, 24 hour frequency or less. The following principles shall apply to all new development or redevelopment activities within the Village and to the preparation of the submissions required under Article IV, Section 42 of this ordinance:

- a.) New development or redevelopment shall be related to the topography and soils of the site so as to create the least potential for erosion. Areas of steep slopes greater than seven percent (7%) where high cuts and fills maybe required are to be

avoided wherever possible, and natural contours should be followed as closely as possible,

- b.)** Natural vegetation shall be retained and protected wherever possible. Areas immediately adjacent to natural watercourses, lakes, ponds, and wetlands are to be left undisturbed wherever possible. Temporary crossings of watercourses, when permitted, must include appropriate stabilization measures,
- c.)** Special precautions shall be taken to prevent damages resultant from any necessary development activity within or adjacent to any stream, lake, pond, abandoned wetland or mine. Preventive measures shall reflect the sensitivity of these areas to erosion and sedimentation,
- d.)** The smallest practical area of land should be exposed for the shortest practical time during development,
- e.)** Sediment basins or traps, filter barriers, diversions, and any other appropriate sediment or runoff control measures shall be installed prior to site clearing and grading and maintained to remove sediment from run-off waters from land undergoing development,
- f.)** The selection of erosion and sediment control measures shall be based on assessment of the probable frequency of climatic and other events likely to contribute to erosion, and on evaluation of the risks, costs, and benefits involved,
- g.)** In the design of erosion control facilities and practices, aesthetics and the requirements of continuing maintenance must be considered,
- h.)** Provisions shall be made to accommodate the increased run-off caused by changed soil and surface conditions during and after development. Drainageways should be designed so that their final gradients and the resultant velocities and rates of discharge will not create additional erosion on-site or downstream,
- i.)** Permanent vegetation and structures shall be installed and functional as soon as practical during development,
- j.)** Those areas being converted from agricultural purposes to other land uses shall be vegetated with an appropriate protective cover prior to development,
- k.)** All waste generated as a result of site development activity shall be properly disposed of and shall be prevented from being carried off the site by either wind or water,
- l.)** All construction sites shall provide measures to prevent sediment from being tracked onto public or private roadways, and

- m.) All temporary soil erosion and sediment control practices shall be maintained to function as intended until the contributing drainage area has been permanently stabilized at which time they shall be removed.

Section 42 - Soil Erosion and Sediment Control Plan Submittal Requirements: Each applicant shall submit the information depending on development size, as regulated to ensure that the provisions of this ordinance are met. The submittal shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts of the development related to erosion both on-site and off-site, and the effectiveness of the proposed erosion and sediment control plan in reducing sediment loss and meet the provisions of Article I, Section 11. The applicant shall certify on the drawing that all clearing, grading, drainage, and construction shall be accomplished in strict conformance with the erosion and sediment control plan. The following information shall be submitted for both existing and proposed property conditions; new developments or re-developments meeting the requirements of Article I, Section 12.

42.01 - Soil Erosion and Sediment Control Plan Requirements: Shall meet the requirements of Article III, Section 30.01, Section 30.011, and Section 30.012.

42.011 - Mapping and Descriptions: The existing and proposed erosion and sediment control features of the property and immediate vicinity including:

- a.) As required in Article III, Section 30.01, Section 30.011, and Section 30.012;
- b.) Location of the slope disturbance line;
- c.) Location and description of the soil erosion and sediment control measures to be employed during construction;
- d.) For any structures proposed to be located on the slope side of the slope disturbance line the map shall include the limits of disturbance including tree removal, soil erosion and sediment control measures during construction, cross section view of any proposed cut or fill, erosion and sediment control measures during construction, details of method (s) proposed for providing slope stability, permanent stormwater control measures, and permanent erosion and sediment control measures all being certified by a registered professional engineer or a "Certified Professional Erosion Control Specialist;"
- e.) The predominant soil types on the site, their location, and their limitations for the proposed use as defined by the U.S.D.A. Natural Resources Conservation Service;
- f.) The proposed use of the site, including present and planned development, areas of clearing, stripping, grading, excavation and filling; proposed contours, finished grades, and street profiles; the stormwater plan as required in Article II; kinds and locations of utilities, areas and acreages proposed to be paved, sodded or seeded, vegetatively stabilized, or left undisturbed; and the location of trees over eight (8) inches in diameter and their type;

- g.)** A soil erosion and sediment control plan, including a narrative, shall be submitted showing all measures necessary to meet the objectives of this ordinance throughout all phases of construction. The development of a soil erosion and sediment control plan shall follow the requirements of this ordinance and the procedures in the latest edition of the "Illinois Procedures and Standards for Urban Soil Erosion and Sediment Control" (commonly known as the Greenbook), which is hereby incorporated into this ordinance by reference. The Village in consultation with the RISWCD, may waive specific requirements for the content of submissions upon finding that the information submitted is sufficient to show that the work will comply with the objectives and principles of this ordinance. Permanent soil erosion and sediment control features needed at the completion of any development site shall be included in the submittal. The submitted soil erosion and sediment control plan shall include:
- 1.)** Location and description, including standard details, of all sediment control measures and specifics of sediment basins and traps, including outlet details;
 - 2.)** Location and description of all soil stabilization and erosion control measures, including seeding mixtures and rates, types of sod, method of seedbed preparation (type and extent of tillage, weed control, planting equipment, etc...), expected seeding dates, type, method and rate of lime and fertilizer application (soil fertility testing required), kind and quantity of mulching for both temporary and permanent vegetative control measures, and types of non-vegetative stabilization measures;
 - 3.)** Location and description of all runoff control measures, including diversions, waterways, and outlets;
 - 4.)** Location and description of methods to prevent tracking of sediment off-site including construction entrance details, as appropriate;
 - 5.)** Description of dust and traffic control measures;
 - 6.)** Locations of stockpiles and description of stabilization methods;
 - 7.)** Description of offsite fill or borrow volumes, locations and methods of stabilization;
 - 8.)** Provisions for maintenance of control measures, including type and frequency of maintenance, easements, and estimates of the cost of maintenance; and
 - 9.)** Identification (name, address, and telephone) of the person(s) or entity which will have legal responsibility for maintenance of soil erosion control

structures and measures during development and after development is completed.

Section 43 - Design and Operation Standards and Requirements:

The practice standards and specifications outlined in the Soil Erosion and Sediment Control plan shall follow criteria in the latest edition of the Illinois Urban Manual.

- a.) All clearing, grading, stripping, excavating, and filling which is subject to the approval requirements of this ordinance shall be subject to the applicable standards and requirements set forth and/or referenced in this ordinance;
- b.) Responsibility: The permittee shall not be relieved of responsibility for damage to persons or property otherwise imposed by law, and the Village or its officers or agents, including the Directors and Staff of the RISWCD will not be made liable for such damage by (1) the issuance of a permit under this ordinance, (2) compliance with the provisions of that permit or with conditions attached to it by the Village, (3) failure of the Village officials to observe or recognize hazardous or unsightly conditions, (4) failure of the Village officials to recommend denial of or to deny a permit, or (5) exemptions from the permit requirements of this ordinance; and
- c.) Site Design Requirements: Practice standards and specifications for measures outlined in the soil erosion and sediment control plan shall follow criteria in the latest edition of the "Illinois Urban Manual: A Technical Manual Designed for Urban Ecosystem Protection and Enhancement", which is hereby incorporated into this ordinance by reference.

43.01 - Erosion and Sediment Control Design Requirements: New developments or re-developments shall comply with Article IV, Section 42 and meet the following:

43.011 - Control measures shall be constructed to control runoff from the property to such an extent possible that sediment is retained on-site.

43.012 - Temporary on-site control measures required shall be constructed and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

43.013 - Disturbed areas shall be stabilized with permanent measures within seven (7) calendar days following the end of active disturbance, or redisturbance consistent with the following criteria:

- a.) Appropriate permanent stabilization measures shall include seeding, mulching, sodding, with non-vegetative measures as a last resort; and
- b.) Areas having slopes greater than 12% shall be stabilized with sod, mat, or blanket in combination with seeding or equivalent.

43.014 - All temporary and permanent erosion and sediment control practices must be maintained and repaired as needed to assure effective performance of their intended function.

43.015 - All temporary erosion and sediment control measures shall be disposed in a proper manner within thirty (30) days after final site stabilization is achieved with permanent soil stabilization measures. Trapped sediment and other disturbed soils resulting from the disposition of temporary measures shall be permanently stabilized to prevent further erosion and sedimentation.

43.016 - Site Development Requirements: On-site sediment control measures, as specified by the following criteria, shall be constructed as specified in the referenced handbooks, and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

- a.)** For new developments or redevelopments less than one (1) acre, filter barriers (including filter fences, straw bales, or equivalent control measures) shall be constructed to control all on-site runoff. Vegetated filter strips, with a minimum width of twenty-five (25) feet, may be used as an alternative only where runoff in sheet flow is expected;
- b.)** For new developments or re-developments more than one (1) acre but less than five (5) acres, a sediment trap or equivalent control measure shall be constructed at the downslope point of the disturbed area,
- c.)** For new developments or re-developments greater than five (5) acres, a sediment basin or equivalent control measure shall be constructed at the down slope point of the disturbed area;
- d.)** Sediment basin and sediment trap designs shall provide for both "dry" detention and "wet" detention sediment storage. The detention storage shall be composed of equal volumes of "wet" detention storage and "dry" detention storage and each shall be sized as regulated in Article III, Section 33. The release rate of the basin shall be that rate as regulated in Article III. The elevation of the outlet structure shall be placed such that it only drains the dry detention storage;
- e.)** The sediment storage shall be sized to store the estimated sediment load generated from the site over the duration of the construction period with a minimum storage equivalent to the volume or sediment generated in one year. For construction periods exceeding one year, the 1-year sediment load and a sediment removal schedule may be substituted; and
- f.)** To the extent possible or as otherwise regulated in this ordinance all desirable trees eight (8) inches in diameter and larger shall be protected for their present and future value for erosion protection and other environmental benefits. Trees that have been selected for preservation shall be marked prior to the beginning of any clearing, grading, stripping, excavation, or filling of the site. A "No" construction zone shall be established and marked at the perimeter of the dripline of each tree which is to be preserved.

43.017 - Stormwater conveyance channels, including ditches, swales, and diversions, and the outlets of all channels and pipes shall be designed and constructed as regulated in Article III. All constructed or modified channels shall be stabilized within 48 hours, consistent with the following standards and as required in the referenced handbooks:

- a.) For grades up to 4 percent, seeding in combination with mulch, erosion blanket, or an equivalent control measure shall be applied. Sod or erosion blanket or mat shall be applied to the bottom of the channel;
- b.) For grades of 4 to 8 percent, sod or an equivalent control measure shall be applied in the channel; and
- c.) For grades greater than 8 percent, rock, riprap, or an equivalent control measure shall be applied over filter fabric or other type of soil protection, or the grade shall be effectively reduced using drop structures.

43.018 - Land disturbance activities in stream channels shall be avoided, where possible, or as regulated in Article III. If disturbance activities are unavoidable, the following requirements shall be met.

- a.) Construction vehicles shall be kept out of the stream channel to the maximum extent practicable. Where construction crossings are necessary, temporary crossings shall be constructed of non-erosive material, such as riprap or gravel;
- b.) The time and area of disturbance of stream channels shall be kept to a minimum. The stream channel, including bed and banks, shall be stabilized within 48 hours after channel disturbance is completed, interrupted, or stopped; and
- c.) Whenever channel relocation is necessary, the new channel shall be constructed under dry conditions and fully stabilized before flow is diverted, incorporating meanders, pool and riffle sequence, and riparian planting.

43.019 - Storm sewer inlets and culverts shall be protected by sediment traps or filter barriers meeting accepted design standards and specifications.

43.020 - Soil storage piles containing more than 10 cubic yards of material shall not be located with a downslope drainage length of less than 50 feet to a roadway, drainage channel, or abandoned mine. Filter barriers, including straw bales, filter fence, or equivalent, shall be installed immediately surrounding the perimeter of the pile.

43.021 - If dewatering devices are used, discharge locations shall be protected from erosion. All pumped discharges shall be routed through appropriately designed sediment traps or basins, or equivalent and shall not be deposited into an abandoned mine.

43.022 - Each site shall have graveled (or equivalent) entrance roads, access drives, and parking areas of sufficient length and width to prevent sediment from being tracked onto public or private

roadways. Any sediment reaching a public or private road shall be removed by shoveling or street cleaning (not flushing) before the end of each workday and transported to a controlled sediment disposal area.

Section 44 - Maintenance of Control Measures: All soil erosion and sediment control measures necessary to meet the requirements of this ordinance shall be maintained by the applicant or subsequent land owner during the period of land disturbance and development of the site in a satisfactory manner to ensure adequate performance. The applicant or contractor responsible for maintaining the soil erosion and sediment control practices shall inspect all such practices at least once every 7 days or within 24 hours of a precipitation event equal to or exceeding 0.5" of rainfall.

Article V - Long Term Maintenance Responsibility:

Section 50 - Long Term Maintenance Responsibility: Maintenance of stormwater drainage, and soil erosion and sediment control facilities located on private property shall be the responsibility of the owner of that property. Before an appropriate permit is obtained from the Village, the applicant shall execute a maintenance agreement with the Village guaranteeing that the applicant and all future owners of the property will maintain its stormwater drainage and soil erosion and sediment control system. Such agreement shall be recorded with the Recorder of Deeds of the County. The maintenance agreement shall include a schedule for regular maintenance of each aspect of the property's stormwater drainage and soil erosion and sediment control system and shall provide for access to the system for inspection by authorized personnel of the Village. The maintenance agreement shall also stipulate that if the appropriate personnel of the Village, notify the property owner in writing of maintenance problems which require correction, the property owner shall begin such corrections within twenty four (24) hours and shall not extend beyond seven (7) calendar days of such notification. If the corrections are not made within this time period the Village may have the necessary work completed and assess the cost to the property owner. The Village shall require a bond to be filed by the property owner for maintenance of the stormwater drainage and soil erosion and sediment control system.

Article VI - Inspections:

Section 60 - Inspections: The Rock Island County SWCD shall make inspections as hereinafter required and shall either approve that portion of the work completed or shall notify the permittee wherein the work fails to comply with the site development or erosion and sediment control plan as approved. The Rock Island County SWCD will notify the Village of permittees failure to comply with ordinance regulations. Plans for grading, stripping, excavating, and filling work bearing the stamp of approval of the Village and Rock Island County SWCD shall be maintained at the site during progress of the work. In order to obtain inspections and to ensure compliance with the approved erosion and sediment control plan, the grading or building permit, and this Ordinance, the permittee shall notify the Village and the Rock Island County SWCD within two (2) working days of the completion of the construction stages specified below:

- a.) Upon completion of installation of sediment and runoff control measures (including perimeter controls and diversions), prior to proceeding with any other earth disturbance or grading;
- b.) After stripping and clearing;
- c.) After rough grading;
- d.) After final grading;
- e.) After seeding and landscaping deadlines; and
- f.) After final stabilization and landscaping, prior to removal of temporary sediment controls.

If stripping, clearing, grading and/or landscaping are to be done in phases or areas, the permittee shall give notice and request inspection at the completion of each of the above work stages in each phase or area. If an inspection is not made and notification of the results given within five (5) working days after notice is received by the Village from the permittee, the permittee may continue work at his/her own risk, without presuming acceptance by the Village. Notification of the results of the inspection shall be given in writing at the site. A duplicate copy shall be kept by the enforcing agency of the Village and/or the Rock Island County SWCD.

Section 61 - Special Precautions: If at any stage of the grading of any development site the Rock Island County SWCD determines by inspection that the nature of the site is such that further work authorized by an existing permit is likely to imperil any property, public way, stream, lake, wetland, or drainage structure, the Village shall require, as a condition of allowing the work to be done, that such reasonable special precautions to be taken as is considered advisable to avoid the likelihood of such peril. "Special precautions" may include, but shall not be limited to, a more level exposed slope, construction of additional drainage facilities, berms, terracing, compaction, or cribbing, installation of plant materials for erosion control, and recommendations of a registered soils engineer and/or engineering geologist which may be made requirements for further work.

61.01 - Where it appears that storm damage may result because the grading on any development site is not complete, work shall be stopped and the permittee required to install temporary structures or take such other measures as may be required to protect adjoining property or the public safety. On large developments or where unusual site conditions prevail, the Zoning Officer shall specify the time of starting grading and time of completion or may require that the operations be conducted in specific stages so as to ensure completion of protective measures or devices prior to the advent of seasonal rains.

Section 62 - Amendment of Plans: Major amendments to stormwater drainage and detention or erosion and sediment control plans shall be submitted to the Zoning Officer and the Rock Island County Soil and Water Conservation District. Plan amendments shall be processed and approved or disapproved in the same manner as the original plans. Field modification of a minor nature may be authorized by the Zoning Officer and/or Rock Island County Soil and Water Conservation District, by written authorization to the permittee.

Article VII - Permitting:

Section 70 - Application for Permit: Application for a development permit shall be made by the owner of the property or his authorized agent to the Zoning Officer on a form furnished for that purpose. Each application shall bear the name(s) and address(es) of the owner or developer of the site, the contractor(s) and of any consulting firm retained by the applicant together with the name of the applicant's principal contact at such firm. Each application shall include certification that any land clearing, construction, or development involving the movement of earth shall be in accordance with the plans approved upon issuance of the permit.

Section 70.01 – Application Fee: All applications for a development permit shall be accompanied with an application fee as set forth in Exhibit A, attached hereto and incorporated herein. In addition, the applicant shall be responsible for reimbursing the Village for any additional cost necessary for review, inspection, and approval of this project including, but not limited to the engineering services of the Village Engineer. The Zoning Officer shall require a \$500.00 deposit to cover these additional costs.

Section 71 - Bond Required: The applicant for a development permit shall be required to file with the Village a faithful performance bond or bonds, letter of credit, or other improvement security satisfactory to the Village Attorney, in an amount deemed sufficient by the Zoning Officer, and for such period as specified by the Village. These faithful performance bond or bonds, letter of credit, or other improvement security would be used to cover engineering and inspection costs, and the cost of failure or repair of improvements installed on the site.

Section 72 - Review and Approval: Each application for an erosion and sediment control plan shall be reviewed and acted upon according to the following procedures:

- a.) As a condition of this ordinance, the Village shall require the applicant, or designated agent, to consult with the Rock Island County Soil and Water Conservation District (RISWCD) on soil erosion and sediment control plans. The

applicant shall submit all required items to the RISWCD the same day that the application is made to the Village.

The RISWCD shall:

1. Review the applicant's soil erosion and sediment control plans and provide written evaluation to the Village regarding the adequacy (effectiveness) to address the provisions of this ordinance. The RISWCD shall retain the services of a professional trained in the implementation of soil erosion and sediment control practices to perform the services outlined in this section. The RISWCD will assess a fee as set forth in Exhibit B, attached hereto, and incorporated herein to be paid by the applicant for performing these services;
2. Attend a pre-construction meeting with the applicant or designated agent to review implementation of erosion and sediment control plans;
3. Conduct onsite inspections during the active construction phases of land development projects to determine whether site development is in compliance with the approved erosion and sediment control plans, and determine adjustments needed to the approved plans. After construction has been completed, determine whether permanent site stabilization has been achieved and identify operation and maintenance needs;
4. Prepare correspondence as needed regarding the effectiveness (or corrective measures needed) or adequacy of soil erosion and sediment control measures, and
5. Consult with land developers, consultants, and contractors concerning the design criteria, installation and maintenance procedures and other information regarding conservation practices recommended under the provisions of this ordinance.

The Village of Carbon Cliff shall:

1. After review of the application and required submissions if it is found to be in conformance with the provisions of this ordinance, approve the erosion and sediment control plan;
 2. Approve the erosion and sediment control plan subject to such reasonable conditions as may be necessary to secure substantially the objectives of this ordinance, and issue the approval subject to these conditions; or
 3. Disapprove the erosion and sediment control plan, indicating the deficiencies and the procedure for submitting a revised application and/or submission.
- b.) No approval for an erosion and sediment control plan shall be issued for an intended development site unless one or more of the following have been obtained: The development, including but not limited to subdivisions and planned unit development, has been approved by the Village where applicable; or

1. Such permit is accompanied by or combined with a valid building permit issued by the Village Building Official; or
2. The proposed earth moving is coordinated with any overall development program previously approved by the Village for the area in which the site is situated; and
3. All relevant federal and state permits including, but not limited to: NPDES, 404, 401, NRI's, etc. have been received for the portion of the site subject to soil disturbance, and
4. Applicant is successful in the appeals process.

72.01 - Failure of the Zoning Officer to act on an original or revised application within thirty (30) days of receipt shall authorize the applicant to proceed in accordance with the plans as filed and in compliance with the regulations contained herein, unless such time is extended by agreement between the Zoning Officer and the applicant. Pending preparation and approval of a revised plan, development activities shall be allowed to proceed in accordance with conditions established by the Zoning Officer.

Section 73 - Expiration of Permit: Every development permit shall expire and become null and void if the work authorized by such permit has not been commenced within one hundred and eighty (180) days, or if not completed by a date which shall be specified in the permit; except that the Zoning Officer may, if the permittee presents satisfactory evidence that unusual difficulties have prevented work being commenced or completed within the specified time limits, grant a reasonable extension of time if written application is made before the expiration date of the permit. The Zoning Officer may require modification of the erosion control plan to prevent any increase in erosion or off-site sediment runoff resulting from any extension.

Section 74 – Scope of Appeals:

74.01 - An appeal may be taken to the Board of Appeals by the applicant, any person or agency which received notice of the filing of the application, or by any person, firm, corporation, office, department, board or bureau aggrieved by decision of the Zoning Officer. Such appeal shall be taken within such time as shall be prescribed by the Board of Appeals by general rule by filing with the Zoning Officer a notice of appeal specifying the grounds thereof. The Zoning Officer shall forthwith transmit to the Board of Appeals all of the papers constituting a record upon which the Section appealed from was taken.

74.02 - The Factors to be considered on appeal shall include, but need not be limited to, the effects of the proposed development activities on the surface water flow to tributary and downstream lands, any comprehensive watershed management plans, or the use of any retention facilities; possible saturation of fill and unsupported cuts by water, both natural and domestic; runoff surface waters that produce erosion and silting of drainageways; nature and type of soil or rock which when disturbed by the proposed development activities may create earth movement and produce slopes that cannot be landscaped; and excessive and unnecessary scarring of the natural landscape through grading or removal of vegetation.

74.03 – Findings on Appeal:

74.031 – An appeal shall stay all proceedings in furtherance of the action appealed from unless the Zoning Officer certifies to the Board of Appeals, after the notice of the appeal has been filed with him, that by reason of facts stated in the certificate a stay would, in his opinion, cause imminent peril to life or property.

74.032 – The Board of Appeals shall select a reasonable time and place for the hearing of the appeal, give due notice thereof to the parties, and shall render a written decision on the appeal without unreasonable delay. The Board of Appeals may affirm or may, upon the concurring vote of four (4) members, reverse wholly or in part or modify the order, requirement, decision, or determination that, in its opinion, ought to be done. To that end, the Board of Appeals shall have all the powers of the officer from whom the appeal is taken. The Zoning Officer shall maintain records of all actions of the Board of Appeals relative to appeals.

Section 75 - Retention of Plans: Plans, specifications, and reports for all site developments shall be retained in original form or on microfilm by the Zoning Officer.

Section 76 – Amendments:

76.01 – This ordinance may be amended, provided that in all amendments adopted under the authority of this Section, due allowance shall be made for existing conditions, the conservation of property values, and the direction of building development to the best advantages of the entire community.

76.02 – Initiations of Amendments: Amendments may be proposed by the Village Board, Plan Commission, Village President, Zoning Official or the Rock Island County SWCD.

76.03 – Application for Amendment: An application for an amendment shall be filed with the Zoning Officer in such form and accompanied by such information as required by the Zoning Officer. Such application shall be forwarded to the Plan Commission with the request to hold a public hearing on said application for amendment.

76.04 – Hearing on Application: The Plan Commission shall hold a public hearing on each application for an amendment at such time and place as shall be established by the Plan Commission. The hearing shall be conducted and a record of such proceedings shall be preserved in such manner, as the Plan Commission shall, by rule, prescribe from time to time.

76.05 – Notice of Hearing: Notice of time and place of such hearing shall be published at least once in one or more newspapers of general circulation in the Village of Carbon Cliff not less than fifteen (15) nor more than thirty (30) days before such hearing. Supplemental or additional notices may be published or distributed as the Plan Commission may, by rule, prescribe from time to time.

76.06 – Findings of Fact and Recommendation of the Plan Commission:

76.061 – Within forty-five (45) days after the close of the hearing on a proposed amendment, the Plan Commission shall make written findings of fact and shall submit same together with its recommendations to the Village Board.

76.062 – The Plan Commission shall not recommend the adoption of a proposed amendment unless it finds that the adoption of such amendment is in the public interest.

76.07 – Action by Village Board:

76.071 – The Village Board shall not act upon a proposed amendment to this Ordinance until it shall have received a written report and recommendation from the Plan Commission on the proposed amendment.

76.072 – The Village Board may grant or deny any amendment.

76.073 – The Village Board may request specific changes to a proposed amendment to this Ordinance once it has received a written report and recommendation from the Plan Commission on the proposed amendment. However, before the proposed amendment with the Village Board’s specific changes, can be adopted by the Village Board; the proposed amendment with the specific changes must be forwarded to the Plan Commission for another Public Hearing, Findings of Fact, and written recommendation.

76.074 – A proposed amendment or a proposed amendment with specific changes that doesn’t receive a written recommendation from the Plan Commission, shall not be adopted except by a concurrence of two-thirds (2/3) of the Village Trustees then holding office.

76.08 – Effect of Denial of Amendment: No application for an amendment that has been denied wholly or in part by the Village Board shall be resubmitted for a period of one (1) year from the date of said denial except on the grounds of new evidence or proof of change of conditions found to be valid by the Plan Commission.

Article VIII - Enforcement:

Section 80 - Stop-Work Order; Revocation of Permit: In the event any person holding a development permit pursuant to this ordinance violates the terms of the permit, or carries on-site development in such a manner as to materially adversely affect the health, welfare, environment, or safety of persons residing or working in the neighborhood of the development site or so as to be materially detrimental to the public welfare or injurious to property or improvements in the neighborhood, the Zoning Officer shall suspend or revoke the development permit.

80.01 - Suspension of a permit shall be by a written stop-work order issued by the Zoning Officer and delivered to the permittee or his agent or the person performing the work. The stop-work order shall be effective immediately, shall state the specific violations cited, and shall state the conditions under which work may be resumed. A stop-work order shall remain in effect until appealed by the permittee to the Board of Appeals at which time the conditions of Article VII,

Section 74 can be met or until the specific violations cited are corrected to the satisfaction of the zoning officer.

80.02 - No development permit shall be revoked until a hearing is held by the Board of Appeals. Written notice of such hearing shall be served on the permittee, either personally or by certified mail return receipt requested, and shall state:

- a.) The reasons for revocation, in clear and concise language; and
- b.) The time, date and place where such hearing will be held.

Such notice shall be served on the permittee at least five (5) days prior to the date set for the hearing. At such hearing, the permittee shall be given an opportunity to be heard and may call witnesses and present evidence on his behalf. At the conclusion of the hearing the Board of Appeals shall determine whether the permit shall be revoked.

Section 81 – Fees: The fee for variances and appeals shall be Seventy-five (\$75.) dollars.

Section 82 - Violations and Penalties: No person shall construct, enlarge, alter, repair or maintain any grading, excavation or fill, or cause the same to be done, contrary to or in violation of any terms of this ordinance. Any person violating any of the provisions of this ordinance shall be deemed guilty of a misdemeanor, and each day during which any violation of any of the provisions of this ordinance is committed, continued, or permitted shall constitute a separate offense. Upon conviction of any such violation, such person, partnership, or corporation shall be punished by a fine of not less than Seventy Five dollar (\$75.00), and nor more than Seven Hundred Fifty dollars (\$750.00) for each offense. In addition to any other penalty authorized by this section, any person, partnership, or corporation convicted of violating any of the provisions of this ordinance shall be required to restore the site to the condition existing prior to commission of the violation, or to bear the expense of such restoration.

Article IX - Effective Date

This ordinance shall be in full force and effect from and after its passage and approval and publication, as required by law.

Passed by Village Board of the Village of Carbon Cliff, Illinois, this ____ day of _____, 2001.

ADOPTED by the Board of Trustees for the Village of Carbon Cliff this ____ day of _____, 2001.

Appendix A

Desirable Trees Native to Northwestern Illinois

Ash, Blue, *Fraxinus quadrangulata*
Ash, Green, *Fraxinus pennsylvanica*
Ash, White, *Fraxinus americana*
Birch, River or Red, *Betula nigra*
Coffeetree, Kentucky, *Gymnocladus dioica*
Hackberry, Common, *Celtis occidentalis*
Hickory, Shagbark, *Carya ovata*
Ironwood (Hophornbeam), *Ostrya virginiana*
Larch, American (Tamarack), *Larix laricina*
Linden, American (Basswood), *Tilia americana*
Maple, Black, *Acer nigrum*
Maple, Red or Swamp, *Acer rubrum*
Maple, Sugar or Rock, *Acer saccharum*
Oak, Black, *Quercus velutina*
Oak, Bur, *Quercus macrocarpa*
Oak, Chinkapin, *Quercus muehlenbergii*
Oak, Pin or Swamp, *Quercus palustris*
Oak, Red, *Quercus rubra*
Oak, Swamp White, *Quercus bicolor*
Pecan, *Carya illinoensis*
Redbud, *Cercis canadensis*
Arborvitae, White Cedar, *Thuja occidentalis*
Juniper, Eastern Redcedar, *Juniperus virginiana*
Pine, Easter White, *Pinus strobus*

Appendix B

Desirable Trees Native to Areas South of Carbon Cliff, Illinois. Additional planting is encouraged.

Baldcypress, *Taxodium distichum*

Beech, European, *Fagus sylvatica* (except)

Buckeye, Red, *Aesculus pavia*

Dogwood, Flowering, *Cornus florida*

Hickory, Shellbark, *Carya laciniosa* (for wet areas)

Persimmon, Common, *Diospyros virginiana*

Sassafras, Common, *Sassafras albidum*

Sourgum (Black Tupelo), *Nyssa sylvatica*

Sweetgum, *Liquidambar styraciflua*

Tuliptree, *Liriodendron tulipifera*

Total number of phases _____ **Phase number** _____

The applicant agrees to the following conditions:

1. Submit all required information listed on the following page for each phase of development, regarding the soil erosion and sediment control (SE/SC) plan.
2. Upon submittal of this application, pay the applicable fee, based on the attached fee schedule, in accordance with total acres of disturbance to the original topography and/or vegetation.
3. Notify representatives from the Village of Carbon Cliff, Rock Island County Soil and Water Conservation District (SWCD) and the Natural Resources Conservation Service, (NRCS) of the pre-construction meeting to review implementation of the SE/SC plan.
4. Allow a Village of Carbon Cliff, Rock Island County SWCD, or NRCS representative the right to conduct on-site investigations throughout all active construction phases to determine whether all necessary SE/SC practices have been installed and are functioning properly.
5. Upon commencement of earthwork or construction, document SE/SC site inspections with all information being accurate and complete.
6. Comply with the Village of Carbon Cliff and Rock Island County SWCD's written and verbal recommendations regarding:
 - A. The SE/SC plan and corrections or changes made thereto.
 - B. Installation and maintenance requirements of the SE/SC practices on-site.
7. If any changes occur to the plans, schedules, etc., the applicant shall be responsible for notifying the Village of Carbon Cliff and the Rock Island County Soil and Water Conservation District.

Upon receipt of all required information, the SE/SC plan will be reviewed within 15 working days and all involved parties will be notified whether or not the plan meets technical standards.

Applicant's Signature: _____ **Date:** _____

Site Plan Checklist

The soil erosion and sediment control plan cannot be reviewed until all of the following information is submitted for each upcoming active construction phase:

1. Existing site conditions and natural resources present, including:

- _____ Site boundaries and adjacent lands which accurately identify site location.
- _____ Buildings, roads and utilities.
- _____ Topography, vegetation, drainage patterns, subwatershed delineation, critical erosion areas, and any subsurface drainage tiles.
- _____ Wetland and floodplain delineation.
- _____ Location and identification of soil types.
- _____ Adjacent areas that affect or are affecting the project site, e.g. drainage onto or through the site affecting wetlands, streams, lakes, and drainage areas downstream.
- _____ Vicinity map.
- _____ Show areas where trees and vegetation are to be preserved.
- _____ Map legend, including north arrow and scale on all materials submitted.

2. Final site conditions, including:

- _____ An accurate depiction of post-construction appearance, e.g. roads, buildings, open space.
- _____ Locations, dimensions, cross sections and elevations of all (temporary and permanent) stormwater management facilities (including sediment basins), plus inlet and outlet locations.
- _____ Surface flow direction, including sheet flow and concentrated flow direction.
- _____ Post-construction topography, final contours should be easily distinguished (2 foot contour is preferred) including subwatershed delineations.

3. A complete soil erosion and sediment control plan, including:

- _____ Location and detailed drawings of all permanent and temporary soil erosion and sediment control practices.
- _____ A schedule outlining the installation of the practices with the responsible parties identified.
- _____ Inspection, and maintenance schedules with responsible parties identified.
- _____ Seeding information: rates, species, dates, fertilization, temporary or permanent.
- _____ Location and dimension of all temporary soil and aggregate stockpiles.

4. Locations, dimension & phase timeline of all land disturbing activities, including:

- _____ Designate construction limits, areas that will be disturbed and areas of wetland fill.
- _____ Describe grading and building schedule and phasing timeline.

Narrative Checklist

The soil erosion and sediment control plan cannot be reviewed until all of the following information is submitted for each upcoming active construction phase:

- _____ **Project description** - Briefly describes the nature and purpose of the land disturbing activity, and the area (acres) to be disturbed.

- _____ **Existing site conditions**- A description of the existing topography , vegetation, drainageways, subsurface drain tile, buildings, roads and utilities.

- _____ **Adjacent areas**- A description of neighboring areas such as streams, lakes, residential areas, roads, etc. which might be affected by the land disturbance. Describe any adjacent or neighboring activities that may affect the soil erosion and sediment control plan.

- _____ **Off-site areas**- Will any other areas be disturbed? Describe any off-site land disturbing activities.

- _____ **Soils**- Provide a brief description of the soils on the site at the exposed soil horizon such as soil name, mapping unit, erodibility, permeability, texture, structure and depth to seasonal high groundwater. (this information is available from the local Soil and Water Conservation District).

- _____ **Critical areas**- A description of areas on the site which have potentially serious problems, e.g. steep or long slopes, channels, intermittent streams, and side hill seeps.

- _____ **Soil erosion and sediment control measures**- A description of the methods which will be used to control erosion and sedimentation on the site. Control methods should meet the standards in section 4 of the Illinois Urban Manual.

- _____ **Permanent stabilization**- A brief description including specifications of how the site will be stabilized after construction is completed.

- _____ **Stormwater runoff calculations**- Will the development site cause an increase in peak runoff rates? Will the increase in runoff cause soil erosion or channel degradation downstream? Describe the strategy to control stormwater runoff.

- _____ **Calculations**- Detailed calculations for the design of temporary sediment basins, permanent stormwater detention basins, diversions, channels, etc.. Include pre and post development runoff.

- _____ **Detail drawings**- Include detail drawings form the Illinois Urban Manual. Any structural practices used that are not referenced to the Illinois Urban Manual or local handbooks should be explained and illustrated with detail drawings.

- _____ **Maintenance** - Provide a schedule of maintenance for all temporary and permanent erosion and sediment control practices to ensure that they perform properly. Identify the parties responsible for maintenance.

EXHIBIT B DEVELOPMENT APPLICATION FEE SCHEDULE

50 cubic yards (38.2 m ³) or less	\$23.50
51 to 100 cubic yards (40 m ³ to 76.5 m ³)	37.00
101 to 1,000 cubic yards (77.2 m ³ to 764.6 m ³)—\$37.00 for the first 100 cubic yards (76.5 m ³) plus \$17.50 for each additional 100 cubic yards (76.5 m ³) or fraction thereof.	
1,001 to 10,000 cubic yards (765.3 m ³ to 7645.5 m ³)—\$194.50 for the first 1,000 cubic yards (764.6 m ³), plus \$14.50 for each additional 1,000 cubic yards (764.6 m ³) or fraction thereof.	
10,001 to 100,000 cubic yards (7646.3 m ³ to 76,455 m ³)—\$325.00 for the first 10,000 cubic yards (7645.5 m ³), plus \$66.00 for each additional 10,000 cubic yards (7645.5 m ³) or fraction thereof.	
100,001 cubic yards (76,456 m ³) or more—\$919.00 for the first 100,000 cubic yards (76,455 m ³), plus \$36.50 for each additional 10,000 cubic yards (7645.5 m ³) or fraction thereof.	
Other Inspections and Fees:	
1. Inspections outside of normal business hours (minimum charge—two hours)	\$50.50 per hour
2. Reinspection fees assessed under provisions of Section 108.8	\$50.50 per hour
3. Inspections for which no fee is specifically indicated (minimum charge—one-half hour)	\$50.50 per hour

FEE SCHEDULE

Fee is based on acreage of the site

Base Fee: \$100 (One acre or less)

*Round acres to nearest whole number

160+ acres = 5\$ for each additional acre

SOIL EROSION AND STORMWATER MANAGEMENT

CHAPTER 1 – GENERAL AND ADMINISTRATIVE PROCEDURES

SECTION 1 – AUTHORITY AND PURPOSE

This policy is enacted as per city regulation of the City of Clinton, Illinois.

The purpose of this policy is to diminish threats to public health and safety, protect property, prevent damage to the environment, and promote public welfare by guiding, regulating and controlling the design, construction, use and maintenance of any new development or redevelopment or other activity which disturbs or breaks the topsoil or otherwise results in the movement of earth and/or changes the stormwater drainage pattern and/or stormwater flows from that which would have occurred if the land had been left in its natural state. This stormwater runoff and resulting soil erosion could result in the inundation of damageable properties, the erosion and destabilization of downstream channels, and the pollution of valuable stream and lake resources. One cause of increases in stormwater runoff quantity or rate and impairment of quality and loss of valuable topsoil is the new development or redevelopment of the land. This policy regulates these activities to minimize adverse impacts.

This policy is adopted to accomplish the following objectives:

1. To assure that new development or redevelopment does not increase the drainage or flood hazards, or create unstable conditions susceptible to soil erosion;
2. To protect new buildings and major improvements to buildings from flood damage due to increased stormwater runoff and soil erosion;
3. To protect human life and health from the hazards of increased flooding and soil erosion on a watershed basis;
4. To lessen the burden on the taxpayer for flood control projects, repairs to flood-damaged public facilities and utilities, correction of channel erosion problems, and flood rescue and relief operations caused by stormwater runoff and soil erosion quantities from new development or redevelopment;
5. To protect, conserve, and promote the orderly development of land and soil, water air, animal, and plant resources;
6. To preserve the natural hydrologic and hydraulic functions of watercourses and flood plains and to protect water quality and aquatic habitats;
7. To preserve the natural characteristics of stream corridors in order to manage flood and stormwater impacts, improve water and groundwater quality, reduce soil erosion, protect aquatic and riparian habitat, maintain quality forest resources, provide recreational opportunities, provide aesthetic benefits, enhance community and economic development.

SECTION 2 – APPLICABILITY:

This policy shall apply to all new development or redevelopment in Clinton, Illinois. Except as otherwise provided in this policy, no person, firm or corporation, public or private, the State of Illinois and its agencies or political subdivisions, the United States of America, and its agencies or political subdivisions, any agent, servant, officer or employee of any of the foregoing which meets the following provisions, or is otherwise exempted in this policy, shall not commence any development activities without first having obtained a development permit from the Building and Zoning Administrator of Clinton, Illinois.

SECTION 3 – EXEMPTIONS:

A development permit shall not be required for the following:

1. Any new development, redevelopment or other activity falling below the minimum standards as set forth in *Chapter 1.0, Section 3.0*.
2. The agricultural use of land, including the implementation of conservation measures included in a farm conservation plan approved by the USDA-NRCS and Soil and Water Conservation District, and including the construction of agricultural structures.
3. The maintenance of any existing stormwater drainage/detention component or structure or any existing soil erosion/sediment control component or structure; including dredging, levee restoration, tree removal or other function which maintains the original design capacities of the above.

4. The construction of, improvements to, or the maintenance of any street, road, highway, or interstate highway performed by any unit of government whose powers grant such authority.

SECTION 4 – EXCEPTIONS:

The Zoning Board of Appeals, Clinton, Illinois, may, in accordance with the following procedures, authorize exceptions to any of the requirements and regulations set forth in this policy:

Application for exception shall be made by a verified petition of the applicant for a development permit, stating fully the grounds of the petition and the facts relied upon by the applicant. Such petition shall be filed with the development permit application. In order for the petition to be granted, it shall be necessary that the Board of Appeals find all of the following facts with the respect to the land referred to in the petition:

1. That the land is of such shape or size or is affected by such physical conditions or is subject to such title limitations or record, that it is impossible or impractical for the applicant to comply with all of the requirements of this policy;
2. That the exception is necessary for the preservation and enjoyment of a substantial property right of the applicant; and
3. That the granting of the exception will not be detrimental to the public welfare, environment or injurious to other property in the vicinity of the subject's property.
4. Each application for an exception shall be made to the Clinton Zoning Office. The Zoning Office and Department of Public Works & Construction will review and transmit recommendations to the Board of Appeals, which shall review such recommendations prior to granting or denying the exception.

The Board of Appeals shall hold a public hearing on each application for exception, within thirty (30) days after receiving the application, in the manner provided with respect to appeals. Within thirty (30) days after public hearing, the Board of Appeals shall either approve the site development permit application with the exceptions and conditions it deems necessary or it shall disapprove such development permit application and exception application or it shall take other such action as appropriate.

SECTION 5 – RESPONSIBILITY:

The applicant shall not be relieved of responsibility for damage to persons or property otherwise imposed by law, and Clinton, Illinois or its officers or agents will not be made liable for such damage, by (1) the issuance of a development permit under this policy, (2) compliance with the provisions of that development permit or conditions attached to it by the Zoning Administrator, (3) failure of Clinton, Illinois officials to observe or recognize hazardous or unsightly conditions, (4) failure of Clinton, Illinois officials to recommend denial or to deny a development permit, or (5) exemptions from development permit requirements of this policy.

SECTION 6 – SEPARABILITY:

The provisions and sections of this policy shall be deemed to be separable, and the invalidity of any portion of this policy shall not affect the validity of the remainder.

SECTION 7 – DEFINITIONS:

For the purposes of this policy certain terms are defined and set forth below:

1. **Adverse Impacts:** Any negative impact on plant, soil, air or water resources affecting their beneficial uses including recreation, aesthetics, aquatic habitat, quality, and quantity.
2. **Applicant:** Any person, firm, or governmental agency who executes the necessary forms to procure official approval of a development or permit to carry out construction of a new development or redevelopment from Clinton, Illinois.
3. **Base Flood Elevation:** The elevation at all locations delineating the level of flooding resulting from the 100-year frequency flood event, which has a one (1) percent chance of occurring in any given year.
4. **Building Permit:** A permit issued by the Clinton, Illinois for the construction, erection or alteration of a structure or building and the related ground and surface preparation prior to and after completion of construction, erection or alteration of a structure or building.

5. **Bypass Flows:** Stormwater runoff from upstream properties tributary to a property's drainage system but not under its control.
6. **Certify or Certification:** Formally attesting that the specific inspections and tests were performed, and that such inspections and tests comply with the applicable requirements of this policy.
7. **Channel:** Any defined river, stream, creek, brook, branch, natural or artificial depression, ponded area, on-stream lake or impoundment, flowage, slough, ditch, conduit, culvert, gully, ravine, wash, or natural or manmade drainage way, which has a definite bed and bank or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.
8. **Channel Modification:** Alteration of a channel by changing the physical dimensions or materials of its bed or banks. Channel modification includes damming, riprapping, (or other armoring), filling, widening, deepening, straightening, relocating, lining, and significant removal of bottom or woody rooted vegetation. Channel modification does not include the man-made clearing of debris or removal of trash.
9. **Clearing:** Any activity that removes the natural vegetative ground cover.
10. **Compensatory Storage:** An artificially excavated, hydraulically equivalent volume of storage within the floodplain used to balance the loss of natural flood storage capacity when fill or structure are placed within the floodplain.
11. **Conduit:** Any channel, pipe, sewer, or culvert used for the conveyance or movement of water whether open or closed.
12. **Cubic Yard:** A one (1) yard by one (1) yard by one (1) yard amount of material in excavation and/or fill above ground level.
13. **DBH:** The measurement of tree diameter taken at 4.5 feet.
14. **Detention Basin:** A facility constructed or modified to provide for the temporary storage of stormwater runoff and the controlled release by gravity of this runoff at a prescribed rate during and after a flood or storm.
15. **Detention Time:** The amount of time stormwater is held within a detention basin.
16. **Development:** Any manmade change to real estate or property, including:
 - 1) The division or subdivision of any duly recorded parcel of property;
 - 2) Construction, reconstruction or placement of a building or any addition to a building;
 - 3) Installation of a manufactured home on a site, preparing a site for a manufactured home, or installing a travel trailer on a site for more than 180 days per year;
 - 4) Construction of roads, bridges, or similar projects;
 - 5) Redevelopment of a site;
 - 6) Filling, dredging, grading, clearing, excavating, paving or other non-agricultural alterations of a ground surface;
 - 7) Storage of materials or deposit of solid or liquid waste;
 - 8) Any other activity that might alter the magnitude, frequency, direction, or velocity of stormwater flows from a property.
17. **Drainage Plan:** A plan, including engineering drawings and supporting calculations, which describes the existing stormwater drainage system and environmental features, including grading, as well as proposed alterations or changes to the drainage system and environment of a property.
18. **Dry Basin:** A detention basin designed to drain after temporary storage of stormwater flows and to normally be dry over much of its bottom area.
19. **Erosion:** The general process whereby soil or earth is moved by rainfall, flowing water, wind or wave action.
20. **Excavation:** Any act by which organic matter, earth, sand, gravel, rock or any other similar material, is cut into, dug, quarried, uncovered, removed, displaced, relocated or bulldozed and shall include the conditions resulting from such actions.
21. **Excess Stormwater Runoff:** The volume and rate of flow of stormwater discharged from a new development or redevelopment which is or will be in excess of that volume and rate which existed before development or redevelopment.
22. **Existing Grade:** The vertical location of the existing ground surface prior to excavation or filling.
23. **Farm Drainage:** The surface drainage methods, i.e., waterways, and surface ditches that follow natural drainage courses.
24. **Farm Tile:** The underground conduit that removes excess subsurface waters and/or surface water.
25. **Fill:** Any act by which earth, sand, gravel, rock, or any other material, is deposited, placed, replaced, pushed, dumped, pulled, transported or moved by man to a new location and shall include the conditions resulting therefrom.
26. **Final Grade:** The vertical location of the ground surface after grading work is completed in accordance with the engineering plans.

27. **Flood Fringe:** That area as designated by the Federal Emergency Management Agency (FEMA) on either side of the floodway. This area is subject to inundation from the base flood but conveys little or no flow.
28. **Flood Hazard Boundary map (FHBM):** A very generalized map prepared by the Federal Emergency Management Agency (FEMA) which shows only where floodplains are located based on very basic data. FHBMs do not include base flood elevations.
29. **Flood Insurance Rate Map (FIRM):** A map prepared by the Federal Emergency Management Agency (FEMA) that depicts the special flood hazard area (SFHA) within a community. This map includes insurance rate zones and regulatory floodplains and may or may not depict regulatory floodways.
30. **Floodplain:** That land adjacent to a body of water with ground surface elevations at or below the base flood or the 100-year flood elevation which is subject to inundation. The floodplain as designated by the Federal Emergency management Agency (FEMA) is also known as the Special flood Hazard Area (SFHA). This area is the collective combination of the regulatory floodway and the flood fringe.
31. **Floodway:** The channel, and that portion of the floodplain, including on-stream lakes, adjacent to a stream or watercourse which is needed to store and convey the anticipated existing and future 100-year frequency flood discharge with no more than a 0.1 foot increase in stage due to any loss of flood conveyance or storage and no more than a ten percent (10%) increase in velocities.
32. **Grading:** The excavation or fill or any combination thereof and shall include the conditions resulting from any excavation or fill.
33. **Hydrograph:** A graph showing for a given location on a stream or conduit, the flow-rate with respect to time.
34. **Hydrograph Method:** This method estimates runoff volume and runoff hydrographs for the point of interest by generating hydrographs for individual sub-areas, combining them, and routing them through stream lengths and reservoir structures. Factors such as rainfall amount and distribution runoff curve number, time of concentration, and travel times are included.
35. **Illinois Drainage Law:** Circular 1355, University of Illinois Extension Office, covering laws that pertain to drainage rights, permits for streams and manmade ditches.
36. **Impervious Surface:** That area of property that is covered by materials other than soil and vegetation and that has no intended capacity to absorb stormwater, such as parking lots, driveways, sidewalks, patios, tennis courts, roofs and other structures.
37. **Infiltration:** The passage or movement of water into the soil surfaces.
38. **Loessal Soil:** A sediment, commonly non-stratified and unconsolidated, composed predominately of silt sized particles with accessory clay and sand.
39. **Lot:** an individual platted parcel in an approved subdivision.
40. **Major Drainage System:** That portion of a drainage system needed to store and convey flows beyond the capacity of the minor drainage system.
41. **Minor Drainage System:** That portion of a drainage system designed for the convenience of the public. It consists of street gutters, storm sewers, small open channels, and swales and, where manmade, is to be designed to handle the 10-year runoff event.
42. **Mitigation:** Mitigation is when the prescribed controls are not sufficient and additional measures are required to offset the development, including those measures necessary to minimize the negative effects which stormwater drainage and development activities might have on the public health, safety and welfare. Examples of mitigation include, but are not limited to compensatory storage, soil erosion and sedimentation control, and channel restoration.
43. **Modified Rational Method:** As described in the Illinois Department of Transportation "Drainage Manual" is based on the principal that the maximum rates of runoff from a given drainage area occurs at that point in time when all parts of the watershed are contributing to the flow. The rainfall generating the peak flow is assumed to be of uniform intensity for the entire watershed with rainfall duration equal to the time of concentration.
44. **Natural:** Conditions resulting from physical, chemical, and biological processes without intervention by man.
45. **Natural Drainage:** Channels formed in the existing surface topography of the earth prior to changes made by unnatural causes.
46. **One Hundred-Year Event:** A rainfall, runoff, or flood event having a one percent change occurring in any given year. A 24-hour storm duration is assumed unless otherwise noted.
47. **Parcel:** All contiguous land in one ownership.
48. **Peak Flow:** The maximum rate of flow of water at a given point in a channel or conduit.
49. **Permittee:** Any person to whom a building permit is issued.

50. **Person:** any individual, firm or corporation, public or private, the State of Illinois and its agencies or political subdivisions, the United States of America, and its agencies or political subdivisions, and any agent, servant, officer or employee of any of the foregoing.
51. **Positive Drainage:** Provision for overland paths for all areas of a property including depressional areas that may also be drained by storm sewer.
52. **Prime Farmland:** Prime farmland is land that is best suited to food, feed, forage, fiber and oilseed crops. It may be cropland, pasture, woodland, or other land, but it is not urban and built up land or water areas. It is either used for food or fiber or is available for those uses. The soil qualities, growing season and moisture supply are those needed for a well managed soil to economically produce a sustained high yield of crops. Prime farmland produces the highest yields with minimum inputs of energy and economic resources, and farming it results in the least damage to the environment.
53. **Property:** A parcel of real estate.
54. **Retention Basin:** A facility designed to completely retain a specified amount of stormwater runoff without release except by means of evaporation, infiltration, emergency bypass or pumping.
55. **Sedimentation:** The process that deposits soils, debris, and other materials either on other ground surfaces or in bodies of water or stormwater drainage systems.
56. **Site:** A parcel of land, or a contiguous combination thereof, where grading work is performed as a single unified operation.
57. **Slope Disturbance Line:** The line that delineates relatively level building areas from areas where slopes exceed four percent (4%) and where special precautions must be taken.
58. **Stormwater Drainage System:** All means, natural and manmade, used for conducting stormwater to, through or from a drainage area to the point of final outlet from a property. The stormwater drainage system includes but is not limited to any of the following: conduits and appurtenance features, canals, channels, ditches, streams, culverts, streets, storm sewers, detention basins, swales and pumping stations.
59. **Stormwater Runoff:** The waters derived from melting snow or rain falling within a tributary drainage basin which are in excess of the infiltration capacity of the soils of that basin, which flow over the surface of the ground or are collected in channels or conduits.
60. **Storm Sewer:** A closed conduit for conveying collected stormwater.
61. **Stream:** Any river, creek, brook, branch, flowrate, ravine, or natural or man-made drainage way which has a definite bed and banks or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.
62. **Stripping:** Any activity that removes the vegetative surface cover including tree removal, any spraying or clearing, and storage or removal of topsoil.
63. **Swale – (Grass lined channel):** A natural or constructed channel that is shaped or graded to required dimensions and established in suitable vegetation for stable conveyance of runoff.
64. **Ten-Year Event:** A runoff, rainfall, or flood event having a ten percent (10%) chance of occurring in any given year. A 24 hour storm duration is assumed unless otherwise noted.
65. **Time of Concentration:** The elapsed time for stormwater to flow from the most hydraulically remote point in a drainage basin to a particular point of interest in that watershed.
66. **Tributary Watershed:** All of the land surface area that contributes runoff to a given point.
67. **Two-Year Event:** A runoff, rainfall, or flood event having a fifty percent (50%) chance of occurring in any given year. A 24-hour storm duration is assumed unless otherwise noted.
68. **Vacant:** Land on which there are no structures or only structures that are secondary to the use or maintenance of the land itself.
69. **Watershed:** All land area drained by, or contributing water to, the same stream, creek, ditch, lake, marsh, stormwater facility, groundwater or depressional area.
70. **Wet Basin:** A detention basin designed to maintain a permanent pool of water after the temporary storage of stormwater runoff.
71. **Wetlands:** Wetlands are defined by regulation as “those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.” For general, but not inclusive locations of designated wetlands refer to mapping prepared jointly by the U.S. Department of Interior, Fish and Wildlife Service and the Illinois Department of Natural Resources, Office of Resource Conservation; National Wetlands inventory Mapping, 1987. The applicant may be required to provide a field investigation by a qualified wetland delineator.

SECTION 8 – ENFORCEMENT AND PENALTIES

CHAPTER 2 – SITE DEVELOPMENT REQUIREMENTS

PART 1 - STORMWATER DRAINAGE AND DETENTION:

Section 1.0 – Drainage Plan Submittal Requirements:

Each applicant shall submit the following information, to ensure that the provisions of this policy are met. The submittal shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts and benefits of the development on water resources both on-site and off-site, and the effectiveness of the proposed drainage plan in managing stormwater runoff, and meet the provisions of Chapter 1.0, Section 2.0. The applicant shall certify on the drawings that all clearing, grading, drainage and construction shall be accomplished in strict conformance with the drainage plan. The following information shall be submitted for both existing and proposed property conditions for all new developments or re-developments that meet or exceed the minimum requirements of Chapter 1.0, Section 3.0.

1.1 - Drainage Plan Requirements: A topographic survey of the property at two-foot (2) contours unless otherwise specified or approved by the Zoning Office & Department of Public Works & Construction. The plan map shall be keyed to a consistent datum specified by the City of Clinton, Illinois. If the mapping is compiled using a digital format and the Global Positioning System (GPS), the applicant will provide both paper and digital copies including GPS points.

1.1.1– Mapping and Descriptions: An existing drainage and proposed drainage plan for the property and one hundred (100) feet surrounding the property at a scale of not more than one hundred (100) feet to one (1) inch, and including the following:

- 1.) property boundary, dimensions, and approximate acreage;
- 2.) building setback lines;
- 3.) all existing and proposed structures and sizes;
- 4.) square feet of existing and proposed impervious surface;
- 5.) all existing, or proposed easements;
- 6.) all existing, abandoned, or proposed water or monitoring well head locations;
- 7.) all sanitary or combined sewer lines and septic systems;
- 8.) the banks and centerline of streams and channels;
- 9.) shoreline of lakes, ponds, and detention basins with normal water level elevation;
- 10.) farm drains and tiles;
- 11.) soils classifications;
- 12.) location, size and slope of stormwater conduits and drainage swales;
- 13.) depressional storage areas;
- 14.) detention facilities;
- 15.) roads, streets and associated stormwater inlets including finished grades;
- 16.) base flood elevation, flood fringe, and regulatory floodway;
- 17.) basis of design for the final drainage network components;
- 18.) a statement giving any applicable engineering assumptions and calculations;
- 19.) a vicinity map showing the relationship of the site to its general surroundings at a scale of not less than two thousand (2,000) feet to one (1) inch (1:24,000);
- 20.) title, scale, north arrow, legend, seal of Licensed Professional Engineer, date, and name of person preparing plans;
- 21.) cross-section data for open channel flow paths and designated overland flow paths;
- 22.) direction of storm flows;

- 23.) flow rates and velocities at critical points in the drainage system;
- 24.) a statement by the design engineer of the drainage system's provision for handling events greater than the 100-year, 24 hour runoff; and
- 25.) A statement of certification of all drainage plans, calculations, and supporting data by a Licensed Professional Engineer.

1.1.2– Environmental Features: A depiction of environmental features of the property and immediate vicinity including the following:

- 1.) the limits of designated regulatory and non-regulatory wetland areas;
- 2.) the location of trees greater than eight (8) inches in diameter, taken at 4.5 dbh;
- 3.) any designated natural areas, prime farmland; and
- 4.) any proposed environmental mitigation features.

Section 2.0 – Minimization of Increases in Runoff Volumes and Rates:

In the selection of a drainage plan for a new development or re-development, the applicant shall evaluate and implement site design features which minimize the increase in runoff volumes and rates from the site. The applicant's drainage plan submittal shall include evaluations of site design features that are consistent with the following hierarchy:

- 1.) Preservation of regulatory floodplains, flood prone and wetland areas, and federal, state and municipally funded erosion control practices, i.e., waterways and terraces.
- 2.) Minimize impervious surfaces on the property, consistent with the needs of the project.
- 3.) Attenuate flows by use of open vegetated swales and natural depressions and preserve the existing natural stream channel.
- 4.) Infiltration of runoff on-site;
- 5.) Provide stormwater retention structures;
- 6.) Provide wet or wetland detention structures;
- 7.) Provide dry detention structures; and
- 8.) Construct storm sewers.

Section 3.0 – Water Quality and Multiple Uses:

The drainage system should be designed to minimize adverse surface and groundwater quality impacts off-site and on the property itself. Detention basins shall incorporate design features to capture stormwater runoff pollutants. Detention of stormwater shall be promoted throughout the property's drainage system to reduce the volume of stormwater runoff and to reduce the quantity of runoff pollutants.

The drainage system should incorporate multiple uses where practicable. Uses considered compatible with stormwater management include open space, aesthetics, aquatic habitat, recreation (boating, fishing, trails, playing fields), wetlands and water quality mitigation.

Section 4.0 – Design Criteria, Standards, and Methods:

4.1 – Release Rates: The drainage system for new developments or re-developments shall be designed to control the peak rate of discharge from the property for the two year, 24-hour and 100-year, 24 hour events to levels which will not cause an increase in flooding or channel instability downstream when considered in aggregate with other developed properties and downstream drainage capacities. For new developments or re-developments meeting the provisions of Section 3.0 the Modified Rational Method of design as specified in the Illinois Department of Transportation (IDOT) "Drainage Manual" will be used to calculate release rates. The peak discharge rate from events less than or equal to the 2 year, 24 hour event and the peak discharge rate for the 100-year, 24 hour event shall be determined by the Zoning Office and Department of Public Works & Construction.

4.1.1 – Detention Basin Outlet Design: Backwater on the outlet structure from the downstream drainage system shall be addressed when designing the outlet.

4.2 – Detention Storage Requirements: The design maximum storage to be provided in the detention basin shall be based on the runoff from the runoff difference before and after development from the 100-

year, 24-hour event. All detention basin storage shall be computed using Hydrograph Methods utilizing reservoir routing (also called modified plus or level pool) or equivalent method.

4.3 – Drainage System Design and Evaluation: The following criteria should be used in evaluating and designing the drainage system. The design will provide capacity to pass the 2-year, 24-hour peak flow in the minor drainage system and an overload flow path for flows in excess of the design capacity. Whenever practicable, the stormwater systems shall not result in the inter-basin transfer of drainage unless no other alternative exists.

4.3.1 – Design Methodologies: Major and minor conveyance systems as well as detention basins shall be designed as specified in Section 4.1.

4.3.2 – Positive Drainage: Whenever practicable, all developments must be provided an overland flow path that will pass the 100-year, 24-hour flow at a stage at least one (1) foot below the lowest foundation grade in the vicinity of the flow path. Overland flow paths designed to handle flows in excess of the minor drainage system capacity shall be provided drainage easements. Street ponding and flow depths shall not exceed curb heights.

4.4 – Rainfall: Unless a continuous simulation approach to drainage system hydrology is used, all design rainfall events shall be based on the Illinois State Water Survey's Bulletin 70. The first quartile point rainfall distribution shall be used for the design and analysis of conveyance systems with critical duration less than or equal to 12 hours. The third quartile point rainfall distribution shall be used for the design and analysis of detention basins and conveyance system with critical duration greater than 12 and less than or equal to 24 hours. The fourth quartile distribution shall be used in the design and analysis of systems with duration greater than 24 hours. The first, third, and fourth quartile distributions described by Huff are presented in Table 37 of Bulletin 70. Refer to Table 13 of Bulletin 70 for rainfall depth, duration, and frequency. The USDDA-NRCS Type II distribution may be used as an alternate to the Huff distributions.

4.5 – Antecedent Moisture: Computations of runoff hydrographs, which do not rely on a continuous accounting of antecedent moisture conditions, shall use wet antecedent moisture condition as a minimum.

4.6 – Wet Detention Basin Design: Wet detention basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing, and as much as feasible to be available for recreational use.

4.6.1– Wet Basin Depths: Wet basins shall be at least three feet deep, excluding near-shore banks and safety ledges. If fish habitat is to be provided, they shall be at least eight (8) feet deep over twenty-five percent (25%) of the bottom area to prevent winter kill.

4.6.2– Wet Basin shoreline Slopes: The side slopes of wet basins at the normal pool elevation shall not be steeper than three to one (3 to 1 horizontal to vertical). It is recommended that aquatic vegetation be established around the perimeter to provide protection from shoreline erosion.

4.6.3– Permanent Pool Volume: The permanent pool volume in a wet basin at normal depth shall be equal to the runoff volume from its watershed for the 2-year, 24-hour event as a minimum.

4.6.4 – Wet Basin Inlet and Outlet Orientation: The distance between detention inlets and outlets shall be maximized. Inlets and outlets shall be at opposite ends of the basin providing that the orientation does not create undue hardship based on topography or other natural constraints. Designers are encouraged to use baffles or berms in the basin bottom to prevent short-circuiting. There shall be no low flow bypass between the inlet and outlet. Paved low flow channels shall not be used. The minimum flow length shall be ten (10) feet with a recommended minimum ratio of two to one (2:1) for width.

4.7 – Dry Detention Basin Design: In addition to the other requirements of this policy, dry basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing and as much as feasible to be available for multiple uses.

4.7.1 – Dry Basin Drainage: Dry basins shall be designed so that eighty percent (80%) of their bottom area shall have standing water no longer than seventy-two (72) hours for any runoff event less

than the 100-year, 24 hour event. Grading plans shall clearly distinguish the wet portion of the basin bottom. Under drains directed to the outlet may be used to accomplish this requirement.

4.7.2– Velocity Dissipation: Velocity dissipation measures shall be incorporated into dry basin designs to minimize erosion at inlets and outlets and to minimize re-suspension of pollutants.

4.7.3– Dry Basin Inlet and Outlet Orientation: Shall be the same as Chapter 3.0, Section 4.6.4.

4.7.4 – Temporary Stilling / Sedimentation Basin: A stilling / sedimentation basin shall be constructed at each major inlet to a dry basin for water storage only, during construction. The basin must be protected from soil erosion. The volume of the basin shall be a minimum of 500 ft.3 per acre of impervious surface in the drainage area. Side slopes shall be no steeper than three (3) feet to one (1) foot (3:1) and basin depths shall be minimum of three (3) feet to minimize re-suspension.

4.8 - Existing Depressional Areas: Existing depressional storage volume will be maintained and the volume of detention storage provided to meet the requirements of this policy shall be in addition to existing storage.

4.9- Minimum Detention Outlet Size: Where a single pipe outlet or orifice plate is to be used to control discharge, it shall have a minimum diameter of twelve (12) inches. If this minimum orifice size permits release rates greater than those specified in this section, outlets, structures such as perforated risers, or flow control orifices shall be used.

4.10–Detention in Flood Plains: The placement of detention basins within the flood plain is strongly discouraged because of questions about their reliable operation during flood events. However, the stormwater detention requirements of this policy may be fulfilled by providing detention storage within flood fringe areas on the project site provided the following provisions are met as well as compliance with Chapter 1.0, Section 2.0.

4.10.1– Detention in Flood Fringe Areas: The placement of a detention basin in a flood fringe area shall require compensatory storage for 1.5 times the volume below the base flood elevation occupied by the detention basin including any berms. The release from the detention storage provided shall still be controlled consistent with the requirements of this section. The applicant shall demonstrate its operation for all stream-flow and floodplain backwater conditions. Excavations for compensatory storage along watercourses shall be opposite or adjacent to the area occupied by detention. All flood plain storage lost below the existing ten-year flood elevation shall be replaced below the existing ten-year elevation. All floodplain storage lost above the existing ten-year flood elevation shall be replaced above the existing ten-year flood elevation. All compensatory storage excavations shall be constructed to drain freely and openly to the watercourse and comply with Chapter 1.0, Section 2.0.

4.10.2– Detention on Prime Farmland: The placement of detention basins shall avoid the utilization of prime farmland. All detention basin construction shall examine potential impacts to adjacent agricultural land and shall address measures that will be implemented to eliminate such impacts and comply with Chapter 1.0, Section 2.0.

4.10.3– Detention in Floodways: Detention basins shall be placed in the floodway only in accordance with Chapter 3.0, Section 4.10.

4.10.4– On-Stream Detention: On-stream detention basins are discouraged but allowable if they provide regional public benefits and if they meet the other provisions of this policy with respect to water quality and control of the two-year and 100-year, 24-hour events from the property. Further criteria are presented in Chapter 3.0, Section 5.0 of this policy. If on-stream detention is used in watersheds larger than one square mile, the applicant will use hydrographic modeling to demonstrate that the design will not increase the water level for any properties upstream or downstream of the property. Also, impoundment of the stream as part of on-stream detention:

- 1.) shall not prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, such as for spawning;
- 2.) shall not cause or contribute to the degradation of water quality or stream aquatic habitat;
- 3.) shall include a design calling for gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin;
- 4.) shall not involve any stream channelization or the filling of wetlands;

- 5.) shall require the implementation of an effective non-point source management program throughout the upstream watershed which shall include as a minimum: runoff reduction “Best Management Practices” (BMPs) consistent with Chapter 3.0, Section 2.0; 2 year, 24 hour detention / sedimentation basins for all development consistent with Chapter 3.0, Section 4.10.4.
- 6.) shall not occur downstream of a wastewater discharge;
- 7.) shall not contribute to the duration or flood frequency of any adjacent land; and
- 8.) shall comply with Chapter 1.0, Section 2.0.

4.11– Drainage Into Wetlands, Rivers, Streams, Lakes, Ponds, and Depressional Storage Areas:

Wetlands, lakes, ponds and depressional storage areas shall be protected from damaging modifications and adverse changes in runoff quality and quantity associated with land developments. In addition to the other requirements of this policy, the following requirements shall be met for all developments whose drainage flows into wetlands, rivers, lakes, ponds, or depressional storage areas:

4.11.1- Detention in Wetlands, Rivers, Streams, Lakes, Ponds or Depressional Storage Areas:

Existing wetlands, rivers, lakes, ponds or depressional storage areas shall not be modified for the purposes of stormwater detention unless it is demonstrated that the proposed modifications will maintain or improve its habitat and ability to perform beneficial functions and shall comply with Chapter 1.0, Section 2.0. Existing storage and release rate characteristics of wetlands, rivers, lakes, ponds or depressional storage areas shall be maintained and the volume of detention storage provided to meet the requirements of this section shall be in addition to this existing storage.

4.11.2– Sediment Control: The existing wetlands, rivers, lakes, ponds or depressional storage areas shall be protected during construction and as further regulated in Chapter 4.0 of this policy, and shall not be filled.

4.11.3- Alteration of Drainage Patterns: Site drainage patterns shall not be altered to substantially decrease or increase the existing area tributary to the wetlands, rivers, lakes, ponds or depressional storage areas as defined in the Illinois Drainage Laws.

4.11.4- Detention/Sedimentation: All runoff from the development shall be routed through a preliminary detention/sedimentation basin designed to capture the two-year, 24-hour event and hold it for at least 24 hours, before being discharged to the wetland, river, lake, pond or depressional storage area. This basin shall be constructed before property grading begins and shall be maintained throughout the construction process. In addition, the drainage hierarchy defined in Chapter 3.0, Section 1.0 should be followed to minimize runoff volumes and rates being discharged to the wetland, river, stream, lake, pond or depressional storage area and as further regulated in Chapter 2.0 and Chapter 4.0 of this policy.

4.11.5– Vegetated Buffer Strip: A buffer strip of at least 36 feet in width, (USDA-NRCS minimum filter strip standard), preferably vegetated with native plant species, shall be maintained or restored around the periphery of a wetland, river, stream, lake, pond or depressional storage area.

4.12– Street Detention, Parking Lot Detention and Culvert Drainage:

4.12.1– Street Detention: If streets are to be used as part of the minor or major drainage system, ponding depths shall not exceed curb heights and shall not remain flooded for more than eight (8) hours for any event less than or equal to the 100-year, 24 hour event.

4.12.2– Parking Lot Detention: The maximum stormwater ponding depth in any parking area shall not exceed six (6) inches for more than four (4) hours.

4.12.3– Culvert, Road and Driveway Crossings: Sizing of culvert crossings shall consider entrance and exit losses as well as tail water conditions on the culvert.

4.13– Infiltration Practices: To effectively reduce runoff volumes, infiltration practices including basins, trenches and porous pavement should be located in hydrologic soil groups “A” and “B” as designated by the USDA-NRCS in the soil survey of DeWitt County, Illinois. Infiltration basins and trenches designed to re-charge groundwater shall not be located within seventy-five (75) feet of a water supply well or building

foundation and comply with Chapter 1.0, Section 2.0. A sediment-settling basin shall be provided to remove coarse sediment from stormwater flows before they reach infiltration basins or trenches. Stormwater shall not be allowed to stand more than seventy (70) hours over eighty percent (80%) of the dry basin's bottom area for the maximum design event to be ex-filtrated. The bottom of infiltration basins or trenches shall be a minimum of four feet above the seasonally high groundwater level. Engineering calculations demonstrating infiltration rates shall be included with the application.

4.13.1– Vegetated Filter Strips and Swales: To effectively filter stormwater pollutants and promote infiltration of runoff, sites should be designed to maximize the use of vegetated filter strips and swales. Whenever practicable, runoff from impervious surfaces should be directed onto filter strips and swales comprised of native grasses and forbs before being routed to a storm sewer or detention basin. (Refer to the Filter Strip Standard in the Illinois Urban Manual for Specifications.)

4.14– Safety Considerations: The drainage system components, especially all detention basins, shall be designed to protect the safety of any children or adults coming in contact with the system during runoff events and shall comply with Chapter 1.0, Section 2.0.

4.14.1– Side Slopes: The side slopes of all detention basins at 100-year, 24 hour capacity shall be as level as practicable to prevent accidental falls into the basin and for stability and ease of maintenance. Side slopes of detention basins and open channels shall not be steep than three (3) to one (1) (3:1) (horizontal to vertical).

4.14.2– Safety Ledge: All wet detention basins shall have a level safety ledge at least four feet in width 2.5 to 3 feet below the normal water depth.

4.14.3– Velocity: Velocities throughout the surface drainage system shall be controlled to safe levels taking into consideration rates and depths of flow.

4.14.4– Overflow Structures: All stormwater detention basins shall be provided with an overflow structure capable of safely passing excess flows at a stage at least one foot below the lowest foundation grade in the vicinity of the detention basin. The design flow rate of the overflow structure shall be equivalent to the 100-year, 24-hour inflow rate.

4.15– Maintenance Consideration: The stormwater drainage system shall be designed to minimize and facilitate maintenance. Turfed side slopes shall be designed to allow lawn-mowing equipment to easily negotiate them. Wet basins shall be provided with alternate outflows, which can be used to completely drain the pool for sediment removal. Pumping may be considered if drainage by gravity is not feasible. Pre-sedimentation basins shall be included, where feasible, for localizing sediment deposition and removal. Site access for heavy equipment shall be provided.

Section 5.0 – Accommodating Flows from Upstream Tributary Areas:

Stormwater runoff from areas tributary to the property shall be considered in the design of the property's drainage system. Whenever practicable, flows from upstream areas that are not to be detained should be routed around the basin being provided for the site being developed.

5.1– Upstream Areas Not Meeting Policy Requirements: When there are areas not meeting the storage and release rates of this policy, tributary to the applicant's property, regionalized detention on the applicant's property shall be explored by the applicant. The following steps shall be followed:

- 1.) The applicant shall compute the storage volume needed for his property using the release rates of Chapter 3.0, Section 4.0, the applicant's property area, and the procedures described in Chapter 3.0, Section 3.0.
- 2.) Areas tributary to the applicant's property, not meeting the storage and release rate requirements of this policy, shall be identified..
- 3.) Using the areas determined above plus the applicant's property area, total storage needed for the combined properties shall be computed.

Allowable release rates shall be computed using the combined property areas. Storage shall be computed as described in Chapter 3.0, Section 4.0. If tributary areas are not developed, a reasonable fully developed land cover, based on local zoning, shall be used for the purposes of computing storage.

Once the necessary combined storage is computed the City of Clinton, Illinois may choose to pay for over-sizing the applicant's detention basin to accommodate the regional flows. The applicant's responsibility will be limited to the storage for his property as computed above. If the City of Clinton, Illinois selects regional storage, then the design produced in Chapter 3.0, Section 3.0 shall be implemented. If regional storage is rejected by the City of Clinton, Illinois, the applicant shall bypass all tributary area flows around the applicant's basin whenever practicable. If the applicant must route upstream flows through his basin and the upstream areas exceed one-square mile in size, the applicant must meet the provision of Section 4.8.3 for on-stream basins.

5.2– Upstream Areas Meeting Policy Requirements: When there are areas which meet the storage and release rate requirements of this policy, tributary to the applicant's property, the upstream flows shall be bypassed around the applicant's detention basin if this is the only practicable alternative. Storage needed for the applicant's property shall be computed as described in Chapter 3.0, Section 5.1. However, if the City of Clinton, Illinois decides to route tributary area flows through an applicant's basin, the final design stormwater releases shall be based on the combined total of the applicant's property plus tributary areas.

Section 6.0 – Early Completion of Detention Facilities:

Where detention, retention, or depressional storage areas are to be used as part of the drainage system for the property, they shall be constructed as the first element of the initial earthwork program. The applicant on a regular basis and before project completion shall remove any eroded sediment captured in these facilities in order to maintain the design volume of the facilities.

Section 7.0 – Fee in Lieu of Detention:

All new development or re-development not exceeding fifteen thousand (15,000) square feet of impervious surface may pay a fee of \$10,000 for each acre-foot of detention which would be required under this policy rather than installing detention facilities on the property, unless specifically directed to do otherwise by the appropriate local official. The City of Clinton, Illinois also shall have the option for new development or re-development exceeding fifteen thousand (15,000) square feet of impervious surface of requiring a fee of \$10,000 for each acre-foot of detention needed in lieu of the applicant building a basin on-site provided the property will discharge stormwater to the City of Clinton, Illinois storm sewer system if applicable.

In instances where regional benefits and economies of scale can be achieved, it will be permissible for adjacent properties to utilize a common regional detention basin. Applicants shall have the option of paying a fee of \$10,000 for each acre-foot of detention required so that the City of Clinton, Illinois can build regional facilities or they can jointly build the necessary facilities themselves.

CHAPTER 4 – SOIL EROSION AND SEDIMENT CONTROL:

Section 1.0 – Findings:

The City of Clinton, Illinois hereby finds that:

1. The soil types found in Clinton, Illinois are susceptible to erosion and if left unprotected could cause loss of soil with resultant damage to property;
2. The topography of the City of Clinton, Illinois contains areas with steep slopes upon which, if clearing of trees and/or inappropriate construction takes place, could result in severe erosion and slope stability problems which could result in damage to property;
3. Excessive quantities of soil may erode from areas undergoing development for certain non-agricultural uses including but not limited to the construction of dwelling units, commercial buildings and industrial plants, the building of roads and highways, the modification of stream channels and drainage ways, and the creation of recreational facilities;
4. The washing, blowing and falling of eroded soil across and upon roadways endangers the health and safety of users thereof, by decreasing vision and reducing traction of road vehicles;

5. Soil erosion necessitates the costly repairing of gullies, washed out fills, and embankments;
6. Sediment from soil erosion tends to clog sewers and ditches and to pollute and silt rivers, streams, lakes, sinkholes, wetlands and reservoirs;
7. Sediment limits the use of water and waterways for most beneficial purposes, promotes the growth of undesirable aquatic weeds, destroys fish and other desirable aquatic life and is costly and difficult to remove; and
8. Sediment reduces the channel capacity of waterways and the storage capacity of flood plains and natural depressions, resulting in increased chances of flooding at risk to public health and safety.

Section 2.0 – General Principles:

It is the objective of this policy to control soil erosion and sedimentation caused by development activities, including clearing grading, stripping, excavating and filling of land, in the City of Clinton, Illinois. Measures taken to control soil erosion and off-site sediment runoff shall be adequate to assure that sediment is not transported from the site by a storm event of ten-year, 24 hour frequency or less. The following principles shall apply to all new development or redevelopment activities within the City of Clinton, Illinois and to the preparation of the submissions required under Chapter 4.0, Section 3.0 of this policy.

1. New development or re-development shall be related to the topography and soils of the site so as to create the least potential for erosion. Areas of steep slopes greater than four percent (4%) where high cuts and fills may be required are to be avoided wherever possible, and natural contours should be followed as closely as possible.
2. Existing and/or natural vegetation shall be retained and protected wherever possible. Areas immediately adjacent to natural watercourses, lakes, ponds, wetlands and urban roadways that have storm sewer inlets are to be left undisturbed wherever possible. Temporary crossings of watercourses, when permitted, must include appropriate stabilization measures.
3. Special precautions shall be taken to prevent damages resultant from any necessary development activity within or adjacent to any stream, lake, pond, wetland and sinkholes from broken farm tile. Preventive measures shall reflect the sensitivity of these areas to erosion and sedimentation.
4. The smallest practical area of land should be exposed for the shortest practical time during development.
5. Sediment basins or traps, filter barriers, diversions, and any other appropriate sediment or runoff control measures shall be installed prior to site clearing and grading and maintained to remove sediment from run-off waters from land undergoing development.
6. The selection of erosion and sediment control measures shall be based on assessment of the probable frequency of climatic and other events likely to contribute to erosion, and on evaluation of the risks, costs and benefits involved.
7. In the design of erosion control facilities and practices, aesthetics and the requirements of continuing maintenance must be considered.
8. Provision shall be made to accommodate the increased run-off caused by changed soil and surface conditions during and after development. Drainage ways should be designed so that their final gradients and the resultant velocities and rates of discharge will not create additional erosion on-site or downstream.
9. Permanent vegetation and structures shall be installed and functional as soon as practical during development.
10. Those areas being converted from agricultural purposes to other land uses shall be vegetated with an appropriate protective cover prior to development.
11. All waste generated as a result of site development activity shall be properly disposed of and shall be prevented from being carried off the site by either wind or water.
12. All construction sites shall provide measures to prevent sediment from being tracked onto public or private roadways.
13. All temporary soil erosion and sediment control practices shall be maintained to function as intended until the contributing drainage area has been permanently stabilized at which time they shall be removed.

Section 3.0 – Erosion and Sediment Control Plan Submittal Requirements:

Each applicant shall submit the information depending on development size, as regulated to ensure that the provisions of this policy are met. The submittal shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts of the development related to erosion both on-site and off-site and the effectiveness of the proposed erosion and sediment control plan in reducing sediment loss and meet the provisions of Chapter 1.0, Section 2.0. The applicant shall certify on the drawing that all clearing, grading, drainage and construction shall be accomplished in strict conformance with the erosion and sediment control plan. The following information shall be submitted for both existing and proposed property conditions; new developments or re-developments meeting the requirements of Chapter 1.0, Section 3.0.

3.1 – Erosion and Sediment Control Plan Requirements: Shall meet the requirements of Chapter 3.0, Section 1.1, Section 1.1.1, and Section 1.1.2.

3.1.1 – Mapping and Descriptions: The existing and proposed erosion and sediment control features of the property and immediate vicinity including:

- 1.) As required in Chapter 3.0, Section 1.1, Section 1.1.1, and Section 1.1.2;
- 2.) Location of the slope disturbance line;
- 3.) Location and description of the erosion and sediment control measures to be employed during construction;
- 4.) For any structures proposed to be located on the slope side of the slope disturbance line, the map shall include the limits of disturbance including tree removal, erosion and sediment control measures during construction, cross section view of any proposed cut or fill, erosion and sediment control measures during construction, details of method(s) proposed for providing slope stability, permanent stormwater control measures, and permanent erosion and sediment control measures all being certified by a registered professional engineer or a “Certified Professional Erosion Control specialist.”
- 5.) The predominant soil types on the site, their location, and their limitations for the proposed use as defined by the USDA Natural Resources Conservation Service.
- 6.) The proposed use of the site, including present and planned development, areas of clearing, stripping, grading, excavation and filling; proposed contours, finished grades, and street profiles; the stormwater plan as required in Chapter 2.0; kinds and locations of utilities, areas and acreage proposed to be paved, sodded or seeded, vegetatively stabilized, or left undisturbed; and the location of trees over eight (*) inches in diameter (taken at 4.5 feet dbh) and their type.
- 7.) The erosion and sediment control plan showing all measures necessary to meet the requirements of this policy throughout all phases of construction and those remaining permanently after completion of the development of the site, including:
 - a.) Location and description, including standard details, of all sediment control measures runoff control measures, including diversions, waterways and outlets, and design specifics of sediment basins and traps including outlet details.
 - b.) Location and description of all soil stabilization and erosion control measures, including seeding mixtures and rates, types of sod, method of seedbed preparation, expected seeding dates, type and rate of lime and fertilizer application, kind and quantity of mulching for both temporary and permanent vegetative control measures, and types of non-vegetative stabilization measures.
 - c.) Location and description of methods to prevent tracking of sediment off-site including construction entrance details, as appropriate.
 - d.) Description of dust and traffic control measures.
 - e.) Locations of stockpiles and description of stabilization methods.
 - f.) Location of off-site fills or borrow volumes, locations and methods of stabilization.
 - g.) Provisions for maintenance of control measures, including type and frequency of maintenance, easements, and estimates of the cost of maintenance.
 - h.) The proposed phases of development of the site, including stripping and clearing, rough grading and construction, and final grading and landscaping. Phasing should identify the expected date on which clearing will begin, the estimated duration of exposure of cleared area, and the sequence of installation

of temporary sediment control measures (including perimeter controls), installation of stormwater drainage, paving streets and parking areas, final grading and the establishment of permanent vegetative cover, and the removal of temporary measures. It shall be the responsibility of the applicant to notify the Building and Zoning Administrator of any significant changes that occur in the site development schedule after the initial erosion and sediment control plan has been approved.

Section 4.0 – Design and Operation Standards and Requirements:

The preparation of soil erosion and sediment control plans and the design criteria, standards, and methods shall be prepared in accordance with the requirements of this policy and the standards and specifications contained in the newly revised “Illinois Urban Manual”. (This manual was revised through an interagency effort. Begun in April 1997 and completed in 1999, participating agencies were USDA-NRCS, US Army Corp of Engineers, US and Illinois Environmental Protection Agency, IL Dept of Transportation, IL Dept of Agriculture, Soil and Water Conservation Districts, IL Dept of Natural Resources, US Fish & Wildlife, Tri-County Planning Commission, NIPC and SWIPC.) In the event of conflict between the provisions of said manuals and of this policy, this policy shall govern.

4.1 – Erosion and Sediment Control Design Requirements: New developments or re-developments shall comply with Chapter 4.0, Section 3.0, and meet the following:

- 4.1.1 – Control measures shall be constructed to control runoff from the property to such an extent possible that sediment is retained on-site.
- 4.1.2 – Temporary on-site control measures required shall be constructed and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.
- 4.1.3 – Disturbed areas shall be stabilized with permanent measures within seven (7) calendar days following the end of active disturbance, or re-disturbance consistent with the following criteria:
 - 1. Appropriate permanent stabilization measures shall include seeding, mulching, and sodding, with non-vegetative measures as a last resort.
 - 2. Areas having slopes greater than eight percent (8%) shall be stabilized with sod, mat, or blanket in combination with seeding or equivalent.
- 4.1.4 – All temporary and permanent erosion and sediment control practices must be maintained and repaired as needed to assure effective performance of their intended function.
- 4.1.5 – All temporary erosion and sediment control measures shall be disposed in a proper manner within thirty (30) days after final site stabilization is achieved with permanent soil stabilization measures. Trapped sediment and other disturbed soils resulting from the disposition of temporary measures shall be permanently stabilized to prevent further erosion and sedimentation.
- 4.1.6 – **Site Development Requirements:** On-site sediment control measures, as specified by the following criteria, shall be constructed as specified in the referenced handbook, and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.
 - 1. For new developments or re-developments less than one (1) acre, filter barriers (including filter fences, straw bales, or equivalent control measures) shall be constructed to control all on-site runoff. Vegetated filter strips, with a minimum width of twenty-five (25) feet, may be used as an alternative only where runoff in sheet flow is expected.
 - 2. For new developments or re-developments more than one (1) acre but less than five (5) acres, a sediment trap or equivalent control measure shall be constructed at the down slope point of the disturbed area.

3. For new developments or re-developments greater than five (5) acres, a sediment basin or equivalent control measure shall be constructed at the down slope point of the disturbed area.
 4. Sediment basin and sediment trap designs shall provide for both “dry” detention and “wet” detention sediment storage. The detention storage shall be composed of equal volumes of “wet” detention storage and “dry” detention storage and each shall be sized as regulated in Chapter 3.0. The elevation of the outlet structure shall be placed such that it only drains the dry detention storage.
 5. The sediment storage shall be sized to store the estimated sediment load generated from the site over the duration of the construction period with a minimum storage equivalent to the volume or sediment generated in one year. For construction periods exceeding one year, the 1-year sediment load, and sediment removal schedule may be substituted.
 6. To the extent possible or as otherwise regulated in this policy all desirable trees eight (8) inches diameter (Taken at 4.5 feet dbh) and larger shall be protected for their present and future value for erosion protection and other environmental benefits. Trees that have been selected for preservation shall be marked prior to the beginning of any clearing, grading, stripping, excavation, or filling of the site. A “No Construction Zone” shall be established and marked at the perimeter of the drip line of each tree, which is to be preserved.
- 4.1.7 - Stormwater conveyance channels, including ditches, swales, and diversions, and the outlets of all channels and pipes shall be designed and constructed as regulated in Chapter 3.0. All constructed or modified channels shall be stabilized within 48 hours, consistent with the following standards, and as required in the referenced handbook:
1. For grades up to 4 percent (4%) seeding in combination with mulch, erosion blanket, or an equivalent control measure shall be applied. Sod or erosion blanket or mat shall be applied to the bottom of the channel.
 2. For grades of four to eight percent (4% - 8%), sod or an equivalent control measure shall be applied in the channel.
 3. For grades greater than eight percent (8%), rock, riprap, or an equivalent control measure shall be applied over filter fabric or other type of soil protection, or the grade shall be effectively reduced using drop structures.
- 4.1.8 – Land disturbance activities in stream channels shall be avoided, where possible, or as regulated in Chapter 3.0. If disturbance activities are unavoidable, the following requirements shall be met:
1. Construction vehicles shall be kept out of the stream channel to the maximum extent practicable. Where construction crossings are necessary, temporary crossings shall be constructed of non-erosive material, such as riprap or gravel.
 2. The time and area of disturbance of stream channels shall be kept to a minimum. The stream channel, including bed and banks, shall be stabilized within 48 hours after channel disturbance is completed, interrupted, or stopped.
 3. Whenever channel relocation is necessary, the new channel shall be constructed under dry conditions and fully stabilized before flow is diverted, incorporating meanders, pool and riffle sequence, and riparian planting.
- 4.1.9 – Storm sewer inlets and culverts shall be protected by sediment traps or filter barriers meeting accepted design standards and specifications.
- 4.1.10 – Soil storage piles containing more than 10 cubic yards of material shall not be located with a down slope drainage length of less than 25 feet to a roadway or drainage channel. Filter barriers, including straw bales, filter fence, or equivalent, shall be installed immediately on the down slope side of the piles.
- 4.1.11 – If de-watering devices are used, discharge locations shall be protected from erosion. All pumped discharges shall be routed through appropriately designed sediment traps or basins, or equivalent and shall not be deposited into a sinkhole.
- 4.1.12 – Each site shall have graveled (or equivalent) entrance roads, access drives, and parking areas of sufficient length and width to prevent sediment from being tracked onto public or private roadways. Any sediment reaching a public or private road shall be removed by

shoveling or street cleaning (not flushing) before the end of each workday and transported to a controlled sediment disposal area.

Section 5.0 – Maintenance of Control Measures:

All soil erosion and sediment control measures necessary to meet the requirements of this policy shall be maintained periodically by the applicant, or subsequent land owner during the period of land disturbance and development of the site in a satisfactory manner to ensure adequate performance.

CHAPTER 5 – Long Term Maintenance Responsibility:

Section 1.0 – Long Term Maintenance Responsibility:

Maintenance of stormwater drainage, and erosion and sediment control facilities located on private property shall be the responsibility of the owner of that property. Before an appropriate permit is obtained from the City of Clinton, Illinois, the applicant shall execute a maintenance agreement with the City of Clinton, Illinois of guaranteeing that the applicant and all future owners of the property will maintain its stormwater drainage and erosion and sediment control system. Such agreement shall be recorded with the Recorder of Deeds of DeWitt County, Illinois. The maintenance agreement shall include a schedule for regular maintenance of each aspect of the property's stormwater drainage and erosion and sediment control system and shall provide for access to the system for inspection by authorized personnel of the City of Clinton, Illinois. The maintenance agreement shall also stipulate that if the appropriate personnel of the City of Clinton, Illinois notifies the property owner in writing of maintenance problems which require correction, the property owner shall begin such corrections within twenty-four (24) hours and shall not extend beyond seven (7) calendar days of such notification. If the corrections are not made within this time period the City of Clinton, Illinois may have the necessary work completed and assesses the cost to the property owner. The City of Clinton, Illinois has the option of requiring a bond to file by the property owner for maintenance of the stormwater drainage and erosion and sediment control system.

CHAPTER 6 – Inspections:

Section 1.0 – Inspections:

The Zoning Office and/or Department of Public Works & Construction of said entities shall make inspections as hereinafter required and shall either approve that portion of the work completed or shall notify the permittee wherein the work fails to comply with the stormwater drainage or erosion and sedimentation control plan as approved. The DeWitt County Soil and Water Conservation District could serve as an agent under a contract agreement for said entities to provide inspection. Plans for grading, stripping, excavating, and filling work bearing the stamp of approval of the Building and Zoning Administrator shall be maintained at the site during progress of the work. In order to obtain inspections and to ensure compliance with this policy, the permittee shall notify the Zoning Office or its agent, within two (2) working days of the completion of the construction stages specified below:

1. Upon completion of installation of the stormwater drainage and erosion and sediment control measures (including perimeter controls and diversions), prior to proceeding with any other earth disturbance or grading;
2. After stripping and clearing;
3. After rough grading;
4. After final grading;
5. After seeding and landscaping deadlines, and
6. After final stabilization and landscaping, prior to removal of sediment controls.

If stripping, clearing, grading and/or landscaping are to be done in phases or areas, the permittee shall give notice and request inspection at the completion of each of the above work stages in each phase or area. If an inspection is not made and the City of Clinton, Illinois receives notification of the results given within five working days after notice from the permittee, the permittee may continue work at his/her own risk, without presuming acceptance by the City of Clinton, Illinois. Notification of the results of the inspection shall be given in writing at the site.

Section 2.0 – Special Precautions:

If at any stage of the grading of any development site the Building and Zoning Administrator of said entities, determines by inspection that the nature of the site is such that further work authorized by an existing permit is likely to imperil any property, public way, stream, lake, wetland, or drainage structure, the Building and Zoning administrator of said entities, may require, as a condition of allowing the work to be done, that such reasonable special precautions to be taken as is considered advisable to avoid the likelihood of such period. "Special precautions" may include, but shall not be limited to, a more level exposed slope, construction of additional drainage facilities, berms, terracing, compaction, or cribbing,

installation of plant materials for erosion control, and recommendations of a registered soils engineer and/or engineering geologist which may be made requirements for further work.

- 2.0.1 – Where it appears that storm damage may result because the grading on any development site is not complete, work will be stopped and the permittee required to install temporary structures or take such other measures as may be required to protect adjoining property or the public safety. On large developments, or where unusual site conditions prevail, the Building and Zoning Administrator of said entities, may specify the time of starting grading and time of completion or may require that the operations be conducted in specific stages so as to ensure completion of protective measures or devices prior to the advent of seasonal rains.

Section 3.0 – Amendment of Plans:

Major amendments to stormwater drainage and detention or erosion and sediment control plans shall be submitted to the Building and Zoning Administrator of said entities, and shall be processed and approved or disapproved in the same manner as the original plans. Field modification of a minor nature may be authorized by the Building and Zoning Administrator of said entities by written authorization to the permittee.

CHAPTER 7 – Permitting:

Section 1.0 – Application for Permit:

Application for a development permit shall be made by the owner of the property or his authorized agent to the City Zoning Office of said entities on a form furnished for that purpose. Each application shall bear the name(s) and address(es) of the owner or developer of the site, the contractor(s) and of any consulting firm retained by the applicant together with the name of the applicant's principal contact at such firm, and shall be accompanied by a filing fee. Each application shall include certification that any land clearing, construction or development involving the movement of earth shall be in accordance with the plans approved upon issuance of the permit.

Section 2.0 – Bond Required:

The applicant for a development permit will be required to file with the City of Clinton, Illinois, a faithful performance bond or bonds, letter of credit, or other improvement security satisfactory to the City of Clinton, Illinois Attorney, in an amount deemed sufficient by the Building and Zoning Administrator of said entities, to cover all costs of improvements, landscaping, maintenance of improvements and landscaping, and soil erosion and sediment control measures for such period as specified by the City of Clinton, Illinois, and engineering and inspection costs to cover the cost of failure or repair of improvements installed on the site.

Section 3.0 – Review and Approval:

Each application for a development permit shall be reviewed and acted upon according to the following procedures:

1. The City Zoning Office and Department of Public Works & Construction of said entities will review each application for a development permit to determine its conformance with the provisions of this policy. The Officer will also refer any application to the DeWitt County Soil and Water Conservation District staff and USDA-NRCS field office for review and comment. Within thirty (30) days after receiving an application, the Zoning Office of said entities shall in writing:
 - a. Approve the permit application if it is found to be in conformance with the provisions of this policy; and issue the permit;
 - b. Approve the permit application subject to such reasonable conditions as may be necessary to secure substantially the objectives of this policy, and issue the permit subject to these conditions; or
 - c. Disapprove the permit application, indicating the deficiencies and the procedure for submitting a revised application and/or submission.

Section 3.1– No development permit shall be issued for intended developments site unless:

1. The development, including but not limited to subdivision or planned unit development, has been approved by the City of Clinton Illinois where applicable; or
2. Such permit is accompanied by or combined with a valid building permit issued by the City of Clinton, Illinois; or
3. The proposed earth moving is coordinated with any overall development program previously approved by the City of Clinton, Illinois for the area in which the site is situated; and
4. All relevant federal and state permits have been received for the portion of the site subject to soil disturbance as noted in Chapter 1.0. Section 2.0.

3.1 – Failure of the Zoning Office of said entities to act on an original or revised application within thirty (30) days of receipt shall authorize the applicant to proceed in accordance with the plans as filed, and in compliance with the regulations contained herein, unless such time is extended by agreement between the Zoning Office of said entities and the applicant. Pending preparation and approval of a revised plan, development activities shall be allowed to proceed in accordance with conditions established by the Zoning Office of said entities.

Section 4.0 – Expiration of Permit:

Every development permit shall expire and become null and void if the work authorized by such permit has not been commenced within one hundred and eighty (180) days, or if not completed by a date which shall be specified in the permit; except that the Building and Zoning Administrator of said entities may, if the permittee presents satisfactory evidence that unusual difficulties have prevented work being commenced or completed within the specified time limits, grant a reasonable extension of time if written application is made before the expiration date of the permit. The Building and Zoning Administrator of said entities might require modification of the erosion control plan to prevent any increase in erosion or off-site sediment runoff resulting from any extension.

Section 5.0 – Appeals:

The applicant, or any person or agency which received notice of the filing of the application, may appeal the decision of the Building and Zoning Administrator to the Board of Appeals. Upon receipt of an appeal, the Board of Appeals shall schedule and hold a public hearing, after giving fifteen (15) days notice thereof. The Board shall render a decision within thirty (30) days after the hearing. Factors to be considered on review shall include, but need not be limited to, the effects of the proposed development activities on the surface water flow to tributary and downstream lands, any comprehensive watershed management plans, or the use of any retention facilities; possible saturation of fill and unsupported cuts by water, both natural and domestic; runoff surface waters that produce erosion and silting of drainage ways; nature and type of soil or rock which when disturbed by the proposed development activities may create earth movement and produce slopes that cannot be landscaped; and excessive and unnecessary scarring of the natural landscape through grading or removal of vegetation.

Section 6.0 – Retention of Plans:

Plans, specifications, and reports for all site developments shall be retained in original form or on microfilm by the Building and Zoning Administrator of said entities.

CHAPTER 8 – Enforcement:

Section 1.0 – Stop-Work Order:

Revocation of Permit: In the event any person holding a development permit pursuant to this policy violates the terms of the permit, or carries on-site development in such a manner as to materially adversely affect the health, welfare, environment, or safety of persons residing or working in the neighborhood of the development site or so as to be materially detrimental to the public welfare or injurious to property or improvements in the neighborhood, the Building and Zoning Administrator of said entities may suspend or revoke the development permit.

- 2.1 – Suspension of a permit shall be by a written stop-work order issued by the Building and Zoning Administrator of said entities, and delivered to the permittee or his agent or the

person performing the work. The stop-work order shall be effective immediately, shall state the specific violations cited, and shall state the conditions under which work may be resumed. A stop-work order shall remain in effect until the next regularly scheduled meeting of the Board of Appeals at which time the conditions of Chapter 7.0, Section 5.0 below, can be met.

2.2 – No development permit shall be revoked until the Board of Appeals of said entities holds a hearing. Written notice of such hearing shall be served on the permittee, either personally or by registered mail, and shall state:

1. The grounds for complaint or reasons for suspension or revocation, in clear and concise language; and
2. The time when and place where such hearing will be held.

Such notice shall be served on the permittee at least five (5) days prior to the date set for the hearing. At such hearing, the permittee shall be given an opportunity to be heard and may call witnesses and present evidence on his behalf. At the conclusion of the hearing, the Board of Appeals of said entities shall determine whether the permit shall be revoked.

Section 2.0 – Violations and Penalties:

No person shall construct, enlarge, alter, repair or maintain any grading, excavation or fill, or cause the same to be done, contrary to or in violation of any terms of this policy. Any person violating any of the provisions of this policy shall be deemed guilty of a misdemeanor, and each day during which any violation of any of the provisions of this policy is committed, continued, or permitted shall constitute a separate offense. Upon conviction of any such violation, such person, partnership, or corporation shall be punished by a fine of not less than Five Hundred Dollars (\$500) per day for each offense. In addition to any other penalty authorized by this section, any person, partnership, or corporation convicted of violating any of the provisions of this policy shall be required to restore the site to the condition existing prior to commission of the violation, or to bear the expense of such restoration.

CHAPTER 9 – Effective Date

This policy shall be in full force and effect from and after its passage and approval and publication, as required by law.

Passed by the City of Clinton, Illinois, on this *day* of *month*, *year*.

ARTICLE I

Authority and Purpose; Other Relevant Permitting; Applicability; Exemptions; Exceptions; and Separability:

Section 10 - Authority and Purpose: This ordinance is enacted pursuant to the police powers granted to the Village of Dwight, Illinois, by the Illinois Compiled Statutes, 65 ILCS 5/1-2-1, 5/11-12-12, 5/11/30-2, and 5/11/31-2.

The purpose of this ordinance is to diminish threats to public health and safety, protect property, prevent damage to the environment and promote public welfare by guiding, regulating, and controlling the design, construction, use, and maintenance of any new development or redevelopment or other activity which disturbs or breaks the topsoil or otherwise results in the movement of earth and/or changes the storm water drainage pattern and/or storm water flows from that which would have occurred if the land had been left in its natural state. This storm water runoff and resulting soil erosion could result in the inundation of damageable properties, the erosion and destabilization of downstream channels, and the pollution of valuable stream and lake resources. One cause of increases in storm water runoff quantity or rate and impairment of quality, and loss of valuable topsoil is the new development or redevelopment of the land. This ordinance regulates these activities to minimize adverse impacts.

This ordinance is adopted to accomplish the following objectives:

- a.) To assure that new development or redevelopment does not increase the drainage or flood hazards, or create unstable conditions susceptible to soil erosion;
- b.) To protect new buildings and major improvements to buildings from flood damage due to increased storm water runoff and soil erosion;
- c.) To protect human life and health from the hazards of increased flooding and soil erosion on a watershed basis;
- d.) To lessen the burden on the taxpayer for flood control projects, repairs to flood-damaged public facilities and utilities, correction of channel erosion problems, and flood rescue and relief operations caused by storm water runoff and soil erosion quantities from new development or redevelopment;

- e.) To protect, conserve, and promote the orderly development of land and soil, water, air, animal, and plant resources;
- f.) To preserve the natural hydrologic and hydraulic functions of watercourses, wetlands and flood plains for protecting water quality, and enhance storm water management and aquatic habitats;
- g.) To preserve the natural characteristics of stream corridors in order to manage flood and storm water impacts, improve water and groundwater quality, reduce soil erosion, protect aquatic and riparian habitat, maintain quality forest resources, provide recreational opportunities, provide aesthetic benefits, enhance community and economic development.

Section 11 - Other Relevant Permitting: Before a Development Permit under this ordinance becomes effective, all required Federal, State, and Local permits will have been received for the site subject to new development or redevelopment. The acquisition of these permits shall be the sole responsibility of the applicant. These may include but are not limited to Section 404 of the Clean Waters Act; Section 106 of the National Historic Preservation Act; Section 10 of the Rivers and Harbors Act; or permitting required by the Illinois Department of Natural Resources, Office of Water Resources in accordance with the Rivers, Lakes and Streams Act, 615 ILCS; the Soil and Water Conservation Districts Act, 70 ILCS; the Farmland Preservation Act, 505 ILCS; the Illinois Groundwater Protection Act, 415 ILCS; and the National Pollutant Discharge Elimination System Permit (NPDES) and Section 401 of the Clean Water Act thru the Illinois Environmental Protection Agency, Division of Water Pollution Control; and the Threatened and Endangered Species Act, 16 USC 1531 ET. SEQ. Compliance is also required with; but not limited to, the Zoning Ordinance of the Village of Dwight, Illinois, and the Uniform Building Code, most recent edition adopted by the Village, Chapter on Excavation and Grading.

Section 12 - Applicability: This ordinance shall apply to all new development or redevelopment in the Village. Except as otherwise provided in this ordinance, no person, firm or corporation, public or private, the State of Illinois and its agencies or political subdivisions, the United States of America, and its agencies or political subdivisions, any agent, servant, officer or employee of any of the foregoing which meets the following provisions or is otherwise exempted in this ordinance, shall not commence any development activities without first having obtained a development permit from the Village Administrator.

12.01 - Any new development or redevelopment that will include an area that will meet or exceed ten thousand (10,000) square feet of total impervious surface (i.e., streets, roof, patio or parking area or any combination thereof); or

12.02 - Any land disturbing activity (i.e., clearing, grading, stripping, excavation, fill, or any combination thereof) that will affect an area that will meet or exceed ten thousand (10,000) square feet or that will exceed 100 cubic yards; or

12.03 - Any land disturbing activity greater than 500 square feet if the activity is within 100 feet of a lake, pond, stream, or wetland; and is done in conjunction with sub sections 12.01 or 12.02; or

12.04 - Any land disturbing activity on the sloping side of the slope disturbance line and is in conjunction with sections 12.01, 12.02, or 12.03; or

12.05 - Any tree cutting or mechanized land clearing that will involve six or more trees, native to North East Central Illinois, that have a diameter in excess of eight (8) inches DBH and is done in conjunction with Article I, Sections 12.01, 12.02, 12.03 or 12.04.

12.06 - The construction of one single family dwelling that is not constructed as part of a residential development shall not be subject to the provisions of this ordinance regarding permanent storm water control measures.

12.07 – The Village reserves the right to require any non-agricultural, construction development activity, regardless of disturbed area or type of activity, to comply with this ordinance if it is determined to be the cause of or a contributor to an existing or potential erosion, sediment, or stormwater impact.

Section 13 - Exemptions: A development permit shall not be required for the following:

- a.) Any new development, redevelopment or other activity falling below the minimum standards as set forth in Article I, Section 12.
- b.) The agricultural use of land, including the implementation of conservation measures included in a farm conservation plan approved by the Natural Resources Conservation Service, and including the construction of agricultural structures.
- c.) The maintenance of any existing storm water drainage/detention component or structure or any existing soil erosion/sediment control component or structure; including dredging, levee restoration, tree removal or other function which maintains the original design capacities of the above.
- d.) The construction of, improvements to, or the maintenance of any street, road, highway or interstate highway performed by any unit of government whose powers grant such authority.

- e.) Development that has been substantially completed before the effective date of the ordinance.

Section 14 - Variances: The Zoning Board of Appeals, after a public hearing, may determine and vary the requirements and regulations of this ordinance in harmony with their general purpose and intent, where the Board of Appeals makes written finding of fact in accordance with the standards herein after prescribed and further, find that there are practical difficulties or particular hard ships in the way of carrying out the strict letter of requirements and regulations of this ordinance.

14.01 - Application for variance shall be made by a verified petition of the applicant for a development permit, stating fully the grounds of the petition and the facts relied upon by the applicant. Such petition shall be filed with the development permit application. Each application for a variance shall be made in writing and filed with the Zoning Administrator. The Zoning Administrator and the Village Engineer will review and transmit recommendations to the Board of Appeals, which shall review such recommendations prior to granting or denying the variance.

14.02 – Standards for variance. The Board of Appeals shall not vary the requirements and regulations of this ordinance, as authorized in this section, unless there is evidence presented to it in each specific case:

14.021 The land is of such shape or size or is affected by such physical conditions or is subject to such title limitations of record, that it is impossible or impractical for the applicant to comply with all of the requirements of this ordinance;

14.022 The variance is necessary for the preservation and enjoyment of a substantial property right of the applicant; and

14.023 The granting of the variance will not be detrimental to the public welfare, environment or injurious to other property in the vicinity of the subject property.

14.03 - The Board of Appeals shall hold a public hearing on each application for variance, in accordance with the Village of Dwight Zoning Ordinance. Within thirty (30) days after the public hearing, the Board of Appeals shall either approve the site development permit application with the variances and conditions it deems necessary or it shall disapprove such development permit application and variance application or it shall take other such action as appropriate.

Section 15 - Separability: The provisions and sections of this ordinance shall be deemed to be separable, and the invalidity of any portion of this ordinance shall not affect the validity of the remainder.

Section 16 - Responsibility: The applicant shall not be relieved of responsibility for damage to persons or property otherwise imposed by law, and the Village or its officers or agents, will not be made liable for such damage, by (1) the issuance of a development permit under this ordinance, (2) compliance with the provisions of that development permit or conditions attached to it by the Zoning Administrator (3) failure of the Village of Dwight Officials to observe or recognize hazardous or unsightly conditions, (4) failure of the Village officials to recommend denial or to deny a development permit, or (5) exemptions from development permit requirements of this ordinance.

Section 17 - Non-conforming Uses: Non-conforming structures and uses shall not be replaced or enlarged in any manner unless such replacement or enlargement conforms to the requirements of this Ordinance and has been approved by the local government having jurisdiction.

Section 18 - Violations: Consistent with Chapter 1.0 Section 3.0 and Chapter 8 Section 2.0 of this Ordinance, it shall be unlawful for any person to undertake any development without first securing a Development Permit in accordance with this Ordinance. It shall be unlawful for any person to violate any provision of this Ordinance. Injunctive relief is specifically authorized for enforcement of the provisions of this Ordinance.

Article II - Definitions:

Section 20 - Definitions: For the purposes of this ordinance certain terms are defined and set forth below:

20.01 - Adverse Impacts: Any negative impact on plant, soil, air or water resources affecting their beneficial uses including recreation, aesthetics, aquatic habitat, quality, and quantity.

20.02 - Applicant: Any person, firm, or governmental agency who executes the necessary forms to procure official approval of a development or permit to carry out construction of a new development or re-development from the Village of Dwight, Illinois.

20.03 - Base Flood Elevation: The elevation at all locations delineating the level of flooding resulting from the 100-year frequency flood event, which has a one percent (1%) probability of being equaled or exceeded in any given year.

20.04 – Board of Appeals: “ Board of Appeals” shall mean the Zoning Board of Appeals of the Village of Dwight, Illinois, with the jurisdiction as set forth in the Municipal Code of the Village of Dwight.

20.05 – Building Inspector: Is the officer or other designated authority charged with the administration and enforcement of the Uniform Building Code for the Village of Dwight, Illinois.

20.06 - Building Permit: A permit issued by the Village of Dwight, Illinois, for the construction, erection or alteration of a structure or building and the related ground and surface preparation prior to and after completion of construction, erection or alteration of a structure or building.

20.07 - Bypass Flows: Storm water runoff from upstream properties tributary to a property's drainage system but not under its control.

20.08 - Certify or Certification: Formally attesting that the specific inspections and tests were performed, and that such inspections and tests comply with the applicable requirements of this ordinance.

20.09 - Channel: Any defined river, stream, creek, brook, branch, natural or artificial depression, ponded area, on-stream lake or impoundment, abandoned mine, flowage, slough, ditch, conduit, culvert, gully, ravine, wash, or natural or manmade drainage way, which has a definite bed and bank or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.

20.10 - Channel Modification: Alteration of a channel by changing the physical dimensions or materials of its bed or banks. Channel modification includes damming, riprapping (or other armoring), filling, widening, deepening, straightening, relocating, lining, and significant removal of bottom or woody rooted vegetation. Channel modification does not include the man-made clearing of debris or removal of trash.

20.11 - Clearing: Any activity, which removes the natural vegetative ground cover.

20.12 - Compensatory Storage: An artificially excavated, hydraulically equivalent volume of storage within the flood plain used to balance the loss of natural flood storage capacity when fill or structure are placed within the flood plain.

20.13 - Conduit: Any channel, pipe, sewer or culvert used for the conveyance or movement of water, whether open or closed.

20.14 – County: County of Livingston, Illinois.

20.15 - Cubic Yard: A one- (1) yard by one (1) yard by one (1) yard amount of material in excavation and/or fill.

20.16 - DBH: The measurement of tree diameter taken 4.5 feet above ground level.

20.17 - Detention Basin: A facility constructed or modified to provide for the temporary storage of storm water runoff and the controlled release by gravity of this runoff at a prescribed rate during and after a flood or storm.

20.18 - Detention Time: The amount of time storm water is held within a detention basin.

20.19 - Development: Any manmade change to real estate or property, including:

- a.) The division or subdivision of any duly recorded parcel of property;
- b.) Construction, reconstruction or placement of a building or any addition to a building valued at more than one thousand dollars (\$1000.);
- c.) Installation of a manufactured home on a site, preparing a site for a manufactured home, or installing a travel trailer on a site for more than 180 days per year;
- d.) Construction of roads, bridges, or similar projects;
- e.) Redevelopment of a site;
- f.) Filling, dredging, grading, clearing, excavating, paving drilling, mining or other non-agri-cultural alterations of a ground surface;
- g.) Storage of materials or deposit of solid or liquid waste;
- h.) Any other activity that might alter the magnitude, frequency, direction, or velocity of storm water flows from a property.

20.20 - Development Permit: A permit issued by the Village of Dwight, IL. for any man made change to real estate.

20.21 - Drainage Plan: A plan, including engineering drawings and supporting calculations, which describes the existing storm water drainage system and environmental features, including grading, as well as proposed alterations or changes to the drainage system and environment of a property.

20.22 - Dry Basin: A detention basin designed to drain after temporary storage of storm water flows and to normally be dry over much of its bottom area.

20.23- Erosion: The general process whereby soil or earth is moved by rainfall, flowing water, wind or wave action.

20.24 - Excavation: Any act by which organic matter, earth, sand, gravel, rock or any other similar material, is cut into, dug, quarried, uncovered, removed, displaced, re-located or bulldozed and shall include the conditions resulting from such actions.

20.25 - Excess Storm Water Runoff: The volume and rate of flow of storm water discharged from a new development or re-development which is or will be in excess of that volume and rate which existed before development or re-development.

20.26 - Existing Grade: The vertical location of the existing ground surface prior to excavation or filling.

20.27 - Farm Drainage: The surface drainage methods, i.e. waterways, and surface ditches that follow natural drainage courses.

20.28 - Farm Tile: The underground conduit that removes excess subsurface waters and/or surface water.

20.29 - Fill: Any act by which earth, sand, gravel, rock, or any other material, is deposited, placed, replaced, pushed, dumped, pulled, transported or moved by man to a new location and shall include the conditions resulting therefrom.

20.30 - Final Grade: The vertical location of the ground surface after grading work is completed in accordance with the engineering plans.

20.31 - Flood Fringe: That area as designated by the Federal Emergency Management Agency (FEMA) on either side of the flood way. This area is subject to inundation from the base flood but conveys little or no flow.

20.32 - Flood Hazard Boundary Map (FHBM): A very generalized map prepared by the Federal Emergency Management Agency (FEMA) which shows only where flood plains are located based on very basic data. FHBM's do not include base flood elevations.

20.33 - Flood Insurance Rate Map (FIRM): A map prepared by the Federal Emergency Management Agency (FEMA) that depicts the special flood hazard area (SFHA) within a

community. This map includes insurance rate zones and regulatory flood plains and may or may not depict regulatory flood ways.

20.34 - Flood Plain: That land adjacent to a body of water with ground surface elevations at or below the base flood or the 100-year frequency flood elevation which is subject to inundation. The flood plain as designated by the Federal Emergency Management Agency (FEMA) is also known as the Special Flood Hazard Area (SFHA). This area is the collective combination of the regulatory flood way and the flood fringe.

20.35 - Flood Way: The channel and that portion of the flood plain, including on-stream lakes, adjacent to a stream or watercourse which is needed to store and convey the anticipated existing and future 100-year frequency flood discharge with no more than a 0.1 foot increase in stage due to any loss of flood conveyance or storage and no more than a ten percent (10%) increase in velocities.

20.36 - Grading: The excavation or fill or any combination thereof and shall include the conditions resulting from any excavation or fill.

20.37 - Hydro Graph: A graph showing for a given location on a stream or conduit, the flow rate with respect to time.

20.38 - Hydro Graph Method: This method estimates runoff volume and runoff hydro graphs for the point of interest by generating hydro graphs for individual subareas, combining them, and routing them through stream lengths and reservoir structures. Factors such as rainfall amount and distribution, runoff curve number, time of concentration, and travel time are included.

20.39 - Illinois Drainage Law: Circular 1355, University of Illinois Extension Office, covering laws that pertain to drainage rights, permits for streams and man made ditches.

20.40 - Impervious Surface: That area of property that is covered by materials other than soil and vegetation and that has no intended capacity to absorb storm water, such as parking lots, driveways, sidewalks, patios, tennis courts, roofs and other structures.

20.41 - Infiltration: The passage or movement of water into the soil surfaces.

20.42 - Livingston County SWCD/LCSWCD: Livingston County Soil & Water Conservation District.

20.43 - Loessal Soil: A sediment, commonly non-stratified and unconsolidated, composed predominately of silt sized particles with accessory clay and sand.

20.44 - Lot: An individual platted parcel in an approved subdivision.

20.45 - Major Drainage System: That portion of a drainage system needed to store and convey flows beyond the capacity of the minor drainage system.

20.46 - Minor Drainage System: That portion of a drainage system designed for the convenience of the public. It consists of street gutters, storm sewers, small open channels, and swales and, where manmade, is to be designed to handle the 10-year runoff event.

20.47 - Mitigation: Mitigation is when the prescribed controls are not sufficient and additional measures are required to offset the development, including those measures necessary to minimize the negative effects which storm water drainage and development activities might have on the public health, safety and welfare. Examples of mitigation include, but are not limited to compensatory storage, soil erosion and sedimentation control, and channel restoration.

20.48 - Natural: Conditions resulting from physical, chemical, and biological processes without intervention by man.

20.49 - Natural Drainage: Channels formed in the existing surface topography of the earth prior to changes made by unnatural causes.

20.50 - One Hundred-Year Event: A rainfall, runoff, or flood event having a one percent (1%) probability of being equaled or exceeded in any given year. A 24 hour storm duration is assumed unless otherwise noted.

20.51 - Parcel: All contiguous land in one ownership.

20.52 - Peak Flow: The maximum rate of flow of water at a given point in a channel or conduit.

20.53 - Permittee: Any person to whom a building permit or a development permit is issued.

20.54 - Person: Any individual, firm or corporation, public or private, the State of Illinois and its agencies or political subdivisions, the United States of America, and its agencies or political subdivisions, and any agent, servant, officer or employee of any of the foregoing.

20.55 - Plan Commission: Planning Commission shall mean the Planning Commission of the Village of Dwight, Illinois, as created and with the jurisdiction as set forth in the Municipal Code of the Village of Dwight, Illinois.

20.56 - Positive Drainage: Provision for overland paths for all areas of a property including depressional areas that may also be drained by storm sewer.

20.57 - Prime Farmland: Prime farmland is land that is best suited to food, feed, forage, fiber and oilseed crops. It may be cropland, pasture, woodland, or other land, but it is not urban and built up land or water areas. It is either used for food or fiber or is available for those uses. The soil qualities, growing season and moisture supply are those needed for a well managed soil to economically produce a sustained high yield of crops. Prime farmland produces the highest yields with minimum inputs of energy and economic resources, and farming it results in the least damage to the environment.

20.58 - Property: A parcel of real estate.

20.59 - Redevelopment: Any alteration of or addition to real estate or property with existing manmade changes to the property as defined by development in Section 2.16 of this Ordinance.

20.60 - Retention Basin: A facility designed to completely retain a specified amount of storm water runoff without release except by means of evaporation, infiltration, emergency bypass or pumping.

20.61 - Sedimentation: The process that deposits soils, debris, and other materials either on other ground surfaces or in bodies of water or storm water drainage systems.

20.62 - Site: A parcel of land, or a contiguous combination thereof, where grading work is performed as a single unified operation.

20.63 - Slope Disturbance Line: The line which delineates relatively level building areas from areas where slopes exceed 7 percent (7%) and where special precautions must be taken.

20.64 - Storm Water Drainage System: All means, natural and manmade, used for conducting storm water to, through or from a drainage area to the point of final outlet from a property. The storm water drainage system includes but is not limited to any of the following: conduits and appurtenance features, canals, channels, ditches, streams, culverts, streets, storm sewers, detention basins, swales and pumping stations.

20.65 - Storm Water Runoff: The waters derived from melting snow or rain falling within a tributary drainage basin which are in excess of the infiltration capacity of the soils of that basin, which flow over the surface of the ground or are collected in channels or conduits.

20.66 - Storm Sewer: A closed conduit for conveying collected storm water.

20.67 - Stream: Any river, creek, brook, branch, flowage, ravine, or natural or man-made drainage way which has a definite bed and banks or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.

20.67 - Stripping: Any activity which removes the vegetative surface cover including tree removal, by spraying or clearing, and storage or removal of top soil.

20.68 - Swale - (Grass lined channel) A natural or constructed channel that is shaped or graded to required dimensions and established in suitable vegetation for stable conveyance of runoff.

20.69 – Ten-Year Event: A runoff, rainfall, or flood event having a ten percent (10%) chance of occurring in any given year. A 24 hour storm duration is assumed unless otherwise note.

20.70 - Time of Concentration: The elapsed time for storm water to flow from the most hydraulically remote point in a drainage basin to a particular point of interest in that watershed.

20.71 - Tributary Watershed: All of the land surface area that contributes runoff to a given point.

20.72 – Two-Year Event: A runoff, rainfall, or flood event having a fifty percent (50%) chance of occurring in any given year. A 24 hour storm duration is assumed unless otherwise noted.

20.73 - Vacant: Land on which there are no structures or only structures which are secondary to the use or maintenance of the land itself.

20.74 – Village: Village of Dwight, Illinois.

20.75 – Village Attorney: Attorney for the Village of Dwight, Illinois.

20.76 – Village Engineer: Engineer for the Village of Dwight, Illinois.

20.77 - Watershed: All land area drained by, or contributing water to, the same stream, creek, ditch, lake, marsh, storm water facility, groundwater or depressional area.

20.78 - Wet Basin: A detention basin designed to maintain a permanent pool of water after the temporary storage of storm water runoff.

20.79 - Wetlands: Wetlands are defined by regulation as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." For general, but not inclusive locations of designated wetlands refer to mapping prepared jointly by the U.S. Department of Interior, Fish and Wildlife Service and the Illinois Department of Natural Resources, Office of Resource Conservation; National Wetlands

Inventory Mapping, 1987. The applicant may be required to provide a field investigation by a qualified wetland delineator.

20.80 – Zoning Administrator: The Village Administrator and the Building Inspector, as Zoning Administrator shall be in charge of the Administration and enforcement of this Ordinance.

Article III- Storm Water Drainage and Detention:

Section 30 - Drainage Plan Submittal Requirements: Each applicant shall submit the following information, to ensure that the provisions of this ordinance are met. The submittal shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts and benefits of the development on water resources both on-site and off-site, and the effectiveness of the proposed drainage plan in managing storm water runoff, and meet the provisions of Article I, Section 11. The applicant shall certify on the drawings that all clearing, grading, drainage, and construction shall be accomplished in strict conformance with the drainage plan. The following information shall be submitted for both existing and proposed property conditions for all new developments or re-developments that meet or exceed the minimum requirements of Article I, Section 12.

30.01 - Drainage Plan Requirements: A topographic survey of the property at two-foot (2) contours unless otherwise specified or approved by the Village Engineer. The plan map shall be keyed to a consistent datum specified by the Village. If the mapping is compiled using a digital format and the Global Positioning System (GPS), the applicant will provide both paper and digital copies including GPS points.

30.011 - Mapping and Descriptions: An existing drainage and proposed drainage plan for the property and one hundred (100) feet surrounding the property at a scale of not more than one hundred (100) feet to one (1) inch, and including the following: " Unless otherwise specified by the Village Engineer"

- a.) property boundary, dimensions, and approximate acreage;
- b.) building setback lines;
- c.) all existing and proposed structures and sizes;
- d.) area in square feet of existing and proposed impervious surface;
- e.) all existing, or proposed easements and covenants;
- f.) all existing, abandoned, or proposed water or monitoring well head locations;
- g.) all sanitary or combined sewer lines and septic systems;
- h.) the banks and centerline of streams and channels;

- i.) shoreline of lakes, ponds, and detention basins with normal water level elevation;
- j.) farm drains and tiles;
- k.) soils classifications;
- l.) location, size and slope of storm water conduits and drainage swales;
- m.) depressional storage areas;
- n.) detention facilities showing inlet & outlet control facilities;
- o.) roads, streets and associated storm water inlets including finished grades;
- p.) base flood elevation, flood fringe, and regulatory flood way;
- q.) basis of design for the final drainage network components;
- r.) a statement giving any applicable engineering assumptions and calculations;
- s.) a vicinity map showing the relationship of the site to its general surroundings at a scale of not less than two thousand (2,000) feet to one (1) inch (1:24,000);
- t.) title, scale, north arrow, legend, seal of Licensed Professional Engineer, date, and name of person preparing plans;
- u.) cross-section data for open channel flow paths and designated overland flow paths;
- v.) direction of storm flows;
- w.) flow rates and velocities at critical points in the drainage system;
- x.) a statement by the design engineer of the drainage system's provision for handling events greater than the 100 year, 24 hour runoff;
- y.) a statement of certification of all drainage plans, calculations, and supporting data by a Licensed Professional Engineer;
- z.) abandoned mine location and type; and
- aa.) subwatershed boundaries within the property.

30.012 - Environmental Features: A depiction of environmental features of the property and immediate vicinity including the following:

- a.) the limits of designated regulatory and non-regulatory wetland areas;
- b.) the location and limits of abandoned mining activity;
- c.) the location of trees greater than eight (8) inches DBH,
- d.) any designated natural areas, prime farmland; and
- e.) any proposed environmental mitigation features.

Section 31 - Minimization of Increases in Runoff Volumes and Rates: In the selection of a drainage plan for a new development or redevelopment, the applicant shall evaluate and implement site design features which minimize the increase in runoff volumes and rates from the

site and addresses the water quality treatment requirements of this ordinance. The applicant's drainage plan submittal shall include evaluations of site design features which are consistent with the following hierarchy:

- a.) Preservation of regulatory flood plains, flood prone and wetland areas;
- b.) Minimize impervious surfaces on the property, consistent with the needs of the project;
- c.) Attenuate flows by use of open vegetated swales and natural depressions and preserves the existing natural stream channel;
- d.) Infiltration of runoff on-site;
- e.) Provide storm water retention structures;
- f.) Provide wet or wetland detention structures;
- g.) Provide dry detention structures; and
- h.) Construct storm sewers.

Section 32 - Water Quality and Multiple Uses: The drainage system should be designed to minimize adverse surface and groundwater quality impacts off-site and on the property itself. Detention basins shall incorporate design features to capture storm water runoff pollutants. In particular, designers shall give preference to wet bottom and wetland type designs and all flows from the development shall be routed through the basin (i.e. low flows shall not be bypassed). Detention of storm water shall be promoted throughout the property's drainage system to reduce the volume of storm water runoff and to reduce the quantity of runoff pollutants.

The drainage system should incorporate multiple uses where practicable. Uses considered compatible with storm water management include open space, aesthetics, aquatic habitat, recreation (boating, fishing, trails, playing fields), wetlands and water quality mitigation.

Section 33 - Design Criteria, Standards, and Methods:

33.01 - Release Rates: The drainage system for new developments or redevelopments shall be designed to control the peak rate of discharge from the property for the 2 year, 24 hour and 100 year, 24 hour events to levels which will not cause an increase in flooding or channel instability downstream when considered in aggregate with other developed properties and downstream drainage capacities. Calculations to determine the peak discharge rate from events less than or equal to the 2 year, 24 hour event and the peak discharge rate for the 100-year, 24 hour event shall be submitted to the Village Engineer for approval.

33.011 - Detention Basin Outlet Design: Backwater on the outlet structure from the downstream drainage system shall be addressed when designing the outlet.

33.02 - Detention Storage Requirements: The design maximum storage to be provided in the detention basin shall be based on the runoff from the runoff difference before and after development from the 100 year, 24 hour event. All detention basin storage shall be computed using Hydro graph Methods utilizing reservoir routing (also called modified pulse or level pool) or equivalent method as described in Section 33.04.

33.03 - Drainage System Design and Evaluation: The following criteria should be used in evaluating and designing the drainage system. The design will provide capacity to pass the 10 year, 24 hour peak flow in the minor drainage system and an overload flow path for flows in excess of the design capacity. Whenever practicable, the storm water systems shall not result in the interbasin transfer of drainage unless no other alternative exists.

33.031 - Design Methodologies: Major and minor conveyance systems for areas up to 10 acres, may be designed using the Rational Formula. The Rational Formula may also be used in sizing the minor drainage system for larger sites up to 100 acres. Runoff hydrograph methods as described in Section 33.04 must be used for major drainage system design for all systems with greater than 10 acres of drainage area and for the design of all detention basins.

33.032 - Positive Drainage: Whenever practicable, all developments must be provided an overland flow path that will pass the 100 year, 24 hour flow at a stage at least one (1) foot below the lowest foundation grade in the vicinity of the flow path. Overland flow paths designed to handle flows in excess of the minor drainage system capacity shall be provided drainage easements. Street ponding and flow depths shall not exceed curb heights.

33.04 - Methods for generating runoff hydrographs: Runoff hydrographs shall be developed incorporating the following assumptions of rainfall amounts and antecedent moisture.

33.041 - Rainfall: Unless a continuous simulation approach to drainage system hydrology is used, all design rainfall events shall be based on the Illinois State Water Survey's Bulletin 70. The first quartile point rainfall distribution shall be used for the design and analysis of conveyance systems with critical durations less than or equal to 12 hours. The third quartile point rainfall distribution shall be used for the design and analysis of detention basins and conveyance system with critical durations greater than 12 and less than or equal to 24 hours. The fourth quartile distribution shall be used in the design and analysis of systems with durations greater than 24 hours. The first, third, and fourth quartile distributions described by Huff are presented in Table 37 of Bulletin 70. Refer to Table 13 of Bulletin 70 for rainfall depth, duration, and frequency. The NRCS Type II distribution may be used as an alternate to the Huff distributions.

33.042 - Antecedent Moisture: Computations of runoff hydrographs, which do not rely on a continuous accounting of antecedent moisture conditions, shall use wet antecedent moisture condition as a minimum.

33.05 - Agriculture Tiles and Sanitary Sewers: Connections to sanitary sewers or existing agricultural storm water management system (tiles) shall not be permitted for new developments. However, in exceptional circumstances and with the approval of the Village Engineer, connections to existing agricultural storm water management systems may be allowed if the applicant demonstrates that the existing system has adequate hydraulic capacity, and structural integrity. Additionally, development meeting the criteria in Section 33 shall either obtain a maintenance agreement or deed or plat restriction covering the entire downstream drain tile in accordance to be determined of this ordinance before a connection to that system is permitted. Field tile systems disturbed during the process of land development must be reconnected by those responsible for their disturbance unless the approved drainage plan incorporates the tiles in the land development design.

33.06 - Wet Detention Basin Design: Wet detention basins shall be designed to remove storm water pollutants, to be safe, to be aesthetically pleasing, and as much as feasible to be available for recreational use.

33.061 - Wet Basin Depths: Wet basins shall be at least three feet deep, excluding near-shore banks and safety ledges. If fish habitat is to be provided they shall be at least ten (10) feet deep over twenty-five (25%) percent of the bottom area to prevent winterkill.

33.062 - Wet Basin Shoreline Slopes: The side slopes of wet basins at the normal pool elevation shall not be steeper than five to one (5 to 1 horizontal to vertical). It is recommended that native aquatic vegetation be established around the perimeter to provide protection from shoreline erosion.

33.063 - Permanent Pool Volume: The permanent pool volume in a wet basin at normal depth shall be equal to the runoff volume from its watershed for the 2 year, 24 hour event as a minimum.

33.064 - Wet Basin Inlet and Outlet Orientation: The distance between detention inlets and outlets shall be maximized. Inlets and outlets shall be at opposite ends of the basin providing that the orientation does not create undue hardship based on topography or other natural constraints. Designers are encouraged to use baffles or berms in the basin bottom to prevent short-circuiting. There shall be no low flow bypass between the inlet and outlet. Paved low flow channels shall not be used. The minimum flow length shall be ten (10) feet with a recommended minimum ratio of two to one (2:1) for width.

33.07 - Dry Detention Basin Design: In addition to the other requirements of this ordinance, dry basins shall be designed to remove storm water pollutants, to be safe, to be aesthetically pleasing and as much as feasible to be available for multiple uses.

33.071 - Dry Basin Drainage: Dry basins shall be designed so that eighty percent (80%) of their bottom area shall have standing water no longer than seventy-two (72) hours for any runoff event less than the 100-year, 24 hour event. Grading plans shall clearly distinguish the wet portion of the basin bottom. Under drains directed to the outlet may be used to accomplish this requirement.

33.072 - Velocity Dissipation: Velocity dissipation measures shall be incorporated into dry basin designs to minimize erosion at inlets and outlets and to minimize resuspension of sediment.

33.073 - Dry Basin Inlet and Outlet Orientation: Shall be the same as Article III, Section 33.064.

33.074 - Temporary Sediment Trap: A sediment trap shall be constructed at each major inlet to a dry basin during construction. The temporary sediment trap should be designed in accordance with criteria in the Illinois Urban Manual.

33.08 - Existing Depressional Areas: Existing depressional storage volume will be maintained and the volume of detention storage provided to meet the requirements of this ordinance shall be in addition to existing storage.

33.09 - Minimum Detention Outlet Size: Where a single pipe outlet or orifice plate is to be used to control discharge, it shall have a minimum diameter of twelve (12) inches. If design release rates call for smaller outlets, a design that minimizes the possibility of clogging shall be used. Minimum outlet restrictor size shall be 4" provided there is adequate downstream capacity. Detention volumes for a development shall be dictated by adherence to the release rates specified in Section 33.01.

33.10 - Detention in Flood Plains: The placement of detention basins within the flood plain is strongly discouraged because of questions about their reliable operation during flood events. However, the storm water detention requirements of this ordinance may be fulfilled by providing detention storage within flood fringe areas on the project site provided the following provisions are met as well as compliance with Article I, Section 11.

33.1001 - Detention in Flood Fringe Areas: The placement of a detention basin in a flood fringe area shall require compensatory storage for 1.5 times the volume below the base flood elevation occupied by the detention basin including any berms. The release from the detention storage provided shall still be controlled consistent with the requirements of this section. The applicant shall demonstrate its operation for all stream-flow and flood plain backwater

conditions. Excavations for compensatory storage along watercourses shall be opposite or adjacent to the area occupied by detention. All flood plain storage lost below the existing ten-year flood elevation shall be replaced below the existing ten-year elevation. All flood plain storage lost above the existing ten-year flood elevation shall be replaced above the existing ten-year flood elevation. All compensatory storage excavations shall be constructed to drain freely and openly to the watercourse and comply with Article I, Section 11.

33.1002 - Detention on Prime Farmland: Whenever feasible, the placement of detention basins shall avoid the utilization of prime farmland. All detention basin construction shall examine potential impacts to adjacent agricultural land and shall address measures that will be implemented to eliminate such impacts and comply with Article I, Section 11.

33.1003 - Detention in Flood Ways: Detention basins shall not be placed in the floodway. Not all floodways are mapped. If the drainage area of the waterway at the proposed construction location is one square mile or greater, the applicant shall contact the Illinois Department of Natural Resources, Office of Water Resources for a determination as to State permit requirements.

33.1004 - On-Stream Detention: On-stream detention basins are discouraged but allowable if they provide regional public benefits and if they meet the other provisions of this ordinance with respect to water quality and control of the 2 year and 100 year, 24 hour events from the property. Further criteria are presented in Article III, Section 34 of this ordinance. If on-stream detention is used in watersheds larger than one square mile, the applicant will use hydrographic modeling to demonstrate that the design will not increase the water level for any properties upstream or downstream of the property. Also, impoundment of the stream as part of on-stream detention:

- a.) shall not prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, such as for spawning;
- b.) shall not cause or contribute to the degradation of water quality or stream aquatic habitat;
- c.) shall include a design calling for gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin;
- d.) shall not involve any stream channelization or the filling of wetlands;
- e.) shall require the implementation of an effective non-point source management program throughout the upstream watershed which shall include as a minimum: runoff reduction "Best Management Practices" (BMP's) consistent with Article III, Section 31; 2 year, 24 hour detention / sedimentation basins for all development consistent with Article III, Section 33.074;
- f.) shall not occur downstream of a wastewater discharge;

- g.) shall not contribute to the duration or flood frequency of any adjacent land, and
- h.) shall comply with Article I, Section 11.

33.11 - Drainage Into Wetlands, Rivers, Streams, Lakes, Ponds, and Depressional Storage Areas: Wetlands, lakes, ponds and depressional storage areas shall be protected from damaging modifications and adverse changes in runoff quality and quantity associated with land developments. In addition to the other requirements of this ordinance, the following requirements shall be met for all developments whose drainage flows into wetlands, rivers, lakes, ponds or depressional storage areas:

33.1101 -Detention in Wetlands, Rivers, Streams, Lakes, Ponds or Depressional Storage Areas: Existing wetlands, rivers, lakes, ponds or depressional storage areas shall not be modified for the purposes of storm water detention unless it is demonstrated that the proposed modifications will maintain or improve its habitat and ability to perform beneficial functions and shall comply with Article I, Section 11. Existing storage and release rate characteristics of wetlands, rivers, lakes, ponds or depressional storage areas shall be maintained and the volume of detention storage provided to meet the requirements of this section shall be in addition to this existing storage.

33.1102 - Sediment Control: The existing wetlands, rivers, lakes, ponds, or depressional storage areas shall be protected during construction and as further regulated in Article IV of this Ordinance, and shall not be filled without appropriate permits under the Clean Water Act.

33.1103 - Alteration of Drainage Patterns: Site drainage patterns shall not be altered to substantially decrease or increase the existing area tributary to wetlands, rivers, lakes, ponds or depressional storage areas. Drainage patterns shall not be altered by development to direct runoff offsite to other than natural drainage outlets existing prior to development.

33.1104 - Detention/Sedimentation: All runoff from the development shall be routed through a preliminary detention/sedimentation basin designed to capture the two-year, 24 hour event and hold it for at least 24 hours, before being discharged to the wetland, river, lake, pond, or depressional storage area. This basin shall be constructed before property grading begins and shall be maintained throughout the construction process. In addition, the drainage hierarchy defined in Article III, Section 30 should be followed to minimize runoff volumes and rates being discharged to the wetland, river, stream, lake, pond, or depressional storage area and as further regulated in Article II and Article IV of this ordinance.

33.1105 - Vegetated Buffer Strip: A buffer strip of at least 25 feet in width, preferably vegetated with native plant species, shall be maintained or restored around the periphery of a wetland, river, stream, lake, pond or depressional storage area.

33.1106 - Loessal Soils: Care must be taken to avoid open flow discharges of storm water over silt (Loessal) soils due to high potential for erosion.

33.1107 - Abandoned Mines: The following requirements apply for new developments or re-developments where abandoned mines are determined to be present:

- a. A storm water detention basin shall not be placed in or over an abandoned mine;
- b. Storm water detention basins shall not be located closer than one hundred (100) feet from the opening of an abandoned mine;
- c. The outflow from a storm water detention basin, channel, ditch or any storm water runoff generated as a result of a new development or redevelopment shall not empty into or be directed, redirected by any means into or through any abandoned mine;
- d. If, after the review of the storm water drainage plan, the Village Engineer may determine that more detailed information is required, a abandoned mine evaluation may be required. A abandoned mine evaluation which addresses the geologic, engineering and environmental factors resulting from a new development or redevelopment be performed by a professional with experience and expertise in abandoned mine topography, whom shall certify the results of the evaluation. This evaluation shall be the responsibility of the applicant and performed at no cost to the Village. After a review of this evaluation the Village Engineer may either approve or disapprove the drainage plan as submitted;
- e. Whenever an abandoned mine is discovered or it becomes apparent that the abandoned mine has not yet been identified, it shall be reported to the Village Engineer; and
- f. Shall comply with Article I, Section 11.

33.12 - Street Detention, Parking Lot Detention, and Culvert Drainage:

33.1201 - Street Detention: If streets are to be used as part of the minor or major drainage system, ponding depths shall not exceed curb heights and shall not remain flooded for more than eight (8) hours for any event less than or equal to the 100 year, 24 hour event.

33.1203 - Parking Lot Detention: The maximum storm water ponding depth in any parking area shall not exceed six (6) inches for more than four (4) hours.

33.1203 - Culvert, Road and Driveway Crossings: Sizing of culvert crossings shall consider entrance and exit losses as well as tailwater conditions on the culvert.

33.13 - Infiltration Practices: To effectively reduce runoff volumes, infiltration practices including basins, trenches, and porous pavement should be located in hydrologic soil groups “A” and “B” as designated by the USDA NRCS and shall follow criteria in the Illinois Urban Manual with Article I, Section 11. Infiltration basins and trenches designed to re-charge groundwater shall not be located within seventy-five (75) feet of a water supply well or building foundation. An appropriate sediment control device shall be provided to remove coarse sediment from storm water flows before they reach infiltration basins or trenches. Storm water shall not be allowed to stand more than seventy-two hours over eighty percent of the dry basin's bottom area for the maximum design event to be ex-filtrated. The bottom of infiltration basins or trenches shall be a minimum of three feet above the seasonally high groundwater and bedrock level. Engineering calculations demonstrating infiltration rates shall be included with the application.

33.1301 - Vegetated Filter Strips and Swales: To effectively filter storm water pollutants and promote infiltration of runoff, sites should be designed to maximize the use of vegetated filter strips and swales, shall be designed to follow criteria in the Illinois Urban Manual. Whenever practicable, runoff from impervious surfaces should be directed onto filter trips and swales comprised of native grasses and forbs before being routed to a storm sewer or detention basin.

33.14 - Safety Considerations: The drainage system components, especially all detention basins, shall be designed to protect the safety of any children or adults coming in contact with the system during runoff events and shall comply with Article I, Section 11.

33.1401 - Side Slopes: The side slopes of all detention basins at 100 year, 24 hour capacity shall be as level as practicable to prevent accidental falls into the basin and for stability and ease of maintenance. Side slopes of detention basins and open channels shall not be steeper than three (3) to one (1) (horizontal to vertical).

33.1402 - Safety Ledge: All wet detention basins shall have a level safety ledge at least four feet in width 2.5 to 3 feet below the normal water depth.

33.1403 - Velocity: Velocities throughout the surface drainage system shall be controlled to safe levels taking into consideration rates and depths of flow.

33.1404 - Overflow Structures: All storm water detention basins shall be provided with an overflow structure capable of safely passing excess flows at a stage at least one foot below the lowest foundation grade in the vicinity of the detention basin. The design flow rate of the overflow structure shall be equivalent to the 100 year, 24 hour inflow rate.

33.15 - Maintenance Considerations: The storm water drainage system shall be designed to minimize and facilitate maintenance. Turfed side slopes shall be designed to allow lawn-mowing

equipment to easily negotiate them. Wet basins shall be provided with alternate outflows, which can be used to completely drain the pool for sediment removal. Pumping may be considered if drainage by gravity is not feasible. Pre-sedimentation basins shall be included, where feasible, for localizing sediment deposition and removal. Site access for heavy equipment shall be provided. Use of native vegetation is strongly encouraged to reduce maintenance, increase wildlife habitat, and to provide other benefits. Vehicles and heavy equipment shall not run over the roots of established trees within the critical root zone. Trees shall be protected following criteria in the Illinois Urban Manual.

33.1501 - A maintenance plan for the ongoing maintenance of all storm water management system components, including wetlands, is required prior to plan approval. The plan shall include:

- a.) Maintenance tasks and their frequency;
- b.) The party responsible for performing the maintenance tasks;
- c.) A description of all permanent public or private access maintenance easements and overland flow paths, and compensatory storage areas; and
- d.) A description of dedicated sources of funding for the required maintenance.

Section 34 - Accommodating Flows From Upstream Tributary Areas: Storm water runoff from areas tributary to the property shall be considered in the design of the property's drainage system. Whenever practicable, flows from upstream areas that are not to be detained should be routed around the basin being provided for the site being developed.

34.01 - Upstream Areas Not meeting Ordinance Requirements: When there are areas not meeting the storage and release rates of this ordinance, tributary to the applicant's property, regionalized detention on the applicant's property shall be explored by the applicant. The following steps shall be followed:

- a.) The applicant shall compute the storage volume needed for his/her property using the release rates of Article III, Section 33 of this Ordinance.
- b.) The applicant shall identify and define areas tributary to the applicant's property, that do not meet the storage and release rate requirements of this Ordinance.
- c.) Using the areas determined above plus the applicant's property area, the applicant shall compare the total storage needed for the combined properties.

If tributary areas are not developed, a reasonable fully developed land cover, based on local zoning, shall be used for the purposes of computing storage.

Once the necessary combined storage is computed the Village may choose to pay for over-sizing the applicant's detention basin to accommodate the regional flows. The applicant's responsibility will be limited to the storage for his property as computed above. If regional storage is selected by the Village then the design produced in Article III, Section 32 shall be implemented. If regional storage is rejected by the Village the applicant shall bypass all tributary area flows around the applicant's basin whenever practicable. If the applicant must route upstream flows through his basin and the upstream areas exceed one-square mile in size, the applicant must meet the provision of Section 33.1004 for on-stream basins.

34.02 - Upstream Areas Meeting Ordinance Requirements: When there are areas which meet the storage and release rate requirements of this ordinance, tributary to the applicant's property, the upstream flows shall be bypassed around the applicant's detention basin if this is the only practicable alternative. Storage needed for the applicant's property shall be computed as described in Article III, Section 34.01. However, if the Village decides to route tributary area flows through an applicant's basin, the final design storm water releases shall be based on the combined total of the applicant's property plus tributary areas. It must be shown that at no time will the runoff rate from the applicant's property exceed the allowable release rate for his/her property alone.

Section 35 - Early Completion of Detention Facilities: Where detention, retention, or depressional storage areas are to be used as part of the drainage system for a property, they shall be constructed as the first element of the initial earthwork program prior to the commencement of mass grading. Any eroded sediment captured in these facilities shall be removed by the applicant on a regular basis and before project completion in order to maintain the design volume of the facilities.

Section 36 - Fee in Lieu of Detention: All new development or redevelopment not exceeding fifteen thousand (15,000) square feet of impervious surface may pay a fee of \$10,000 for each acre-foot of detention which would be required under this ordinance rather than installing detention facilities on the property, unless specifically directed to do otherwise by the Zoning Administrator. The Village, also shall have the option for new development or re-development exceeding fifteen thousand (15,000) square feet of impervious surface of requiring a fee of \$10,000 for each acre-foot of detention needed in lieu of the applicant building a basin on-site provided the property will discharge storm water to the Village storm drainage system if applicable.

In instances where regional benefits and economies of scale can be achieved, it will be permissible for adjacent properties to utilize a common regional detention basin. Applicants shall have the option of paying a fee of \$10,000 for each acre-foot of detention required so that the Village can build regional facilities or the applicants can jointly build the necessary facilities themselves.

The \$10,000 fee for each acre-foot is based on the value of \$10,000 in the year 2001. Said fee may be increased by the Village from time to time based on inflation as determined by the Consumer Price Index so that this amount will increase over time. In lieu of using the Consumer Price Index, and amount of not more than two (2) percent per year may be used to increase the fee.

Article IV - SOIL EROSION AND SEDIMENT CONTROL:

Section 40 - Findings: The Village hereby finds that:

- a.** The soil types found in the Village of Dwight, Illinois are susceptible to erosion and if left unprotected could cause severe loss of soil with resultant damage to property;
- b.** The topography of the Village contains areas with steep slopes upon which, if clearing of trees and/or inappropriate construction takes place, could result in severe erosion and slope stability problems which could result in damage to property;
- c.** Excessive quantities of soil may erode from areas undergoing development for certain non-agricultural uses including but not limited to the construction of dwelling units, commercial buildings and industrial plants, the building of roads and highways, the modification of stream channels and drainage ways, and the creation of recreational facilities;
- d.** The washing, blowing, and falling of eroded soil across and upon roadways endangers the health and safety of users thereof, by decreasing vision and reducing traction of road vehicles;
- e.** Soil erosion necessitates the costly repairing of gullies, washed out fills, and embankments;

- f. Sediment from soil erosion clogs drainage systems and pollutes rivers, streams, lakes, wetlands, and reservoirs;
- g. Sediment limits the use of water and waterways for most beneficial purposes, promotes the growth of undesirable aquatic weeds, destroys fish and other desirable aquatic life, and is costly and difficult to remove; and
- h. Sediment reduces the channel capacity of waterways and the storage capacity of flood plains and natural depressions, resulting in increased chances of flooding at risk to public health and safety.

Section - 41 - General Principles: It is the objective of this ordinance to control soil erosion and sedimentation caused by development activities, including clearing, grading, stripping, excavating, and filling of land, in the Village. Measures taken to control soil erosion and off-site sediment runoff shall be adequate to assure that sediment is not transported from the site by a storm event of ten-year frequency, 24 hour duration or less. The following principles shall apply to all new development or redevelopment activities within the Village and to the preparation of the submissions required under Article IV, Section 42 of this ordinance:

- a. New development or redevelopment shall be related to the topography and soils of the site so as to create the least potential for erosion. Areas of steep slopes greater than seven percent (7%) where high cuts and fills maybe required are to be avoided wherever possible, and natural contours should be followed as closely as possible,
- b. Natural vegetation shall be retained and protected wherever possible. Areas immediately adjacent to natural watercourses, lakes, ponds, and wetlands are to be left undisturbed wherever possible. Temporary crossings of watercourses, when permitted, must include appropriate stabilization measures,
- c. Special precautions shall be taken to prevent damages resultant from any necessary development activity within or adjacent to any stream, lake, pond, abandoned mine or wetland. Preventive measures shall reflect the sensitivity of these areas to erosion and sedimentation,
- d. The smallest practical area of land should be exposed for the shortest practical time during development,

- e. Sediment basins or traps, filter barriers, diversions, and any other appropriate sediment or runoff control measures shall be installed prior to site clearing and grading and maintained to remove sediment from run-off waters from land undergoing development,
- f. The selection of erosion and sediment control measures shall be based on assessment of the probable frequency of climatic and other events likely to contribute to erosion, and on evaluation of the risks, costs, and benefits involved,
- g. In the design of erosion control facilities and practices, aesthetics and the requirements of continuing maintenance must be considered,
- h. Provisions shall be made to accommodate the increased run-off caused by changed soil and surface conditions during and after development. Drainage ways should be designed so that their final gradients and the resultant velocities and rates of discharge will not create additional erosion on-site or downstream,
- i. Permanent vegetation and structures shall be installed and functional as soon as practical during development,
- j. Those areas being converted from agricultural purposes to other land uses shall be vegetated with an appropriate protective cover prior to development,
- k. All waste generated as a result of site development activity shall be properly disposed of and shall be prevented from being carried off the site by either wind or water,
- l. All construction sites shall provide measures to prevent sediment from being tracked onto public or private roadways, and
- m. All temporary soil erosion and sediment control practices shall be maintained to function as intended until the contributing drainage area has been permanently stabilized at which time they shall be removed.

Section 42 - Soil Erosion and Sediment Control Plan Submittal Requirements: Each applicant shall submit the information depending on development size, as regulated to ensure that the provisions of this ordinance are met. The submittal shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts of the development related to erosion both on-site and off-site, and the effectiveness of the proposed erosion and sediment control plan in reducing sediment loss and meet the provisions of Article I, Section 11. The applicant shall certify on the drawing that all clearing, grading, drainage, and

construction shall be accomplished in strict conformance with the erosion and sediment control plan. The following information shall be submitted for both existing and proposed property conditions; new developments or re-developments meeting the requirements of Article I, Section 12.

42.01 - Soil Erosion and Sediment Control Plan Requirements: Shall meet the requirements of Article III, Section 30.01, Section 30.011, and Section 30.012.

42.011 - Mapping and Descriptions: The existing and proposed erosion and sediment control features of the property and immediate vicinity including:

- a.) As required in Article III, Section 30.01, Section 30.011, and Section 30.012;
- b.) Location of the slope disturbance line;
- c.) Location and description of the soil erosion and sediment control measures to be employed during construction;
- d.) For any structures proposed to be located on the slope side of the slope disturbance line the map shall include the limits of disturbance including tree removal, soil erosion and sediment control measures during construction, cross section view of any proposed cut or fill, erosion and sediment control measures during construction, details of method (s) proposed for providing slope stability, permanent storm water control measures, and permanent erosion and sediment control measures all being certified by a registered professional engineer or a "Certified Professional in Erosion and Sediment Control;"
- e.) The predominant soil types on the site, their location, and their limitations for the proposed use as defined by the U.S.D.A. Natural Resources Conservation Service;
- f.) The proposed use of the site, including present and planned development, areas of clearing, stripping, grading, excavation and filling; proposed contours, finished grades, and street profiles; the storm water plan as required in Article II; kinds and locations of utilities, areas and acreage proposed to be paved, sodded or seeded, vegetatively stabilized, or left undisturbed; and the location of trees over eight (8) inches in diameter and their type;

g.) A soil erosion and sediment control plan, including a narrative, shall be submitted showing all measures necessary to meet the requirements of this Ordinance throughout all phases of construction and those remaining permanently after completion of the development of the site. The development of a soil erosion and sediment control plan shall follow the requirements of this ordinance and the procedures in the latest edition of the "Illinois Procedures and Standards for Urban Soil Erosion and Sediment Control" (commonly known as the Greenbook), which is hereby incorporated into this ordinance by reference. The Village may waive specific requirements for the content of submissions upon finding that the information submitted is sufficient to show that the work will comply with the objectives and principles of this ordinance. Permanent soil erosion and sediment control features needed at the completion of any development site shall be included in the submittal. The submitted soil erosion and sediment control plan shall include:

- 1.)** Location and description, including standard details, of all sediment control measures and specifics of sediment basins and traps, including outlet details;
- 2.)** Location and description of all soil stabilization and erosion control measures, including seeding mixtures and rates, types of sod, method of seedbed preparation (type and extent of tillage, weed control, planting equipment, etc...), expected seeding dates, type, method and rate of lime and fertilizer application (soil fertility testing required), kind and quantity of mulching for both temporary and permanent vegetative control measures, and types of non-vegetative stabilization measures;
- 3.)** Location and description of all runoff control measures, including diversions, waterways, and outlets;
- 4.)** Location and description of methods to prevent tracking of sediment off-site including construction entrance details, as appropriate;
- 5.)** Description of dust and traffic control measures;
- 6.)** Locations of stockpiles and description of stabilization methods;

- 7.) Description of offsite fill or borrow volumes, locations and methods of stabilization;
- 8.) Provisions for maintenance of control measures, including type and frequency of maintenance, easements, and estimates of the cost of maintenance; and
- 9.) The proposed phases of development of the site, including stripping and clearing, rough grading and construction, and final grading and landscaping. Phasing should identify the expected date on which clearing will begin, the estimated duration of exposure of cleared area, and the sequence of installation of temporary sediment control measures (including perimeter controls), installation of stormwater drainage, paving streets and parking areas, final grading and the establishment of permanent vegetative cover, and the removal of temporary measures. It shall be the responsibility of the applicant to notify the Building Inspector and Zoning Administrator of any significant changes that occur in the site development schedule after the initial erosion and sediment control plan has been approved.
- 10.) Identification (name, address, and telephone) of the person(s) or entity which will have legal responsibility for maintenance of soil erosion control structures and measures during development and after development is completed.

Section 43 - Design and Operation Standards and Requirements:

The practice standards and specifications outlined in the Soil Erosion and Sediment Control plan shall follow criteria in the latest edition of the Illinois Urban Manual, which is hereby incorporated into this Ordinance by reference. In the event of conflict between the provisions of said manual and this Ordinance, this Ordinance shall govern.

- a.) All clearing, grading, stripping, excavating, and filling which is subject to the approval requirements of this ordinance shall be subject to the applicable standards and requirements set forth and/or referenced in this ordinance;
- b.) Responsibility: The permittee shall not be relieved of responsibility for damage to persons or property otherwise imposed by law, and the Village or its officers or agents will not be made liable for such

damage by (1) the issuance of a permit under this ordinance, (2) compliance with the provisions of that permit or with conditions attached to it by the Village, (3) failure of the Village officials to observe or recognized hazardous or unsightly conditions, (4) failure of the Village officials to recommend denial of or to deny a permit, or (5) exemptions from the permit requirements of this ordinance; and

- c.) Site Design Requirements: Practice standards and specifications for measures outlined in the soil erosion and sediment control plan shall follow criteria in the latest edition of the "Illinois Urban Manual: A Technical Manual Designed for Urban Ecosystem Protection and Enhancement", which is hereby incorporated into this ordinance by reference.

43.01 - Erosion and Sediment Control Design Requirements: New developments or re-developments shall comply with Article IV, Section 42 and meet the following:

43.011 - Control measures shall be constructed to control runoff from the property to such an extent possible that sediment is retained on-site.

43.012 - Temporary on-site control measures required shall be constructed and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

43.013 - Disturbed areas shall be stabilized with permanent measures within seven (7) calendar days following the end of active disturbance, or redisturbance consistent with the following criteria:

- a. Appropriate permanent stabilization measures shall include seeding, mulching, sodding, with non-vegetative measures as a last resort; and
- b. Areas having slopes greater than 12% shall be stabilized with sod, mat, or blanket in combination with seeding or equivalent.

43.014 - All temporary and permanent erosion and sediment control practices must be maintained and repaired as needed to assure effective performance of their intended function.

43.015 - All temporary erosion and sediment control measures shall be disposed in a proper manner within thirty (30) days after final site stabilization is achieved with permanent soil stabilization measures. Trapped sediment and other disturbed soils resulting from the disposition

of temporary measures shall be permanently stabilized to prevent further erosion and sedimentation.

43.016 - Site Development Requirements: On-site sediment control measures, as specified by the following criteria, shall be constructed as specified in the referenced handbooks, and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

- a.** For new developments or redevelopments less than one (1) acre, filter barriers (including filter fences, straw bales, or equivalent control measures) shall be constructed to control all on-site runoff. Vegetated filter strips, with a minimum width of twenty-five (25) feet, may be used as an alternative only where runoff in sheet flow is expected;
- b.** For new developments or re-developments more than one (1) acre but less than five (5) acres, a sediment trap or equivalent control measure shall be constructed at the downslope point of the disturbed area,
- c.** For new developments or re-developments greater than five (5) acres, a sediment basin or equivalent control measure shall be constructed at the down slope point of the disturbed area;
- d.** Sediment basin and sediment trap designs shall provide for both "dry" detention and "wet" detention sediment storage. The detention storage shall be composed of equal volumes of "wet" detention storage and "dry" detention storage and each shall be sized as regulated in Article III 3.0. The release rate of the basin shall be that rate as regulated in Article III. The elevation of the outlet structure shall be placed such that it only drains the dry detention storage;
- e.** The sediment storage shall be sized to store the estimated sediment load generated from the site over the duration of the construction period with a minimum storage equivalent to the volume or sediment generated in one year. For construction periods exceeding one year, the 1-year sediment load and a sediment removal schedule may be substituted; and
- f.** To the extent possible or as otherwise regulated in this ordinance all desirable trees eight (8) inches in diameter and larger shall be protected for their present and future value for erosion protection and other environmental benefits. Trees that have been selected for preservation shall be marked prior to the beginning of any clearing, grading, stripping, excavation, or filling of the site. A "No Construction Zone" shall be

established and marked at one (1) foot beyond the perimeter of the dripline of each tree which is to be preserved.

43.017 - Storm water conveyance channels, including ditches, swales, and diversions, and the outlets of all channels and pipes shall be designed and constructed as regulated in Article III. All constructed or modified channels shall be stabilized within 48 hours, consistent with the following standards and as required in the referenced handbooks:

- a.** For grades up to 4 percent, seeding in combination with mulch, erosion blanket, or an equivalent control measure shall be applied. Sod or erosion blanket or mat shall be applied to the bottom of the channel;
- b.** For grades of 4 to 8 percent, sod or an equivalent control measure shall be applied in the channel; and
- c.** For grades greater than 8 percent, rock, riprap, or an equivalent control measure shall be applied over filter fabric or other type of soil protection, or the grade shall be effectively reduced using drop structures.

43.018 Land disturbance activities in stream channels shall be avoided, where possible, or as regulated in Article III. If disturbance activities are unavoidable, the following requirements shall be met.

- a.** Construction vehicles shall be kept out of the stream channel to the maximum extent practicable. Where construction crossings are necessary, temporary crossings shall be constructed of non-erosive material, such as riprap or gravel;
- b.** The time and area of disturbance of stream channels shall be kept to a minimum. The stream channel, including bed and banks, shall be stabilized within 48 hours after channel disturbance is completed, interrupted, or stopped; and
- c.** Whenever channel relocation is necessary, the new channel shall be constructed under dry conditions and fully stabilized before flow is diverted, incorporating meanders, pool and riffle sequence, and riparian planting.

43.019 - Storm sewer inlets and culverts shall be protected by sediment traps or filter barriers meeting accepted design standards and specifications.

43.020 - Soil storage piles containing more than 10 cubic yards of material shall not be located with a downslope drainage length of less than 50 feet to a roadway, drainage channel, or abandoned mine. Filter barriers, including straw bales, filter fence, or equivalent, shall be installed immediately surrounding the perimeter of the pile.

43.021 - If dewatering devices are used, discharge locations shall be protected from erosion. All pumped discharges shall be routed through appropriately designed sediment traps or basins, or equivalent and shall not be deposited into an abandoned mine.

43.022 - Each site shall have graveled (or equivalent) entrance roads, access drives, and parking areas of sufficient length and width to prevent sediment from being tracked onto public or private roadways. Any sediment reaching a public or private road shall be removed by shoveling or street cleaning (not flushing) before the end of each workday and transported to a controlled sediment disposal area.

Section 44 - Maintenance of Control Measures: All soil erosion and sediment control measures necessary to meet the requirements of this ordinance shall be maintained by the applicant or subsequent land owner during the period of land disturbance and development of the site in a satisfactory manner to ensure adequate performance. The applicant or contractor responsible for maintaining the soil erosion and sediment control practices shall inspect all such practices at least once every 7 days or within 24 hours of a precipitation event equal to or exceeding 0.5" of rainfall.

Article V - Long Term Maintenance Responsibility:

Section 50 - Long Term Maintenance Responsibility: Maintenance of storm water drainage, and soil erosion and sediment control facilities located on private property shall be the responsibility of the owner of that property. Before an appropriate permit is obtained from the Village, the applicant shall execute a maintenance agreement with the Village guaranteeing that the applicant and all future owners of the property will maintain its storm water drainage and soil erosion and sediment control system. Such agreement shall be recorded with the Recorder of Deeds of the County. The maintenance agreement shall include a schedule for regular maintenance of each aspect of the property's storm water drainage and soil erosion and sediment control system and shall provide for access to the system for inspection by authorized personnel of the Village. The maintenance agreement shall also stipulate that if the appropriate personnel of the Village notify the property owner in writing of maintenance problems which require correction, the property owner shall begin such corrections within twenty four (24) hours and shall not extend beyond seven (7) calendar days of such notification. If the corrections are not made within this time period the Village may have the necessary work completed and assess the cost to the property owner. The Village shall require a bond to be filed by the property owner for maintenance of the storm water drainage and soil erosion and sediment control system.

Article VI - Inspections:

Section 60 - Inspections: The Village Engineer shall make inspections as hereinafter required and shall either approve that portion of the work completed or shall notify the permittee wherein the work fails to comply with the storm water drainage or erosion and sediment control plan as approved. Plans for grading, stripping, excavating, and filling work bearing the signed approval of the Village shall be maintained at the site during progress of the work. In order to obtain inspections and to ensure compliance with the approved erosion and sediment control plan, the grading or building permit, and this Ordinance, the permittee shall notify the Village within two (2) working days of the completion of the construction stages specified below:

- a. Upon completion of installation of sediment and runoff control measures (including perimeter controls and diversions), prior to proceeding with any other earth disturbance or grading;
- b. After stripping and clearing;
- c. After rough grading;
- d. After final grading;
- e. After seeding and landscaping deadlines; and
- f. After final stabilization and landscaping, prior to removal of temporary sediment controls.

If stripping, clearing, grading and/or landscaping are to be done in phases or areas, the permittee shall give notice and request inspection at the completion of each of the above work stages in each phase or area. If an inspection is not made and notification of the results given within five (5) working days after notice is received by the Village from the permittee, the permittee may continue work at his/her own risk, without presuming acceptance by the Village. Notification of the results of the inspection shall be given in writing at the site. A duplicate copy shall be kept by the enforcing agency of the Village.

Section 61 - Special Precautions: If at any stage of the grading of any development site the Village determines by inspection that the nature of the site is such that further work authorized by an existing permit is likely to imperil any property, public way, stream, lake, wetland, or drainage structure, the Village shall require, as a condition of allowing the work to be done, that such reasonable special precautions to be taken as is considered advisable to avoid the likelihood of such peril. "Special precautions" may include, but shall not be limited to, a more level exposed slope, construction of additional drainage facilities, berms, terracing, compaction, or cribbing,

installation of plant materials for erosion control, and obtaining and following recommendations of a registered professional engineer with adequate knowledge and experience in the field of soil erosion and sediment control and/or a certified professional in Erosion and Sediment Control which may be made requirements for further work.

61.01 - Where it appears that storm damage may result because the grading on any development site is not complete, work shall be stopped and the permittee required to install temporary structures or take such other measures as may be required to protect adjoining property or the public safety. On large developments, or where unusual site conditions prevail, the Zoning Administrator shall specify the time of starting grading and time of completion or may require that the operations be conducted in specific stages so as to ensure completion of protective measures or devices prior to the advent of seasonal rains.

Section 62 - Amendment of Plans: Major amendments to storm water drainage and detention or erosion and sediment control plans shall be submitted to the Zoning Administrator and shall be processed and approved or disapproved in the same manner as the original plans. Field modification of a minor nature may be authorized by the Zoning Administrator by written authorization to the permittee.

Article VII - Permitting:

Section 70 - Application for Permit: Application for a development permit shall be made by the owner of the property or his authorized agent to the Village on a form furnished for that purpose. Each application shall bear the name(s) and address(es) of the owner or developer of the site, the contractor(s) and of any consulting firm retained by the applicant together with the name of the applicant's principal contact at such firm. Each application shall include certification that any land clearing, construction, or development involving the movement of earth shall be in accordance with the plans approved upon issuance of the permit.

Section 70.01 – Application Fee: All applications for a development permit shall be accompanied with an application fee as set forth in Exhibit A, attached hereto and incorporated herein. In addition, the applicant shall be responsible for reimbursing the Village for any additional cost necessary for review, inspection, and approval of this project, including but not limited to the engineering services of the Village Engineer. The Zoning Administrator shall require a \$500.00 deposit to cover these additional costs.

Section 71 - Bond Required: The applicant for a development permit shall be required to file with the Village a faithful performance bond or bonds, letter of credit, or other improvement security satisfactory to the Village Attorney in an amount deemed sufficient by the Zoning Administrator to cover all costs of improvements, landscaping, maintenance of improvements

and landscaping, and soil erosion and sediment control measures for such period as specified by the Village and engineering and inspection costs to cover the cost of failure or repair of improvements installed on the site.

Section 71.01 The Bond shall conform to the following requirements:

- (1) The Surety company issuing the bond shall be licensed by the Illinois Department of Insurance pursuant to the Illinois Insurance Code.
- (2) The surety bond shall be on the form provided in appendix () herein.
- (3) Any payments made under the bond will be placed in a special fund designated by the Village.
- (4) The Bond must guarantee that the permittee will comply with the issued permit and will meet all permit conditions.
- (5) The surety will become liable on the Bond obligation when, during the term of the Bond, the permittee fails to perform as guaranteed by the Bond. The permittee fails to perform when:
 - (a) He/she abandons the project
 - (b) He/she is adjudicated bankrupt
 - (c) He/she fails to comply with the terms of the storm water management and soil erosion and sediment control permit.
 - (d) He/she fails to perform work as ordered to do so by the Building and Zoning Administrator of said entities or by a court of competent jurisdiction.
- (1) The sum of the bond shall be determined by the permit analyst in accordance with objective criteria based on the types and sizes of development, size of retention basins needed, cost to develop and implement storm water management and soil erosion and sediment control techniques as specified in the permit, the acreage of the project, and any other criteria deemed appropriate by the Village.
- (2) Upon application to the Village and submission of proof of accurate cost estimates for developing and implementing the storm water management and soil erosion and sediment control system in accordance with principles set forth in this ordinance and in accordance with any permit issued, the Village may consider and lower the amount required for bonding upon a showing of special circumstances.
- (3) The bond must be issued for the time it will take to complete the development or redevelopment project and shall be for a term of at least two years and must not be cancelable during the term.
- (4) The Village shall release the surety if, after the surety becomes liable on the bond, the permittee or another person provided immediate compliance with the permit no later than 30 days notice is sent from the Village.
- (5) After required work has been completed, the Village shall refund any unspent money that was paid to the Village.

Section 72 - Review and Approval: Each application for an approved erosion and sediment control plan shall be reviewed and acted upon according to the following procedures:

1. The Village Engineer shall:

1. Review the applicant's soil erosion and sediment control plans and provide written evaluation to the Village regarding the adequacy (effectiveness) to address the provisions of this ordinance. The Village shall retain the services of a professional trained in the implementation of soil erosion and sediment control practices to perform the services outlined in this section. The Village will assess a fee as set forth in Exhibit A, attached hereto, and incorporated herein to be paid by the applicant for performing these services;
2. Attend a pre-construction meeting with the applicant or designated agent to review implementation of erosion and sediment control plans;
3. Conduct onsite inspections during the active construction phases of land development projects to determine whether site development is in compliance with the approval erosion and sediment control plans, and determine adjustments needed to the approved plans. After construction has been completed, determine whether permanent site stabilization has been achieved and identify operation and maintenance needs;
4. Prepare correspondence as needed regarding the effectiveness (or corrective measures needed) or adequacy of soil erosion and sediment control measures, and
5. Consult with land developers, consultants, and contractors concerning the design criteria, installation and maintenance procedures and other information regarding conservation practices recommended under the provisions of this ordinance.

b. **The Village of Dwight shall:**

1. After review of the application and required submissions if it is found to be in conformance with the provisions of this ordinance, approve the erosion and sediment control plan;

2. Approve the erosion and sediment control plan subject to such reasonable conditions as may be necessary to secure substantially the objectives of this ordinance, and issue the approval subject to these conditions; or
3. Disapprove the erosion and sediment control plan, indicating the deficiencies and the procedure for submitting a revised application and/or submission

c. No approval for an erosion and sediment control plan shall be issued for an intended development site unless one or more of the following have been obtained:

1. the development, including but not limited to subdivisions and planned unit development, has been approved by the Village where applicable; or
2. such permit is accompanied by or combined with a valid building permit issued by the Village Building Inspector; or
3. the proposed earth moving is coordinated with any overall development program previously approved by the Village for the area in which the site is situated; and
4. all relevant federal and state permits including, but not limited to: NPDES, 404, 401, NRI's, etc. have been received for the portion of the site subject to soil disturbance, and
5. Applicant is successful in the appeals process.

72.01 - Failure of the Zoning Administrator to act on an original or revised application within thirty (30) days of receipt shall authorize the applicant to proceed in accordance with the plans as filed and in compliance with the regulations contained herein, unless such time is extended by agreement between the Zoning Administrator and the applicant. Pending preparation and approval of a revised plan, development activities shall be allowed to proceed in accordance with conditions established by the Zoning Administrator.

Section 73 - Expiration of Permit: Every development permit shall expire and become null and void if the work authorized by such permit has not been commenced within one hundred and eighty (180) days, or if not completed by a date which shall be specified in the permit; except that the Zoning Administrator may, if the permittee presents satisfactory evidence that unusual

difficulties have prevented work being commenced or completed within the specified time limits, grant a reasonable extension of time if written application is made before the expiration date of the permit. The Zoning Administrator may require modification of the erosion control plan to prevent any increase in erosion or off-site sediment runoff resulting from any extension.

Section 74 – Scope of Appeals:

74.01 - An appeal may be taken to the Board of Appeals by the applicant, any person or agency which received notice of the filing of the application, or by any person, firm, corporation, office, department, board or bureau aggrieved by decision of the Zoning Administrator. Such appeal shall be taken within such time as shall be prescribed by the Board of Appeals by general rule by filing with the Zoning Administrator a notice of appeal specifying the grounds thereof. The Zoning Administrator shall forthwith transmit to the Board of Appeals all of the papers constituting a record upon which the Section appealed from was taken.

74.02 - The factors to be considered on appeal shall include, but need not be limited to, the effects of the proposed development activities on the surface water flow to tributary and downstream lands, any comprehensive watershed management plans, or the use of any retention facilities; possible saturation of fill and unsupported cuts by water, both natural and domestic; runoff surface waters that produce erosion and silting of drainage ways; nature and type of soil or rock which when disturbed by the proposed development activities may create earth movement and produce slopes that cannot be landscaped; and excessive and unnecessary scarring of the natural landscape through grading or removal of vegetation.

74.03 – Findings on Appeal:

74.031 – An appeal shall stay all proceedings in furtherance of the action appealed from unless the Zoning Administrator certifies to the Board of Appeals, after the notice of the appeal has been filed with him, that by reason of facts stated in the certificate a stay would, in his opinion, cause imminent peril to life or property.

74.032 – The Board of Appeals shall select a reasonable time and place for the hearing of the appeal, give due notice thereof to the parties, and shall render a written decision on the appeal without unreasonable delay. The Board of Appeals may affirm or may, upon the concurring vote of four (4) members, reverse wholly or in part or modify the order, requirement, decision, or determination that, in its opinion, ought to be done. To that end, the Board of Appeals shall have all the powers of the officer from whom the appeal is taken. The Zoning Administrator shall maintain records of all actions of the Board of Appeals relative to appeals.

Section 75 - Retention of Plans: Plans, specifications, and reports for all site developments shall be retained in original form or on microfilm by the Zoning Administrator.

Section 76 – Amendments:

76.01 – The ordinance may be amended, provided that in all amendments adopted under the authority of this Section, due allowance shall be made for existing conditions, the conservation of property values, and the direction of building development to the best advantages of the entire community.

76.02 – Initiations of Amendments: Amendments may be proposed by the Village Board, Planning Commission, Village President, Zoning Administrator or the Livingston County SWCD.

76.03 – Application for Amendment: An application or an amendment shall be filed with the Zoning Administrator in such form and accompanied by such information as required by the Zoning Administrator. Such application shall be forwarded to the Planning Commission with the request to hold a public hearing on said application for amendment.

76.04 – Hearing on Application: The Planning commission shall hold a public hearing on each application for an amendment at such time and place as shall be established by the Planning Commission. The hearing shall be conducted and a record of such proceedings shall be preserved in such manner, as the Planning Commission shall, by rule, prescribe from time to time.

76.05 – Notice of Hearing: Notice of time and place of such hearing shall be published at least once in one or more newspapers or general circulation in the Village of Dwight not less than fifteen (15) nor more than thirty (30) days before such hearing. Supplemental or additional notices may be published or distributed as the Planning Commission may, by rule, prescribe from time to time.

76.06 – Findings of Fact and Recommendation of the Planning Commission:

76.061 – Within forty-five (45) days after the close of the hearing on a proposed amendment, the Planning Commission shall make written findings of fact and shall submit same together with its recommendations to the Village Board.

76.062 – The Planning Commission shall not recommend the adoption of a proposed amendment unless it finds that the adoption of such amendment is in the public interest.

76.07 – Action by Village Board:

76.071 – The Village Board shall not act upon a proposed amendment to this Ordinance until it shall have received a written report and recommendation from the Planning Commission on the proposed amendment.

76.072 – The Village Board may grant or deny an application for an amendment.

76.073 – The Village Board may request specific changes to a proposed amendment to this Ordinance once it has received a written report and recommendation from the Planning Commission on the proposed amendment. However, before the proposed amendment with the Village Board's specific changes, can be adopted by the Village Board; the proposed amendment with the specific changes must be forwarded to the Planning Commission for another Public Hearing, Findings of Facts, and written recommendation.

76.074 – A proposed amendment or a proposed amendment with specific changes that doesn't receive a written recommendation from the Planning Commission, shall not be adopted except by a favorable vote of two-thirds (2/3) of the Village Trustees then holding office.

76.08 – Effect of Denial of Amendment: No application for an amendment that has been denied wholly or in part by the Village Board shall be resubmitted for a period of one (1) year from the date of said denial except on the grounds of new evidence or proof of change of conditions found to be valid by the Planning Commission.

Article VIII - Enforcement:

Section 80 - Stop-Work Order; Revocation of Permit: In the event any person holding a development permit pursuant to this ordinance violates the terms of the permit, or carries on-site development in such a manner as to materially adversely affect the health, welfare, environment, or safety of persons residing or working in the neighborhood of the development site or so as to be materially detrimental to the public welfare or injurious to property or improvements in the neighborhood, the Zoning Administrator shall suspend or revoke the development permit.

80.01 - Suspension of a permit shall be by a written stop-work order issued by the Zoning Administrator and delivered to the permittee or his agent or the person performing the work. The stop-work order shall be effective immediately, shall state the specific violations cited, and shall state the conditions under which work may be resumed. A stop-work order shall remain in effect until appealed by the permittee to the Board of Appeals at which time the conditions of Article VII, Section 74 can be met.

80.02 - No development permit shall be revoked until a hearing is held by the Board of Appeals. Written notice of such hearing shall be served on the permittee, either personally or by certified mail return receipt requested, and shall state:

- a. The reasons for revocation, in clear and concise language; and
- b. The time, date and place where such hearing will be held.

Such notice shall be served on the permittee at least five (5) days prior to the date set for the hearing. At such hearing, the permittee shall be given an opportunity to be heard and may call witnesses and present evidence on his behalf. At the conclusion of the hearing the Board of Appeals shall determine whether the permit shall be revoked.

Section 81 – Fees: The fee for variances and appeals are as set forth in Exhibit A.

Section 82 - Violations and Penalties: No person shall construct, enlarge, alter, repair or maintain any grading, excavation or fill, or cause the same to be done, contrary to or in violation of any terms of this ordinance. Any person violating any of the provisions of this ordinance shall be deemed guilty of a misdemeanor, and each day during which any violation of any of the provisions of this ordinance is committed, continued, or permitted shall constitute a separate offense. Upon conviction of any such violation, such person, partnership, or corporation shall be punished by a fine of not less than Seventy Five dollar (\$75.00), and nor more than Seven Hundred Fifty dollars (\$750.00) for each offense. In addition to any other penalty authorized by this section, any person, partnership, or corporation convicted of violating any of the provisions of this ordinance shall be required to restore

the site to the condition existing prior to commission of the violation, or to bear the expense of such restoration.

Section 83 – Repealer: All ordinances and resolutions or any part thereof in conflict with all or any part of this Ordinance are hereby repealed in so far as they do conflict.

Section 84 – Severability: That if any section, subdivision, or sentence of this ordinance shall for any reason be held invalid or unconstitutional, such decision shall not affect the validity of the remaining portion of this ordinance.

Article IX - Effective Date

This ordinance shall be in full force and effect from and after its passage and approval and publication, as required by law.

Passed by Village Board of the Village of Dwight, Illinois, this ____ day _____ of , 2001.

Section 200.0 Purpose

This Ordinance is enacted pursuant to the police powers granted to this Village by Illinois Revised Statutes, Chapter 24, Sections 1-2-1, 11-12-12m, 11-30-8 and 11-31-2. The purpose of this Ordinance is to maintain this Village's eligibility in the National Flood Insurance Program; to minimize potential losses due to periodic flooding including loss of life, loss of property, health and safety hazards, disruption of commerce and governmental services, extraordinary public expenditures for flood protection and relief, and impairment of the tax base, all of which adversely affect the public health, safety and general welfare; and to preserve and enhance the quality of surface waters, conserve economic and natural

values and provide for the wise utilization of water and related land resources. This Ordinance is adopted in order to accomplish the following specific purposes:

- 200.1 To meet the requirements of Chapter 19, paragraph 65(g) of the Illinois Revised Statutes, An Act in Relation to the Regulation of the Rivers, Lakes and Streams of the State of Illinois, “approved June 10, 1911, as amended.
- 200.2 To assure that new development does not increase the flood or drainage hazards to others, or creating unstable conditions susceptible to erosion;
- 200.3 To protect new buildings and major improvements to buildings from flood damage;
- 200.4 To protect new buildings and major improvements to buildings from flood damage;
- 200.5 To lessen the burden on the taxpayer for flood control projects, repairs to flood-damaged public facilities and utilities, and flood rescue and relief operations; and
- 200.6 To make federally subsidized flood insurance available for property in the Village by fulfilling the requirements of the National Flood Insurance Program.
- 200.7 To comply with the rules and regulations of the National Flood Insurance Program codified as 44 CFR 59-79, as amended.
- 200.8 To protect, conserve, and promote the orderly development of land and water resources:
- 200.9 To preserve the natural hydrologic functions of watercourses and flood plains and to protect water quality and aquatic habitats;
- 200.10 To preserve the natural characteristics of stream corridors in order to moderate flood and storm water impacts, improve water quality, reduce soil erosion, protect aquatic and riparian habitat, provide recreational opportunities, provide aesthetic benefits and enhance community and economic development.

Section 300.0 Definitions

For the purposes of this Ordinance, the following definitions are adopted:

- 300.1 **ACT:** An act in relation to the regulation of the rivers, lakes and streams of the State of Illinois,” Ill. Rev. Stat. 1987, ch. 19, par. 52 et seq.
- 300.2 **APPLICANT:** Any person, firm, corporation or agency which submits an application.
- 300.3 **APPROPRIATE USE:** Only uses of the regulatory floodway that are permissible and will be considered for permit issuance. The only uses that will be allowed are as specified in Section 802.0.
- 300.4 **BASE FLOOD:** The flood having a one-percent probability of being equaled or exceeded in any given year. The base flood is also known as the 100-year frequency flood event. Application of the base flood elevation at any location is as defined in Section 600 of this ordinance.
- 300.5 **BUILDING:** A structure that is principally above ground and is enclosed by walls and a roof. The term includes a gas or liquid storage tank, a manufactured home, mobile home or a prefabricated building. This term also includes recreational vehicles and travel trailers to be installed on a site for more than 180 days.
- 300.6 **CHANNEL:** Any river, stream, creek, brook, branch, natural or artificial depression, ponded area, flowage, slough, ditch, conduit, culvert, gully, ravine, wash, or natural or man-made drainageway, which has a definite bed and banks or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.
- 300.7 **CHANNEL MODIFICATION:** Alteration of a channel by changing the physical dimensions or materials of its bed or banks. Channel modification includes damming, rip-rapping (or other armoring), widening, deepening, straightening, relocating, lining and significant removal of bottom or woody vegetation. Channel modification does not include the clearing of dead or dying vegetation, debris, or trash from the channel. Channelization is a severe form of channel modification involving a significant change in the channel cross-section and typically involving relocation of the existing channel (e.g. straightening).
- 300.8 **COMPENSATORY STORAGE:** An artificially excavated, hydraulically equivalent volume of storage within the SFHA used to balance the loss of natural flood storage capacity when artificial fill or structures are placed within the flood plain. The uncompensated loss of natural flood plain storage can increase off-site floodwater elevations and flows.

- 300.9 **CONDITIONAL APPROVAL OF A REGULATOR FLOODWAY MAP CHANGE:** Preconstruction approval by DWR and the Federal Emergency Management Agency of a proposed change to the floodway map. This preconstruction approval, pursuant to this Part, gives assurances to the property owner that once an Appropriate Use is constructed according to permitted plans, the floodway map can be changed, as previously agreed, upon review and acceptance of as-built plans.
- 300.10 **CONDITIONAL LETTER OF MAP REVISION (CLOMR):** A letter which indicates that the Federal Emergency Management Agency will revise base flood elevations, flood insurance rate zones, flood boundaries or floodway as shown on an effective Flood Hazard Boundary Map or Flood Insurance Rate Map, once the as-built plans are submitted and approved.
- 300.11 **CONTROL STRUCTURE:** A structure designed to control the rate of flow that passes through the structure, given a specific upstream and downstream water surface elevation.
- 300.12 **DAM:** All obstructions, wall embankments or barriers, together with their abutments and appurtenant works, if any, constructed for the purpose of storing or diverting water or creating a pool. Underground water storage tanks are not included.
- 300.13 **DEVELOPMENT:** Any man-made change to real estate, including:
- (A) Construction, reconstruction, repair, or placement of a building or any addition to a building.
 - (B) Installing a manufactured home on a site, preparing a site for a manufactured home, or installing a travel trailer on a site for more than 180 days.
 - (C) Drilling, mining, installing utilities, construction of roads, bridges, or similar projects.
 - (D) Demolition of a structure or redevelopment of a site.
 - (E) Clearing of land as an adjunct of construction.
 - (F) Construction or erection of levees, walls, fences, dams, or culverts; channel modification; filling, dredging, grading, excavating, paving, or other non-agricultural alterations of the ground surface; storage of materials; deposit of solid or liquid waste;

(G) Any other activity of man that might change the direction, height, or velocity of flood or surface water, including extensive vegetation removal; Development does not include maintenance of existing buildings and facilities such as re-roofing or resurfacing of roads when there is no increase in elevation, or gardening, plowing, and similar agricultural practices that do not involve filling, grading, or construction of levees.

300.14 DWR: Illinois Department of Transportation, Division of Water Resources.

300.15 ELEVATION CERTIFICATES: A form published by the Federal Emergency Management Agency that is used to certify the elevation to which a building has been elevated.

300.16 EROSION: The general process whereby soils are moved by flowing water or wave action

300.17 EXEMPT ORGANIZATIONS: Organizations which are exempt from this ordinance per the Ill. Rev. Stat. including state, federal or local units of government.

300.18 FEMA: Federal Emergency Management Agency and its regulations at 44 CFR 59-79 effective as October 1, 1988. This incorporation does not include any later editions or amendments.

300.19 FLOOD: A general and temporary condition of partial or complete inundation of normally dry land areas from overflow of inland or tidal waves, or the unusual and rapid accumulation or runoff of surface waters from any source.

300.20 FLOOD FREQUENCY: A period of years, based on a statistical analysis, during which a flood of a stated magnitude may be expected to be equaled or exceeded.

300.21 FLOOD FRINGE: That portion of the flood plain outside of the regulatory floodway.

300.22 FLOOD INSURANCE RATE MAPS (FIRM): A map prepared by the Federal Emergency Management Agency that depicts the special flood hazard area (SFHA) within a community. This map includes insurance rate zones and flood plains and may or may not depict floodways.

- 300.23 FLOOD PLAIN: That land typically adjacent to a body of water with ground surface elevations at or below the base flood or the 100-year frequency flood elevation. Flood plains may also include detached Special Flood Hazard Areas, ponding areas, etc. The flood plain is also known as the Special Flood Hazard Area (SFHA). The flood plains are those lands within the jurisdiction of the Village of Plainfield that are subject to inundation by the base flood of 100-year frequency flood. The SFHA's of the Village of Plainfield are generally identified as such on the Flood Insurance Rate Map of the Village of Plainfield prepared by the Federal Emergency Management Agency (or the U.S. Department of Housing and Urban Development) and Dated November 17, 1981. The SFHA's of those parts of unincorporated Will County that are within the extraterritorial jurisdiction of the Village or that may be annexed into the Village are generally identified as such on the Flood Insurance Rate Map prepared for Will County by the Federal Emergency Management Agency (or the U.S. Department of Housing and Urban Development) and dated April 15, 1982.
- 300.24 FLOODPROOFING: Any combination of structural and non-structural additions, changes or adjustments to structures which reduce or eliminate flood damage to real estate or improved real property, water and sanitary facilities, structures and their contents.
- 300.25 FLOODPROOFING CERTIFICATE: A form published by the Federal Emergency Management Agency that is used to certify that a building has been designed and constructed to be structurally dry floodproofed to the flood protection elevation.
- 300.26 FLOOD PROTECTION ELEVATION (FPE): The elevation of the base flood or 100-year frequency flood plus two feet of freeboard at any given location in the SFHA.
- 300.27 FREEBOARD: An increment of elevation added to the base flood elevation to provide a factor of safety for uncertainties in calculations, unknown localized conditions, wave actions and unpredictable effects such as those caused by ice or debris jams.
- 300.28 HYDROLOGIC AND HYDRAULIC CALCULATIONS: Engineering analysis which determine expected flood flows and flood elevations based on land characteristics and rainfall events.
- 300.29 LETTER OF MAP AMENDMENT (LOMA): Official determination by FEMA that a specific structure is not in a 100-year flood zone: amends the effective Flood Hazard Boundary Map or FIRM.

- 300.30 LETTER OF MAP REVISION (LOMR): Letter that revises base flood or 100-year frequency flood elevations, flood insurance rate zones, flood boundaries or floodways as shown on an effective FHBM or FIRM.
- 300.31 MANUFACTURED HOME: A structure, transportable in one or more sections, which is built on a permanent chassis and is designated for use with or without a permanent foundation when connected to the required utilities. The term manufactured homes also includes park trailers, travel trailers and other similar vehicles placed on site for more that 180 consecutive days.
- 300.32 MANUFACTURED HOME PARK OR SUBDIVISION: A parcel (or contiguous parcels) of land divided into two or more manufactured home lots for rent or sale.
- 300.33 MITIGATION: Mitigation includes those measures necessary to minimize the negative effects which flood plain development activities might have on the public health, safety and welfare. Examples of mitigation include compensatory storage, soil erosion and sedimentation control, and channel restoration.
- 300.34 NGVD: National Geodetic Vertical Datum of 1929. Reference surface set by the National geodetic Survey deduced from a continental adjustment of all existing adjustments in 1929.
- 300.35 NATURAL: When used in reference to channels means those channels formed by the existing surface topography of the earth prior to changes made by man. A natural stream tends to follow a meandering path; its flood plain is not constrained by levees; the area near the bank has not been cleared, mowed or cultivate; the stream flows over soil and geologic materials typical of the area with no substantial alteration of the course or cross-section of the stream caused by filling or excavating. A modified channel may regain some natural characteristics over time as the channel meanders and vegetation is re-established. Similarly, a modified channel may be restored to more natural conditions by man through re-grading and re-vegetation.
- 300.36 ORDINARY HIGH WATER MARK (OHWM): The point on the bank or shore up to which the presence and action of surface water is so continuous so as to leave a distinctive mark such as by erosion, destruction or prevention of terrestrial vegetation, predominance of aquatic vegetation or other easily recognized characteristics.
- 300.37 PUBLIC FLOOD CONTROL PROJECT: A flood control project which

will be operated and maintained by a public agency to reduce flood damages to existing buildings and structures which includes a hydrologic and hydraulic study of the existing and proposed conditions of the watershed. Nothing in this definition shall preclude the design, engineering, construction or financing, in whole or in part, of a flood control project by persons or parties who are not public agencies.

300.38 PUBLICLY NAVIGABLE WATERS: All streams and lakes capable of being navigated by watercraft.

300.39 REGISTERED LAND SURVEYOR: A land surveyor registered in the State of Illinois, under the Illinois Land Surveyors Act (Ill. Rev. Stat. 1987, ch. 111, pars. 3201-3234).

300.40 REGISTERED PROFESSIONAL ENGINEER: An engineer registered in the State of Illinois, under the Illinois Professional Engineering Act (Ill. Rev. Stat. 1987, ch. 111, pars. 5101-5137).

300.41 REGULATORY FLOODWAY: The channel, including on-stream lakes, and that portion of the flood plain adjacent to a stream or watercourse as designated by DWR, which is needed to store and convey the existing and anticipated future 100-year frequency flood discharge with no more than a 0.1 foot increase in stage due to the loss of flood conveyance or storage, and no more than a 10% increase in velocities. The regulatory floodways are designated for the DuPage River, Lily Cache Creek, Springhole creek, East Norman Drain and West Norman Drain, on the Flood Boundary and Floodway Map prepared by FEMA (or Department of Housing and Urban Development) and dated May 17, 1982. The regulatory floodways for those parts of unincorporated Will County that are within the extraterritorial jurisdiction of the Village that may be annexed into the Village are designated for the DuPage River, Lily Cache Creek, Springhold Creek, East Norman Drain and West Norman Drain on the Flood Boundary and Floodway map prepared by FEMA (or Department of Housing and Urban Development) and dated April 51, 1982. To locate the regulatory floodway boundary on any site, the regulatory floodway boundary should be scaled off the regulatory floodway boundary should be scaled off the regulatory floodway map and located on a site plan, using reference marks common to both maps. Where interpretation is needed to determine the exact location of the regulatory floodway boundary, the Division should be contacted for the interpretation.

300.42 REPAIR, REMODELING OR MAINTENANCE: Development activities which do not result in any increases in the outside dimension of a building or any changes to the dimensions of a structure.

- 300.43 **RETENTION/DETENTION FACILITY:** A retention facility stores stormwater runoff without a gravity release. A detention facility provides for storage of stormwater runoff and controlled release of this runoff during and after a flood or storm.
- 300.44 **RIVERINE SFHA:** Any SFHA subject to flooding from a river, creek, intermittent stream, ditch, on stream lake system or any other identified channel. This term does not include areas subject to flooding from lakes, ponding areas, areas of sheet flow, or other areas not subject to overbank flooding.
- 300.45 **RUNOFF:** The water derived from melting snow or rain falling on the land surface, flowing over the surface of the ground or collected in channels or conduits.
- 300.46 **SEDIMENTATION:** The processes that deposit soils, debris, and other materials either on other ground surfaces or in bodies of water or watercourses.
- 300.47 **SPECIAL FLOOD HAZARD AREA (SFHA):** Any base flood area subject to flooding from a river, creek, intermittent stream, ditch, or any other identified channel or ponding and shown on a Flood Hazard boundary Map or Flood Insurance Rate Map as Zone A, A0, A1-30 AE, A99, AH, V0, V30, VE, V, M, or E.
- 300.48 **STRUCTURE:** The results of a man-made change to the land constructed on or below the ground, including the construction, reconstruction or placement of a building or any addition to a building; installing a manufactured home on a site; preparing a site for a manufactured home or installing a travel trailer on a site for more than 180 days.
- 300.49 **SUBSTANTIAL IMPROVEMENT:** Any repair, reconstruction or improvement of a structure, the cost of which equals or exceeds 50 percent of the market value of the structure either, (a) before the improvement or repair is started, or (b) if the structure has been damaged, and is being restored, before the damage occurred. For the purposes of this definition “substantial Improvement” is considered to occur when the first alteration of any wall, ceiling, floor, or other structural part of the building commences, whether or not that alteration affects the external dimensions of the structure. The term does not, however, include either (1) any project for improvement of a structure to comply with existing state or local health, sanitary, or safety code specifications which are solely

necessary to assure safe living conditions or (2) any alteration of a structure listed on the National Register of Historic Places or a State Inventory of Historic Places.

300.50 TRANSITION SECTION: Reaches of the stream or floodway where water flows from a narrow cross-section to a wide cross-section or vice versa.

Section 400.0 How to Use This Ordinance

The Village Administrator shall be responsible for fulfilling all of the duties listed in Section 500.0.

To fulfill those duties, the Village Administrator first should use the criteria listed in Section 600.0, base Flood Elevations, to determine whether the development site is located within a flood plain. Once it has been determined that a site is located within a flood plain, the village Administrator must determine whether the development site is with in a flood fringe, a regulatory floodway, or within a SFHA or flood plain on which no floodway has been identified. If the site is within a flood fringe, the village Administrator shall require that the minimum requirements of Section 799.0 be met. If the site is within a floodway, the Village Administrator shall require that the minimum requirements of Section 800.0 be met. If the site is located within a SFHA or flood plain for which no detailed study has been completed and approved, the village Administrator shall require that the minimum requirements of Section 900.0 be met.

In addition, the general requirements of Section 10000.0 shall be met for all developments meeting the requirements of Section 700.0, 800.0, or 900.0. The Village Administrator shall assure that all subdivision proposals shall meet the requirements of Section 1100.0.

If a variance is to be granted for a proposal, the Village Administrator shall review the requirements of Section 1200.0 to make sure they are met. In addition, the Village Administrator shall complete all notification requirements.

In order to assure that property owners obtain permits as required in this Ordinance, the Village Administrator may take any and all actions as outlined in Section 1400.0

Section 500.0 Duties of the Enforcement Official(s)

The Village Administrator shall be responsible for the general administration and enforcement of this Ordinance which shall include the following:

501.0 Determining the Flood Plain Designation. Check all new development

sites to determine whether they are in a Special Flood Hazard Area (SFHA). If they are in a SFHA, determine whether they are in a floodway, flood fringe or in a flood plain on which a detailed study has not been conducted which drains more than one (1) square mile.

- 502.0 Professional Engineer Review. If the development site is within a floodway or in a flood plain on which a detailed study has not been conducted which drains more than (1) square mile then the permit shall be referred to a registered professional engineer (P.E.) Under the employ or contract of the Village for review to ensure that the development meets the requirements of Section 800.0. In the case of an Appropriate Use, the P.E. shall state in writing that the development meets the requirements of Section 800.0.
- 503.0 Dam Safety Requirements. Ensure that a DWR Dam Safety permit has been issued or a letter indicating no Dam Safety permit is required. If the proposed development activity includes construction of a dam as defined in Section 300.12. Regulated dams may include weirs, restrictive culverts or impoundment structures.
- 504.0 Other permit Requirements. Ensure that any and all required federal, state and local permits are received prior to the issuance of a flood plain development permit.
- 505.0 Plan Review and Permit Issuance. Ensure that all development activities within the SFHAs of the jurisdiction of the Village meet the requirements of this Ordinance and issue a flood plain development permit in accordance with the provisions of this Ordinance and other regulations of this community when the development meets the conditions of this Ordinance.
- 506.0 Inspection Review. Inspect all development projects before, during and after construction to assure proper elevation of the structure and to ensure they comply with the provisions of this Ordinance;
- 507.0 Elevation and Floodproofing Certificates. Maintain in the permit files an Elevation Certificate certifying the elevation of the lowest floor (including basement) or a residential or non-residential building or the elevation to which a non-residential building has been floodproofed, using a Floodproofing Certificate, for all buildings subject to section 1000.0 of this Ordinance for public inspection and provide copies of same;
- 508.0 Records for Public Inspection. Maintain for public inspection and furnish upon request base flood data, SFHA and regulatory floodway maps, copies

of federal or state permit documents, variance documentation, Conditional Letter of Map Revision, Letter of Map Revision, Letter of Map Amendment and “as built” elevation and floodproofing or elevation and floodproofing certificates for all buildings constructed subject to this Ordinance.

509.0 State Permits. Ensure that construction authorization has been granted by the Illinois Division of Water Resources, for all development projects subject to Sections 800.0 and 900.0 of this Ordinance, unless enforcement responsibility has been delegated to the Village Administrator. Upon acceptance of this Ordinance by DWR and FEMA, responsibility is hereby delegated to the Village Administrator as per 92 Ill. Adm. Code 708 for construction in the regulatory floodway and flood plain when floodways have not been defined in Sections 800.0 and 900.0 of this Ordinance. However, the following review approvals are not delegated to the Village Administrator and shall require review or permits from DWR:

- a. Organizations which are exempt from this Ordinance, as per the Illinois Revised Statutes;
- b. Department of Transportation projects, dams or impoundment structures as defined in Section 300.12 and all other state, federal or local unit of government projects, including projects of the Village and County, except for those projects meeting the requirements of Sec. 802.5;
- c. An engineer’s determination that an existing bridge or culvert crossing is not a source of flood damage and the analysis indicating the proposed flood profile, per Section 802.1(e);
- d. An engineer’s analysis of the flood profile to Section 802.1(d);
- e. Alternative transition sections and hydraulically equivalent compensatory storage as indicated in section 802.1(a, b, and h);
- f. Permit issuance of structures within or over publicly navigable rivers, lakes and streams;
- g. Any changes in the base Flood Elevation or floodway locations; and,
- h. Base Flood Elevation determinations where none now exist.

510.0 Cooperation with other agencies. Cooperate with state and federal flood

plain management agencies to improve base flood or 100-year frequency flood and floodway data and to improve the administration of this Ordinance. Submit data to DWR and the Federal Emergency Management Agency for proposed revisions of a regulatory map. Submit reports as required for the National Flood Insurance Program. Notify the Federal Emergency Management Agency of any proposed amendments to this Ordinance.

- 511.0 Promulgate Regulations. Promulgate rules and regulations as necessary to administer and enforce the provisions of this Ordinance, subject however to the review and approval of DWR and FEMA for any Ordinance changes.

Section 600.0 Base Flood Elevation

This Ordinance's protection standard is based on the Flood Insurance Study for the Village. If a base flood elevation or 100-year frequency flood elevation is not available for a particular site, then the protection standard shall be according to the best existing data available in the Illinois State Water Survey's Flood Plain Information Repository. When a party disagrees with the best available data, he/she may finance the detailed engineering study needed to replace existing data with better data and submit it to DWR and FEMA.

- 601.0 The base flood or 100-year frequency flood elevation for the SFHAs of DuPage River and Lily Cache Creek, Springhole Creek, East Norman Drain and West Norman Drain shall be as delineated on the 100-year flood profiles in the Flood Insurance Study of the Village prepared by FEMA (or the Department of Housing and Urban Development) and dated May 17, 1982, and such amendments to such study and maps as may be prepared from time to time.
- 602.0 The base flood or 100-year frequency flood elevation for the SFHAs of those parts of unincorporated Will County that are within the extraterritorial jurisdiction of the Village or that may be annexed into the Village shall be as delineated on the 100-year flood profiles in the Flood Insurance Study of Will County prepared by FEMA (or the Department of Housing and Urban Development) and dated October 15, 1981, and such amendments or revisions to such study and maps as may be prepared from time to time.
- 603.0 The base flood or 100-year frequency flood elevation for each SFHA delineated as an "AH Zone" or "AO Zone" shall be that elevation (or depth) delineated on the Flood Insurance Rate Map of the Village.

604.0 The base flood or 100-year frequency flood elevation each of the remaining SFHAs delineated as an “A Zone” on the Flood Insurance Rate Map of the Village shall be according to the best existing data available in the Illinois State Water Survey Flood Plain Information Repository. When no base flood or 100-year frequency flood elevation for a riverine SFHA shall be determined from a backwater model, such as HEC-II, WSP-2, or a dynamic model such as HIP. The flood flows used in the hydraulic models shall be obtained from a hydrologic model, such as HEC-I, TR-20, or HIP, or by techniques presented in various publications prepared by the United States Geological Survey for estimating peak flood discharges. Flood flows should be based on anticipated future land use conditions in the watershed as determined from adopted local and regional land use plans. Along any watercourses draining more than one (1) square mile, the above analyses shall be submitted to DWR for approval, once approved it must be submitted to the Illinois State Water Survey Floodplain Information Repository for filing. For a non-riverine SFHA, the Base Flood Elevation shall be the historic Flood of Record plus three feet, unless calculated by a detailed engineering study and approved by the Illinois State Water Survey.

Section 700.0

Development in and/or filling of the flood fringe may be permitted if protection is provided against the base flood or 100-year frequency flood by proper elevation, and compensatory storage and other provisions of this Ordinance are met. No use will be permitted which adversely affects the capacity of drainage facilities or systems. Developments located within the flood fringe shall meet the requirements of this section, along with the requirements of Section 1000.0.

701.0 Development Permit. No person, firm, corporation, or governmental body not exempted by state law shall commence any development in the SFHA without first obtaining a development permit from the Village.

701.1 Application for a development permit shall be made on a form provided by the Village. The application shall be accompanied by drawings of the site, drawn to scale, showing property line dimensions and legal description for the property and sealed by a licensed engineer, architect or land surveyor; existing grade elevations in M.S.L., 1929 adj. datum or N.G.V.D. and all changes in grade resulting from excavation or filling; the location and dimensions of all buildings and additions to buildings. For all proposed buildings, the elevation of the lowest floor (including basement) and lowest adjacent grade shall be shown on the submitted plans and the development will be subject to the requirements of Section 1000.0 of this Ordinance.

- 701.2 Upon receipt of a development permit application, the Village Administrator shall compare the elevation of the site to the base flood or 100-year frequency flood elevation. Any development located on land that can be shown to have been higher than the base flood elevation as of the site's first Flood Insurance Rate Map identification is not in the SFHA and, therefore, not subject to the requirements of this Ordinance. The Building Official shall maintain documentation of the existing ground elevation at the development site and certification that this ground elevation existed prior to the date of the site's first Flood Insurance Rate Map identification.
- 701.3 A soil erosion and sedimentation control plan for disturbed areas shall be submitted. This plan shall include a description of the sequence of grading activities and the temporary sediment and erosion control measures to be implemented to mitigate their effects. This plan shall also include a description of final stabilization and re-vegetation measures, and the identification of a responsible party to ensure post-construction maintenance.
- 701.4 The Village Administrator shall be responsible for obtaining from the application, copies of all other local, state and federal permits, approvals or permit-not-required letters that may be required for this type of activity. The Village Administrator shall not issue a permit unless all other local, state and federal permits have been obtained.
- 702.0 Preventing Increased Damages. No development in the flood fringe shall create a threat to public health and safety.
- 702.1 If fill is being used to elevate the site above the base flood or 100-year frequency flood elevation, the applicant shall submit sufficient data and obtain a letter of map revision (LOMR) from FEMA for the purpose of removing the site from the flood plain.
- 702.2 Compensatory Storage. Whenever any portion of a flood plain is authorized for use, the volume of space which will be occupied by the authorized fill or structure below the base flood or 100-year frequency flood elevation shall be compensated for and balanced by a hydraulically equivalent volume of excavation taken from below the base flood or 100-year frequency flood elevation. The excavation volume shall be at least equal to 1.5 times the volume of storage lost due to the fill or structure. In the case of streams and watercourses, such excavation shall be made opposite or adjacent to the areas so filled or occupied. All flood plain storage lost below the existing 10-year flood elevation shall be replaced below the proposed 10-year flood elevation. All flood plain storage lost

above the existing 10-year flood elevation shall be replaced above the proposed 10-year flood elevation. All such excavations shall be constructed to drain freely and openly to the watercourse.

Section 800.0 Occupation and Use of Identified Floodways

This section applies to proposed development, redevelopment, site modification or building modification within a regulatory floodway. The regulatory floodway for the DuPage River, Lily Cache Creek, Springhole Creek, East Norman Drain and West Norman Drain shall be as delineated on the regulatory floodway maps designated by DWR according and reference in Section 300.41. Only those uses and structures will be permitted which meet the criteria in this section. All floodway modifications shall be the minimum necessary to accomplish the purpose of the project. The development shall also meet the requirements of Section 1000.

801.0 Development Permit. No person, firm, corporation or governmental body not exempted by state law shall commence any development in a floodway without first obtaining a development permit from the Village.

801.1 Application for a development permit shall be made on a form provided by the village. The application shall include the following information:

- a. Name and address of applicant;
- b. Site location (including legal description) of the property, drawn to scale, on the regulatory floodway map, indicating whether it is proposed to be in an incorporated or unincorporated area;
- c. Name of stream or body of water affected;
- d. Description of proposed activity;
- e. Statement of purpose of proposed activity;
- f. Anticipated dates of initiation and completion of activity;
- g. Name and mailing address of the owner of the subject property if different from the applicant;
- h. Signature of applicant or the applicant's agent;
- i. If the applicant is a corporation, the president or other authorized officer shall sign the application form;

- j. If the applicant is a partnership, each partner shall sign the application form; and
- k. If the applicant is a land trust, the trust officer shall sign the name of the trustee by him (her) as trust officer. A disclosure affidavit shall be filed with the application, identifying each beneficiary of the trust by name and address and defining the respective interests therein.
- l. Plans of the proposed activity shall be provided which include as a minimum:
 - (i) A vicinity map showing the site of the activity, name of the waterway, boundary lines, names of roads in the vicinity of the site, graphic or numerical scale, and north arrow;
 - (ii) A plan view of the project and engineering study reach showing existing and proposed conditions including principal dimensions of the structure or work, elevations in mean sea level (1929 adjustment) datum or N.G.V.D., adjacent property lines and ownership, drainage and flood control easements, location of any channels and any existing or future access roads, distance between proposed activity and navigation channel (when the proposed construction is near a commercially navigable body of water), regulatory floodway limit, flood plain limit, specifications and dimensions of any proposed channel modifications, location and orientation of cross-sections, north arrow, and a graphic or numerical scale.
 - (iii) Cross-section views of the project and engineering study reach showing existing and proposed conditions including principal dimensions of the work as shown in plan view, existing and proposed elevations, normal water elevation, 10-year frequency flood elevation, 100-year frequency flood elevation, and graphic or numerical scales (horizontal and vertical);
 - (iv) A soil erosion and sedimentation control plan for disturbed areas. This plan shall include a description of the sequence of grading activities and the temporary sediment and erosion control measures to be implemented to mitigate their effects. This plan shall also include a

description of final stabilization and re-vegetation measures, and the identification of a responsible party to ensure post-construction maintenance.

- (v) A copy of the regulatory floodway map, marked to reflect any proposed change in the regulatory floodway location.
- m. Any and all other local, state and federal permits or approval letters that may be required for this type of development.
- n. Engineering calculations and supporting data shall be submitted showing that the proposed work will meet the permit criteria of Section 802.0.
- o. If the regulatory floodway delineation, base flood or 100-year frequency flood elevation will change due to the proposed project, the application will not be considered complete until DWR has indicated conditional approval of the regulatory floodway map change. No structures may be built until a Letter of Map Revision has been approved by FEMA.
- p. The application for a structure shall be accompanied by drawings of the site, drawn to scale showing property line dimensions and existing ground elevations and all changes in grade resulting from any proposed excavation or filling, and flood plain and floodway limits; sealed by a registered professional engineer, licensed architect or registered land surveyor; the location and dimensions of all buildings and additions to buildings; and the elevation of the lowest floor (including basement) of all proposed buildings subject to the requirements of Section 1000.0 of this Ordinance.
- q. If the proposed project involves a channel modification, the applicant shall submit following information:
 - (i) A discussion of the purpose of and need for the proposed work;
 - (ii) A discussion of the feasibility of using alternative locations or methods to accomplish the purpose of the proposed work;
 - (iii) An analysis of the extent and permanence of the impacts the project would have on the physical and biological conditions of the body of water affected;

- (iv) An analysis of the extent and permanence of the impacts each feasible alternative identified in 802.1 (d)(i) of this Section would have on the physical and biological conditions of the body of water affected; and
- (v) An analysis of the impacts of the proposed project, considering cumulative effects on the physical and biological conditions of the body of water affected.

801.2 The Village Administrator shall be responsible for obtaining from the applicant copies of all other local, state, and federal permits and approvals that may be required for this type of activity. The Village Administrator shall not issue the development permit unless all required federal and state permits have been obtained. A Registered Professional Engineer, under the employ or contract of the Village shall review and approve applications reviewed under this Section.

802.0 Preventing Increased Damages and a List of Appropriate Uses. The only development in a floodway which will be allowed are Appropriate Uses, which will not cause a rise in the base flood elevation, and which will not create a damaging or potentially damaging increase in flood heights or velocity or be a threat to public health and safety and welfare or impair the natural hydrologic and hydraulic functions of the floodway or channel, or permanently impair existing water quality or aquatic habitat. Construction impacts shall be minimized by appropriate mitigation methods as called for in this Ordinance. Only those Appropriate Uses listed in 92 Ill. Adm. Code 708 will be allowed. Appropriate uses do not include the construction or placement of any new structures, fill, building additions, buildings on stilts, excavation or channel modifications done to accommodate otherwise non-appropriate uses in the floodway, fencing (including landscaping or planting designed to act as a fence) and storage of materials except as specifically defined above as an Appropriate Use. The approved Appropriate Uses are as follows:

- a. Flood control structures, dikes, dams and other public works or private improvements relating to the control of drainage, flooding, erosion, or water quality or habitat for fish and wildlife.
- b. Structures or facilities relating to the use of, or requiring access to, the water or shoreline, such as pumping and treatment facilities, and facilities and improvements related to recreational boating, commercial shipping and other functionally water depended uses;

- c. Storm and sanitary sewer outfalls;
- d. Underground and overhead utilities;
- e. Recreational facilities such as playing fields and trail systems including any related fencing (at least 50% open when viewed from any one direction) built parallel to the direction of flood flows, and including open air pavilions;
- f. Detached garages, storage sheds, or other non-habitable accessory structures without toilet facilities to existing buildings that will not block flood flows, nor reduce floodway storage;
- g. Bridges, culverts, roadways, sidewalks, railways, runways and taxiways and any modification thereto;
- h. Parking lots and any modifications thereto (where depth of flooding at the 100-year frequency flood event will not exceed 1.0') and aircraft parking aprons built at or below ground elevation;
- i. Regulatory floodway re-grading, without fill, to create a positive non-erosive slope toward a watercourse.
- j. Flood proofing activities to protect previously existing lawful structures including the construction of water tight window wells, elevating structures, or construction of floodwalls around residential, commercial or industrial principal structures where the outside toe of the floodwall shall be no more than ten (10) feet away from the exterior wall of the existing structure, and, which are not considered substantial improvements to the structure.
- k. In the case of damaged or replacement buildings, reconstruction or repairs made to a building that are valued at less than 50% of the market value of the building before it was damaged or replaced, and which do not increase the outside dimensions of the building.
- l. Additions to existing buildings above the BFE that do not increase the building's foot print and are valued at less than 50% of the market value of the building.

802.1 Within the regulatory floodway as identified on the regulatory floodway maps designate by DWR, the construction of an Appropriate Use, will be considered permissible provided that the proposed project meets the

following engineering and mitigation criteria and is so stated in writing with supporting plans, calculations and data by a registered professional engineer and provided that any structure meets the protection requirements of Section 1000.0 of this Ordinance:

a. Preservation of Flood Conveyance, so as Not to Increase Flood Stages Upstream. For appropriate uses other than bridge or culvert crossings, on-stream structures or dams, all effective regulatory floodway conveyance lost due to the project will be replaced for all flood events up to and including the 100-year frequency flood. In calculation effective regulatory floodway conveyance, the following factors shall be taken into consideration:

(i) Regulatory floodway conveyance, $'K' = 1.486/n AR^{2/3}$

Where “n” is Manning’s roughness factor, “A” is the effective area of the cross-section, and “R” is the ratio of the area to the wetted perimeter. (See Open Channel Hydraulics, Ven Te Chow, 1959, McGraw-Hill Book Company, New York)

(ii) The same Manning’s “n” value shall be used for both existing and proposed conditions unless a recorded maintenance agreement with a federal, state or local unit of government can assure the proposed conditions will be maintained or the land cover is changing from a vegetative to a non-vegetative land cover.

(iii) Transition sections shall be provided and used in calculations of effective regulatory floodway conveyance. The following expansion and contraction ratios shall be used unless and applicant’s engineer can prove to DWR through engineering calculations or model tests that more abrupt transitions may be used with the same efficiency:

(a) When water is flowing from a narrow section to a wider section, the water should be assumed to expand no faster than at a rate of one foot horizontal for every four feet of the flooded stream’s length.

(b) When water is flowing from a wide section to a narrow section, the water should be assumed to contract no faster than at a rate of one foot

horizontal for every one foot of the flooded stream's length.

- (c) When expanding or contracting flows in a vertical direction, a minimum of one foot vertical transition for every ten feet of stream length shall be used.
 - (d) Transition sections shall be provided between cross-sections with rapid expansions and contractions and when meeting the regulatory floodway delineation on adjacent properties.
 - (e) All cross-sections used in the calculations shall be located perpendicular to the flood flows.
- b. Preservation of Floodway Storage so as not to Increase Downstream Flooding. Compensatory storage shall be provided for any regulatory floodway storage lost due to the proposed work from the volume of fill or structures placed and the impact of any related flood control projects. Compensatory storage for fill or structures shall be equal to at least 1.5 times the volume of flood plain storage lost. Artificially created storage lost due to a reduction in head loss behind a bridge shall not be required to be replaced. The compensatory regulatory floodway storage shall be placed between the proposed normal water elevation and the proposed 100-year flood elevation. All regulatory floodway storage lost below the existing 10-year flood elevation shall be replaced below the proposed 10-year flood elevation. All regulatory floodway storage lost above the existing 10-year flood elevation shall be replaced above the proposed 10-year flood elevation. All such excavations shall be constructed to drain freely and openly to the watercourse. If the compensatory storage will not be placed at the location of the proposed construction, the applicant's engineer shall demonstrate to DWR through a determination of flood discharges and water surface elevations that the compensatory storage is hydraulically equivalent.
- c. Preservation of Floodway Velocities so as Not to Increase Stream Erosion of Flood Heights. For all Appropriate Uses, except bridges or culverts or on stream structures, the proposed work will not result in an increase in the average channel or regulatory floodway velocities. However in the case of bridges or culverts or on stream structures built for the purpose of backing up water in the stream during normal or flood flows, velocities may be

increased at the structure site if scour, erosion and sedimentation will be avoided by the use of rip-rap or other design measures.

- d. Construction of New Bridges or Culvert Crossings and Roadway Approaches. The proposed structure shall not result in an increase of upstream flood stages greater than 0.1 foot when compared to the existing conditions for all flood events up to and including the 100-year frequency event' or the upstream flood stage increases will be contained within the channel banks (or within existing vertical extensions of the channel banks) such as within the design protection grade of existing levees or flood walls or within recorded flood easements. If the proposed construction will increase upstream flood stages greater than 0.1 feet, the developer must contact

DWR, Dam Safety Section for a Dam Safety permit or waiver.

- (i) The engineering analysis of upstream flood stages must be calculated using the flood study flows, and corresponding flood elevations for tailwater conditions for the flood study specified in Section 600.0 of this Ordinance. Culverts must be analyzed using the U.S. DOT, FHWA Hydraulic Chart for the Selection of Highway Culverts. Bridges must be analyzed using the U.S. DOT/Federal Highway Administration Hydraulics of Bridge Waterways calculation procedures.
- (ii) Lost floodway storage must be compensated for per Section 802.1(b).
- (iii) Velocity increases must be mitigated per Section 802.1(c).
- (iv) If the crossing is proposed over a public water that is used for recreational or commercial navigation, a Department of Transportation permit must be received.
- (v) The hydraulic analysis for the backwater caused by the bridge showing the existing condition and proposed regulatory profile must be submitted to DWR for concurrence that a CLOMR is not required by Section 802.0.
- (vi) All excavations for the construction of the crossing shall

be designated per Section 802.1(h).

- e. Reconstruction or Modification of Existing Bridges, Culverts, and Approach Roads.
 - (i) The bridge or culvert and roadway approach reconstruction or modification shall be constructed with no more than 0.1 foot increase in backwater over the existing flood profile for all flood frequencies up to and including the 100-year event, if the existing structure is not a source of flood damage.
 - (ii) If the existing bridge or culvert and roadway approach is a source of flood damage to buildings or structures in the upstream flood plain, the applicant's engineer shall evaluate the feasibility of redesigning the structure to reduce the existing backwater, taking into consideration the effects of flood stages on upstream and downstream properties.
 - (iii) The determination as to whether or not the existing crossing is a source of flood damage and should be redesigned must be prepared in accordance with the Department of Transportation Rules 92 Ill. Adm. Code 708 (floodway Construction in Northeastern Illinois) and submitted to the Division for review and concurrence before a permit is issued.

- f. On-stream Structures Built for the Purpose of Backing Up Water.

Any increase in upstream flood stages greater than 0.0 foot when compared to the existing conditions, for all flood events up to and including the 200-year frequency event shall be contained within the channel banks (or within existing vertical extensions of the channel banks) such as within the design protection grade of existing levees or flood walls or within recorded flood easements. A permit or letter indicating a permit is not required must be obtained from DWR, Dam safety Section for a Dam Safety permit or waiver for any structure built for the purpose of backing up water in the stream during normal or flood flow. All dams and impoundment structures as defined in Section 300.12 shall meet the permitting requirements of 92 Ill. Adm. Code 702 (construction and Maintenance of Dams). If the proposed activity involves a modification of the channel or floodway to accommodate an impoundment, it shall be demonstrated that:

- (i) The impoundment is determined to be in the public interest by providing flood control, public recreation, or regional stormwater detention;
 - (ii) The impoundment will not prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, such as for spawning;
 - (iii) The impoundment will not cause or contribute to degraded water quality or habitat conditions. Impoundment design should include gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin.
 - (iv) A non-point source control plan has been implemented in the upstream watershed to control the effects of sediment runoff as well as minimize the input of nutrients, oil and grease, metals and other pollutants. If there is more than one municipality in the upstream watershed, the municipality in which the impoundment is constructed should coordinate with upstream municipalities to ensure comprehensive watershed control;
 - (v) The project otherwise complies with the requirements of Section 800.
- g. Flood Proofing of Existing Habitable, Residential and Commercial structures. If construction is required beyond the outside dimensions of the existing building, the outside perimeter of the floodproofing construction shall be placed no further than 10 feet from the outside of the building. Compensation of lost storage and conveyance will not be required for floodproofing activities.
- h. Excavation in the Floodway. When excavation is proposed in the design of bridges and culvert openings, including the modifications to and replacement of existing bridge and culvert structures, or to compensate for lost conveyance for other Appropriate Uses, transition sections shall be provided for the excavation . The following expansion and contraction ratios shall be used unless an applicant engineer can prove to DWR through engineering calculations or model tests that more abrupt transitions may be used with the same efficiency:
- (i) When water is flowing from a narrow section to a wider section, the water should be assumed to expand no faster

than at a rate of one foot horizontal for every four feet of the flooded stream's length;

- (ii) When water is flowing from a wide section to a narrow section, the water should be assumed to contract no faster than at a rate of one foot horizontal for every one foot of the flooded stream's length; and
 - (iii) When expanding or contracting flows in a vertical direction, a minimum of one foot vertical transition for every ten feet of stream length shall be used.
 - (iv) Erosion/scour protection shall be provided inland upstream and downstream of the transitions sections.
- i. If the proposed activity involves a channel modification, it shall be demonstrated that:
- (i) There are no practicable alternatives to the activity which would accomplish its purpose with less impact to the natural conditions of the body of water affected. Possible alternatives include levees, bank stabilization, flood proofing of existing structures, removal of structures from the flood plain, clearing the channel, high flow channel, or the establishment of a stream side buffer strip or green belt. Channel modification is acceptable if the purpose is to restore natural conditions and improve water quality and fish and wildlife habitat;
 - (ii) Water quality, habitat, and other natural functions would be significantly improved by the modification and no significant habitat area may be destroyed, or the impacts are offset by the replacement of an equivalent degree of natural resource values;
 - (iii) The activity has been planned and designed and will be constructed in a way which will minimize its adverse impacts on the natural conditions of the body of water affected, consistent with the following criteria:
 - (a) The physical characteristics of the modified channel shall match as closely as possible those of the existing channel in length, cross-section, slope and sinuosity. If the existing channel has been

previously modified, restoration of more natural physical conditions should be incorporated into channel modification design, where practical.

- (b) Hydraulically effective transitions shall be provided at both the upstream and down stream ends of the project, designed such that they will prevent erosion.
- (c) One-sided construction of a channel shall be used when feasible. Removal of streamside (riparian) vegetation should be limited to one side of the channel, where possible to preserve the shading and stabilization effects of the vegetation.
- (d) Clearing of vegetation shall be limited to that which is essential for construction of the channel.
- (e) Channel banks shall be constructed with a side slope no steeper than 3:1 horizontal to vertical, wherever practicable. Natural vegetation and gradual side slopes are the preferred methods for bank stabilization. Where high velocities or sharp bends necessitate the use of alternative stabilization measures, natural rock or rip-rap are preferred materials. Artificial materials such as concrete, gabions, or construction rubble should be avoided unless there are no practicable alternatives.
- (f) All disturbed areas associated with the modification shall be seeded or otherwise stabilized as soon as possible upon completion of construction. Erosion blanket or an equivalent material shall be required to stabilize disturbed channel banks prior to establishment of the vegetative cover.
- (g) If the existing channel contains considerable bottom diversity such as deep pools, riffles, and other similar features, such features shall be provided in the new channel. Spawning and nesting areas and flow characteristics compatible with fish habitat shall also be established, where

appropriate.

- (h) A sediment basin shall be installed at the downstream end of the modification to reduce sedimentation and degradation of downstream water quality.
 - (i) New or relocated channels should be built in the dry and all items of construction, including vegetation, should be completed prior to diversion of water into the new channel.
 - (j) There shall be no increases in stage or velocity as the channel enters or leaves the project site for any frequency flood unless necessitated by a public flood control project or unless such an increase is justified as part of a habitat improvement or erosion control project.
 - (k) Unless the modification is for a public flood control project, there shall be no reduction in the volume of floodwater storage outside the floodway as a result of the modification; and
- (iv) The project otherwise complies with the requirements of Section 800.
- j. Seeding and Stabilization Plan. For all activities located in a floodway, a seeding and stabilization plan shall be submitted by the applicant.
- k. Soil Erosion and sedimentation Measures. For all activities in the floodway, including grading, filling, and excavation, in which there is potential for erosion of exposed soil, soil erosion and sedimentation control measures shall be employed consistent with the following criteria:
- (i) The construction area shall be minimized to preserve the maximum vegetation possible. Construction shall be scheduled to minimize the time soil is exposed and unprotected. In no case shall the existing natural vegetation be destroyed, removed, or disturbed more than 15 days prior to the initiation of improvements.

- (ii) Temporary and/or permanent soil stabilization shall be applied to denuded areas as soon as possible. As a minimum, soil stabilization shall be provided within 15 days after final grade is reached on any portion of the site, and within 15 days to denuded areas which may not be at final grade but will remain undisturbed for longer than 60 days.
 - (iii) Sedimentation control measures shall be installed before any significant grading or filling is initiated on the site to prevent the movement of eroded sediments off site or into the channel. Potential sediment control devices include filter fences, straw bale fences, check dams, diversion ditches, and sediment basins.
 - (iv) A vegetated buffer strip of at least 25 feet in width shall be preserved and/or re-established, where possible, along existing channels (See 802.1 (p)). Construction vehicle use of channels shall be minimized. Temporary stream crossings shall be constructed, wherever necessary, to minimize erosion. Necessary construction in or along channels shall be restabilized immediately.
 - (v) Soil erosion and sedimentation control measures shall be designed and implemented consistent with “Procedures and Standards for Urban Soil Erosion and Sedimentation Control in Illinois” (1988) also known as the “Green Book” and “Standards and Specifications for Soil Erosion and Sediment Control” (IEPA, 1987).
- l. Public Flood Control Projects. For public flood control projects, the permitting requirements of this section will be considered met if the applicant can demonstrate to DWR through hydraulic and hydrologic calculations that the proposed project will not singularly or cumulatively result in increased flood heights outside the project right-of-way or easements for all flood events up to an including the 100-year frequency event.
- m. General Criteria for Analysis of Flood Elevations.
- (i) The flood profiles, flows and floodway data in the regulatory floodway study, referenced in Section 600.0, must be used for analysis of the base conditions. If the study data appears to be in error or conditions have

changed, DWR shall be contacted for approval and concurrence on the appropriate base conditions data to use.

- (ii) If the 100-year regulatory floodway elevation at the site of the proposed construction is affected by backwater from a downstream receiving stream with a larger drainage area, the proposed construction shall be shown to meet the requirements of this section for the 100-year frequency flood elevations of the regulatory floodway conditions and conditions with the receiving stream at normal water elevations.
 - (iii) If the applicant learns from DWR, local governments, or a private owner that a downstream restrictive bridge or culvert is scheduled to be removed, reconstructed, modified, or a regional flood control project is scheduled to be built, removed, constructed or modified within the next five years, the proposed construction shall be analyzed and shown to meet the requirements of this section for both the existing conditions and the expected flood profile conditions when the bridge, culvert or flood control project is built.
- n. Conditional Letter of Map Revision. If the Appropriate Use would result in a change in the regulatory floodway location or the 100-year frequency flood elevation, the applicant shall submit to DWR and to FEMA all the information, calculations and documents necessary to be issued a conditional regulatory floodway map revision and receive from DWR a conditional approval of the regulatory floodway change before a permit is issued. However, the final regulatory floodway map will not be changed by DWR until as-built plans or record drawings are submitted and accepted by FEMA and DWR. In the case of non-government projects, the municipality in incorporated areas and the county in unincorporated areas shall concur with the proposed conditional regulatory floodway map revision before DWR approval can be given. No filling, grading, dredging or excavating shall take place until a conditional approval is issued. No further development activities shall take place until a final Letter of Map Revision (LOMR) is issued by FEMA and DWR.
- o. Professional Engineer's Supervision. All engineering analyses shall be performed by or under the supervision of a registered

professional engineer.

- p. For all activities in the floodway involving construction within 25 feet of the channel, the following criteria shall be met:
 - (i) A natural vegetation buffer strip shall be preserved within at least 25 feet of the ordinary high water mark of the channel.
 - (ii) Where it is impossible to protect this buffer strip during the construction of an Appropriate Use, a vegetated buffer strip shall be established upon completion of construction.
 - (iii) The use of native riparian vegetation is preferred in the buffer strip. Access through this buffer strip shall be provided, when necessary, for stream maintenance purposes.

After receipt of conditional approval of the regulatory floodway change and issuance of a permit and a Conditional Letter of Map Revision, construction as necessary to change the regulatory floodway designation may proceed but no buildings or structures or other construction that is not an Appropriate Use may be placed in that area until the regulatory floodway map is changed and a final Letter of Map Revision is received. The regulatory floodway map will be revised upon acceptance and concurrence by DWR and FEMA of the “as built” plans.

802.2 State Review. For those projects listed below located in a regulatory floodway, the following criteria shall be submitted to DWR for their review and concurrence prior to the issuance of a permit:

- a. DWR will review an engineer’s analysis of the flood profile due to a proposed bridge pursuant to Section 802.1(d).
- b. DWR will review an engineer’s determination that an existing bridge or culvert crossing is not a source of flood damage and the analysis indicating the proposed flood profile, pursuant to Section 802.1(e).
- c. The DWR will review alternative transition sections and hydraulically equivalent storage pursuant to Section 802.1 (a, b and h).
- d. The DWR will review and approve prior to the start of construction any Department projects, dams (as defined in Section

300.12) and all other state, federal or local units of government projects, including projects of the municipality or country.

802.3 Other Permits. In addition to the other requirements of this Ordinance, a development permit for a site located in a floodway shall not be issued unless the applicant first obtains a permit or written documentation that a permit is not required from DWR, issued pursuant to Illinois Revised Statutes, Chapter 19, Section 52 et seq. No permit from DWR shall be required if the Division has delegated this responsibility to the Village Administrator.

802.4 Dam Safety Permits. Any work involving the construction, modification or removal of a dam as defined in Section 300.12 per 92 Ill. Adm. Code 702 (Rules for Construction of Dams) shall obtain an Illinois Division of Water Resources Dam safety permit prior to the start of construction of a dam. If the Village Administrator finds a dam that does not have a DWR permit, the Village Administrator shall immediately notify the Dam Safety Section of the Division of Water Resources. If the Village Administrator finds a dam which is believed to be in unsafe condition, the Village Administrator shall immediately notify the owner of the dam, DWR, Dam Safety Section in Springfield and the Illinois Emergency Services and Disaster Agency (ESDA).

802.5 Activities That Do Not Require a Registered Professional Engineer's Review. The following activities may be permitted without a registered professional engineers review. Such activities shall still meet the other requirements of this Ordinance, including the mitigation requirements.

- a. Underground and overhead utilities that:
 - (i) Do not result in any increase in existing ground elevations, or
 - (ii) Do not require the placement of above ground structures in the floodway, or
 - (iii) In the case of underground stream crossings, the top of the pipe or encasement is buried a minimum of 3' below the existing stream bed, and
 - (iv) In the case of overhead utilities, no supporting towers are placed in the watercourse and are designed in such a fashion as not to catch debris.

- b. Storm and sanitary sewer outfalls that:
 - (i) Do not extend riverward or lakeward of the existing adjacent natural bank slope, and
 - (ii) Do not result in an increase in ground elevation, and
 - (iii) Are designed so as not to cause stream erosion at the outfall location.
- c. Construction of sidewalks, athletic fields excluding fences, properly anchored playground equipment and patios at grade.
- d. Construction of shoreline and streambank protection that:
 - (i) Does not exceed 1000 feet in length.
 - (ii) Materials are not placed higher than the existing top of bank.
 - (iii) Materials are placed so as not to reduce the cross-sectional area of the stream channel or bank of the lake.
- e. Temporary stream crossing in which:
 - (i) The approach roads will be 0.5' (½ foot) or less above natural grade.
 - (ii) The crossing will allow stream flow to pass without backing up the water above the stream bank vegetation line or above any drainage tile or outfall invert.
 - (iii) The top of the roadway fill in the channel will be at least 2' below the top of the lowest bank. Any fill in the channel shall be non-erosive material, such as rip-rap or gravel.
 - (iv) All disturbed stream banks will be seeded or otherwise stabilized as soon as possible upon installation and again upon removal of construction.
 - (v) The access road and temporary crossings will be removed within one year after authorization.

Not Identified.

In SFHA or flood plains, where no floodways have been identified and no base flood or 100-year frequency flood elevations have been established by FEMA, and draining more than a square mile, no development shall be permitted unless the cumulative effect of the proposals, when combined with all other existing and anticipated uses and structures, shall not significantly impede or increase the flow and passage of the floodwaters nor significantly increase the base flood or 100-year frequency flood elevation.

901.1 Development Permit. No person, firm, corporation, or governmental body, not exempted by state law, shall commence any development in a SFHA or flood plain without first obtaining a development permit from the Village. Application for a development permit shall be made on a form provided by the Village. The application shall be accompanied by drawings of the site, drawn to scale showing property line dimensions; and existing grade elevations and all changes in grade resulting from excavation or filling, sealed by a licensed engineer, architect or surveyor; the location and dimensions of all buildings and additions to buildings; and the elevations of the lowest floor (including basement) of all proposed buildings subject to the requirements of Section 1000 of this Ordinance.

The application for a development permit shall also include the following information:

- a. A detailed description of the proposed activity, its purpose, and intended use;
- b. Site location (including legal description) of the property, drawn to scale, on the regulatory floodway maps, indicating whether it is proposed to be in an incorporated or unincorporated area;
- c. Anticipated dates of initiation and completion of activity;
- d. Plans of the proposed activity shall be provided which include as a minimum:
 - (i) A vicinity map showing the site of the activity, name of the waterway, boundary lines, names of roads in the vicinity of the site, graphic or numerical scale, and north arrow;
 - (ii) A plan view of the project and engineering study reach showing existing and proposed conditions including principal dimensions of the structure or work, elevations

in mean sea level (1929 adjustment) datum or N.G.V.D., adjacent property lines and ownership, drainage and flood control easements, distance between proposed activity and navigation channel (when the proposed construction is near a commercially navigable body of water), flood plain limit, location and orientation of cross-sections, north arrow, and a graphical or numerical scale;

(iii) Cross-section views of the project and engineering study reach showing existing and proposed conditions including principal dimensions of the work as shown in plan view, existing and proposed elevations, normal water elevation, 10-year frequency flood elevation, 100-year frequency flood elevation, and graphical or numerical scales (horizontal and vertical); and

e. Engineering calculations and supporting data shall be submitted showing that the proposed work will meet the criteria of Section 902.0.

f. Any and all other local, state and federal permits or approvals that may be required for this type of development.

901.2 Based on the best available existing data according to the Illinois state Water Survey's Flood Plain Information Repository, the Village Administrator shall compare the elevation of the site to the base flood or 100-year frequency flood elevation. Should no elevation information exist for the site, the developer's engineer shall calculate the elevation according to Section 604.0. Any development located on land that can be shown to have been higher than the base flood elevation as of the site's first Flood Insurance Rate Map Identification is not in the SFHA and, therefore, not subject to the requirements of this Ordinance. The Building Official shall maintain documentation of the existing ground elevation at the development site and certification that this ground elevation existed prior to the date of the site's first Flood Insurance Rate Map identification.

901.3 The Village Administrator shall be responsible for obtaining from the applicant copies of all other local, state, and federal permits, approvals or permit-not-required letters that may be required for this type of activity. The Village Administrator shall not issue the development permit unless all required local, state and federal permits have been obtained.

902.0 Preventing Increased Damages. No development in the SFHA, where a floodway has not been determined shall create a damaging or potentially damaging increase in flood heights or velocity or threat to public health,

safety and welfare or impair the natural hydrologic and hydraulic functions of the floodway or channel, or impair existing water quality or aquatic habitat. Construction impacts shall be minimized by appropriate mitigation methods as called for in this Ordinance.

- 902.1 Within all riverine SFHA's where the floodway has not been determined, the following standards shall apply:
- a. The developer shall have a Registered Professional Engineer state in writing and show through supporting plans, calculations, and data that the project meets the engineering requirements of Section 802.1 (a) through (l) for the entire flood plain as calculated under the provisions of Section 604.00 of this Ordinance. As an alternative, the developer should have an engineering study performed to determine a floodway and submit that engineering study to DWR for acceptance as a regulatory floodway. Upon acceptance of their floodway by the Department, the developer shall then demonstrate that the project meets the requirements of Section 800.0 for the regulatory floodway. The floodway shall be defined according to the definition in Section 300.41 of this Ordinance.
 - b. A development permit shall not be issued unless the applicant first obtains a permit from DWR or written documentation that a permit is not required from DWR.
 - c. No permit from DWR shall be required if the Division has delegated permit responsibility to the Village Administrator per 92 Ill. Adm. Code, Part 708 for regulatory floodways, per DWR Statewide Permit entitled "Construction in Flood Plains with No Designated Floodways in Northeastern Illinois."
 - d. Dam Safety Permits. Any work involving the construction, modification or removal of a dam or an on-stream structure to impound water as defined in Section 300.12 shall obtain an Illinois Division of Water Resources Dam safety permit or letter indicating a permit is not required prior to the start of construction of a dam. If the Village Administrator finds a dam that does not have DWR permit, the Village Administrator shall immediately notify the Dam Safety Section of the Division of Water Resources. If the Village Administrator finds a dam which is believed to be in unsafe condition, the Village Administrator shall immediately notify the owner of the dam and the Illinois Emergency Services, DWR, Dam Safety Section in Springfield and Disaster Agency (ESDA).

- e. The following activities may be permitted without a Registered Professional Engineer's review or calculation of a base flood elevation and regulatory floodway. Such activities shall still meet the other requirements of this Ordinance:
 - (i) Underground and overhead utilities that:
 - (a) Do not result in any increase in existing ground elevations, or
 - (b) Do not require the placement of above ground structures in the floodway, or
 - (c) In the case of underground stream crossings, the top of the pipe or encasement is buried a minimum of 3' below the existing streambed, and
 - (d) In the case of overhead utilities, no supporting towers are placed in the watercourse and are designed in such a fashion as not to catch debris.
 - (ii) Storm and sanitary sewer outfalls that:
 - (a) Do not extend riverward or lakeward of the existing adjacent natural bank slope, and
 - (b) Do not result in an increase in ground elevation, and
 - (c) Are designed so as not to cause stream bank erosion at the outfall location.
 - (iii) Construction of shoreline and streambed protection that:
 - (a) Does not exceed 1000 feet in length or 2 cubic yards per lineal foot of streambed.
 - (b) Materials are not placed higher than the existing top of bank.
 - (c) Materials are placed so as not to reduce the cross-sectional area of the stream channel by more than 10%.

- (iv) Temporary stream crossings in which:
 - (a) The approach roads will be 0.5' (½ foot) or less above natural grade.
 - (b) The crossing will allow stream flow to pass without backing up the water above the stream bank vegetation line or above any drainage tile or outfall invert.
 - (c) The top of the roadway fill in the channel will be at least 2' below the top of the lowest bank. Any fill in the channel shall be non-erosive material, such as rip-rap or gravel.
 - (d) All disturbed stream banks will be seeded or otherwise stabilized as soon as possible upon installation and again upon removal of construction.
 - (e) The access road and temporary crossings will be removed within one year after authorization.
- (v) The construction of light poles, sign posts and similar structures.
- (vi) The construction of sidewalks, driveways, athletic fields (excluding fences), patios and similar surfaces which are built at grade;
- (vii) The construction of properly anchored, walled, open structures such as playground equipment, pavilions, and carports built at or below existing grade that would not obstruct the flow of flood waters;
- (viii) The placement of properly anchored buildings not exceeding seventy (70) square feet in size, nor ten (10) feet in any one dimension (e.g., animal shelters and tool sheds);
- (ix) The construction of additions to existing buildings which do not increase the first floor area by more than twenty (20) percent, which are located on the upstream or downstream side of the existing building, and which do not extend beyond the sides of the existing building that

are parallel to the flow of flood waters;

- (x) Minor maintenance dredging of a stream channel where:
 - (a) The affected length of stream is less than 1000 feet.
 - (b) The work is confined to reestablishing flows in natural stream channels, or
 - (c) The cross-sectional area of the dredged channel conforms to that of the natural channel upstream and downstream of the site.

- f. The flood carrying capacity within any altered or relocated watercourse shall be maintained.

902.2 Compensatory Storage. Whenever any portion of a flood plain is authorized for use, the volume of space which will be occupied by the authorized fill or structure below the base flood or 100-year frequency flood elevation shall be compensated for and balanced by a hydraulically equivalent volume of excavation taken from below the base flood or 100-year frequency flood elevation. The excavation volume shall be at least equal to 1.5 times the volume of storage lost due to the fill or structure. In the case of streams and watercourses, such excavation shall be made opposite or adjacent to the areas so filled or occupied. All flood plain storage lost below the existing 10-year flood elevation shall be replaced below the proposed 10-year flood elevation. All flood plain storage lost above the existing 10-year flood elevation shall be replaced above the proposed 10-year flood elevation shall be replaced above the proposed 10-year flood elevation. All such excavations shall be constructed to drain freely and openly to the watercourse.

1000.0 Permitting Requirements Applicable to All Flood Plain Areas.

In addition to the requirements found in Sections 700.0, 800.0, and 900.0 for development in flood fringes, regulatory floodways, and SFHA or flood plains where no floodways have been identified (Zones A, A0, AH, AE A1-A30, A99, V0, V1-V30, VE, V, M or E), the following requirements shall be met.

1001.0 Public Health Standards

1001.1 No developments in the SFHA shall include locating or storing chemicals, explosives, buoyant materials, animal wastes, fertilizers, flammable liquids, pollutants, or other hazardous or toxic materials below the flood plain elevation.

1001.2 New and replacement water supply systems, wells, sanitary sewer lines and on-site waste disposal systems may be permitted providing all manholes or other above ground openings located below the FPE are watertight.

1002.0 Carrying Capacity and Notification. For all projects involving channel modification, fill, or stream maintenance (including levees), the flood carrying capacity of the watercourse shall be maintained. In addition, the Village Administrator shall notify adjacent communities in writing 30 days prior to the issuance of a permit for the alteration or relocation of the watercourse.

1003.0 Protecting Buildings. All buildings located within a 100-year flood plain also know as SFHA, shall be protected from flood damage below the flood protection elevation. However, existing buildings located within a regulatory floodway shall also meet the more restrictive Appropriate Use standards included in Section 800.0. This building protection criteria applies to the following situations:

- a. Construction or placement of a new building.
- b. A structural alteration to an existing building that either increases the first floor area by more than 20% or the building's market value by more than 50%;
- c. Installing a manufactured home on a new site or a new manufactured home on an existing site. This building protection requirements does not apply to returning a mobile home to the same site it lawfully occupied before it was removed to avoid flood damage; and
- d. Installing a travel trailer on a site for more than 180 days.

This building protection requirement may be met by one of the following methods.

1003.1 A residential or non-residential building, when allowed, may be constructed on permanent land fill in accordance with the following:

- a. The lowest floor, (including basement) shall be at or above the flood protection elevation.
- b. The fill shall be placed in layers no greater than one (1) foot deep before compaction and should extend at least ten (10) feet beyond the foundation of the building before sloping below the flood protection elevation. The top of the fill shall be above the flood protection elevation. However, the ten (10) foot minimum may be waived if a structural engineer certifies an alternative method to protect the building from damages due to hydrostatic pressures. The fill shall be protected against erosion and scour. The fill shall not adversely effect the flow or surface drainage from or onto neighboring properties.

1003.2 A residential or non-residential building may be elevated in accordance with the following:

- a. The building or improvements shall be elevated on crawl space, stilts, piles, walls, or other foundation that is permanently open to flood waters and not subject to damage by hydrostatic pressures of the base flood or 100-year frequency flood. The permanent openings shall be no more than one foot above grade, and consists of a minimum of two openings. The openings must have a total net area of not less than one square inch for every one square foot of enclosed area subject to flooding below the Base Flood Elevation.
- b. The foundation and supporting members shall be anchored and aligned in relation to flood flows and adjoining structures so as to minimize exposure to known hydrodynamic forces such as current, waves, ice and floating debris.
- c. All areas below the flood protection elevation shall be constructed of materials resistant to flood damage. The lowest floor (including basement) and all electrical, heating, ventilating, plumbing and air conditioning equipment and utility meters shall be locate at or above the flood protection elevation. Water and sewer pipes, electrical and telephone lines, submersible pumps, and other waterproofed service facilities may be located below the flood protection elevation.
- d. No area below the flood protection elevation shall be used for storage of items or materials.

- e. Manufactured homes and travel trailers to be installed on a site for more than 180 days, shall be elevated to or above the flood protection elevation; and, shall be anchored to resist flotation, collapse, or lateral movement by being tied down in accordance with the Rules and regulations for the Illinois Mobile Home Tie-Down Act issued pursuant to 77 Ill. Adm. Code 870.

1003.3 Only a non-residential building may be structurally floodproofed (in lieu of elevation) provided that a registered professional engineer shall certify that the building has been structurally dry floodproofed below the flood protection elevation, the structure and attendant utility facilities are watertight and capable of resisting the effects of the base flood or 100-year frequency flood. The building design shall take into account flood velocities, duration, rate of rise, hydrostatic and hydrodynamic forces, the effects of buoyancy, and impacts from debris or ice. Floodproofing measures shall be operable without human intervention and without an outside source of electricity (levees, berms, floodwalls and similar works are not considered floodproofing for the purpose of this subsection).

1003.4 Non-conforming structures located in a regulatory floodway may remain in use, but may not be enlarged, replaced or structurally altered. A non-conforming structure damaged by flood, fire, wind or other natural or man-made disaster may be restored unless the damage exceeds fifty percent (50%) of its market value before it was damaged, in which case it shall conform to this Ordinance.

Section 1100.0 Other Development Requirements

The Board of Trustees shall take into account flood hazards, to the extent that they are known in all official actions related to land management, use and development.

1100.1 New subdivisions, manufactured home parks, annexation agreements, and Planned Unit Developments (PUDs) within the SFHA shall be reviewed to assure that the proposed developments are consistent with Sections 700, 800, 900 and 1000 of this Ordinance and the need to minimize flood damage. Plats or plans for new subdivisions, mobile home parks and Planned Unit Developments (PUDs) shall include a signed statement by a Registered Professional Engineer that the plat or plans account for changes in the drainage of surface waters in accordance with the Plat Act (Ill. Rev. Stat., Ch. 109, Sec. 2).

1100.2 Proposals for new subdivisions, manufactured home parks, travel trailer parks, planned unit developments (PUDs) and additions to manufactured

home parks and additions to subdivisions shall include base flood or 100-year frequency flood elevation data and floodway delineations.. Where this information is not available from an existing study filed with the Illinois State Water Survey, the applicant's engineer shall be responsible for calculating the base flood or 100-year frequency flood elevation per Section 604.0 and the floodway delineation per the definition in Section 300.41 and submitting it to the State Water Survey and DWR for review and approval as best available regulatory data.

1100.3 Streets, blocks, lots, parks and other public grounds shall be located and laid out in such a manner as to preserve and utilize natural streams and channels. Wherever possible, the flood plains shall be included within parks or other public grounds.

1100.4 The Board of Trustees shall not approve any Planned Unit Development (PUD) or plat of subdivision located outside the corporate limits unless such agreement or plat is in accordance with the provisions of this Ordinance.

Section 1200.0 Variances

No variances shall be granted to any development located in a regulatory floodway as defined in Section 300.13. However, when a development proposal is located outside of a regulatory floodway, and whenever the standards of this Ordinance place undue hardship on a specific development proposal, the applicant may apply to the Village for a variance. The Village Administrator shall review the applicant's request for a variance and shall submit his recommendation to the Board of Trustees.

1200.1 No variance shall be granted unless the applicant demonstrates that:

- a. The development activity cannot be located outside the SFHA;
- b. An exceptional hardship would result if the variance were not granted;
- c. The relief requested is the minimum necessary;
- d. There will be no additional threat to public health and safety.
- e. There will be no additional public expense for flood protection, rescue or relief operations, policing, or repairs to stream beds and banks, roads, utilities, or other public facilities;

- f. The provisions of Sections 702.0 and 902.0 of this Ordinance shall still be met;
- g. The activity is not in a regulatory floodway;
- h. The applicant's circumstances are unique and do not represent a general problem, and
- i. The granting of the variance will not alter the essential character of the area involved including existing stream uses.

1200.2 The Village Administrator shall notify an applicant in writing that a variance from the requirements of Section 1000.0 that would lessen the degree of protection to a building will:

- a. Result in increased premium rates for flood insurance up to amounts as high as \$25 for \$100 of insurance coverage.
- b. Increase the risks to life and property; and
- c. Require that the applicant proceed with knowledge of these risks and that he will acknowledge in writing that he assumes the risk and liability.

1200.3 Variances requested in connection with restoration of a site or building listed on the National Register of Historical Places or documented as worthy of preservation by the Illinois Historic Preservation Agency may be granted using criteria more permissive than the requirements of Sections 1200.0 and 1200.2.

Section 1300.0 Disclaimer of Liability

The degree of flood protection required by this Ordinance is considered reasonable for regulatory purposes and is based on available information derived from engineering and scientific methods of study. Larger floods may occur or flood heights may be increased by man-made or natural causes. This Ordinance does not imply that development, either inside or outside of the SFHA, will be free from flooding or damage. This Ordinance does not create liability on the part of the Village or any officer or employee thereof for any flood damage that results from reliance on this Ordinance or any administrative decision made lawfully thereunder.

Section 1400.0 Penalty

Failure to comply with the requirements of a permit or conditions of a variance resolution shall be deemed to be a violation of this Ordinance. Upon due investigation, the Village Administrator may determine that a violation of the minimum standards of this Ordinance exist. The Village Administrator shall notify the owner in writing of such violation.

1400.1 If such owner fails after ten days notice to correct the violation:

- a. The Village Administrator may make application to the Circuit Court for an injunction requiring conformance with this Ordinance

or make such other order as the Court deems necessary to secure compliance with the Ordinance.
- b. Any person who violates this Ordinance shall, upon conviction thereof, be fined not less than one hundred dollars (\$100.00) or more than one thousand dollars (\$1000.00) for each offence.
- c. A separate offense shall be deemed committed upon each day during or on which a violation occurs or continues.
- d. The Village Administrator may record a notice of violation on the title to the property.

1400.2 The Village Administrator shall inform the owner that any such violation is considered a willful act to increase flood damages and, therefore, may cause coverage by a Standard Flood Insurance Policy to be suspended.

1400.3 Nothing herein shall prevent the Village Administrator from taking such other lawful action to prevent or remedy any violations. All costs connected therewith shall accrue to the person or persons responsible.

Section 1500.0 Abrogation and Greater Restrictions

This Ordinance is not intended to repeal, abrogate or impair any existing easements, covenants, or deed restrictions. Where this Ordinance and other ordinance, easements, covenants, or deed restrictions conflict or overlap, whichever imposes the more stringent restrictions shall prevail. This Ordinance is intended to repeal the original ordinance or resolution which was adopted to meet the National Flood Insurance Program regulations, but is not intended to repeal the resolution which the Village passed in order to establish initial eligibility for the program. Ordinance 1039 is hereby repealed.

Section 1600.0 Separability

The provisions and sections of this Ordinance shall be deemed separable and the invalidity of any portion of this Ordinance shall not affect the validity of the remainder.

Section 1700.0 Effective Date

This Ordinance shall be in full force and effect from and after its passage, approval, and publication, as required by law.

Section 3-9-2: SOIL EROSION AND SEDIMENT CONTROL ORDINANCE

NOW, THEREFORE, BE IT ORDAINED BY THE PRESIDENT AND BOARD OF TRUSTEES OF THE VILLAGE OF PLAINFIELD, WILL COUNTY, ILLINOIS, AS FOLLOWS:

100.0 Findings and Purpose

101.0 Findings

The Board of Trustees of the Village of Plainfield hereby finds that:

- 101.1 Excessive quantities of soil may erode from areas undergoing development for certain non-agricultural uses including but not limited to the construction of dwelling units, commercial buildings and industrial plants, the building of roads and highways, the modification of stream channels and drainageways, and the creation of recreational facilities;
- 101.2 The washing, blowing, and falling of eroded soil across and upon roadways endangers the health and safety of users thereof, by decreasing vision and reducing traction of road vehicles;
- 101.3 Soil erosion necessitates the costly repairing of gullies, washed-out fills, and embankments;
- 101.4 Sediment from soil erosion tends to clog sewers and ditches and to pollute and silt rivers, streams, lakes, wetlands, and reservoirs;
- 101.5 Sediment limits the use of water and waterways for most beneficial purposes, promotes the growth of undesirable aquatic weeds, destroys fish and other desirable aquatic life, and is costly and difficult to remove; and
- 101.6 Sediment reduces the channel capacity of waterways and the storage capacity of floodplains and natural depressions, resulting in increased chances of flooding at risk to public health and safety.

The Board of Trustees therefore declares that the purpose of this ordinance is to safeguard persons, protect property, prevent damage to the environment, and

promote the public welfare by guiding, regulating and controlling the design, construction, use and maintenance of any development or other activity which disturbs or breaks the topsoil or otherwise results in the movement of earth on land situated in the Village of Plainfield. It is the intention of this ordinance that the delivery of sediment from sites affected by land disturbing activities be limited, as closely as practicable, to that which would have occurred if the land had been left in its natural undisturbed state. The ordinance is applied to all development, as defined in section 3-9-1, in the Village.

200.0 Definitions

For the purposes of this Ordinance certain terms used herein are defined as set forth below:

- 200.1 **BUILDING PERMIT:** A permit issued by the Village of Plainfield for the construction, erection or alteration of a structure or building.
- 200.2 **CERTIFY OR CERTIFICATION:** Formally attesting that the specific inspections and tests where required have been performed, and that such tests comply with the applicable requirements of this Ordinance.
- 200.3 **CLEARING:** Any activity which removes vegetative ground cover.
- 200.4 **CUBIC YARDS:** The amount of material in excavation and/or fill measured by the method of "average end areas".
- 200.5 **EXCAVATION:** Any act by which organic matter, earth, sand, gravel, rock or any other similar material is cut into, dug, quarried, uncovered, removed, displaced, relocated or bulldozed and shall include the conditions resulting therefrom.
- 200.6 **EXISTING GRADE:** The vertical location of the existing ground surface prior to excavation or filling.
- 200.7 **FILL:** Any act by which, earth, sand, gravel, rock or any other material is deposited, placed, replaced, pushed, dumped, pulled, transported or moved by man to a new location and shall include the conditions resulting therefrom.
- 200.8 **FINAL GRADE:** The vertical location of the ground or pavement surface after the grading work is completed in accordance with the site development plan.

- 200.9 GRADING: Excavation or fill or any combination thereof and shall include the conditions resulting from any excavation or fill.
- 200.10 NATURAL DRAINAGE: Channels formed in the existing surface topography of the earth prior to changes made by unnatural causes.
- 200.11 PARCEL: All contiguous land in one ownership.
- 200.12 PERMITTEE: Any person to whom a site development permit is issued.
- 200.13 PERSON: Any individual, firm or corporation, public or private, the State of Illinois and its agencies or political subdivisions, and the United States of America, its agencies and instrumentalities, and any agent, servant, officer or employee of any of the foregoing.
- 200.14 REMOVAL: Cutting vegetation to the ground or stumps, complete extraction, or killing by spraying.
- 200.15 SITE: A lot or parcel of land, or a contiguous combination thereof, where grading work is performed as a single unified operation.
- 200.16 SITE DEVELOPMENT: Altering terrain and/or vegetation and constructing improvements.
- 200.17 SITE DEVELOPMENT PLAN: A permit issued by the Village of Plainfield for the construction or alteration of ground improvements and structures for the control of erosion, runoff and grading.
- 200.18 STREAM: Any river, creek, brook, branch, flowage, ravine, or natural or man-made drainageway which has a definite bed and banks or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.
- 200.19 STRIPPING: Any activity which removes the vegetative surface cover including tree removal, clearing, and storage or removal of top soil.
- 200.20 VACANT: Land on which there are no structures or only structures which are secondary to the use or maintenance of the land itself.
- 200.21 VILLAGE: The Village of Plainfield, Will County, Illinois.
- 200.22 WETLANDS: Areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and that

under normal circumstances do support, a prevalence of vegetation typically adapted for line if saturated soil conditions.

300.00 General Principles

It is the objective of this ordinance to control soil erosion and sedimentation caused by development activities, including clearing, grading, stripping, excavating, and filling of land, in the Village. Measures taken to control soil erosion and offsite sediment runoff should be adequate to assure that sediment is not transported from the site by a storm event of ten-year frequency or less.

The erosion and sedimentation control practices discussed in the Illinois Urban Manual and the following principles shall apply to all development activities within the Village and to the preparation of the submissions required under Section 400.0 of this ordinance:

- 300.1 Development should be related to the topography and soils of the site so as to create the least potential for erosion. Areas of steep slopes where high cuts and fills may be required should be avoided wherever possible, and natural contours should be followed as closely as possible.
- 300.2 Natural vegetation should be retained and protected wherever possible. Areas immediately adjacent to natural watercourses, lakes, ponds, and wetlands should be left undisturbed wherever possible. Temporary crossings of watercourses, when permitted, must include appropriate stabilization measures.
- 300.3 Special precautions should be taken to prevent damages resultant from any necessary development activity within or adjacent to any stream, lake, pond, or wetland. Preventative measures should reflect the sensitivity of these areas to erosion and sedimentation.
- 300.4 The smallest practical area of land should be exposed for the shortest practical time during development.
- 300.5 Sediment basins or traps, filter barriers, diversions, and any other appropriate sediment or runoff control measures should be installed prior to site clearing and grading and maintained to remove sediment from runoff waters from land undergoing development.
- 300.6 The selection of erosion and sedimentation control measures should be

based on assessment of the probable frequency of climatic and other events likely to contribute to erosion, and on evaluation of the risks, costs, and benefits involved.

- 300.7 In the design of erosion control facilities and practices, aesthetics and the requirements of continuing maintenance should be considered.
- 300.8 Provision should be made to accommodate the increased run-off caused by changed soil and surface conditions during and after development. Drainageways should be designed so that their final gradients and the resultant velocities and rates of discharge will no create additional erosion onsite or downstream.
- 300.9 Permanent vegetation and structures should be installed and functional as soon as practical during development.
- 300.10 Those areas being converted from agricultural purposes to other land uses should be vegetated with an appropriate protective cover prior to development.
- 300.11 All waste generated as a result of site development activity should be property disposed of and should be prevented from being carried off the site by either wind or water.
- 300.12 All construction sites should provide measures to prevent sediment from being tracked onto public or private roadways.

400.0 Site Development Permit

401.0 Permit Required

Except as otherwise provided in this ordinance, no persons shall commence or perform any clearing, grading, stripping, excavating, or filling of land which meets the following provisions without having first obtained a site development permit from the Building Department of the Village of Plainfield.

- 401.1 Any land distributing activity (i.e., clearing, grading, stripping, excavation, fill, or any combination thereof) that will affect an area in excess of 5000 sq. ft.;
- 401.2 Any land disturbing activity that will affect an area in access of 500 sq. ft. if the activity is within 25 feet of a lake, pond, stream, or wetland; or
- 401.3 Excavation, fill, or any combination thereof that will exceed 100 cubic

yards.

402.0 Exceptions

A permit shall not be required for any of the following provided that the person responsible for any such development shall implement necessary soil erosion and sediment control measures to satisfy the principles set forth in Section 300.0 of this Ordinance.

402.1 Excavation below final grade for the basement and footings of a single-family residence and appurtenant structures on a site in excess of two acres for which a building permit has been issued by the Village.

402.2 Agricultural use of land, including the implementation of conservation measures included in a farm conservation plan approved by the Soil and Water Conservation District and including the construction of agricultural structures;

402.3 Installation, renovation, or replacement of a septic system to serve an existing dwelling or structure.

403.0 Application for Permit

Application for a site development permit shall be made by the owner of the property or his authorized agent to the Planning Department on a form furnished for that purpose. Each application shall bear the name(s) and address(es) of the owner or developer of the site and of any consulting firm retained by the applicant together with the name of the applicant's principal contact as such firm. Each application shall include certification that any land clearing, construction, or development involving the movement of earth shall be in accordance with the plans approved upon issuance of the permit.

404.0 Submissions

Each application for a site development permit shall be accompanied by the following information:

404.1 A vicinity map in sufficient detail to enable easy location in the field of the site for which the permit is sought, and including the boundary line and approximate acreage of the site, existing zoning, and a legend and scale.

404.2 A development plan of the site showing:

- a. Existing topography of the site and adjacent land within

approximately 100 feet of the boundaries, drawn at no greater than two-foot contour intervals and clearly portraying the conformation and drainage pattern of the area.

- b. The location of existing buildings, structures, utilities, streams, lakes, floodplains, wetlands and depressions, drainage facilities, vegetative cover, paved areas, and other significant natural or man-made features on the site and adjacent land within 100 feet of the boundary.
 - c. A general description of the predominant soil types on the site, their location, and their limitations for the proposed use.
 - d. Proposed use of the site, including present development and plan utilization; areas of clearing, stripping, grading, excavation, and filling; proposed contours, finished grades, and street profiles; provisions for storm drainage, including storm sewers, swales, detention basins and any other measures to control the rate of runoff, within a drainage area map, indications of flow directions, and computations; kinds and locations of utilities; and areas and acreage proposed to be paved, covered, sodded or seeded, vegetatively stabilized, or left undisturbed.
- 404.3 An erosion and sediment control plan showing all measures necessary to meet the objectives of this ordinance throughout all phases of construction and permanently after completion of development of the site, including:
- a. Location and description, including standard details, of all sediment control measures and design specifics of sediment basins and traps, including outlet details.
 - b. Location and description of all soil stabilization and erosion control measures, including seeding mixtures and rates, types of sod, method of seedbed preparation, expected seeding dates, type and rate of lime and fertilizer application, kind and quantity of mulching for both temporary and permanent vegetative control measures, and types of non-vegetative stabilization measures.
 - c. Location and description of all runoff control measures, including diversions, waterways, and outlets.
 - d. Location and description of methods to prevent tracking of sediment offsite, including construction entrance details, as appropriate.

- e. Description of dust and traffic control measures.
- f. Locations of stockpiles and description of stabilization methods.
- g. Description of off-site fill or borrow volumes, locations, and methods of stabilization.
- h. Provisions for maintenance of control measures, including type and frequency of maintenance, easements, and estimates of the cost of maintenance.
- i. Identification (name, address, and telephone) of the person(s) or entity which will have legal responsibility for maintenance of erosion control structures and measures during development and after development is completed.

404.4 The proposed phasing of development of the site, including stripping and clearing, rough grading and construction, and final grading and landscaping. Phasing should identify the expected date on which clearing will begin, the estimated duration of exposure of cleared areas, and the sequence of installation of temporary sediment control measures (including perimeter controls), clearing and grading, installation of temporary soil stabilization measures, installation of storm drainage, paving streets and parking areas, final grading and the establishment of permanent vegetative cover, and the removal of temporary measures, it shall be the responsibility of the applicant to notify the Planning Department of any signification changes which occur in the site development schedule after the initial erosion and sediment control plan has been approved.

These submissions shall be prepared in accordance with the requirements of this ordinance and the standards and requirements contained in the "Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control" prepared by the Northeastern Illinois Soil Erosion and Sedimentation Control Steering Committee and adopted by the Will County Soil and Water Conservation District, which standards and requirements are hereby incorporated into this ordinance by reference.

The Village may waive specific requirements for the content of submissions upon finding that the information submitted to show that the work will comply with the objectives and principles of this ordinance.

405.0 Bonds

The applicant is required to file with the Village a faithful performance bond or bonds, letter of credit, or other improvement security satisfactory to the Village Attorney in an amount deemed sufficient by the Village Engineer and Village Attorney to cover all costs of improvements, landscaping, maintenance of improvements and landscaping, and soil erosion and sediment control measures for such period as specified by the Village, and engineering and inspection costs to cover the cost of failure or repair of improvements installed on the site.

406.0 Review and Approval

Each application for a site development permit shall be reviewed and acted upon according to the following procedures:

406.1 The Planning Department will review each application for a site development permit to determine its conformance with the provisions of this ordinance. The Planning Department may also refer any application to the Will County Soil and Water Conservation District and/or any other local government or public agency within whose jurisdiction the site is located for review and comment. Within thirty (30) days after receiving an application, the Planning Department shall in writing:

- a. Approve the permit application if it is found to be in conformance with the provisions of this ordinance, and issue the permit.
- b. Approve the permit application subject to such reasonable conditions as may be necessary to secure substantially the objectives of this ordinance, and issue the permit subject to these conditions; or
- c. Disapprove the permit application, indicating the deficiencies and the procedure for submitting a revised application and/or submission.

406.2 No site development permit shall be issued for an intended development site unless:

- a. the development, including but not limited to subdivisions and planned unit development, has been approved by the Village where applicable, or
- b. such permit is accompanied by or combined with a valid building permit issued by the Village, or
- c. the proposed earth moving is coordinated with any overall

development program previously approved by the Village for the area in which the site is situated; and

- d. all relevant federal and state permits (i.e., for floodplains and wetlands) have been received for the portion of the site subject to soil disturbance.

406.3 Failure of the Village to act on an original or revised application within thirty (30) days of receipt shall authorize the applicant to proceed in accordance with the plans as filed unless such time is extended by agreement between the Village and the applicant. Pending preparation and approval of a revised plan, development activities shall be allowed to proceed in accordance with conditions established by the Village.

407.0 Expiration of Permit

Every site development permit shall expire and become null and void if the work authorized by such permit has not been commenced within one hundred and eighty (180) days, or is not completed by a date which shall be specified in the permit; except that the Planning Department may, if the permittee presents satisfactory evidence that unusual difficulties have prevented work being commenced or completed within the specified time limits, grant a reasonable extension of time if written application is made before the expiration date of the permit. The Planning Department may require modification of the erosion control plan to prevent any increase in erosion control plan to prevent any increase in erosion or offsite sediment runoff resulting from any extension.

408.0 Appeals

The applicant, or any person or agency which received notice of the filing of the application may appeal the decision of the Planning Department as provided in Section 406.0, to the Board of Appeals. Upon receipt of an appeal, the Board of Appeals shall schedule and hold a public hearing, after giving 15 days notice thereof. The board shall render a decision within thirty (30) days after the hearing.

Factors to be considered on review shall include, but need not be limited to, the effects of the proposed development activities on the surface water flow to tributary and downstream lands, any comprehensive watershed management plans, or the use of any retention facilities; possible saturation of fill and unsupported cuts by water, both natural and domestic; runoff surface waters that produce erosion and silting of drainageways; nature and type of soil or rock which when disturbed by the proposed development activities may create earth movement and produce slopes that cannot be landscaped and excessive and unnecessary scarring of the natural landscape through grading or removal of vegetation.

409.0 Retention of Plans

Plans, specifications, and reports for all site developments shall be retained in original form or on microfilm by the Village.

500.0 Design and Operation Standards and Requirements

501.0 Applicability

All clearing, grading, stripping, excavating, and filling which is subject to the permit requirements of this ordinance shall be subject to the applicable standards and requirements set forth in this Section 500.0.

502.0 Responsibility

The permittee shall not be relieved of responsibility for damage to persons or property otherwise imposed by law, and the Village or its officers or agents will not be made liable for such damage, by:

1. the issuance of a permit under this ordinance,
2. compliance with the provisions of that permit or with conditions attached to it by the Planning Department,
3. failure of Village Officials to observe or recognize hazardous or unsightly conditions,
4. failure of Village officials to recommend denial of or to deny a permit, or
5. exemptions from the permit requirements of this ordinance.

503.0 Site Design Requirements

503.1 On-site sediment control measures, as specified by the following criteria, shall be constructed and functional prior to initiating clearing, grading, stripping, excavating or fill activities on the site.

- a. For disturbed areas draining less than 1 acre, filter barriers (including filter fences, straw bales, or equivalent control measures) shall be constructed to control all offsite runoff as specified in reference handbooks. Vegetated filter strips, with a minimum width of 25 feet, may be used as an alternative only where runoff in sheet flow is expected.

- b. For disturbed areas draining more than one but less than five acres, a sediment trap or equivalent control measure shall be constructed at the downslope point of the disturbed area.
- c. For disturbed areas draining more than five acres, a sediment basin or equivalent control measure shall be constructed at the downslope point of the disturbed area.
- d. Sediment basins and sediment traps designs shall provide for both detention storage and sediment storage. The detention storage shall be composed of equal volumes of "wet" detention storage and "dry" detention storage and each shall be sized for the 2-year, 24-hour runoff from the site under maximum runoff conditions during construction. The release rate of the basin shall be that rate required to achieve minimum detention times of at least 10 hours. The elevation of the outlet structure shall be placed such that it only drains the dry detention storage.
- e. The sediment storage shall be sized to store the estimated sediment load generated from the site over the duration of the construction period with a minimum storage equivalent to the volume of sediment generated in one year. For construction periods exceeding one year, the one-year sediment load and a sediment removal schedule may be substituted.

503.2 Stormwater conveyance channels, including ditches, swales, and diversions, and the outlets of all channels and pipes shall be designed and constructed to withstand the expected flow velocity from the 10-year frequency storm without erosion. All constructed or modified channels shall be stabilized within 48 hours, consistent with the following standards:

- a. For grades up to 4 percent, seeding in combination with mulch, erosion blanket, or an equivalent control measure shall be applied. Sod or erosion blanket or mat shall be applied to the bottom of the channel.
- b. For grades of 4 to 8 percent, sod or an equivalent control measure shall be applied in the channel.
- c. For grades greater than 8 percent, rock, riprap, or an equivalent control measure shall be applied, or the grade shall be effectively reduced using drop structures.

- 503.3 Disturbed areas shall be stabilized with temporary or permanent measures within 7 calendar days following the end of active disturbance, or re-disturbance, consistent with the following criteria:
- a. Appropriate temporary or permanent stabilization measures shall include seeding, mulching, sodding, and/or non-vegetative measures.
 - b. Areas having slopes greater than 12 percent shall be stabilized with sod, mat or blanket in combination with seeding, or equivalent.
- 503.4 Land disturbance activities in stream channels shall be avoided, where possible. If disturbance activities are unavoidable, the following requirements shall be met:
- a. Construction vehicles shall be kept out of the stream channel to the maximum extent practicable. Where construction crossings are necessary, temporary crossings shall be constructed on non-erosive material, such as riprap or gravel.
 - b. The time and area of disturbance of stream channels shall be kept to a minimum. The stream channel, including bed and banks, shall be restabilized within 48 hours after channel disturbance is completed, interrupted, or stopped.
 - c. Whenever channel relocation is necessary, the new channel shall be constructed in the dry and fully stabilized before flow is diverted.
- 503.5 Storm sewer inlets and culverts shall be protected by sediment traps or filter barriers meeting accepted design standards and specifications.
- 503.6 Soil storage piles containing more than 10 cubic yards of material shall not be located with a downslope drainage length of less than 25 feet to a roadway or drainage channel. Filter barriers, including straw bales, filter fence, or equivalent, shall be installed immediately on the downslope side of the piles.
- 503.7 If dewatering devices are used, discharge locations shall be protected from erosion. All pumped discharges shall be routed through appropriately designed sediment traps or basins or equivalent.
- 503.8 Each site shall have graveled (or equivalent) entrance roads, access drives,

and parking areas of sufficient length and width to prevent sediment from being tracked onto public or private roadways. Any sediment reaching a public or private road shall be removed by shoveling or street cleaning (not flushing) before the end of each workday and transported to a controlled sediment disposal area.

503.9 All temporary and permanent erosion and sediment control practices must be maintained and repaired as needed to assure effective performance of their intended function.

503.10 All temporary erosion and sediment control measures shall be disposed of within thirty (30) days after final site stabilization is achieved with permanent soil stabilization measures. Trapped sediment and other disturbed soils resulting from the disposition of temporary measures should be permanently stabilized to prevent further erosion and sedimentation.

504.0 Handbooks Adopted by Reference

The standards and specifications contained in the "Illinois Procedures and Standards for Urban Soil Erosion and Sedimentation Control" cited in Section 400.0 are hereby incorporated into this Section 500.0 and made a part hereof by reference for the purpose of delineating procedures and methods of operation under site development and erosion and sedimentation control plans approved under Section 400.0. In the event of conflict between provisions of said manuals and of this ordinance, the ordinance shall govern.

505.0 Maintenance and Control Measures

All soil erosion and sediment control measures necessary to meet the requirements of this ordinance shall be maintained periodically by the applicant or subsequent land owner during the period of land disturbance and development of the site in a satisfactory manner to ensure adequate performance.

506.0 Inspection

The Building Official or his representative shall make inspections as hereinafter required and shall either approve that portion of the work completed or shall notify the permittee wherein the work fails to comply with the site development or erosion and sedimentation control plan as approved. Plans for grading, stripping, excavating, and filling work bearing the stamp of approval of the (permitting authority) shall be maintained at the site during progress of the work. In order to obtain inspections and to ensure compliance with the approved erosion and sediment control plan, the grading or building permit, and this Ordinance, the

permittee shall notify the Building Official within two (2) working days of the completion of the construction stages specified below:

1. Upon completion of installation of sediment and runoff control measures (including perimeter controls and diversions), prior to proceeding with any other earth disturbance or grading,
2. After stripping and clearing,
3. After rough grading,
4. After final grading,
5. After seeding and landscaping deadlines, and
6. After final stabilization and landscaping, prior to removal of sediment controls.

If stripping, clearing, grading and/or landscaping are to be done in phases or areas, the permittee shall give notice and request inspection at the completion of each of the above work stages in each phase or area. If an inspection is not made and notification of the results given within five working days after notice is received by the Village from the permittee, the permittee may continue work at his/her own risk, without presuming acceptance by the Village. Notification of the results of the inspection shall be given in writing at the site.

507.0 Special Precautions

507.1 If at any stage of the grading of any development site, the Building Official determines by inspection that the nature of the site is such that further work authorized by an existing permit is likely to imperil any property, public way, stream, lake, wetland, or drainage structure, the Building Official may require, as a condition of allowing the work to be done, that such reasonable special precautions to be taken as considered advisable to avoid the likelihood of such peril. "Special precautions" may include, but shall not be limited to, a more level exposed slope, construction of additional drainage facilities, berm, more level exposed slope, construction of additional drainage facilities, berm, terracing, compaction, or cribbing, installation of plant materials for erosion control, and recommendations of a registered soils engineer and/or engineering geologist which may be made requirements for further work.

507.2 Where it appears that storm damage may result because the grading on any development site is not complete, work may be stopped and the permittee

required to install temporary structures or take such other measures as may be required to protect adjoining property or the public safety. On large developments or where unusual site conditions prevail, the Village may specify the time of starting grading and time of completion or may require that the operations be conducted in specific stages so as to insure completion of protective measures or devices prior to the advent of seasonal rains.

508.0 Amendment of Plans

Major amendments of the site development or erosion and sedimentation control plans shall be submitted to the Planning Department and shall be processed and approved or disapproved in the same manner as the original plans. Field modifications of a minor nature may be authorized by the Building Official by written authorization to the permittee.

600.0 Enforcement

601.0 Exceptions

The Board of Appeals may, in accordance with the following procedures, authorize exceptions to any of the requirements and regulations set forth in this ordinance.

601.1 Application for any exception shall be made by a verified petition of the applicant for a site development permit, stating fully the grounds of the petition and the facts relied upon by the applicant. Such petition shall be filed with the site development application. In order for the petition to be granted, it shall be necessary that the Board of Appeals find all of the following facts with respect to the land referred to in the petition:

- a. That the land is of such shape or size or is affected by such physical conditions or is subject to such title limitations of record, that it is impossible or impractical for the applicant to comply with all of the requirements of this ordinance;
- b. That the exception is necessary for the preservation and enjoyment of a substantial property right of the applicant; and
- c. That the granting of the exception will not be detrimental to the public welfare or injurious to other property in the vicinity of the subject property.

601.2 Each application for an exception shall be referred to the Planning

Department for review. The Village Planner shall transmit his/her recommendations to the Board of Appeals, which shall review such recommendations prior to granting or denying such recommendations prior to granting or denying the exception.

601.3 The Board of Appeals shall hold a public hearing on each application for exception, within thirty (30) days after receiving application, in the manner provided with respect to appeals. After public hearing, the Board may approve the site development permit application with the exceptions and conditions it deems necessary or it may disapprove such site development permit application and exception application or it may take such other action as appropriate.

602.0 Stop-Work Order; Revocation of Permit

In the event any person holding a site development permit pursuant to this ordinance violates the terms of the permit, or carries on site development in such a manner as to materially adversely affect the health, welfare, or safety of persons residing or working in the neighborhood of the development site or so as to be materially detrimental to the public welfare or injurious to property or improvements in the neighborhood, the Village may suspend or revoke the site development permit.

602.1 Suspension of a permit shall be by a written stop-work order issued by the Building Official and delivered to the permittee or his agent or the person performing the work. The stop-work order shall be effective immediately, shall state the specific violations cited, and shall state the conditions under which work may be resumed. A stop-work order shall remain in effect until the next regularly scheduled meeting of the Board of Appeals at which the conditions of sub-paragraph 602.2 below can be met, unless the permittee immediately takes all action necessary to come into compliance with the ordinance.

602.2 No site development permit shall be permanently suspended or revoked until a hearing is held by the Board of Appeals. Written notice of such hearing shall be served on the permittee, either personally or by registered mail, and shall state:

1. the grounds for complaint or reasons for suspension or revocation, in clear and concise language; and
2. the time when and place where such hearing will be held.

Such notice shall be served on the permittee at least five (5) days prior to

the date set for hearing. At such hearing, the permittee shall be given an opportunity to be heard and may call witnesses and present evidence on his behalf. At the conclusion of the hearing the Board of Appeals shall determine whether the permit shall be suspended or revoked.

603.0 Violations and Penalties

No person shall construct, enlarge, alter, repair, or maintain any grading, excavation or fill, or cause the same to be done, contrary to or in violation of any terms of this ordinance. Any person violating any of the provisions of this ordinance shall be deemed guilty of an ordinance violation, and each day during which any violation of any of the provisions of this ordinance is committed, continued, or permitted shall constitute a separate offense. Upon conviction of any such violation, such person, partnership, or corporation shall be punished by a fine of not more than \$1000.00 for each offense. In addition to any other penalty authorized by this section, any person, partnership, or corporation convicted of violating any of the provisions of this ordinance shall be required to restore the site to the condition existing prior to commission of the violation, or to bear the expense of such restoration.

604.0 Separability

The provisions and sections of this ordinance shall be deemed to be separable, and the invalidity of any portion of this ordinance shall not affect the validity of the remainder.

605.0 Effective Date

This ordinance shall be in full force and effect from and after its passage and approval and publication, as required by law.

This ordinance shall be numbered as Ordinance No. 1748.

PASSED this 18th day of August, 1997.

- 4-10- 15: Stop-Work Order; Revocation of Permit
- 4-10- 16: Violations and Penalties

NOW, THEREFORE, BE IT ORDAINED BY THE PRESIDENT AND BOARD OF TRUSTEES OF THE VILLAGE OF PLAINFIELD, WILL COUNTY, ILLINOIS, AS FOLLOWS:

4-10-1:AUTHORITY: The Lowland Conservancy Overlay District is adopted by the Board of Trustees, pursuant to 65 Illinois Compiled Statutes 5/11-13-1.

4-10-2:SHORT TITLE: This Chapter shall be known and may be cited as the PLAINFIELD LOWLAND CONSERVANCY OVERLAY DISTRICT ORDINANCE.

4-10-3:PURPOSE AND INTENT: It is the purpose and intent of this Chapter to promote the health, safety and general welfare of the present and future residents of Plainfield and downstream drainage areas by providing for the protection, preservation, proper maintenance, and use of Plainfield watercourses, lakes, ponds, floodplain and wetland areas. This Chapter applies to all development within the Village. This Chapter is more specifically adopted:

- (A) To prevent flood damage by preserving storm and flood water storage capacity;
- (B) To maintain the normal hydrologic balance of streams, floodplains, ponds, lakes, wetlands, and groundwater by storing and providing for infiltration of wet-period runoff in floodplains and wetlands, and releasing it slowly to the stream to maintain in-stream flow;
- (C) To manage stormwater runoff and maintain natural runoff conveyance systems, and minimize the need for major storm sewer construction and drainageway modification;
- (D) To improve water quality, both by filtering and storing sediments and attached pollutants, nutrients, and organic compounds before they drain into streams or wetlands, and by maintaining the natural pollutant-assimilating capabilities of streams, floodplains and wetlands;
- (E) To protect shorelines and stream banks from soil erosion, using natural means and materials wherever possible;
- (F) To protect fish spawning, breeding, nursery and feeding grounds;
- (G) To protect wildlife habitat;
- (H) To preserve areas of special recreational, scenic, or scientific interest, including

natural areas and habitats of endangered species;

- (I) To maintain and enhance the aesthetic qualities of developing areas; and
- (J) To encourage the continued economic growth and high quality of life of the

Village which depends in part on an adequate quality of water, a pleasing natural environment, and recreational opportunities in proximity to the Village.

In order to achieve the purpose and intent of this Chapter, Village hereby designates the Lowland Conservancy Overlay District which shall be considered as an overlay to the zoning districts created by the Village zoning ordinances as amended. Any proposed development activity with the District must obtain a special use permit as approved by the governing body of the Village.

4-10-4:DEFINITIONS:

ARMORING: A form of channel modification which involves the placement of materials (concrete, riprap, bulkheads, etc.) within a stream channel or along a shoreline to protect property above streams, lakes, and ponds from erosion and wave damage caused by wave action and stream flow.

BULKHEAD: A retaining wall that protects property along water.

CHANNEL: A natural or artificial watercourse of perceptible extent that periodically or continuously contains moving water, or which forms a connecting link between two (2) bodies of water. It has a definite bed and banks that serve to contain the water.

CHANNEL MODIFICATION OR CHANNELIZATION: To alter a watercourse by changing the physical dimension or materials of the channel. Channel modification includes damming, riprapping (or other armoring), widening, deepening, straightening, relocating, lining and significant removal of bottom or woody vegetation. Channel modification does not include the clearing of debris or trash from the watercourse. Channelization is a severe form of channel modification involving a significant change in the channel cross-section and typically involving relocation of the existing channel (e.g., straightening).

CONTROL STRUCTURES: A structure designed to control the rate of stormwater runoff that passes through the structure, given a specific upstream and downstream water surface elevation.

CULVERT: A structure designed to carry drainage water or small streams

below barriers such as roads, driveways, or railway embankments.

DEPRESSION 1 AREA: Any area which is lower in elevation on all sides than surrounding properties (i.e., does not drain freely), or whose drainage is severely limited such as by a restrictive culvert. A depressional area will fill with water on occasion when run off into it exceeds rate of infiltration into underlying soil or exceeds the discharge through its controlled outlet. Large depressional areas may provide significant stormwater or floodplain storage.

DEVELOPMENT: The carrying out of any building, agricultural, or mining operation, or the making of any change in the use or appearance of land, and the dividing of land into two (2) or more parcels. The following

activities or uses shall be taken, for the purposes of this Chapter, to involve development as defined herein:

- (A) Any construction, reconstruction, or alteration of a structure to occupy more or less ground area, or the on-site preparation for same;
- (B) Any change in the intensity of use of land, such as an increase in the number of dwelling units on land; or a material increase in the site coverage of businesses, manufacturing establishments, offices, and dwelling units, including mobile homes, campers, and recreational vehicles, on land;
- (C) Any agricultural use of land including, but not limited to, the use of land in horticulture, floriculture, forestry, dairy, livestock, poultry, beekeeping, pisciculture, and all forms of farm products and farm production;
- (D) The commencement of drilling, except to obtain soil samples, or the commencement of mining, filling, excavation, dredging, grading or other alterations of the topography;
- (E) Demolition of a structure or redevelopment of a site;
- (F) Clearing of land as an adjunct of construction for agricultural, private residential, commercial or industrial use;

- (G) Deposit of refuse, solid or liquid waste, or fill on a parcel of land, or the storage of materials;
- (H) Construction, excavation, or fill operations relating to the creation or modification of any road, street, parking facility or any drainage canal, or to the installation of utilities or any other grading activity that alters the existing topography;
- (I) Construction or erection of dams, levees, walls, fences, bridges or culverts; and
- (J) Any other activity that might change the direction, height, or velocity of flood or surface waters.

DISTRICT: The Lowland Conservancy Overlay District as defined in Section 4-10-6-2 of this Chapter.

EROSION: The general process whereby soils are moved by flowing water or wave action.

FILTERED VIEW: The maintenance or establishment of woody vegetation of sufficient density to screen developments from a stream or wetland, to provide for streamback stabilization and erosion control, to serve as an aid to infiltration of surface runoff, and to provide cover to shade the water. The vegetation need not be so dense as to completely block the view. Filtered view means no clear cutting.

FLOODPLAIN: That land adjacent to a body of water with ground surface elevations at or below the 100-year frequency flood elevation.

FLOODWAY: That portion of the floodplain (sometimes referred to as the base floodplain or special flood hazard area) required to store and convey the base flood. The floodway is the 100-year floodway as designated and regulated by the Illinois Department of Transportation/Division of Water Resources. The remainder of the floodplain which is outside the regulatory floodway is referred to as the flood fringe or floodway fringe.

HYDRAULIC CHARACTERISTICS: The features of a watercourse which determine its water conveyance capacity. These features include but are not limited to: size and configuration of the cross-section of the watercourse and floodway; texture and roughness of materials along the watercourse; alignment of watercourse; gradient of watercourse; amount and type of vegetation within the watercourse; and size, configuration, and

other characteristics of structures within the watercourse. In low-lying areas the characteristics of the overbank area also determine water conveyance capacity.

LAKE OR POND: Any inland waterbody, fed by spring or surface water flow.

LOT: An area of land, with defined boundaries, that is designated in official assessor's records as being one parcel.

NATURAL: In reference to watercourses, means those stream channels, grassed waterways and swales formed by the existing surface topography of the earth prior to changes made by unnatural causes. A natural stream tends to follow a meandering path; its floodplain is not constrained by levees; the area near the bank has not been cleared, mowed or cultivated; the stream flows over soil and geologic materials typical of the area with no alteration of the course or cross-section of the stream caused by filling or excavating.

ORDINARY HIGH WATER MARK (OHWM): The point on the bank or shore up to which the presence and action of surface water is so continuous so as to leave a distinctive mark such as by erosion, destruction or prevention of terrestrial vegetation, predominance of aquatic vegetation, or other easily recognized characteristics.

QUALIFIED PROFESSIONAL: A person trained in one or more of the disciplines of biology, geology, soil science, engineering, or hydrology whose training and experience ensure a competent analysis and assessment of stream, lake, pond and wetland conditions and impacts.

REGISTERED PROFESSIONAL ENGINEER: A professional engineer registered under the provisions of "The Illinois Professional Engineering Act" and any act amendatory thereof.

RETENTION/DETENTION FACILITY: A facility that provides for storage of storm water runoff and controlled release of this runoff during and after a flood or storm.

RUNOFF: The portion of precipitation on the land that is not absorbed by the soil or plant material and which runs off the land.

SEDIMENTATION: The processes that deposit soils, debris, and other materials either on other ground surfaces or in water bodies or watercourses.

SETBACK: The horizontal distance between any portion of a structure or any

development activity and the ordinary high water mark of a perennial or intermittent stream, the ordinary high water mark of a lake or pond, or the edge of a wetland, measured from the structure's or development's closest point to the ordinary high water mark, or edge.

STREAM: A body of running water flowing continuously or intermittently in a channel on or below the surface of the ground; 7.5 minute topographic maps of the U.S. Geological Survey are one reference for identifying perennial and intermittent streams. For purposes of this Chapter, the term "stream" does not include storm sewers.

STRUCTURE: Anything that is constructed, erected or moved to or from any premises which is located above, on, or below the ground including, but not limited to roads, signs, billboards, and mobile homes. Temporary recreational facilities including, but not limited to, tents, camper trailers, and recreation vehicles are not considered structures when used less than one hundred eighty (180) days per year and located landward of the minimum setback provided as a natural vegetation strip.

VEGETATION: All plant growth, especially trees, shrubs, mosses, and grasses.

WATERCOURSE: Any river, stream, creek, brook, branch, natural or artificial depression, ponded area, slough, gulch, draw, ditch, channel, conduit, culvert, swale, grass waterway, gully, ravine, wash, or natural or man-made drainageway, which has a definite channel, bed and banks, in or into which stormwater runoff and floodwater flow either regularly or intermittently.

WETLAND: Those transitional lands between terrestrial and aquatic system where the water table is usually at or near the surface or the land is covered by shallow water. Classification or areas as wetlands shall follow the "Classification of Wetlands and Deepwater Habitats of the United States" as published by the U.S. Fish and Wildlife Service (FWS/OBS-79/31).

4-10-5:SPECIAL USE PERMIT: To ensure that proposed development activity can be carried out in a manner which is compatible and harmonious with the natural amenities of the Lowland Conservancy Overlay District and with surrounding land uses, a request for a special use permit for such development activity must be submitted for approval by the governing body of the Village.

No special use permit shall be issued unless the Village finds that:

- (A) The development will not detrimentally affect or destroy natural features such as ponds, streams, wetlands, and forested areas, nor impair their natural functions, but will preserve and incorporate such features into the development's site;
- (B) The location of natural features and the site's topography have been considered in the designing and siting of all physical improvements;
- (C) Adequate assurances have been received that the clearing of the site of topsoil, trees, and other natural features will not occur before the commencement of building operations; only those areas approved for the placement of physical improvements may be cleared;
- (D) The development will not reduce the natural retention storage capacity of any watercourse, nor increase the magnitude and volume of flooding at other locations; and that in addition, the development will not increase stream velocities; and
- (E) The soil and subsoil conditions are suitable for excavation and site preparation, and the drainage is designed to prevent erosion and environmentally deleterious surface runoff.

There shall be no development, including the immediate or future clearing or removal of natural ground cover and/or trees, within the Lowland Conservancy Overlay District for any purpose, unless a special use permit is granted subject to the provisions of this Chapter or the provisions of the Village Zoning Ordinance.

Dumping, filling, mining, excavating, dredging, or transferring of any earth material within the district is prohibited unless a special use permit is granted.

No ponds or impoundments shall be created nor other alterations or improvements shall be allowed in the district for recreational uses, storm water management, flood control, agricultural uses or as scenic features unless a special use permit is granted.

4-10-5-1: APPLICATION FOR PERMIT; FEE: Application for a special use permit shall be made by the owner of the property, or his/her authorized agent, to the Village on a form furnished for that purpose. Each application shall bear the name(s) and address(es) of the owner or developer of the site and of any consulting firm retained by the applicant

together with the name of the applicant's principal contact at such firm, and shall be accompanied by a filing fee of one hundred dollars (\$100.00). Each application shall include certification that any land clearing, construction, or development involving the movement of earth shall be in accordance with the plans approved upon issuance of the permit.

4-10-5-2: SUBMISSIONS: Each application for a special use permit shall be accompanied by the following information as specified in the sections cited:

General Provisions:

	Section
Site Development Plan	4-10-6-4
Geologic and Soil Report	4-10-6-5
Drainage Control Plan	4-10-6-6
Site Grading and Excavation Plan	4-10-6-7
Landscape Plan	4-10-6-8

Justification for Watercourse
Relocation and Minor Modifications:

Stream Modification/Relocation Plan	4-10-7-2
Channel and Bank Armoring	4-10-7-3
Culverts	4-10-7-4
On-Stream Impoundments	4-10-7-5
Impact Assessment (at option of the Village)	4-10-8

Where a proposed development activity is less than two and one-half (2 1/2) acres in area the Village, upon approval of the Village Engineer, may waive or simplify any or all of the submission requirements provided, that the person responsible for any such development shall implement necessary protection measures to satisfy the purpose and intent set forth in Section 4-10-3 of this Chapter.

4-10-5-3: BONDS: The applicant may be required to file with the Village a faithful performance bond or bonds, letter of credit, or other improvement security satisfactory to the Village Attorney, in an amount deemed sufficient by the Village to cover all costs of improvements, landscaping, or maintenance of improvements and landscaping, for such period as specified by the Village, and engineering and inspection costs to cover the cost of failure or repair of improvements installed on the site.

4-10-5-4: REVIEW AND APPROVAL: Each application for a special use permit shall be reviewed and acted upon according to the following procedures:

(A) The Village Board will review each application for a special use permit to determine its conformance with the provisions of this Chapter. The Board may also refer any application to the Will County Soil and Water Conservation District and/or any other local government or public agency within whose jurisdiction the site is located for review and comments. Within thirty (30) days after receiving an application, the Village Board shall in writing:

- 1) approve the permit application, if it is found to be in conformance with the provisions of this Chapter and issue the permit;
- 2) approve the permit application subject to such reasonable conditions as may be necessary to secure substantially the objectives of this Chapter, and issue the permit subject to these conditions; or
- 3) disapprove the permit application, indicating the deficiencies and the procedure for submitting a revised application and/or submission.

(B) No special use permit shall be issued for an intended development site unless:

1. The development, including but not limited to subdivisions and planned unit developments, has been approved by the Village where applicable; or
2. Such permit is accompanied by or combined with a valid building permit issued by the Village; or
3. The proposed development is coordinated with any overall development program previously approved by the Village for the area in which the site is situated.

(C) Failure of the Village to act on an original or revised application within thirty (30) days of receipt shall authorize the applicant to proceed in accordance with the plans as filed, unless such time is extended by agreement between the Village and the applicant. Pending preparation and approval of a revised plan, development activities shall be allowed to proceed in accordance with conditions established by the Village.

4-10-5-5: PERMIT EXCEPTIONS: The provisions of this Chapter shall not apply to:

- (A) Emergency work necessary to preserve life or property; when emergency work is performed under this Section, the person performing it shall report the pertinent facts relating to the work to the Village within ten (10) days after commencement of the work and shall thereafter obtain a special use permit and shall perform such work as may be determined by the agency to be reasonably necessary to correct any impairment to the watercourse, lake, pond, floodplain or wetland (in terms of the purposes of this Chapter, subsection 4-10-3(A) through (J));
- (B) Work consisting of the operation, repair, or maintenance of any lawful use of land existing on the date of adoption of the Ordinance codified in this Chapter;
- (C) Land adjacent to farm ditches if:
 - 1. Such lands are not adjacent to a natural stream or river; or
 - 2. Those parts of such drainage ditches adjacent to such lands were not streams before ditching; or
 - 3. Such lands are maintained in agricultural uses without buildings and structures.

Where farm ditches are found to contribute to adverse environmental impacts or hazards to persons or property, the Village may include designated farm ditches in the District. The Village may also require that linings, bulkheads, dikes and culverts to be removed to mitigate hazards, or that other mitigative measures be taken, such as the maintenance of a natural vegetation buffer strip.

4-10-5-6: EFFECT ON OTHER PERMITS: The granting of a special use permit under the provisions herein shall in no way affect the owner's responsibility to obtain the approval required by any other statute, ordinance, or regulation of any State agency or subdivision thereof, or to meet other Village ordinances and regulations. Where State and/or Federal permits are required, a special use permit will not be issued until they are obtained.

4-10-6: GENERAL PROVISIONS; AREA AFFECTED: This Chapter applies to development in or near streams, lakes, ponds and wetlands within the Village. Streams, lakes, and ponds (including intermittent streams) are

those which are shown on the United States Department of the Interior Geological Survey (USGS) 7.5 minute quadrangle maps and those additional streams, lakes, and ponds delineated on maps adopted as part of this Chapter. Those maps are hereby made a part of this Chapter, and two (2) copies thereof shall remain on file in the office of the Village Clerk for public inspection. Within the jurisdiction of the Village, those waterbodies and watercourses that are named and are subject to the provisions of this Chapter are: (list of waterbodies and watercourses). Wetlands are those designated in the U.S. Fish and Wildlife Service/Illinois Department of Conservation wetland inventory and those additional wetlands delineated on maps adopted as part of this Chapter.

If new drainage courses, lakes, ponds or wetlands are created as part of a development, the requirements for setbacks and uses within setbacks, and the criteria for watercourse relocation and minor modification shall apply. The District shall be amended as appropriate to include these areas.

4-10-6-1: **LOWLAND CONSERVANCY OVERLAY DISTRICT:** The Lowland Conservancy Overlay District shall be considered as an overlay to the zoning districts created by the Village Zoning Ordinance as amended. In addition to the requirements of this Chapter, applicants for a special use permit within the District shall meet all requirements of the underlying zoning districts. In the event of a conflict between the overlay district requirements and the underlying zoning district requirements, the most restrictive requirements prevail.

4-10-6-2: **DISTRICT BOUNDARY:** The procedures, standards and requirements contained in this Chapter shall apply to all lots within wetlands and streams, and all lots lying wholly or in part:

- (A) Within the special flood hazard area (SFHA) designated by the Federal Emergency Management Agency (FEMA); or
- (B) Within one hundred feet (100') of the ordinary high water mark (OHWM) of a perennial stream or intermittent stream, the ordinary high watermark of a lake or pond, or the edge of a wetland; or
- (C) Within depressional areas serving as floodplain or stormwater storage areas, as designated on the Lowland Conservancy District Map.

The District is designated on a map labeled "Lowland Conservancy Overlay District Map", which is made to be part of this Chapter and which has the same force and effect as if all the notations, references, and

descriptions shown thereon were set forth or described herein. Designated areas are shown on said Map which shall be and remain on file in the office of the Village Clerk, and additional areas may be approved from time to time and be made exhibits hereto.

4-10-6-3: MINIMUM SETBACK OF DEVELOPMENT ACTIVITY FROM STREAMS:

- (A) Minimum Setback: Absolutely no development activity (except as provided below) may occur within the minimum setback which is defined as seventy five feet (75') from the ordinary high water mark of streams, lakes and ponds, or the edge of wetlands, or within a designated depressional area. In no case shall the setback be less than the boundary of the 100-year floodway as defined by FEMA. These setback requirements do not apply to a stream in a culvert unless the stream is taken out of the culvert as part of development activity. If a culvert functions as a low-flow culvert, where water is intended to periodically flow over it, the setback requirements apply.

- (B) Development Activities: The following development activities may be permitted, subject to issuance of a special use permit, within the minimum setback areas only if, as a practical matter, they cannot be located outside the setback area. Such development activities will only be approved based upon a report, prepared by a qualified professional, which demonstrates that they will not adversely affect water quality; destroy, damage or disrupt significant habitat area, adversely affect drainage and/or stormwater retention capabilities; adversely affect flood conveyance and storage; lead to unstable earth conditions, create erosion hazards, or be materially detrimental to any other property in the area of the subject property or to the Village as a whole, including the loss of open space or scenic vistas:
 - 1. Minor improvements such as walkways, benches, comfort stations, informational displays, directional signs, foot bridges, observation decks, and docks;
 - 2. The maintenance, repair, replacement, and reconstruction of existing highways and bridges, electrical transmission and telecommunication lines, poles, and towers; and
 - 3. The establishment and development of public and private

parks and recreation areas, outdoor education areas, historic natural and scientific areas, game refuges, fish and wildlife improvement projects, game bird and animal farms, wildlife preserves and public boat launching ramps.

(C) Considerations: Review of the proposed development activity within the minimum setback area will consider the following:

1. Only limited filling and excavating necessary for the development of public boat launching ramps, swimming beaches, or the development of park shelters or similar structures is allowed. The development and maintenance of roads, parking lots and other impervious surfaces necessary for permitted uses are allowed only on a very limited basis, and where no alternate location outside of the setback area is available.
2. Land surface modification within the minimum setback shall be permitted for the development of stormwater drainage swales between the developed area of the site (including a stormwater detention facility on the site) and a stream, lake or pond, or wetlands detention basins within the setback are generally discouraged, unless it can be shown that resultant modification will not impair water quality, habitat, or flood storage functions.
3. No filling or excavating within wetlands is permitted except to install piers for the limited development of walkways and observation decks. Walkways and observation decks should avoid high quality wetland areas, and should not adversely affect natural areas designated in the Illinois Natural Areas Inventory or the habitat of rare or endangered species.
4. Wetland area occupied by the development of decks and walkways must be mitigated by an equal area of wetland habitat improvement.
5. Modification of degraded wetlands for purposes of stormwater management is permitted where the quality of the wetland is improved and total wetland acreage is preserved. Where such modification is permitted, wetlands shall be protected from the effects of increased

stormwater runoff by measures such as detention or sedimentation basins, vegetated swales and buffer strips, and sediment and erosion control measures on adjacent developments. the direct entry of storm sewers into wetlands shall be avoided. Environmental impact analysis of wetland

modification may be required in accordance with Section 4-10-8 of this Chapter.

(D) Applicants For Special Use Permit:

1. An applicant for a special use permit must stabilize areas left exposed after land surface modification with vegetation normally associated with that stream or wetland. The planting of native riparian vegetation is recommended as the preferred stabilization measure. Other techniques should be used only when and where vegetation fails to control erosion. The preferred alternative is riprap, using natural rock materials where practicable, installed on eroding bank areas in a manner that provides interstitial space for vegetative growth and habitat for macroinvertebrates and other stream organisms. Lining of the stream channel bottom is not permitted.
2. The applicant shall minimize access to the applicant's proposed development activity within all or part of the Lowland Conservancy Overlay District where such access could adversely affect the stream, lake, pond, wetland, or related environmentally sensitive areas.

4-10-6-4: SITE DEVELOPMENT PLAN: A site development plan must be prepared for any proposed development within, or partly within, the Lowland Conservancy Overlay District and must indicate:

- (A) Dimension and area of parcel, showing also the vicinity of the site in sufficient detail to enable easy location, in the field, of the site for which the special use permit is sought, and including the boundary line, underlying zoning, a legend, a scale, and a north arrow (this requirement may be satisfied by the submission of a separate vicinity map);
- (B) Location of any existing and proposed structures;

- (C) Location of existing or proposed on-site sewage systems or private water supply systems;
- (D) Location of any perennial or intermittent stream, lake or pond, and its ordinary high water mark;
- (E) Location and landward limit of all wetlands;
- (F) Location of setback lines as defined in this Chapter;
- (G) Location of the 100-year floodway;
- (H) Location of existing or future access roads;
- (I) Specifications and dimensions of stream, wetland or other water areas proposed for alterations;
- (J) Cross-sections and calculations indicating any changes in flood storage volumes; and
- (K) Such other information as reasonably requested by Village.

The applicant shall present evidence, prepared by a qualified professional, that demonstrates that the proposed development activity will not endanger health and safety, including danger from the obstruction or diversion of flood flow. The developer shall also show, by submitting appropriate calculations and resource inventories, that the proposed development activity will not substantially reduce natural floodwater storage capacity, destroy valuable habitat for aquatic or other flora and fauna, adversely affect water quality or ground water resources, increase stormwater runoff velocity so that water levels on other lands are substantially raised or the danger from flooding increased, or adversely impact any other natural stream, floodplain, or wetland functions, and is otherwise consistent with the intent of this Chapter.

4-10-6-5: **GEOLOGIC AND SOIL CHARACTERISTICS; REPORT:** The site proposed for development shall be investigated to determine the soil and geologic characteristics, including soil erosion potential. A report, prepared by a licensed professional engineer, geoscientist, or soil scientist experienced in the practice of geologic and soil mechanics, shall be submitted with every application for land development within the Lowland Conservancy Overlay District. This report shall include a description of soil type and stability of surface and subsurface conditions. Any area which the investigation indicates as being subject to geologic or

soil hazards shall not be subjected to development, unless the engineer or soil scientist can demonstrate conclusively that these hazards can be overcome.

4-10-6-6: HYDROLOGIC CONTROLS/DRAINAGE CONTROL PLAN:

A drainage control plan that describes the hydraulic characteristics of on-site and nearby watercourses as well as the proposed drainage plan, prepared by a registered professional engineer experienced in hydrology and hydraulics, shall be submitted with each application for land development within the Lowland Conservancy Overlay District. Unless otherwise noted, the following restrictions, requirements and standards shall apply to all development within the Lowland Conservancy Overlay District:

- (A) Natural open-channel drainageways shall be preserved; and
- (B) Runoff from areas of concentrated impervious cover (e.g., roofs, driveways, streets, patios, etc.) shall be collected and transported to a drainageway (preferably a natural drainageway) with sufficient capacity to accept the discharge without undue erosion or detrimental impact. Vegetated drainage swales are preferred over conveyances constructed of concrete or other manufactured materials.

The drainage control plan shall identify appropriate measures, such as recharge basins and detention/retention basins, which will limit the quantitative and qualitative effects of stormwater runoff to pre-development conditions.

4-10-6-7: SITE GRADING AND EXCAVATION PLAN: Section 4-10-6-7 applies to the extent that grading and excavation and erosion control plans, which satisfy the following requirements, are not already required by a jurisdiction.

- (A) Application; Contents of Plan: A site grading and excavation plan, prepared by a registered professional engineer, trained and experienced in civil engineering, shall be submitted with each application for a special use permit and shall include the following:
 - 1. Details of the existing terrain and drainage pattern with one foot (1') contours;
 - 2. Proposed site contours at one foot (1') intervals;

3. Dimensions, elevation and contours of grading, excavation and fill;
 4. A description of methods to be employed in disposing of soil and other materials that is removed from allowable grading and excavation sites, including location of the disposal site if on the property;
 5. A schedule showing when each stage of the project will be completed, including the total area of soil surface to be disturbed during each stage, and estimated starting and completion dates. The schedule shall be prepared so as to limit, to the shortest possible period, the time soil is exposed and unprotected. In no case shall the existing natural vegetation be destroyed, removed or disturbed more than fifteen (15) days prior to initiation of the improvements; and
 6. A detailed description of the re-vegetation and stabilization methods to be employed, to be prepared in conjunction with the landscape plan per Section 4-10-6-8. This description should include locations of erosion control measures such as sedimentation basins, straw bales, diversion swales, etc.
- (B) Compliance With Chapter: The grading and excavation plan must be consistent with all the provisions of this Chapter.
- (C) Restrictions and Requirements: Unless otherwise provided in this Chapter, the following restrictions, requirements and standards shall apply to all development within the District:
1. Every effort shall be made to develop the site in such a manner so as to minimize the alteration of the natural topography;
 2. No grading, filling, cleaning, clearing, terracing or excavation of any kind shall be initiated until final engineering plans are approved and the special use permit is granted by the Village; and
 3. The depositing of any excavation, grading or clearing material within a stream, lake, pond or

wetland area (i.e., within the District) shall be prohibited.

- (D) **Installation of Physical Barrier:** In addition to locating all site improvements on the subject property to minimize adverse impacts on the stream, lake, pond, or wetland, the applicant shall install a berm, curb, or other physical barrier during construction, and following completion of the project, where necessary, to prevent direct runoff and erosion from any modified land surface into a stream, lake, pond, or wetland. All parking and vehicle circulation areas should be located as far as possible from a stream, lake, pond or wetland.
- (E) **Limit Activity:** The Village may limit development activity in or near a stream, lake, pond, or wetland to specific months, and to a maximum number of continuous days or hours, in order to minimize adverse impacts. Also, the Village may require that equipment be operated from only one side of a stream, lake, or pond in order to minimize bank disruption. Other development techniques, donations, and restrictions may be required in order to minimize adverse impacts on streams, lakes, ponds or wetlands, and on any related areas not subject to development activity.

4-10-6-8: **NATURAL VEGETATION BUFFER STRIP REQUIRED:** To minimize erosion, stabilize the streambank, protect water quality, maintain water temperature at natural levels, preserve fish and wildlife habitat, to screen man-made structures, and also to preserve aesthetic values of the natural watercourse and wetland areas, a natural vegetation strip shall be maintained along the edge of the stream, lake, pond or wetland. The natural vegetation strip shall extend landward a minimum of twenty five feet (25') from the ordinary high water mark of a perennial or intermittent stream, lake or pond and the edge of a wetland.

Within the natural vegetation strip, trees and shrubs may be selectively pruned or removed for harvest of merchantable timber, to achieve a filtered view of the waterbody from the principal structure and for reasonable private access to the stream, lake, pond or wetland. Said pruning and removal activities shall ensure that a live root system stays intact to provide for streambank stabilization and erosion control.

A landscape plan, prepared by a professional landscape architect, shall be submitted with each special use permit application for development activity within the Lowland Conservancy Overlay District and contain the following:

- (A) A plan describing the existing vegetative cover of the property and showing those areas where the vegetation will be removed as part of the proposed construction; and
- (B) A plan describing the proposed re-vegetation of disturbed areas specifying the materials to be used. The vegetation must be planned in such a way that access for stream maintenance purposes shall not be prevented.

4-10-7: WATERCOURSE RELOCATION AND MINOR MODIFICATIONS:

Watercourse relocation or modification is generally not permitted because these activities are not usually consistent with the purposes of this Chapter. Under certain circumstances, relocation and minor modification may be permitted through a special use permit where certain problems can be mitigated by relocation and/or minor modification, specifically when:

- (A) Off-site hydrologic conditions are causing erosion, flooding and related problems; or
- (B) On-site soil and geologic conditions are resulting in unstable conditions that pose hazards to life, health, and existing structures or property; or
- (C) The quality of previously modified or relocated streams can be improved through restoration; or
- (D) Officially adopted stormwater management plans call for placement of detention or retention facilities in a stream; or
- (E) Public utilities, including sanitary sewers, pipelines, and roadways require stream crossing or relocation where there are not practical alternatives.

Modifications of watercourses as a convenience for site design purposes is not permitted.

4-10-7-1: PERMITTING STREAM MODIFICATION: Stream modification, when permitted, is subject to the following conditions and restrictions:

- (A) Water quality, habitat and other natural functions must be significantly improved by the modification; no significant habitat area may be destroyed;

- (B) The amount of flow and velocity of a stream is not to be increased or decreased as the stream enters or leaves a subject property, unless this reflects an improvement over previous conditions in terms of reduced flooding, reduced erosion, or enhanced low-flow conditions;
- (C) Prior to diverting water into a new channel, a qualified professional approved by the Village shall inspect the stream modification, and issue a written report to the Village that the modified stream complies with the requirements of Section 4-10-7-2; and
- (D) Stream channel enlargement, or other modifications that would increase conveyance, shall not be permitted if the intended purpose is to accommodate development activities in the floodplain.

4-10-7-2: CONTENT OF STREAM MODIFICATION/RELOCATION PLAN: Stream relocation may be permitted in accordance with a stream relocation plan which provides for:

- (A) The creation of a natural meander pattern, pools, riffles, substrate;
- (B) The formation of gentle side slopes (at least 3 feet horizontally per 1 foot vertically), including installation of erosion control features;
- (C) The utilization of natural materials wherever possible;
- (D) The planting of vegetation normally associated with streams, including primarily native riparian vegetation;
- (E) The creation of spawning and nesting areas wherever appropriate;
- (F) The reestablishment of the fish population wherever appropriate;
- (G) The restoration of water flow characteristics compatible with fish habitat areas, wherever appropriate;
- (H) The filling and re-vegetation of the prior channel;
- (I) A proposed phasing plan, specifying time of year for all project phases;
- (J) Plans for sediment and erosion control; and

- (K) Establishment of a low-flow channel which reflects the conditions of a natural stream.

4-10-7-3: ARMORING OF CHANNELS AND BANKS: Armoring in the form of bulkheads, riprap or other materials or devices is not permitted except in accordance with the following:

- (A) Significant erosion cannot be prevented in any other way and the use of vegetation and gradual bank slopes has not sufficiently stabilized the shoreline or bank;
- (B) The bulkhead or other device is not placed within a wetland, or between a wetland and a lake or pond;
- (C) The bulkhead, riprap or other device will minimize the transmittal of wave energy or currents to other properties; and
- (D) The exchange in the horizontal or vertical configuration of the land must be kept to a minimum.

Where permission to install bulkheads or other armoring devices is requested as part of the special use permit application, documentation and certification pertaining to the items above must be submitted.

4-10-7-4: USE OF CULVERTS: Culverts are not permitted in streams except in accordance with the following:

- (A) Where a culvert is necessary for creating access to a property; use of culverts as a convenience, in order to facilitate general site design, is not to be considered.
- (B) The culvert must allow passage of fish inhabiting the stream, and accommodate the 100-year flood event without increasing upstream flooding, except where a restricting culvert is desirable as part of an overall storm and floodwater management plan;
- (C) The culvert must be maintained free of debris and sediment to allow free passage of water, and if applicable, fish; and
- (D) The stream bottom should not be significantly widened for the placement of a culvert as this increases siltation; if multiple culverts must be installed, one culvert should be at the level of the bottom of the stream and the others at or above normal water elevation.

4-10-7-5: ON-STREAM IMPOUNDMENTS: Impoundment of streams is not permitted except in accordance with the following:

- (A) The impoundment is determined to be in the public interest by providing regional stormwater detention, flood control, or public recreation;
- (B) The impoundment will not prevent the upstream migration of indigenous fish species;
- (C) A nonpoint source control plan has been implemented in the upstream watershed to control the effects of sediment runoff as well as minimized the input of nutrients, oil and grease, metals, and other pollutants;
- (D) Impoundments without permanent low-flow pools are preferred except where a permanent pool is necessary to achieve the intended benefits of the impoundment (e.g., recreation or water quality mitigation); and
- (E) Impoundment design shall include gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin.

4-10-8: IMPACT ASSESSMENT: The Village may ask an applicant to submit a report prepared by a qualified professional, and approved by the Village, in order to assess the potential impact of proposed development on a lake, stream or wetland and associated environmentally sensitive areas, including loss of flood storage potential, loss of habitat, changes in species diversity and quantity, impacts on water quality, increases in human intrusion, and impacts on associated streams, lakes, ponds, wetlands or downstream areas.

4-10-9: STREAM MAINTENANCE EASEMENT: The applicant shall grant an access easement for stream maintenance purposes to the Village over twenty five feet (25') parallel to the stream bank.

4-10-10: BONDS: The Village may required the posting of a bond or surety to ensure compliance with any aspect of this Chapter.

4-10-11: LIABILITY: Prior to issuance of a construction permit, the applicant shall enter into an agreement with the Village which runs with the property, in a form acceptable to the Village Attorney, indemnifying the Village for any damage resulting from development activity on the subject property which is related to the physical condition of the stream or

wetland.

4-10-12: **SEPARABILITY:** Every section, provision, or part of this Chapter is declared separable from every other section, provision, or part; and if any section, provision, or part thereof shall be held invalid, it shall not affect any other section, provision, or part.

4-10-13: **RETROACTIVITY:** The requirements of this Chapter apply to all platted and unplatted lands within the jurisdiction of the Village.

4-10-14: **ENFORCEMENT:** Authority for administration of this Chapter resides with the Village Board.

4-10-15: **STOP-WORK ORDER; REVOCATION OF PERMIT:** In the event any person holding a special use permit pursuant to this Chapter violates the terms of the permit, or carries on-site development in such a manner so as to materially and adversely affect the health, welfare, or safety of persons residing or working in the neighborhood of the development site, or so as to be materially detrimental to the public welfare or injurious to property or improvements in the neighborhood, the Village may suspend or revoke the special use permit.

(A) Suspension of a permit shall be by a written stop-work order issued by the Village and delivered to the permittee or his agent or the person performing the work. The stop-work order shall be effective immediately, shall state the specific violations cited, and shall state the conditions under which work may be resumed. A stop-work order shall remain in effect until the next regularly scheduled meeting of the Village Board, at which the conditions of subsection (B) below can be met.

(B) No special use permit shall be permanently suspended or revoked until a hearing is held by the Village Board. Written notice of such hearing shall be served on the permittee, either personally or by registered mail, and shall state:

1. The grounds for complaint or reasons for suspension or revocation, in clear and concise language; and
2. The time when and place where such hearing will be held.

Such notice shall be served on the permittee at least five (5) days prior to the date set for the hearing. At such hearing, the permittee shall be given an opportunity to be heard and may call witnesses

and present evidence on his/her behalf. At the conclusion of the hearing the Village Board shall determine whether the permit shall be suspended or revoked.

4-10-16: VIOLATIONS AND PENALTIES: No person shall undertake or continue any development activity contrary to or in violation of any terms of this Chapter. Any person violating any of the provisions of this Chapter shall be deemed guilty of an ordinance violation, and each day during which any violation of any of the provisions of this Chapter is committed, continued, or permitted shall constitute a separate offense. Upon conviction of any such violation, such person, partnership, or corporation shall be punished by a fine of not more than one thousand dollars (\$1000.00) for each offense. In addition to any other penalty authorized by this Section, any person, partnership, or corporation convicted by violating any of the provisions of this Chapter shall be required to restore the site to the condition existing prior to commission of the violation, or to bear the expense of such restoration.

4-10-17: EFFECTIVE DATE:

This ordinance shall be in full force and effect from and after its passage and approval and publication, as required by law.

This ordinance shall be numbered as Ordinance No. 1749.

Section 3-9-4:

STORMWATER DRAINAGE & DETENTION ORDINANCE

NOW, THEREFORE, BE IT ORDAINED BY THE PRESIDENT AND BOARD OF TRUSTEES OF THE VILLAGE OF PLAINFIELD, WILL COUNTY, ILLINOIS, AS FOLLOWS:

100.0 Authority and Purpose

This ordinance is enacted pursuant to the police powers granted to Will County, Village of Plainfield, by the Illinois Compiled Statutes (Chapter 65, Sections 5\11-12-5,6 and 12; 5\11-13-1; 11-14-1; 5\11-30-2 and 8; 5\11-105-1; 5\11-109-1; 5\11-110-1; and Chapter 50, Section 815\1.)

The purpose of this ordinance is to diminish threats to public health, safety and welfare caused by runoff of excessive stormwater from new development and redevelopment in the Village. This excessive stormwater could result in the inundation of damageable properties, the erosion and destabilization of downstream channels, and the pollution of valuable stream and lake resources. The cause of increases in stormwater runoff quantity and rate and impairment of quality is the development and improvement of land and as such this ordinance regulates these activities to prevent adverse impacts.

This ordinance is adopted to accomplish the following objectives:

- 100.1 To insure that new development does not increase the drainage or flood hazards to others, or create unstable conditions susceptible to erosion;
- 100.2 To protect new buildings and major improvements to buildings from flood damage due to increased stormwater runoff;
- 100.3 To protect human life and health from the hazards of increased flooding on a watershed basis;
- 100.4 To lessen the burden on the taxpayer for flood control projects, repairs to flood damaged public facilities and utilities, correction of channel erosion problems, and flood rescue and relief operations caused by increased

stormwater runoff quantities from new development;

- 100.5 To protect, conserve, and promote the orderly development of land and water resources;
 - 100.6 To preserve the natural hydrologic and hydraulic functions of watercourses and flood-plains and to protect water quality and aquatic habitats;
 - 100.7 To preserve the natural characteristics of stream corridors in order to moderate flood and stormwater impacts, improve water quality, reduce soil erosion, protect aquatic and riparian habitat.
 - 100.8 To enhance community aesthetics by promoting establishment of nontidal wetlands for recreational, environmental and ecological benefits.
- 200.0 Definitions
- 200.1 **ADVERSE IMPACTS:** Any deleterious impact on water resources or wetlands affecting their beneficial uses including recreation, aesthetics, aquatic habitat, quality, and quantity.
 - 200.2 **APPLICANT:** Any person, firm, or governmental agency who executes the necessary forms to procure official approval of a development or permit to carry out construction of a development from the Village of Plainfield.
 - 200.3 **BASE FLOOD ELEVATION:** The elevation at all locations delineating the level of flooding resulting from the 100 year frequency flood event.
 - 200.4 **BEST MANAGEMENT PRACTICE (BMP):** A measure used to control adverse stormwater-related effects. BMPs include devices such as swales, filter strips, infiltration trenches, and detention basins designed to remove pollutants, reduce runoff rates and volumes, and protect aquatic habitats.
 - 200.5 **BYPASS FLOWS:** Stormwater runoff from upstream properties tributary to a property's drainage system but not under its control.
 - 200.6 **CHANNEL:** Any river, stream, creek, brook, branch, natural or artificial depression, ponded area, flowage, slough, ditch, conduit, culvert, gully, ravine, wash, or natural or manmade drainageway, which has a definite bed and bank or shoreline, in or into which surface or groundwater flows, either perennially or intermittently.
 - 200.7 **CHANNEL MODIFICATION:** Alteration of a channel by changing the

physical dimensions or materials of its bed or banks. Channel modification includes damming, riprapping (or other armoring), widening, deepening, straightening, relocating, lining, and significant removal of bottom or woody rooted vegetation. Channel modification does not include the clearing of debris or removal of trash.

200.8 COMPENSATORY STORAGE: An artificially excavated, hydraulically equivalent volume of storage within the floodplain used to balance the loss of natural flood storage capacity when fill or structures are placed within the floodplain.

200.9 CONDUIT: Any channel, pipe, sewer or culvert used for the conveyance or movement of water, whether open or closed.

200.10 DETENTION BASIN: A facility constructed or modified to provide for the temporary storage of stormwater runoff and the controlled release by gravity of this runoff at a prescribed rate during and after a flood or storm.

200.11 DETENTION TIME: The mean residence time of stormwater in a detention basin.

200.12 DEVELOPMENT:

Any man-made change to real estate, including;

- a. Preparation of a plot or subdivision;
- b. Construction, reconstruction or placement of building or any addition to a building;
- c. Installation of a manufactured home on a site, preparing a site for a manufactured home, or installing a travel trailer on a site for more than 180 days;
- d. Construction of roads, bridges, or similar projects;
- e. Redevelopment of a site;
- f. Filling, dredging, grading, clearing, excavating, paving, or other non-agricultural alterations of the ground surface;
- g. Storage of materials or deposit of solid or liquid waste; and
- h. Any other activity that might alter the magnitude, frequency, deviation, direction, or velocity of stormwater flows from a

property.

- 200.13 DRAINAGE PLAN: A plan, including engineering drawings and supporting calculations, which describes the existing stormwater drainage system and environmental features, as well as the drainage system and environmental features which are proposed after development of a property.
- 200.14 DRY BASIN: A detention basin designated to drain completely after temporary storage of stormwater flows and to normally be dry over the majority of its bottom area.
- 200.15 EROSION: The general process whereby earth is removed by flowing water or wave action.
- 200.16 EXCESS STORMWATER RUN-OFF: The volume and rate of flow of stormwater discharged from an urbanized drainage area which is or will be in excess of that volume and rate which pertained before urbanization.
- 200.17 FLOODPLAIN: The land adjacent to a body of water with ground surface elevations at or below the base flood or the 100-year frequency flood elevation. The floodplain is also known as the Special Flood Hazard Area (SFHA).
- 200.18 FLOOD FRINGE: That portion of the floodplain outside of the regulatory floodway.
- 200.19 FLOODWAY: The channel and that portion of the floodplain adjacent to a stream or watercourse which is needed to store and convey the anticipated existing and future 100-year frequency flood discharge with no more than a 0.1 foot increase in stage due to any loss of flood conveyance or storage and no more than a ten percent increase in velocities.
- 200.20 HYDROGRAPH: A graph showing for a given location on a stream or conduit, the flow rate with respect to time.
- 200.21 INFILTRATION: The passage or movement of water into the soil surfaces.
- 200.22 MAJOR DRAINAGE SYSTEM: That portion of a drainage system needed to store and convey flows beyond the capacity of the minor drainage system.
- 200.23 MINOR DRAINAGE SYSTEM: That portion of a drainage system

designed for the convenience of the public. It consists of street gutters, storm sewers, small open channels, and swales and, where manmade, is designed to handle a minimum of the 10-year runoff event.

200.24 MITIGATION: Mitigation includes those measures necessary to minimize the negative effects which stormwater drainage and development activities might have on the public health, safety and welfare. Examples of mitigation include compensatory storage, soil erosion and sedimentation control, and channel restoration.

200.25 NATURAL: Conditions resulting from physical, chemical, and biological processes without intervention by man.

200.26 ONE HUNDRED-YEAR EVENT: A rainfall, runoff, or flood event having a one percent change of occurring in any given year.

200.27 POSITIVE DRAINAGE: Provision for overland paths for all areas of a property including depressional areas that may also be drained by storm sewer.

200.28 PEAK FLOW: The maximum rate of flow of water at a given point in a channel or conduit.

200.29 PROPERTY: A parcel of real estate.

200.30 REGULATORY FLOODWAY: The channel, including on-stream lakes, and that portion of the floodplain adjacent to a stream or watercourse as designated by DWR, which is needed to store and convey the existing and anticipated future 100-year frequency flood discharge with no more than a 0.1 foot increase in stage due to the loss of flood conveyance or storage, and no more than a ten percent increase in velocities. The regulatory floodways are designated for the DuPage River, Lily Cache Creek, Springhole Creek, East Norman Drain, and West Norman Drain, on the Flood Boundary and Floodway Map prepared by FEMA (or Department of Housing and Urban Development) and dated September 6, 1995. The regulatory floodways for those parts of unincorporated jurisdiction of the Village that may be annexed into the Village are designated for the DuPage River, Lily Cache Creek, Springhole Creek, East Norman Drain and West Norman Drain on the Flood Boundary and Floodway map prepared by FEMA (or department of Housing and Urban Development) and dated September 6, 1995. To locate the regulatory floodway boundary on any site, the regulatory floodway boundary should be scaled off the regulatory floodway map and located on a site plan, using reference marks common to both maps. Where interpretation is needed to determine the

exact location of the regulatory floodway boundary, the Division should be contacted for the interpretation.

200.31 RETENTION BASIN: A facility designed to completely retain a specified amount of stormwater runoff without release except by means of evaporation, infiltration, emergency bypass or pumping.

200.32 SEDIMENTATION: The process that deposits soils, debris, and other materials either on other ground surfaces or in bodies of water or stormwater drainage systems.

200.33 STORMWATER DRAINAGE SYSTEM: All means, natural or man-made, used for conducting stormwater to, through or from a drainage area to the point of final outlet from a property. The stormwater drainage system includes but is not limited to any of the following: conduits and appurtenance features, canals, channels, ditches, streams, culverts, streets, storm sewers, detention basins, swales and pumping stations.

200.34 STORMWATER RUNOFF: The waters derived from melting snow or rain falling within a tributary drainage basin which are in excess of the infiltration capacity of the soils of that basin, which flow over the surface of the ground or are collected in channels or conduits.

200.35 STORM SEWER: A closed conduit for conveying collected stormwater.

200.36 TIME OF CONCENTRATION: The elapsed time for stormwater to flow from the most hydraulically remote point in a drainage basin to a particular point of interest in that watershed.

200.37 TRIBUTARY WATERSHED: All of the land surface area that contributes runoff to a given point.

200.38 TWO-YEAR EVENT A runoff, rainfall, or flood event having a fifty percent chance of occurring in any given year.

200.39 WET BASIN: A detention basin designed to maintain a permanent pool of water after the temporary storage of stormwater runoff.

300.0 Stormwater Detention

A combination of storage and controlled release of stormwater runoff shall be required for all non-residential developments of two or more acres, for all multi-family developments of two or more acres, all single family subdivisions of five or more acres, and for all sites involving

improvements which have and will have impervious areas of 50% of gross lot area or greater. In cases where improvements will be made to facilities existing prior to the date of this ordinance, the percent of imperviousness will be based on the entire parcel. If this percentage is 50% or greater, the storm water detention requirement shall be applied only to the portion of the parcel being improved.

For properties which are not required to have stormwater release and storage structures per this section, Best Management Practices, for pollutant removal and runoff minimization should be applied.

400.0 Drainage Plan Submittal Requirements

Each applicant shall submit the following information, depending on development size, to ensure that the provisions of this ordinance are met. The submittal shall include sufficient information to evaluate the environmental characteristics of the property, the potential adverse impacts of the development on water resources both on-site and downstream, and the effectiveness of the proposed drainage plan in managing stormwater runoff. The applicant shall certify on the drawings that all clearing, grading, drainage, and construction shall be accomplished in strict conformance with the drainage plan. The following information shall be submitted for both existing and proposed property conditions. All information and data required and submitted shall be prepared by and bear the seal of registered Illinois Professional Engineer.

Properties smaller than 10 acres shall submit only the Basic Drainage Plan called for in Section 401.0. Properties larger than 10 acres shall comply with the submittal requirements of both the Basic Drainage Plan and the Advanced Drainage Plan of Section 402.0.

401.0 Basic Drainage Plan

401.1 Topographic Map: A topographic survey of the property at one-foot contours under existing and proposed conditions, and areas upstream and downstream, necessary to determine off-site impacts of the proposed drainage plan. The map shall be keyed to a consistent datum specified by the Village of Plainfield.

401.2 Drainage System: Mapping and descriptions, where relevant, of existing and proposed drainage system features of the property and immediate vicinity including:

- a. the banks and centerline of streams and channels;

- b. shoreline of lakes, ponds, and detention basins;
- c. farm drains and tiles;
- d. sub-watershed boundaries within the property;
- e. watershed soils classifications;
- f. the property's location within the larger watershed;
- g. location, size and slope of stormwater conduits and drainage swales;
- h. sanitary sewers;
- i. depressional storage areas;
- j. delineation of upstream and downstream drainage features and watersheds which might be affected by the development;
- k. detention facilities;
- l. roads and streets and associated stormwater inlets;
- m. base flood elevation, and regulatory floodway where identified for the property; and
- n. basis of design for the final drainage network components.

401.3 Environmental Features: A depiction of environmental features of the property and immediate vicinity including the following:

- a. the limits of wetland areas;
- b. any designated natural areas; and
- c. any proposed environmental mitigation features.

402.0 Advanced Drainage Plan

The same information as required in Section 401.0 is required for properties larger than 10 acres along with the following additional

information for the minor drainage system's design runoff event and the 100-year event of critical duration:

- a. elevations and maps of 100-year flooding;
- b. cross-section data for open channel flow paths and designated overland flow paths;
- c. direction of stormflows;
- d. flow rates and velocities at representative points in the drainage system; and
- e. a statement by the design engineer of the drainage system's provisions for handling events greater than that 100-year's runoff.

500.0 Minimization of Increases in Runoff Volumes and Rates

It is the policy of the Plan Commission to encourage design of storm water runoff systems that help retain and maximize the ground water recharge capacity of the area being developed. Wherever possible the subdivider shall give consideration to providing compensatory recharge for the reduction in percolation which occurs when ground surface is paved or roofed over. The use of natural gravel deposits for the lower portions of storm runoff storage areas, the flattening of drainage slopes and the retention of natural topography are examples of possible recharge methods.

In the selection of a drainage plan for a development, the applicant shall evaluate and implement, where practicable, site design features which minimize the increase in runoff volumes and rates from the site. The applicant's drainage plan submittal shall include evaluations of site design features which are consistent with the following hierarchy:

1. Minimize impervious surfaces on the property, consistent with the needs of the project;
2. Attenuate flows by use of open vegetated swales and natural depressions so as to reduce runoff rates and volumes, protect aquatic habitats and remove pollutants, and preserve existing natural stream channels;
3. Infiltrate runoff on-site;

4. Provide stormwater retention structures;
5. Utilize wetland detention basins;
6. Provide stormwater detention structures; and
7. Construct storm sewers.

600.0 Water Quality and Multiple Uses

The drainage system should be designed to minimize adverse water quality impacts downstream and on the property itself. Detention basins shall incorporate design features to capture stormwater runoff pollutants and preference shall be given to wetland systems and wet basins over dry basin designs. Retention and infiltration of stormwater shall be promoted throughout the property's drainage system to reduce the volume of stormwater runoff and to reduce the quantity of runoff pollutants. Best Management Practices (BMP) including structural devices (e.g. swales, filter strips, infiltration trenches, and detention basins) designed to remove pollutants, reduce runoff rates and volumes, and protect aquatic habitats shall be used. All flows from the site shall be routed through the basin(s).

The drainage system should incorporate multiple uses where practicable. Uses considered compatible with stormwater management include open space, aesthetics, aquatic habitat, recreation (boating, trails, playing fields), wetlands and water quality mitigation. The applicant should avoid using portions of the property exclusively for stormwater management.

700.0 Design Criteria, Standards, and Methods

701.0 Release Rates:

- a. The drainage system for a property shall be designed to control the peak rate of discharge from the property for the two-year, 24-hour and 100-year, 24-hour events to levels which will not cause an increase in flooding or channel instability downstream when considered in aggregate with other developed properties and downstream drainage capacities. The peak discharge from events less than or equal to the two-year event shall not be greater than 0.04 cfs per acre of property drained. The peak 100-year discharge shall not be greater than 0.15 cfs per acre of property drained. The peak 100-year discharge shall not be greater than 0.15 cfs per acre of property drained.

- b. Should downstream sewers, streams and channels be found by the Village Engineer to be inadequate to receive the release rate provided herein, the allowable release rate shall be reduced to that rate permitted by the receiving downstream sewers and channels. Additional detention, as determined by the Village Engineer, shall be required to store that portion of the runoff exceeding the capacity of the receiving sewers and channels.

701.1 Detention Basin Outlet Design: Backwater on the outlet structure from the downstream drainage system shall be evaluated when designing the outlet.

702.0 Detention Storage Requirements: The design maximum storage to be provided in a detention basin shall be based on the runoff from the 100-year, 24-hour event and reservoir (also called modified plus or level pool) routing or equal. Detention storage shall be computed using hydrograph methods as described in this section.

703.0 Drainage System Design and Evaluation: The following criteria should be used in evaluating and designing the drainage system. The underlying objective is to provide capacity to pass the 10-year peak flow in the minor drainage system and an overload flow path for flows in excess of the design capacity.

703.1 Design Methodologies:

- a. Major and minor conveyance systems for all developments ten acres or less may be designed using the Rational Method with a release rate not to exceed 0.15 cfs/acre for the 100-year storm.
- b. Major drainage systems for all developments greater than ten acres must be designed by Runoff Hydrograph methods as described in Section 704.0 with release rates not to exceed 0.04 cfs/acre for the 2-year storm and 0.15 cfs/acre for the 100-year storm, except where it can be shown that said methods result in a greater than ten percent loss of developable land (gross-acreage less any floodplain, wetlands, or other areas recognized as undevelopable by the Board) in which case requirements for developments ten acres or less shall be followed.
- c. The Rational Method may be used in sizing the minor drainage system for all sites.
- d. If in the opinion of the Village Engineer release rates less than

those outlined above are required due to downstream conveyance limitations, those release rates shall be used.

- 703.2 Positive Drainage: Whenever practicable, all areas of the property must be provided an overland flow path that will pass the 100-year flow at a stage at least one foot below the lowest foundation grade in the vicinity of the flow path. Overland flow paths designed to handle flows in excess of the minor drainage system capacity shall be provided drainage easements. All drainage easements shall prohibit the placing of sandboxes, above grade planters, nonflow-through fences, and other obstructions across these overland flow paths. Street ponding and flow depths shall not exceed curb heights by more than one inch.
- 704.0 Methods for Generating Runoff Hydrographs: Runoff hydrographs shall be developed incorporating the following assumptions of rainfall amounts and antecedent moisture.
- 704.1 Rainfall: Unless a continuous simulation approach to drainage system hydrology is used, all design rainfall events shall be based on the Illinois State Water Survey's Bulletin 70. The first quartile point rainfall distribution shall be used for the design and analysis of conveyance systems with critical durations less than or equal to twelve hours. The third quartile point rainfall distribution shall be used for the design and analysis of detention basins and conveyance system with critical durations greater than twelve and less than or equal to 24 hours. The fourth quartile distribution shall be used in the design and analysis of systems with durations greater than 24 hours. The first, third and fourth quartile distributions described by Huff are presented in Table 37 of Bulletin 70. The SCS Type II distribution may be used as an alternate to the Huff distributions. The effects of a 16-inch, 18-hour SCS Type II rainfall shall also be assessed so as to predict the operation of the system during an event similar to the July 1996 (or current) rainfall of record. But this event need not be considered as the design condition.
- 704.2 Antecedent Moisture: Computations of runoff hydrographs which do not rely on a continuous accounting of antecedent moisture conditions shall assume a minimum antecedent moisture condition of two.
- 705.0 Wet Detention Basin Design: Wet detention basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing, and as much as feasible to be available for recreational use. Designs incorporating wetland establishment to further control pollutants, increase aesthetics and provide recreational opportunities are encouraged.

- 705.1 Wet Basin Depths: Wet basins shall be at least three feet deep, excluding near shore banks and safety ledges. If fish habitat is to be provided they shall be at least ten feet deep over twenty-five percent of the bottom area to prevent winter freeze out.
- 705.2 Wet Basin Shoreline Slopes: The side slopes of wet basins at the normal pool elevation shall not be steeper than 5 to 1 (horizontal and vertical).
- 705.3 Permanent Pool Volume: The permanent pool volume in a wet basin at normal depth shall be equal to the runoff volume from its watershed for the 2-year event.
- 705.4 Inlet and Outlet Orientation: To the extent feasible, the distance between detention inlets and outlets shall be maximized. If possible, they should be at opposite ends of the basin and located to avoid short-circuiting. The use of paved low flow channels is discouraged.
- 706.0 Wetland and Dry Detention Basin Design: In addition to the other requirements of this Ordinance, wetland and dry basins shall be designed to remove stormwater pollutants, to be safe, to be aesthetically pleasing and as much as feasible to be available for multiple uses.
- 706.1 Wetland and Dry Basin Drainage: Dry basins shall be designed so that the portion of their bottom area which is intended to be dry shall have standing water no longer than seventy-two hours for any runoff event less than the 100-year event. Under drains directed to the outlet may be used to accomplish this requirement. Grading plans shall clearly distinguish the wet/wetland portion of the basin from the dry portion.
- 706.2 Velocity Dissipation: Velocity dissipation measures shall be incorporated into dry basin designs to minimize the resuspension of pollutants.
- 706.3 Inlet and Outlet Orientation: To the extent feasible, the distance between detention inlets and outlets shall be maximized. If possible, they should be at opposite ends of the basin.
- 706.4 Stilling/Sedimentation Basins: A stilling/sedimentation basin should be constructed at each major inlet to a wetland or dry basin consistent with Section 709.4.
- 707.0 RESERVED
- 708.0 Detention in Floodplains: The placement of detention basins within the floodplain is strongly discouraged because of questions about their reliable

operation during flood events. However, the stormwater detention requirements of this ordinance may be fulfilled by providing detention storage within flood fringe areas on the project site provided the following provisions are met.

- 708.1 Detention in Flood Fringe Areas: The placement of a detention basin in a flood fringe area shall require compensatory storage for 1.5 times the volume below the base flood elevation occupied by the detention basin including any berms. The release from the detention storage provided shall still be controlled consistent with the requirements of this section. The applicant shall demonstrate its operation for all stream flow and floodplain backwater conditions. Excavations for compensatory storage along watercourses shall be opposite or adjacent to the area occupied by detention. All floodplain storage lost below the 10-year flood elevation shall be replaced above the proposed 10-year flood elevation. All compensatory storage excavations shall be constructed to drain freely and openly to the watercourse.
- 708.2 Detention in Floodways: Detention basins shall be placed in the floodway only in accordance with 708.3.
- 708.3 On-stream Detention: On-stream detention basins are discouraged but allowable if they provide regional public benefits and if they meet the other provisions of this ordinance with respect to water quality and control of the 2-year and 100- year, 24-hour events from the property. Further criteria are presented in Section 800.0 of this ordinance. If on-stream detention is used for watersheds larger than one square mile, it is recommended that the applicant use dynamic modeling to demonstrate that the design will not increase stage for any properties upstream or downstream of the property. Also impoundment of the stream as part of on-stream detention:
- a. shall not prevent the migration of indigenous fish species, which require access to upstream areas as part of their life cycle, such as for spawning;
 - b. shall not cause or contribute to the degradation of water quality or stream aquatic habitat;
 - c. shall include a design calling for gradual bank slopes, appropriate bank stabilization measures, and a pre-sedimentation basin;
 - d. shall not involve any stream channelization or the filling of wetlands;

- e. shall require the implementation of an effective nonpoint source management program throughout the upstream watershed;
- f. shall not occur downstream of a wastewater discharge; and
- g. shall comply with 92 Illinois Administrative Code Parts 702 and 708 and the floodplain ordinance of the Village of Plainfield.

709.0 Drainage into Wetlands: Existing wetlands shall be protected from damaging modifications and adverse changes in runoff quality and quantity associated with land developments. In addition to the other requirements of this ordinance, the following requirements shall be met for all developments whose drainage flows into wetlands.

709.1 Detention Wetlands: Existing wetlands shall not be modified for the purposes of stormwater detention unless it is demonstrated that the existing wetland is low in quality and the proposed modifications will improve its habitat and ability to perform beneficial functions. Existing depressional storage in wetlands shall be maintained and the volume of detention storage provided to meet the requirements of this section shall be in addition to this existing storage. Establishment of new emergent wetlands to accept drainage from stormwater detention systems are encouraged as a benefit to aesthetics, pollution control and recreational opportunity.

709.2 Sediment Control: The existing wetland shall be protected during construction by appropriate soil erosion and sediment control measures and shall not be filled.

709.3 Alteration of Drainage Patterns: Site drainage patterns shall not be altered to substantially decrease or increase the existing area tributary to the wetland.

709.4 Detention/Sedimentation: All runoff from the development shall be routed through a preliminary detention/sedimentation basin incorporating pollutant removal functions and designed to capture the 2-year, 24-hour event and hold it for at least 24 hours, before being discharged to the wetland. The area of the basin shall be at least 500 square feet per acre of impervious surface in the drainage area. Side slopes shall be no steeper than three horizontal to one vertical and basin depths should be at least

three feet to minimize resuspension of accumulated sediment. This basin shall be constructed before property grading begins.

In addition, the drainage hierarchy defined in section 500.0 should be followed to minimize runoff volumes and rates being discharged to the wetland.

- 709.5 **Vegetated Buffer Strip:** A buffer strip of at least 25 feet in width, preferable vegetated with native plant species, shall be maintained or restored around the periphery of the wetland.
- 709.6 **Vegetated Filter Strips and Swales:** To effectively filter stormwater pollutants and promote infiltration of runoff, sites should be designed to maximize the use of vegetated filter strips and swales. Wherever practicable, runoff from impervious surfaces should be directed onto filter strips and swales before being routed to a storm sewer or detention basin.
- 710.0 **Street, Parking Lot, and Culvert Damage**
- 710.1 **Streets:** If streets are to be used as part of the minor or major drainage system, ponding depths shall not exceed curb heights by more than one-inch and shall not remain flooded for more than eight hours for any event less than or equal to the 100-year event.
- 710.2 **Parking Lots:** The maximum stormwater ponding depth in any parking area shall not exceed six inches for more than four hours.
- 710.3 **Culvert Road and Driveway Crossings:** Sizing of culvert crossing shall consider entrance and exit losses as well as tailwater conditions on the culvert.
- 711.0 **Infiltration Practices:** To effectively reduce runoff volumes, infiltration practices including basins, trenches, and porous pavement should be located on soils in hydrologic soil groups "A" or "B" as designated by the U.S. Soil Conservation Services. Infiltration basins and trenches designed to recharge groundwater shall not be located within seventy-five feet of a water supply well or a building foundation. A sediment settling basin shall be provided to remove coarse sediment from stormwater flows before they reach infiltration basins or trenches. Stormwater shall not be allowed to stand more than seventy-two hours over eighty percent of a dry basin's bottom area for the maximum design event to be ex-filtrated. The bottom of infiltration facilities shall be a minimum of four feet above seasonally high groundwater and bedrock.
- 712.0 **Safety Considerations:** The drainage system components, especially all detention basins, shall be designed to protect the safety of any children or

adults coming in contact with the system during runoff events.

- 712.1 Side Slopes: the side slopes of all detention basins at 100-year capacity shall be a level as practicable to prevent accidental falls into the basin and for stability and ease of maintenance. Side slopes of detention basins and open channels shall not be steeper than three to one (horizontal to vertical).
- 712.2 Safety Ledge: All wet detention basins shall have a level safety ledge at least 4 feet in width 2.5 to 3 feet below the normal water depth.
- 712.3 Velocity: Velocities throughout the surface drainage system shall be controlled to safe levels taking into consideration rate and depths of flow.
- 712.4 Overflow Structures: All stormwater detention basins shall be provided with an overflow structure capable of safely passing excess flows at a stage at least one foot below the lowest foundation grade in the vicinity of the detention basin. The design flow rate of the overflow structure shall be equivalent to the 100-year inflow rate.
- 713.0 Maintenance Considerations: The stormwater drainage system shall be designed to minimize and facilitate maintenance. Turfed side slopes shall be designed to allow lawn mowing equipment to easily negotiate them. Wet basins shall be provided with alternate outflows which can be used to completely drain the pool for sediment removal. (Pumping may be considered if drainage by gravity is not feasible.) Pre-sedimentation basins shall be included, where feasible, for localizing sediment deposition and removal. Access for heavy equipment shall be provided.

800.0 The Bypass System

The bypass system shall be designed to comply with the requirements of Section 3-9-3B of the subdivision Control Ordinance. Design capacity shall be predicated on the assumption that all upstream areas have been fully developed as proposed in the Plainfield Official Plan and/or the Will County Comprehensive Plan. The bypass flow rate shall be computed using a runoff coefficient of not less than 0.35. An allowance, equivalent to the reduction in the flow rate provided, will be made for upstream detention that has been previously approved by the Village and/or Will County and that has been constructed. (700.0)

Bypass channels may be incorporated into lot or improvement designs as follows:

- a. Drainage ways may be provided in a depressed median of a double roadway, street, or parkway, provided the median is wide enough to permit flat side slopes along the storm channel.
- b. A continuous easement shall be provided along rear lot lines within which utility lines and drainage facilities may be located and maintained, but within no accessory buildings and/or obstructing structures may be located.
- c. Any such bypass drainage way shall be provided with an easement at least twelve feet wide, six feet on each side of a lot line where applicable. Such an easement will permit necessary public channel maintenance and improvement.

Where development of a property presents the threat of flooding or damage by flash runoff to downstream residents, the facilities for storm water runoff control shall be constructed prior to any earth moving or drainage constructed on the project side.

900.0 Early Completion of Detention Facilities

Where detention, retention, or depressional storage areas are to be used as part of the drainage system for a property, they shall be constructed as the first element of the initial earthwork program. Any eroded sediment captured in these facilities shall be removed by the applicant before project completion in order to maintain the design volume of the facilities.

1000.0 Reserved

1100.0 Maintenance Responsibility

Maintenance of stormwater drainage facilities located on private property shall be the responsibility of the owner of that property. Before a Construction permit is obtained from the Village of Plainfield, the applicant shall execute a maintenance agreement with the Village of Plainfield guaranteeing that the applicant and all future owners of the property will maintain its stormwater drainage system. The maintenance agreement shall also specifically authorize representatives of the Village of Plainfield to enter on to the property for the purpose of inspections and maintenance of the drainage system. Such agreement shall be recorded with the Recorded of Deeds of Will County. The maintenance agreement shall include a schedule for regular maintenance of each aspect of the property's stormwater drainage system and shall provide for access to the

system for inspection by authorized personnel of the Village of Plainfield. The maintenance agreement shall also stipulate that if the Village Attorney of the Village of Plainfield notify the property owner in writing of maintenance problems which require correction, the property owner shall make such corrections within 30 (thirty) calendar days of such notification. If the corrections are not made within this time period the Village of Plainfield may have the necessary work completed and assess the cost to the property owner.

The Village of Plainfield has the option of requiring a bond to be filed by the property owner for maintenance of the stormwater drainage system.

1200.0 Administration

1201.0 Inspections

1201.10 Inspections During Construction: General site grading shall not begin until any necessary detention facilities are in place and operational. The Village Building Official or his representative will also conduct periodic inspections of the work in progress to be certain that the drainage system is being built as designed. If any violations of the provisions or requirements of this ordinance are noted during such inspections, the Village Building Official shall notify the property owner in writing of the items needing correction. The property owner shall be given ten (10) calendar days to make such corrections unless given a specific extension of time in writing by the Village Building Official.

Failure to complete such corrections within the specified time period shall constitute a violation of this ordinance.

1201.20 Final Inspection: Upon notification by the applicant that the drainage system is completed, the Village Engineer or his representative shall conduct a final inspection. If the drainage system is found to contain deficiencies which require correction the Village of Plainfield shall notify the property owner of the necessary corrections. The property owner shall correct such deficiencies within ten (10) calendar days unless given a specific extension of time in writing by the Village. Failure to make necessary corrections within the specified time period shall constitute a violation of this ordinance. Upon finding that the drainage system meets the provisions and requirements of this ordinance the Village Engineer shall issue a written report of drainage system completion to the Village President and Board of Trustees. The Village shall notify the property owner of satisfactory completion.

1201.30 Routine Inspections: All privately owned drainage systems shall be

inspected by representatives of the Village of Plainfield not less often than once per year. A written report shall be filed of the results of any inspection and a copy sent to the property owner detailing any problems which need correction.

1202.0 Enforcement: The administration and enforcement of this ordinance shall be the responsibility of the Planning & Building Department of the Village of Plainfield.

1203.0 Appeals: All appeals to the Village Engineer, Village Building Official or Village Planner's decisions regarding the interpretation of this ordinance shall be heard by the Village President and Board of Trustees of the Village of Plainfield.

1300.0 Severability

If any section, clause, provision or portion of this ordinance is judged unconstitutional or invalid by a court of competent jurisdiction, the remainder of this ordinance shall remain in force and not be affected by such judgment.

1400.00 Penalties

Any person convicted of violating any of the provisions or requirements of this ordinance shall be guilty of an ordinance violation and shall be subject to a fine of not more than \$1000.00 or be imprisoned for not more than 6 months. Each day the violation continues shall be considered a separate offense.

1500.0 Effective Date

This ordinance shall be in full force and effect from and after its passage and approval and publication, as required by law.

This ordinance shall be numbered as Ordinance No. 1747.

APPENDIX F - USDA PROGRAMS THAT MAY BE APPLICABLE TO URBAN OR URBANIZING AREAS

INTRODUCTION

This appendix contains information on the United States Department of Agriculture (USDA) programs approved under the Farm Security and Rural Investment Act of 2002 (2002 Farm Bill) regarding the bill's conservation provisions. Although tailored for agricultural lands, these programs may complement local initiatives in urban or urbanizing areas regarding environmentally-sensitive areas and storm water management, floodplain preservation, ground water recharge, wildlife habitat, open space, recreation, and the preservation of rural character. Opportunities may exist for utilizing these programs as land is converted from agricultural to urban land uses. These programs could also be useful in meeting requirements of the Non-point Source Discharge Elimination System (NPDES) phase II. Developers and municipal planners can conceivably take advantage of USDA programs and become a program participant as long as the land associated with the program continues to meet USDA criteria. Crucial issues affecting USDA criteria includes having the land registered with a valid farm tract number and insuring that participation in the USDA program(s) is initiated prior to changes in agricultural land use.

The following is a summary of programs that could possibly assist conservation activities in an urban or urbanizing areas:

Conservation Reserve Program (CRP) The CRP is a voluntary program for eligible producers that offers incentive and maintenance payments for specified conservation activities on eligible crop or pasture lands. The program's purpose is to encourage the planting of ground covers that improve soil, water and wildlife resources. CRP makes available federal cost-share assistance of up to 50% of the participant's cost in installing approved conservation practices. Contract duration may last from ten to fifteen years. CRP could potentially be used in steep-sloped areas that would otherwise prohibit development. CRP could also be utilized for tree or native grass plantings in conjunction with required buffers between development and sensitive water bodies.

Environmental Quality Incentives Program (EQIP) EQIP is a voluntary program for eligible producers, on eligible land, that offers incentive payments of up to 90% of the costs on eligible conservation practices. Soon to be available under the EQIP program are Conservation Innovation Grants. These grants, after their draft provisions have been finalized, are anticipated to be available for use by the broader public to leverage federal investment, stimulate innovative approaches, and accelerate technology transfer. Any development proposal that could incorporate conservation best management practices could potentially be eligible under this program. Developers who need to meet local development requirements mandating groundwater protection, buffers and storm water detention, could utilize this program to help offset implementation costs. Some types of practices that could qualify under EQIP include riparian forest buffers, rock chutes, wetland enhancement, filter strips, diversions, water and sediment control basins, and grassed waterways. One example in Illinois of the use of EQIP funds in an urbanizing area includes a site near East Peoria, where EQIP funds were used prior to site development for the construction of two ponds to include spillway construction, seeding, and mulching.

Farmland Protection Program/Farm and Ranch Lands Protection Program (FPP/FRPP)

The purpose of the FPP/FRPP is to encourage topsoil protection by limiting non-agricultural uses of the land. Under the program, the federal government may contribute up to 50% of the cost for the purchase of development rights regarding a qualifying parcel. At the time of this writing, the FRPP rules were in draft form and open for public comment. The FRPP is anticipated to be similar in many ways to the FPP program, which has been repealed. The FRPP program could potentially be used in conjunction with community development or agricultural land subdivision. The FRPP could be useful for development requirements that encourage open space set-asides which maximizes land remaining on the tax rolls. FRPP would also be useful for planned unit developments or conservation subdivision designs that permit the agreed-upon density, yet allow larger areas of contiguous open space. Land under FRPP could also be used for other than row-crop production. Tree farms, specialty crops, gardens, and nurseries are all potential land uses under the program that could continue to generate revenues for both the land owner and the community while providing open space, aesthetic features, and passive storm water management.

Wildlife Habitat Incentives Program (WHIP) Through this program, NRCS provides technical expertise and funding needed for practices that enhance wildlife habitat on private land. Landowners may enter into five to ten year agreements to implement an approved habitat enhancement plan. Longer agreements may be available for landowners that are willing to create long-lasting habitat for especially vulnerable species. This program is unique in that a farm tract number is not a requirement for enrollment. Any privately owned land can be eligible under WHIP as long as it enhances wildlife habitat. Examples of where this program could be utilized in site planning and development include odd lots or land contiguous to streams, lakes, or storm water detention/retention areas where native plantings that enhance wildlife habitat are desirable.

Wetlands Reserve Program (WRP) WRP is a voluntary program that provides technical and financial assistance to eligible landowners to address wetlands, wildlife habitat, and other soil and water natural resource concerns. Through this program, eligible landowners must file an application for either a permanent conservation easement, a 30-year easement, or a minimum 10-year restoration agreement. The federal government may pay up to 100% for wetland restoration and permanent easement costs; 75% of restoration and 75% of the permanent easement costs on a 30-year easement; and 75% of restoration costs for a restoration cost-share agreement.

One example of a development that has taken advantage of the wetland reserve program has been the Hidden Creek development in Ohio, where 232 acres were set aside in perpetuity to protect wildlife habitat along a nearby creek. The developer, working in cooperation with the NRCS and the local soil and water conservation district, desired to maintain the environmentally-sensitive areas of the property in a natural state and made the decision to qualify and participate. Prior to development, the environmentally-sensitive lands were set aside and the USDA-NRCS, in accordance with WRP program criteria, designed the wetlands and were awarded a permanent conservation easement. The developer was eligible for cost-share money and technical

assistance and the wetlands thereafter will provide wetland functions that can be used in conjunction with development: passive storm water detention, ground water filtering, and natural open space.

Included as part of this appendix are fact sheets regarding each of the above mentioned programs.

The intent here is to provide the reader with examples of concepts, incentives and resources from the USDA that could potentially be incorporated into community-based conservation projects. While an effort has been made to provide an accurate listing of program information, this information is constantly changing to better meet the public's needs. For the most up-to-date information regarding programs, please contact your local USDA service center or visit the national USDA-NRCS website at <http://www.il.nrcs.usda.gov>

Conservation Reserve Program

Authorization

The Food Security Act of 1985, as amended, authorized the Conservation Reserve Program (CRP), which is implemented through the Farm Service Agency (FSA) on behalf of the Commodity Credit Corporation (CCC). The program is also governed by the regulations published in 7 CFR part 1410.

Overview

The CRP is a voluntary program that offers annual rental payments, incentive payments, and annual maintenance payments for certain activities, and cost-share assistance to establish approved cover on eligible cropland.

The program encourages farmers to plant long-term resource-conserving covers to improve soil, water, and wildlife resources. CCC makes available cost-share assistance in an amount equal to not more than 50 percent of the participant's costs in establishing approved practices. Contract duration is between 10 and 15 years.

CRP is administered by FSA. The Natural Resources Conservation Service, Cooperative State Research and Education Extension Service, state forestry agencies, and local soil and water conservation districts provide

technical support. Private sector technical assistance vendors may also be available.

Eligible Land

To be eligible for placement in the CRP land must be:

- Cropland that is planted or considered planted to an agricultural commodity 2 of the 5 most recent crop years (including field margins) and which is physically and legally capable of being planted in a normal manner to an agricultural commodity; or
- Marginal pastureland that is either:
 - Certain acreage enrolled in the Water Bank Program; or
 - Suitable for use as a riparian buffer to be planted to trees.

Additional Requirements for Cropland

In addition to the eligible land requirements, cropland must meet one of the following:

1. Have a weighted average Erosion Index (EI) of 8 or higher or be considered highly erodible land according to the conservation compliance provisions;
2. Be considered a cropped wetland;

3. Be devoted to any of a number of highly beneficial environmental practices, such as filter strips, riparian buffers, grass waterways, shelterbelts, wellhead protection areas, and other similar practices;
4. Be subject to scour erosion;
5. Be located in a national or state CRP conservation priority area;
6. Be cropland associated with or surrounding noncropped wetlands.

Ranking Criteria

Offers for CRP contracts are ranked according to the Environmental Benefits Index (EBI).

The designated technical agency collects data for each of the EBI factors, based upon the relative environmental benefits for the land offered. Each eligible offer is ranked in comparison to all others and selections made from that ranking.

EBI factors include:

- Wildlife habitat benefits resulting from covers on contract acreage;
- Water quality benefits from reduced erosion, runoff, and leaching;
- On-farm benefits of reduced erosion;
- Benefits that will likely endure beyond the contract period;

- Air quality benefits from reduced wind erosion;
- Benefits of enrollment in conservation priority areas where enrollment would contribute to the improvement of identified adverse water quality, wildlife habitat, or air quality; and
- Cost.

Producer Eligibility Requirements

A producer must have owned or operated the land for at least 12 months prior to close of the signup period, unless:

- The new owner acquired the land as a result of death of the previous owner;
- The only ownership change occurred due to foreclosure where the owner exercised a timely right of redemption in accordance with state law; or
- The circumstances of the acquisition present adequate assurance to CCC that the new owner did not acquire the land for the purpose of placing it in CRP.

Rental Rates

The CCC bases rental rates on the relative productivity of soils within each county and the average dryland cash rent or the cash-rent equivalent.

The maximum CRP rental rate for each offer is calculated in advance of enrollment. Producers may offer land at that rate or may offer a

lower rental rate to increase the likelihood that their offer will be accepted.

In addition, CCC offers additional financial incentives of up to 20 percent of the annual payment for certain continuous signup practices.

Other Payments

The CCC encourages restoration of wetlands by offering a one-time incentive payment equal to 25 percent of the cost of restoring the hydrology of the site. This is in addition to the 50-percent cost share provided to establish approved cover.

Continuous Signup

Eligible acreage devoted to certain special conservation practices, such as riparian buffers, filter strips, grass waterways, shelterbelts, living snow fences, contour grass strips, salt tolerant vegetation, and shallow water areas for wildlife, may be enrolled at any time under the CCC's continuous signup and are not subject to competitive bidding. In addition, land within a designated public wellhead area may be eligible to be enrolled on a continuous basis. (See *FSA Fact Sheet: "Continuous Signup for High-Priority Practices"* for further details.)

The United States Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, sexual orientation, or marital or family status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audio-tape, etc.) should contact USDA's TARGET Center at 202-720-2600 (voice and TDD).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326-W, Whitten Building, 1400 Independence Avenue, SW, Washington, DC 20250-9410 or call (202) 720-5964 (voice and TDD). USDA is an equal opportunity provider and employer.

Fact Sheet

June 2002

Environmental Quality Incentives Program

Overview

The Environmental Quality Incentives Program (EQIP) is a voluntary conservation program that promotes agricultural production and environmental quality as compatible National goals. Through EQIP, farmers and ranchers may receive financial and technical help to install or implement structural and management conservation practices on eligible agricultural land.

EQIP was reauthorized in the Farm Security and Rural Investment Act of 2002 (Farm Bill). The Natural Resources Conservation Service (NRCS) administers EQIP. Funding for EQIP comes from the Commodity Credit Corporation.

How EQIP Works

EQIP activities are carried out according to an EQIP plan of operations developed in conjunction with the producer. Contracts for confined livestock feeding operations require development and implementation of a comprehensive nutrient management plan (CNMP). This plan is approved by the local conservation district. Practices are subject to NRCS technical standards adapted for local conditions. Farmers and ranchers may elect to use an approved third-party provider for technical assistance.

EQIP applications are accepted throughout the year. NRCS evaluates each application using a state and locally developed evaluation process. Higher priorities are given to applications that encourage the use of cost-effective conservation practices, address National conservation priorities, and optimize environmental benefits.

State Technical Committees, Tribal representatives, and local working groups convened by the conservation district advise NRCS on implementation of the program to address identified resource needs and concerns.

EQIP may pay up to 75 percent of the costs of certain conservation practices important to improving and maintaining the health of natural resources in the area. Incentive payments may be made to encourage a producer to adopt land management practices, such as nutrient management, manure management, integrated pest management, irrigation water management, and wildlife habitat management, or to develop a CNMP and components of a CNMP. Limited resource farmers and beginning farmers may be eligible for up to 90 percent of the cost of conservation practices.

EQIP offers contracts with a minimum term of one year after implementation of the last scheduled practice and a maximum term of ten years. These contracts provide incentive payments and cost share payments for implementing conservation practices.

Total cost-share and incentive payments are limited to \$450,000 per individual over the period of the 2002 Farm Bill, regardless of the number of farms or contracts. Starting in fiscal year 2003, no individual or entity may receive EQIP payments in any crop year in which the individual or entity's average adjusted gross income for the preceding three years exceeds \$2.5 million, unless 75 percent of that income is from farming, ranching, or forestry interests.

Conservation Innovation Grants

EQIP provides opportunities for Conservation Innovation Grants, which are competitive grant awards to stimulate innovative approaches to environmental enhancement and protection, in conjunction with agricultural production.

The Secretary of Agriculture is authorized to use EQIP funds each fiscal year from 2003 to 2007 to award grants to government or non-government organizations or individuals that leverage Federal funds to implement innovative approaches to conservation. Grant amounts may not exceed 50 percent of the total cost of each project.

Conservation Innovation Grants provide the opportunity for the U.S. Department of Agriculture (USDA) to work with other public and private entities to accelerate technology transfer and implementation of promising technologies to address the Nation's most pressing agricultural related natural resource problems. Agricultural producers, particularly those facing the most difficult challenges, will benefit by having more options for enhancing the environment and meeting Federal, State, and local regulations.

Ground and Surface Water Conservation

EQIP provides for additional funding specifically to promote ground and surface water conservation activities to improve irrigation systems; convert to the production of less water intensive agricultural commodities; improve water storage through measures such as water banking and groundwater recharge; or institute other measures that improve groundwater and surface water conservation, as determined by the Secretary.

Assistance to a producer may be provided only to facilitate a conservation measure that results in a net savings in groundwater or surface water resources in the agricultural operation of the producer. This provision is funded for fiscal years 2002 through 2007.

Eligibility

Producers engaged in livestock or crop production on eligible land may apply for the program. Eligible land includes cropland; rangeland; pasture; private non-industrial forestland; and other farm or ranch lands, as determined by the Secretary.

For More Information

If you need more information about EQIP, please contact your local USDA Service Center, listed in the telephone book under U.S. Department of Agriculture, or your local conservation district. Information also is available on the World Wide Web at: <http://www.nrcs.usda.gov/programs/farmbill/2002/>

Visit USDA on the Web at:

Fact Sheet

May 2002

Farmland Protection Program

Overview

The Farmland Protection Program (FPP) is a voluntary program that helps farmers and ranchers keep their land in agriculture. The program provides matching funds to State, Tribal, or local governments and non-governmental organizations with existing farmland protection programs to purchase conservation easements or other interests in land. FPP is reauthorized in the Farm Security and Rural Investment Act of 2002 (Farm Bill). The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) manages the program.

Benefit/Accomplishments

Through 2001, more than 108,000 acres have been protected in 28 states.

How FPP Works

USDA works through State, Tribal, and local governments and non-governmental organizations to conduct the FPP. These entities acquire conservation easements from landowners. Participating landowners agree not to convert their land to non-agricultural uses and to develop and implement a conservation plan for any highly erodible land. All highly erodible lands enrolled must have a conservation plan developed based on the standards in the NRCS Field Office Technical Guide and approved by the local conservation district. Landowners retain all rights to use the property for agriculture.

To participate, a landowner submits an application to an entity—a State, Tribal, or local government or a non-governmental organization—that has an existing farmland protection program. The NRCS State

conservationist, with advice from the State Technical Committee, awards funds to qualified entities to conduct their farmland protection programs. Although a minimum of 30 years is required for conservation easements, priority is given to applications with perpetual easements.

Eligibility

To qualify for FPP, the land offered must be part or all of a farm or ranch and must:

- Contain prime, unique, or other productive soil or historical or archaeological resources;
- Be included in a pending offer from a State, Tribal, or local government or non-governmental organization's farmland protection program;
- Be privately owned;
- Be covered by a conservation plan for any highly erodible land;
- Be large enough to sustain agricultural production;
- Be accessible to markets for what the land produces; and
- Be surrounded by parcels of land that can support long-term agricultural production.

If the land cannot be converted to non-agricultural uses because of existing deed restrictions or other legal constraints, it is ineligible for FPP.

Funding

FPP is funded through the Commodity Credit Corporation. The FPP share of the easement cost must not exceed 50 percent of the appraised fair market value of the conservation easement or other interest in the land. A State,

Tribal, or local government or non-governmental organization may supplement its share of the easement cost through a landowner's donation, not to exceed 25 percent of the appraised fair market value of the conservation easement.

For More Information

If you need more information about FPP, please contact your local USDA Service Center, listed in the telephone book under U.S. Department of Agriculture, or your local conservation district. Information also is available on the World Wide Web at:
<http://www.nrcs.usda.gov/programs/farmbill/2002/>

Visit USDA on the Web at:
<http://www.usda.gov/farmbill>

Fact Sheet

May 2002

Wildlife Habitat Incentives Program

Overview

The Wildlife Habitat Incentives Program (WHIP) is a voluntary program that encourages creation of high quality wildlife habitats that support wildlife populations of National, State, Tribal, and local significance. Through WHIP, the Natural Resources Conservation Service (NRCS) provides technical and financial assistance to landowners and others to develop upland, wetland, riparian, and aquatic habitat areas on their property.

WHIP is reauthorized in the Farm Security and Rural Investment Act of 2002 (Farm Bill). Through WHIP, NRCS works with private landowners and operators; conservation districts; and Federal, State, and Tribal agencies to develop wildlife habitat on their property. Funding for WHIP comes from the Commodity Credit Corporation.

Benefits

Since WHIP began in 1998, nearly 11,000 participants have enrolled more than 1.6 million acres into the program. Most efforts have concentrated on improving upland wildlife habitat, such as native prairie, but there is an increasing emphasis on improving riparian and aquatic areas. The 2002 Farm Bill greatly expands the available tools for improving wildlife habitat conditions across the Nation.

Species that have benefited from WHIP activities include the grasshopper sparrow, bobwhite quail, swift fox, short-eared owl, Karner-blue butterfly, gopher tortoise, Louisiana black bear, Eastern collared lizard,

Bachman's sparrow, ovenbird, and acorn woodpecker.

How WHIP Works

Conservation districts convene local work groups to identify local wildlife habitat priorities. The local work groups then provide input to the State Technical Committee that advises the State conservationist in the development of a State WHIP plan. The State WHIP plan serves as a guide for the development of the State WHIP ranking criteria.

Persons interested in entering into a cost-share agreement with the U.S. Department of Agriculture (USDA) to develop wildlife habitat may file an application at any time. Participants voluntarily limit future use of the land for a period of time, but retain private ownership.

NRCS works with the participant to develop a wildlife habitat development plan. This plan becomes the basis of the cost-share agreement between NRCS and the participant. NRCS provides cost-share payments to landowners under these agreements that are usually 5 to 10 years in duration, depending upon the practices to be installed.

There are shorter-term agreements to install practices that are needed to meet wildlife emergencies, as approved by the NRCS State conservationist. NRCS also provides greater cost-share assistance to landowners who enter into agreements of 15 years or more for practices on essential plant and animal habitat. NRCS can use up to 15 percent of its available WHIP funds for this purpose.

NRCS does not place limits on the number of acres that can be enrolled in the program or the amount of payment made; however, some States may choose to establish such requirements. NRCS welcomes projects that provide valuable wildlife habitat and does not want to discourage any landowner who desires to implement practices that will improve habitat conditions for declining species.

NRCS continues to provide assistance to landowners after completion of habitat development activities. This assistance may be in the form of monitoring habitat practices, reviewing management guidelines, or providing basic biological and engineering advice on how to achieve optimum results for targeted species.

Applications are accepted through a continuous sign-up process. Applications may be obtained and filed at any time with your local USDA Service Center or conservation district office. Applications also may be obtained through USDA's e-gov Internet site at: www.sc.egov.usda.gov. Enter "Natural Resources Conservation Service" in the Agency field, "Wildlife Habitat Incentives Program" in the Program Name field, and "CCC-1250" in the Form Number field. Applications also may be accepted by cooperating conservation partners approved or designated by NRCS.

Eligibility

Eligible lands under the program are:

- Privately owned land;
- Federal land when the primary benefit is on private or Tribal land;
- State and local government land on a limited basis; and
- Tribal land.

If land is determined eligible, NRCS places emphasis on enrolling:

- Habitat areas for wildlife species experiencing declining or significantly reduced populations;
- Practices beneficial to fish and wildlife that may not otherwise be funded; and
- Wildlife and fishery habitats identified by local and State partners and Indian Tribes in each State.

For More Information

If you need more information about WHIP, please contact your local USDA Service Center, listed in the telephone book under U.S. Department of Agriculture, or your local conservation district. Information also is available on the World Wide Web at: <http://www.nrcs.usda.gov/programs/farmbill/2002/>

Visit USDA on the Web at:
<http://www.usda.gov/farmbill>

Fact Sheet

May 2002

Wetlands Reserve Program

Overview

The Wetlands Reserve Program (WRP) is a voluntary program that provides technical and financial assistance to eligible landowners to address wetland, wildlife habitat, soil, water, and related natural resource concerns on private lands in an environmentally beneficial and cost-effective manner. The program provides an opportunity for landowners to receive financial incentives to enhance wetlands in exchange for retiring marginal land from agriculture. WRP is reauthorized in the Farm Security and Rural Investment Act of 2002 (Farm Bill). The Natural Resources Conservation Service (NRCS) administers the program. Funding for WRP comes from the Commodity Credit Corporation.

Benefits

WRP participants benefit by:

- Receiving financial and technical assistance in return for restoring and protecting wetland functions and values;
- Seeing a reduction in problems associated with farming potentially difficult areas; and
- Having incentives to develop wildlife recreational opportunities on their land.

Wetlands benefit the Nation by providing fish and wildlife habitat; improving water quality by filtering sediments and chemicals; reducing flooding; recharging groundwater; protecting biological diversity; as well as providing opportunities for educational, scientific, and recreational activities.

How WRP Works

Landowners and Tribes may file an application for a conservation easement or a cost-share

restoration agreement with the U.S.

Department of Agriculture (USDA) to restore and protect wetlands. Participants voluntarily limit future use of the land, but retain private ownership.

The program offers three enrollment options:

Permanent Easement. This is a conservation easement in perpetuity. Easement payments for this option equal the lowest of three amounts: the agricultural value of the land, an established payment cap, or an amount offered by the landowner. In addition to paying for the easement, USDA pays 100 percent of the costs of restoring the wetland.

30-Year Easement. Easement payments through this option are 75 percent of what would be paid for a permanent easement. USDA also pays 75 percent of restoration costs.

For both permanent and 30-year easements, USDA pays all costs associated with recording the easement in the local land records office, including recording fees, charges for abstracts, survey and appraisal fees, and title insurance.

Restoration Cost-Share Agreement. This is an agreement (generally for a minimum of 10 years) to re-establish degraded or lost wetland habitat. USDA pays 75 percent of the cost of the restoration activity. This enrollment option does not place an easement on the property. Other agencies, conservation districts, and private conservation organizations may provide additional assistance for easement payments and wetland restoration costs as a way to reduce the landowner's share of the

costs. Such special partnership efforts are encouraged.

NRCS and its partners, including conservation districts, continue to provide assistance to landowners after completion of restoration activities. This assistance may be in the form of reviewing restoration measures, clarifying technical and administrative aspects of the easement and project management needs, and providing basic biological and engineering advice on how to achieve optimum results for wetland dependent species.

Applications are accepted through a continuous sign-up process. Applications may be obtained and filed at any time with your local USDA Service Center or conservation district office. Applications also may be obtained through USDA's e-gov Internet site at: www.sc.egov.usda.gov. Enter "Natural Resources Conservation Service" in the Agency field, "Wetlands Reserve Program" in the Program Name field, and "CCC-1250" in the Form Number field.

Eligibility

To offer a conservation easement, the landowner must have owned the land for at least 12 months prior to enrolling it in the program, unless the land was inherited, the landowner exercised the landowner's right of redemption after foreclosure, or the landowner can prove the land was not obtained for the purpose of enrolling it in the program. To participate in a restoration cost-share agreement, the landowner must show evidence of ownership.

To be eligible for WRP, land must be restorable and be suitable for wildlife benefits. This includes:

- Wetlands farmed under natural conditions;
- Farmed wetlands;
- Prior converted cropland;
- Farmed wetland pasture;

- Farmland that has become a wetland as a result of flooding;
- Range land, pasture, or production forest land where the hydrology has been significantly degraded and can be restored;
- Riparian areas which link protected wetlands;
- Lands adjacent to protected wetlands that contribute significantly to wetland functions and values; and
- Previously restored wetlands that need long-term protection.

Ineligible Land. Ineligible land includes wetlands converted after December 23, 1985; lands with timber stands established under a Conservation Reserve Program contract; Federal lands; and lands where conditions make restoration impossible.

Uses of WRP Land

On acreage subject to a WRP easement, participants control access to the land and may lease the land for hunting, fishing, and other undeveloped recreational activities. At any time, a participant may request that additional activities be evaluated to determine if they are compatible uses for the site. This request may include such items as permission to cut hay, graze livestock, or harvest wood products. Compatible uses are allowed if they are fully consistent with the protection and enhancement of the wetland.

For More Information

If you need more information about WRP, please contact your local USDA Service Center, listed in the telephone book under U.S. Department of Agriculture, or your local conservation district. Information also is available on the World Wide Web at: <http://www.nrcs.usda.gov/programs/farmbill/2002/>

Visit USDA on the Web at:
<http://www.usda.gov/farmbill>

APPENDIX G - GRANT INFORMATION SUMMARY FOR CONSERVATION PROJECTS

INTRODUCTION

FOR THE LATEST VERSION OF THIS SUMMARY WITH HYPERLINKS, PLEASE VISIT THE USDA-NRCS WEBSITE AT: <http://www.il.nrcs.usda.gov>

This summary is intended to assist individuals, groups, and local units of government in search of funding or other financial incentives for community-based conservation projects in Illinois. The list is divided into five categories: federal funding sources, state funding sources, other public/private sources, and private sources. A key has been developed to identify eligible groups for each grant after the title of the grant:

Key to group eligibility:

- “I” individuals eligible
- “G” local units of government
- “O” all organizations eligible to apply
- “P” private not-for-profit (501C3) groups only eligible
- “E” educational institutions
- “U” unknown or eligibility varies, need to contact administrators.

For the purposes of this document, conservation is defined as holistically as possible to include grants or financial incentives that enhance the wise use and management of natural and cultural resources in urban, suburban, and rural communities. Some of these grants may not have conservation as a specific goal, but could be used to achieve multiple objectives that include conservation.

The intent of this document is to provide the reader with examples of what is available in financial incentives. Many other funding alternatives exist, and may better fit local needs. This document is provided as a public service and does not constitute a recommendation or endorsement of any particular grant or program; also note that the absence of any particular grant or program does not constitute a negative endorsement. While an effort has been made to provide an accurate listing, funding information is constantly changing and omissions or errors may occur. Please recycle previous editions. For corrections, comments or additional copies of this summary, please contact:

USDA- Natural Resources Conservation Service (NRCS)

FEDERAL FUNDING SOURCES

The federal government is an excellent place to investigate funding resources for conservation projects. Once you identify your specific requirements, the Catalog of Federal Domestic Grants (CFDA) is the single best place to look for federal funding sources-the catalog should be available at your local library or you can view the CFDA on-line:

Catalog of Federal Domestic Assistance:

<http://www.cfda.gov>

Web site for federal forms and grant administration procedures:

<http://www.whitehouse.gov/omb/grants/index.html>

Web sites of federal agencies may give you more information about individual government programs as well as provide information on other opportunities for assistance:

United States Department of Agriculture (USDA) Illinois Natural Resources Conservation Service (NRCS):

<http://www.il.nrcs.usda.gov>

Federal Emergency Management Agency (FEMA)

<http://www.fema.gov>

United States Department of Housing and Urban Development (HUD):

<http://www.hud.gov>

United States Environmental Protection Agency (USEPA)

<http://www.epa.gov/ogd>

USEPA Catalog of Funding Sources for Watershed Protection

<http://www.epa.gov/owow/wtr1/watershed/wacademy/fund/wfund.pdf>

Partners for Fish and Wildlife: O, I, E, G.

- Eligible projects include restoration or enhancement of wildlife habitat, does not fund land acquisition or salaries.
- Need to call for application deadlines.
- Matching or in-kind services preferred, 10-year habitat development agreement required.
- Contact the US Fish and Wildlife Service (USFWS) at 847-381-2253 or 309-793-5800 for information.

Northeastern Illinois Wetlands Conservation Account: I, G, O, P, E.

- Eligible projects include restoration, enhancement, and preservation of wetlands. Other eligible projects include those that promote understanding, appreciation, and stewardship of wetlands
- Application deadlines vary. \$5,000-\$150,000 grant range.
- Matching funds preferred but not required. Limited to Northeastern Illinois area.
- Contact the U.S. Fish and Wildlife Service at 847-381-2253 for information.

Challenge Grant Program: O, I, E, G.

- Purpose for wildlife habitat restoration, streambank stabilization, or education.
- Application deadlines from June to August. Grant ranges vary up to \$10,000.
- 50% Match required.
- Contact U.S. Fish and Wildlife Service at 847-381-2253 or 309-793-5800.

US Environmental Protection Agency - Environmental Education Grants: E, P, G.

- Eligible projects include environmental education activities such as curricula design or dissemination, designing or demonstrating educational field methods, and training educators.

- November deadline.
- Requires a minimum of 25% matching funds or in-kind services.
- Contact US Environmental Protection Agency (USEPA) at 312-353-5282.
<http://www.epa.gov/region5/enved>.

Environmental Justice Small Grants: E, P.

- Projects include those that use community-based approaches for environmental protection.
- Project grants shall not exceed \$20,000.
- Contact USEPA at 1-312-353-1440 or 1-800-962-6215.
<http://www.epa.gov/seahome/resources>

Community based Environmental Protection for Communities: U

- Purpose is to provide place-based approaches to address community and environmental approaches to slow the loss of open space, habitat, and wetlands.
- Matching share required.
- Need to call for deadlines
- Contact USEPA at 312-886-4856
<http://www.epa.gov/ecocommunity>

Section 1135 Project Modifications for the Improvement of the Environment: G, P, U.

- Federal funds and technical assistance available for studies, planning, engineering, construction and administration.
- Cost-share up to \$5 million plus non-federal match, 25% for project costs.
- Contact Army Corps of Engineers at 312-353-6400, 309-794-5590 or 314-331-8404.

Section 206 Aquatic Ecosystem Restoration: G, P, U.

- Projects include funding and assistance to carry out ecosystem restoration and enhancement that is documented to be in the public interest, will improve the environment, and is cost effective.
- Federal cost-share of up to \$5 million is available, 35% non-federal cost-share required.
- Contact the Army Corps of Engineers at 312-353-6400, 309-794-5590 or 314-331-8404

Scenic Byway Program: U.

- Purpose is to create or preserve treasured American byways or roads.
<http://www.byways.org>

Federal Tax Incentives for Conservation: I, O, U.

- Owners of environmentally sensitive land that has been donated for conservation purposes, or has been placed in a conservation easement, may qualify for significant federal tax deductions.
- Reference is the Internal Revenue Service (IRS) Code [170(h)].
- Contact the IRS or your federal tax advisor for more information.

STATE FUNDING SOURCES

The State of Illinois administers numerous programs for community-based conservation. Some of the money for these programs originates at the federal level and is “pass-through” funding, but much comes directly from the State.

Useful State websites:

Catalog of State Assistance to Local Governments:

<http://www.legis.state.il.us/commission/igcc/catalog1999.pdf>

Illinois Dept of Natural Resources (IDNR):

<http://www.dnr.state.il.us/finast.htm>

Education grants:

<http://www.dnr.state.il.us/lands/education/classrm/grant>.

Illinois Department of Agriculture (IDOA):

<http://www.agr.state.il.us>

Illinois Environmental Protection Agency (IEPA):

<http://www.epa.state.il.us/>

Illinois FIRST Program: U

-Conservation purposes include brownfield cleanups and construction of trails and parks.

-Contact your local state legislative office for application details.

<http://www100.state.il.us/state/ilfirst>

Hazard Mitigation Assistance Program: G.

-Governments must be enrolled and in good standing with the National Flood Insurance Program (NFIP).

-Eligible initiatives for projects include acquisition of insured structures and underlying real property for open space uses.

-Provides up to 75% of project costs, 25% match required.

-Contact is the Illinois Emergency Management Agency (IEMA) at 217-782-8719.

<http://www.state.il.us/iema>

Non-point Source Management Program (Section 319 grants): G, O.

-Eligible projects include controlling or eliminating non-point pollution sources.

-Application deadline is August.

-Requires 40% matching funds or in-kind services.

-Contact Illinois Environmental Protection Agency (IEPA) at 217-782-3362.

<http://www.epa.state.il.us/water/financial-assistance>

Illinois Clean Lakes Program: G.

-Financial assistance available for lakes over 6 acres that are publicly-owned with public access.

-Application deadline is Aug. 31 (pre-approval) and Oct. 31 (final approval).

-Requires 40% match for phase I, 50% local match for phase II.

-Contact IEPA at 217-782-3362.

<http://www.epa.state.il.us/water/financial-assistance/index.html>

Lake Education Assistance Program: G, E, P.

-Eligible projects include educational programs on inland lakes and lake watersheds.

-Maximum funding of \$500 is reimbursed after completion. Deadlines are Sept. & Jan.

-Contact IEPA at 217-782-3362.

<http://www.epa.state.il.us/water/financial-assistance/index.html>

Priority Lake and Watershed Implementation Program: G.

-Eligible projects include funding to implement protection/restoration practices that improve water quality prioritized publicly-owned lakes.

-Funding up to 100%, projects range from \$5,000 to \$30,000.

-Contact IEPA at 217-782-3362.

<http://www.epa.state.il.us/water/financial-assistance/index.html>

Open Space Lands Acquisition and Development (OSLAD) Program & Open Lands Trust Grant Program: G.

-Eligible projects include money for acquisition and development of public parks for passive recreation/open space.

-Application deadlines vary. Conservation easement required with both programs.

-Funding is reimbursable up to 50% of project costs, reimbursable up to \$2 million for the Trust Grant.
-Contact Illinois Dept. of Natural Resources (IDNR) for both programs at 217-782-7481.
<http://dnr.state.il.us/ocd/>

Greenways and Trails Planning Assistance Program: G.

-Eligible units of government include counties and communities > 10,000
-\$20,000 maximum awarded, 50% in-kind contribution required.
-Must follow a planning process
-Contact IDNR at 217-782-3715
<http://www.dnr.state.il.us/gnthome.htm>

Illinois Trail Grant Programs: G,P,O.

-A collection of various trail programs where eligible projects include acquiring or constructing non-motorized bicycle and snowmobile paths and facilities.
-Deadline is March and May.
-0%-50% match required, depending upon which type of trail grant.
-Contact IDNR at 217-782-7481.
<http://dnr.state.il.us/ocd/gaoutnew.htm>

Urban & Community Forestry Grant Program: G.

-Purpose is to create or enhance local forestry programs in communities with a local forestry ordinance.
-May deadline.
-50% match required, reimbursement up to \$5,000.
-Contact IDNR at 217-782-2361.

Illinois Wildlife Preservation Fund (Small Project Program): I, O, U.

-Eligible projects include those that deal with management, site inventories or on-going education programs.
-Deadline is April.
-Funding up to \$1,000 per project, match preferred but not required.
-Contact IDNR at 217-785-8774.

Small Projects Fund: G.

-Provides assistance to smaller communities for alleviating locally significant drainage and flood problems.
-Provides funding for planning and implementation of flood control projects in accordance with an adopted plan.
-Grants and technical assistance awarded up to \$100,000.
-Contact IDNR-OWR at 217-782-4637.

Schoolyard Habitat Action Grants: E, O.

-Eligible projects include enhancement of wildlife habitat, with emphasis on youth involvement and education.
-Project must involve a trained WILD educator or facilitator, Maximum funding to \$600.
-Application deadline is October.
-Contact the IDNR at 217-524-4126.
<http://dnr.state.il.us/lands/education/CLASSRM/grants>

Conservation 2000 -- Ecosystems Program: O.

-Eligible projects include habitat protection or improvement, technical assistance, and education.
-The Ecosystems Program provides financial and technical support to groups (ecosystem partners) which seek to maintain and enhance ecological and economic conditions in key watersheds of Illinois.
-February deadline, contact IDNR at 217-782-7940.
<http://dnr.state.il.us/c2000>

Illinois Transportation Enhancement Program: G.

-Eligible projects include those that support alternative modes of transportation and that preserve visual and cultural resources, including historic preservation and landscaping beautification.

- Planning is encouraged to be completed now for new disbursements.
- Local 20% match required for projects, 50% match for land acquisition.
- Contact Illinois Dept. of Transportation (IDOT) at 1-800-493-3434.
<http://www.dot.state.il.us>

Learn & Serve Illinois: E.

- Eligible projects include those that combine conservation with hands-on learning in public schools.
- Grades K-12 and regional education offices only eligible, similar program exists for colleges/universities.
- Contact is at 312-814-3606 ggreene@isbe.net
<http://www.isbe.state.il.us/learnservice>

Certified Local Government Program [for historic preservation]: G.

- Eligible projects include historical surveys, education and historical preservation planning.
- October deadline, 40% match required.
- Contact the Illinois Historic Preservation Agency at 217-785-5042.
<http://www.state.il.us/hpa>

Illinois Heritage Grants [for historic preservation]: G, O.

- Eligible projects are those that entail historical construction.
- 40% match required.
- Contact the Illinois Historic Preservation Agency at 217-785-5042
<http://state.il.us/hpa>

State Tax Incentives for Conservation: O, I.

- Urban land that is environmentally sensitive may qualify for significant property tax reductions:
 - Real Property Conservation Rights Act (765 ILCS 120/1 et seq.).
 - If land is qualified by having a conservation easement, it may be assessed at 8 1/3 fair market value.
 - Illinois Natural Areas Preservation Act (525 ILCS 30/1 et seq)/17 Ill Adm. Code.
 - If land is qualified by being designated as an Illinois Nature Preserve, it may be assessed at \$1/year in perpetuity.
 - Open Space Assessment (Illinois Property Tax Code Sections 10-155).
 - A lower use evaluation is used for land in open space, 10 acre minimum area, not applicable in Cook County.
 - Preferential Assessment of Common Areas (Illinois Property Tax Code Sections 10-35).
 - Purpose is to encourage open space in residential developments, if qualifying, assessment is reduced to \$1/year.

Other tax incentives may also apply, contact IDNR regarding the Real Property Conservation Rights Act and the Illinois Natural Areas Preservation Act at 217-785-8774. Contact your local township or county assessor to determine eligibility under the Open Space Assessment and Preferential Assessment of Common Areas.

OTHER PUBLIC/PRIVATE SOURCES

Community Development Assistance Program (Community Development Block Grant): G.

- Eligible projects must include activities that improve community welfare, specifically in moderate or low-income areas. Conservation-related projects can possibly include the acquisition of real property (e.g., flood-prone areas), construction of water or sewer facilities, and initiatives for energy conservation. Funding competition is intense.
- Application deadlines vary; no match required.
- Money originates at the federal level as the Community Development Block Grant and is administered directly to “entitlement” communities such as the urbanized counties in Northeastern Illinois and selected municipalities such as the City of Chicago. In other areas, municipalities and other units of local government should contact their county government to apply for funds from the state under the Community Development Assistance Program. Community groups should work through their local municipality in incorporated areas and the next level of local government (i.e. township or county) in other areas.

Conservation 2000 -- Streambank Stabilization & Restoration Program (SSRP): G, O, I.

- Eligible projects include naturalized stream bank stabilization practices in rural and urban communities.
- Application deadlines are January, May and September.
- 25% match required, 20% for qualified watershed planning areas.
- Contact the local Soil & Water Conservation District that services your county. Offices are listed in the phone book under "local government."

Habitat Restoration Fund for the Fox and Kishwaukee River Watersheds: I, O, E, G.

- Eligible projects include native plantings, upland habitat & wetland restoration.
- Deadlines in March and August.
- 75% cost-share, up to \$5,000.
- Contact the Lake, Kane-DuPage, DeKalb, Boone, McHenry or North Cook Soil and Water Conservation Districts for more information.

Great Lakes Basin Program for Soil Erosion and Sediment Control: U.

- USDA-sponsored projects include protection of Great Lakes Water Quality by controlling erosion and sedimentation (only available in Lake, Cook, and Will Counties). Typical grant amount around \$25,000.
- Application deadline in January.
- Contact the Great Lakes Commission at 734-665-9135.
- <http://www.glc.org/basin/RFP.html>

Chicago Wilderness Small Grants: U.

- Eligible projects include natural areas enhancement, education, and research that focus on biological diversity of northeastern Illinois, northwestern Indiana, and the southeastern Wisconsin region.
- Application deadlines vary, need to call
- 1:1 matching funds or in-kind services required.
- Contact the Chicago Wilderness at 312-346-8166 ext. 30 for information.

Wetland Restoration Fund: G, U.

- Eligible projects include wetlands and other aquatic ecosystem restorations, projects must be in the six-county Chicago metropolitan area and have either a conservation easement or be owned by a government agency.
- Deadline is March and October
- No match required, project site must have a conservation easement, projects range from \$5,000-\$100,000
- Contact Corelands at 312-427-4256, ext. 241.

River Network's Watershed Assistance Grants Program: U.

- Eligible projects include community-based partnerships that conserve or restore watersheds.
- Deadlines are February 18 and June 15
- Grant amounts range from \$1,500-30,000.
- Contact River Network at 503-241-3506 ext. 47.
- <http://www.rivernetwork.org> wag@rivernetwork.org

Community Tree Planting & Partnership Enhancement Monetary Grant Program: P.

- Eligible projects include community tree plantings with seedlings and grants to organizations for urban areas.
- Seedlings are donated directly to organizations conducting the plantings or monetary grants.
- Seedlings must be maintained and reports required for two years after grant award.
- Contact the National Tree Trust at 202-628-8733/Fax-8735 for more information on both these programs.
- <http://www.nationaltreetrust.com>

National Fish and Wildlife Foundation Grants: U.

- Eligible projects include habitat restoration and protection on private lands
- Deadlines vary per individual program
- Sample grant sizes range from under \$5,000 to \$75,000.

-Contact is at 202-857-0166
<http://www.nfwf.org>

North American Lake Management Society: U.

-Grant Programs and other incentives periodically offered to enhance the protection of lake watersheds.
<http://www.nalms.org/>

America the Beautiful Fund: U.

-Free seeds provided in support of USDA-sponsored initiative
-Phone is at 202-638-1649
<http://www.america-the-beautiful.org>

Illinois Conservation Foundation: P, G.

-Eligible projects include those that enhance natural resources.
-February deadlines.
-Grants up to \$5,000.
-Contact is at 312-814-7237
<http://www.icf.org>

PRIVATE SOURCES

Private sources of funding for community and urban conservation projects include corporations and individuals that have established foundations for charitable purposes. Many corporate foundations focus their philanthropy in areas near their operations, so local retailers, businesses, or the local chamber of commerce might be a source of revenue for your project. Most, but not all, require that the group applying for funding be sponsored by a not-for-profit [501(c)(3)] corporation. Information about private foundations can be identified through organizations that specialize in grant information research. Fees for services or products may be charged by these organizations, so be sure to clarify if charges will be incurred. For “do-it-yourselfers,” local grant data collection centers are available throughout Illinois and in convenient Indiana and Missouri locations:

Resources for Global Sustainability

P.O. Box 3665, Cary, NC 27519.
