

TRANSMITTAL

To: Bureau of Design and Environment
Attention: Tom Brooks
From: Illinois Natural History Survey
Regarding: Mitigation Monitoring

Title and Location

Title: Eckmann Site
Location: adjacent to the east edge of Cahokia Canal, 0.8 km (0.5 mi) west of I 255
County: Madison

Survey conducted by: Rick Larimore, Allen Plocher, Dave Ketzner, and Dennis Keene
Illinois Natural History Survey
Division of Ecology and Conservation Science
1816 S. Oak Street
Champaign, Illinois 61820
(217) 244-6716 (Larimore)

Date conducted: October 8, 2008

Project summary:

The project area for the proposed multi-use wetland compensation site was examined. Vegetation community composition, soils, and hydrology are described. Surrounding land use is addressed. All existing wetlands within the project area have been described and mapped.

Mitigation Monitoring

To: Thomas Brooks

From: Rick Larimore, Allen Plocher, David Ketzner, and Dennis Keene

Date: December 22, 2008

Regarding: Mitigation Monitoring – Eckmann Site/Multi-Use Wetland Compensation,
Madison County

Roadwork on FAP 14 (IL 3) resulted in wetland impacts. Compensation for these and other impacts is proposed on the Eckmann-Bischoff property near Collinsville, IL, Madison Co. (Legal location: T 3 N, R 9 W, Sect. 25, S/2 and NE/4, NE/4 and N/2, SE/4). This 25.1 ha (62 acre) tract occurs within an abandoned Mississippi River oxbow and is bordered by forested wetland and marsh to the south and east and Cahokia Canal levee to the west. The site occurs on the Mississippi River floodplain and the presettlement environment consisted of mesic and hydric floodplain forest, wet shrubland, marsh and backwater ponds and sloughs. The surrounding land use is primarily cropland and developed land. The forested land to the south is listed as Illinois Natural Area – Levee Lake and is in public ownership. The property, originally consisting of cropland considered to be nonwetland by the NRCS, was acquired by the IDOT in 1995 (Plocher et al. 1994) and 1997 (Keene and Ketzner 1997). Wetland and natural area restoration was to proceed by natural revegetation utilizing the soil seed bank and colonization from adjacent marsh and forested wetland (Thomas Brooks personal comm.). The State and Federally listed *Boltonia decurrens* had previously been located in low numbers at this site; however, fewer, (less than 10) individuals were found in 2008. As of 2000, 17 ha (42 acres) of wetlands (marsh and wet shrubland) had developed on the site (Ketzner et al. 2001); this was found to be the approximate area of wetland in 2002 (Ketterling and Robinson 2002, Robinson and Larimore 2003) and again in 2003 (Fucciolo et al. 2003, Larimore et al. 2004). Monitoring of the site began in 2002 and was conducted again in 2003. After that time monitoring was determined to be unnecessary since the site had been developing natural vegetation for seven years and that stable plant communities and hydrology were demonstrated. The ISGS and INHS submitted a letter and map (Figure 1) to IDOT showing wetlands with ISGS hydrological data and INHS vegetation surveys combined (Robinson and Larimore 2003).

Hydrology

Low topography and proximity to the Mississippi River combine to keep this area consistently wet. This site receives water through precipitation, sheet flow from adjacent higher ground, and occasionally from backflow via Schneider Ditch (Rorick, 1994). Water leaves the site by way of soil infiltration, evapotranspiration and by sheet flow into Schneider Ditch on occasions.

Size of immediate watershed: < 13 km² (5 mi²) The Mississippi River has a watershed greater than 25,920 km² (10,000 mi²). The hydrologic basin unit code is 07140101, Mississippi River, Upper.

Soils

Soil samples were taken where possible at the site. Most of the site was inundated with water reaching 2-3 ft in some areas. The NRCS had Wakeland silt loam and Beaucoup silt clay loam mapped at the site. Upon evaluation of this site, the uninundated area appeared to be Petrolia silty clay loam. Petrolia silty clay loam is a hydric poorly drained soil. Depth to the seasonal high water table is 0 to 0.5 ft. This soil is ideal for wetland plants and wildlife. This soil lies on the western portion of the site.

Vegetation

This site is made up of marsh, wet meadow, wet floodplain forest, and forbland plant communities. The plant communities have remained fairly stable since 2003; however, much of the wet floodplain forest was wet shrubland at that time. The marsh community, dominated by *Typha angustifolia* and *T. latifolia* and the wet meadow community, dominated by *Carex hyalinolepis*, *Leersia oryzoides*, and *Phyla lanceolata* are of good natural quality (FQI = 20.5), (percent weedy or non-native = 27.5%). The wet floodplain forest community is of fair natural quality (FQI = 11.5), (percent weedy or non-native = 39.3%).

The forbland on the western edge of the property, dominated by *Setaria faberi* and *Solidago canadensis* is of fair to poor quality. The wet floodplain forest communities to the east and south (Illinois Natural Area – Levee Lake) of the property appear to be of fairly good quality. North of the property lies a marsh (*Typha* spp.) and shallow pond apparently used for duck hunting and possibly in a conservation program of some kind.

Summary

All revegetation of this site has been ‘natural’ with no seeding or planting, relying on the seed bank and colonization from adjacent seed sources to enhance natural quality. Since this property was acquired by IDOT in 1995 and 1997 (Keene and Ketzner 1997), approximately 17 ha (42 acres) of marsh and wet shrubland had developed in 2000 (Ketzner et al. 2001); this was found to be the approximate area of wetland in 2002 (Robinson and Larimore 2003) and 2003 (Larimore et al. 2004). The area of wetland in 2008 was 21.0 ha (51.8 ac) out of 25.1 ha (62 acres). For the most part wet shrubland has become wet floodplain forest as many saplings have become tree sized. Other plant communities have remained quite stable, about the same as in 2003. The abundance of *Phragmites australis* and *Typha angustifolia* in the marsh community is a concern but it is not apparent that these species are increasing.

Table 1. Plant Communities within the Project Area

1. Marsh (most of eastern two thirds of tract)

Dominant Species

Understory - *Typha angustifolia* and *T. latifolia*

2. Wet Meadow (in western one third of tract)

Dominant Species

Understory - *Carex hyalinolepis*, *Leersia oryzoides*, and *Phyla lanceolata*

3. Wet Floodplain Forest (through northern and western thirds of tract)

Dominant Species

Overstory – *Populus deltoids*

Sapling Layer – *Fraxinus pennsylvanica*, *Populus deltoides*

Understory - *Carex hyalinolepis*, *Toxicodendron radicans*

4. Forbland (far western edge of tract)

Dominant Species

Understory – *Setaria faberi*, *Solidago canadensis*

Wetland Assessment

All potential wetlands within the project area were examined on October 8, 2008. Four on-site wetland determinations were performed and it was determined that three of these sites are wetlands. Results of these determinations are summarized below and described in more detail on the accompanying forms (Appendix 1). The wetland delineation sites are marked on the enclosed digital ortho photograph (Figure 1). Wetland boundaries were mapped using Trimble Global Positioning System (GPS) and depicted using ArcView 3.3 overlain on a digital ortho photograph. GPS data has been posted on the IDOT extranet site.

The following sources were examined while surveying the project area to determine wetland locations and boundaries: United States Geological Survey topographic map and National Wetland Inventory (NWI) map (Monks Mound 7.5 minute quadrangle); aerial photograph; Reed (1988); Leeper (2004); Mohlenbrock (1986); U.S. Army Corps of Engineers (1993); and Environmental Laboratory (1987). These materials were used during an on-site evaluation of vegetation, soils, and hydrology.

Included with the assessment of a site is its Floristic Quality Index, developed by Swink and Wilhelm (1979) and modified by Taft *et al.* (1997) and Swink and Wilhelm (1994). Although the Index is not a substitute for quantitative vegetation analysis in assessing plant communities, it provides a measure of the floristic integrity or level of disturbance of a site. Each plant species native to Illinois is assigned a Coefficient of Conservatism (C value), a number between 0 and 10. The rating number given to each plant is subjective and indicates the likelihood of finding the plant on an undisturbed site in a natural plant community. A plant species that has a low C value is common and is likely to tolerate disturbed conditions; a species with a high C value is relatively rare and is likely to require specific, undisturbed habitats. The Floristic Quality Index (FQI) is calculated as follows: $FQI = \sum C / \sqrt{N}$, where $\sum C$ represents the sum of the numerical ratings for all species recorded for a site, and N represents the number of plant species found on the site. The C value for each species is shown in the species list for the site. The mean C value (also known as mean rated quality) was also calculated for each site. This value is calculated as follows: $mCv = \sum C / N$. Species not native to Illinois (indicated by * in the species list) are not included in the calculations. Plants not identified to species level are not rated and also not included in the calculations. FQI values of less than 10 indicate low natural quality, while sites with values of 20 or more (mean C > 3.0) have at least some evidence of native character and may be considered environmental assets. However, diversity and species composition (therefore FQI and mean C values) may differ naturally between plant community types and seasonally within community types.

Wetland Site Summaries

Site 1: This marsh is located 99 m (325 ft) east of the Cahokia Canal and extends from there east through much of the tract. One small portion of this site is located in the extreme southwest corner of the tract. The small portion is approximately 0.6 ha (1.6 ac) and the large portion 11.8 ha (29.1 ac) in area for a total of 12.4 ha (30.7 ac). Dominant hydrophytic vegetation, wetland hydrology and hydric soils are all present; therefore, the wetland criteria are met and this site is a wetland. This site provides good quality wildlife habitat. This site was not coded as wetland by the NWI.

Site 2: This wet meadow is made up of two areas, both in the western one third of the tract. The southern portion is adjacent to the base of the Cahokia Canal levee and extends east to the western edge of Site 3. The northern portion lies approximately 15.2 m (50 ft) east of the base of the Cahokia Canal levee and extends west to Site 3 and south. The southern portion is approximately 0.9 ha (2.2 ac) and the northern portion 1.7 ha (4.1 ac) in area for a total of 2.5 ha (6.3 ac). Dominant hydrophytic vegetation, wetland hydrology and hydric soils are all present, therefore, the wetland criteria are met and this site is a wetland. This site provides good quality wildlife habitat. This site was not coded as wetland by the NWI.

The FQI and mean C of marsh and wet meadow combined was 20.5 and 2.56 respectively. These values indicate good natural quality.

Site 3: This wet floodplain forest is made up of two areas. The southern portion is adjacent to the base of the Cahokia Canal levee and extends east to the western edge of Site 1. The northern portion lies approximately 15.2 m (450 ft) east of the Cahokia Canal and extends east along the northern half of Site 1 to the eastern edge of the tract. The southern portion is approximately 3.2 ha (8.0 ac) and the northern portion 2.8 ha (6.9 ac) in area for a total of 6.0 ha (14.8 ac). Dominant hydrophytic vegetation, wetland hydrology and hydric soils are all present; therefore, the wetland criteria are met and this site is a wetland. This site provides medium quality wildlife habitat. The FQI was 11.5 and mean C value was 2.39. These values indicate fair natural quality. This site was not coded as wetland by the NWI.

Site 4: This forbland lies on the western edge of the tract just east of the base of the Cahokia Canal levee. Hydric soils are present; however, dominant hydrophytic vegetation and wetland hydrology are not. The wetland criteria are not all met and this site is not a wetland. This site was dominated by *Setaria faberi* and *Solidago canadensis*. This site was not coded as wetland by the NWI.

Routine Wetland Determinations

ROUTINE ON-SITE WETLAND DETERMINATION

Site 1 (page 1 of 5)

Field Investigators: Larimore, Plocher, Ketzner, and Keene**Date:** October 8, 2008**Project Name:** Eckmann mitigation site**State:** Illinois **County:** Madison **Applicant:** IDOT District 8**Site Name:** marsh**Legal Description:** S 1/2 of NE 1/4 and NE 1/4 of NE ¼ Sec 25, T 3 N, R 9 W**Location** This marsh is located 99 m (325 ft) east of the Cahokia Canal and extends from there east through much of the tract. One small portion of this site is located in the extreme southwest corner of the tract.

Do normal environmental conditions exist at this site? Yes: X No:

Have the vegetation, soils, and/or hydrology been significantly disturbed? Yes: No: X

VEGETATION**Dominant Plant Species****Indicator Status****Stratum***Typha angustifolia*

OBL

herb

Typha latifolia

OBL

herb

Percentage of dominant species that are OBL, FACW, FAC+, or FAC: 100%

Hydrophytic vegetation? Yes: X No:**Rationale:** More than 50% of the dominants are OBL, FACW, FAC+ or FAC**SOILS**

Series and phase: Undetermined (inundated area)

On Madison County hydric soils list?: Yes: No: X

Is the soil a histosol? Yes: No: X

Histic epipedon present? Yes: No: X

Redox concentrations: Yes: No: Undet: X

Redox depletions: Yes: No: Undet: X

Matrix color: NA

Other hydric soil indicators: Soil is saturated.

Hydric soils: Yes: X No:**Rationale:** This site was inundated. This soil is ponded for a long duration or a very long duration during the growing season. This characteristic is evidence of a hydric soil.

ROUTINE ON-SITE WETLAND DETERMINATION

Site 1 (page 2 of 5)

Field Investigators: Larimore, Plocher, Ketzner, and Keene

Date: October 8, 2008

Project Name: Eckmann mitigation site

State: Illinois **County:** Madison **Applicant:** IDOT District 8

Site Name: marsh

Legal Description: S 1/2 of NE 1/4 and NE 1/4 of NE ¼ Sec 25, T 3 N, R 9 W

Location This marsh is located 99 m (325 ft) east of the Cahokia Canal and extends from there east through much of the tract. One small portion of this site is located in the extreme southwest corner of the tract.

HYDROLOGY

Inundated: Yes: X No: Depth of standing water: 0 to 0.3 m (0 to 12 in)

Depth to saturated soil: at surface

Overview of hydrological flow through the system: This site receives water through precipitation, sheet flow from adjacent higher ground, and occasionally from backflow via Schneider Ditch (Rorick, 1994). Water leaves the site by way of soil infiltration, evapotranspiration and by sheet flow into Schneider Ditch on occasions.

Size of immediate watershed: < 13 km² (5 mi²) The Mississippi River has a watershed greater than 25,920 km² (10,000 mi²).

Other field evidence observed: drift lines, water marks, and water-borne sediment deposits

Wetland hydrology? Yes: X No:

Rationale: Topographic position indicates that water leaves this site slowly. In our opinion this site is flooded or saturated long enough during the growing season to satisfy the wetland hydrology criterion.

DETERMINATION AND RATIONALE:

Is the site a wetland? Yes: X No:

Rationale for decision: Dominant hydrophytic vegetation, wetland hydrology, and hydric soils are all present. The wetland criteria are all met and this site is a wetland. This site was not coded as wetland by the NWI.

Determined by: Rick Larimore and Allen Plocher (vegetation and hydrology)
David Ketzner (GPS, vegetation, and hydrology)

ROUTINE ON-SITE WETLAND DETERMINATION

Site 2 (page 1 of 5)

Field Investigators: Larimore, Plocher, Ketzner, and Keene**Date:** October 8, 2008**Project Name:** Eckmann mitigation site**State:** Illinois **County:** Madison **Applicant:** IDOT District 8**Site Name:** wet meadow**Legal Description:** S 1/2 of NE 1/4 and NE 1/4 of NE 1/4 Sec 25, T 3 N, R 9 W**Location** This wet meadow is made up of two areas both in the western one third of the tract. The southern portion is adjacent to the base of the Cahokia Canal levee and extends east to the western edge of Site 3. The northern portion lies approximately 15.2 m (50 ft) east of the base of the Cahokia Canal levee and extends west to Site 3 and south.Do normal environmental conditions exist at this site? Yes: No: Have the vegetation, soils, and/or hydrology been significantly disturbed? Yes: No: **VEGETATION**

Dominant Plant Species	Indicator Status	Stratum
<i>Carex hyalinolepis</i>	OBL	herb
<i>Leersia oryzoides</i>	OBL	herb
<i>Phyla lanceolata</i>	OBL	herb

Percentage of dominant species that are OBL, FACW, FAC+, or FAC: 100%

Hydrophytic vegetation? Yes: No: **Rationale:** More than 50% of the dominants are OBL, FACW, FAC+ or FAC**SOILS**

Series and phase: Petrolia silty clay loam

On Illinois State hydric soils list? Yes: No: Is the soil a histosol? Yes: No: Histic epipedon present? Yes: No: Redox concentrations: Yes: No: Redox depletions: Yes: No:

Matrix color: 2.5Y 4/1

Other indicators: This soil is found in low areas and was inundated in many places.

Hydric soils: Yes: No: **Rationale:** The Natural Resources Conservation Service classifies Petrolia silty clay loam as having aquic conditions. This soil has iron masses, iron depletions, and an iron depleted matrix. Furthermore, this soil meets the NRCS hydric soil indicator F3 (depleted matrix). These characteristics are evidence of a hydric soil.

State: Illinois **County:** Madison **Applicant:** IDOT District 8

Site Name: wet meadow

Legal Description: S 1/2 of NE 1/4 and NE 1/4 of NE 1/4 Sec 25, T 3 N, R 9 W

Location This wet meadow is made up of two areas both in the western one third of the tract. The southern portion is adjacent to the base of the Cahokia Canal levee and extends east to the western edge of Site 3. The northern portion lies approximately 15.2 m (50 ft) east of the base of the Cahokia Canal levee and extends west to Site 3 and south.

HYDROLOGY

Inundated: Yes: X No: Depth of standing water: 0 to 0.3 m (0 to 12 in)

Depth to saturated soil: at surface

Overview of hydrological flow through the system: This site receives water through precipitation, sheet flow from adjacent higher ground, and occasionally from backflow via Schneider Ditch (Rorick, 1994). Water leaves the site by way of soil infiltration, evapotranspiration and by sheet flow into Schneider Ditch on occasions.

Size of immediate watershed: < 13 km² (5 mi²) The Mississippi River has a watershed greater than 25,920 km² (10,000 mi²).

Other field evidence observed: drift lines, water stains, and sediment deposits

Wetland hydrology? Yes: X No:

Rationale: Topographic position indicates that water leaves this site slowly. In our opinion this site is flooded or saturated long enough during the growing season to satisfy the wetland hydrology criterion.

DETERMINATION AND RATIONALE:

Is the site a wetland? Yes: X No:

Rationale for decision: Dominant hydrophytic vegetation, wetland hydrology, and hydric soils are all present. The wetland criteria are all met and this site is a wetland. This site was not coded as wetland by the NWI.

Determined by: Rick Larimore and Allen Plocher (vegetation and hydrology)
 David Ketzner (GPS, vegetation, and hydrology)
 Dennis Keene (soils and hydrology)

ROUTINE ON-SITE WETLAND DETERMINATION

Site 3 (page 1 of 3)

Field Investigators: Larimore, Plocher, Ketzner, and Keene**Date:** October 8, 2008**Project Name:** Eckmann mitigation site**State:** Illinois **County:** Madison **Applicant:** IDOT District 8**Site Name:** wet floodplain forest**Legal Description:** S 1/2 of NE 1/4 and NE 1/4 of NE 1/4 Sec 25, T 3 N, R 9 W**Location** This wet floodplain forest is made up of two areas. The southern portion is adjacent to the base of the Cahokia Canal levee and extends east to the western edge of Site 1. The northern portion lies approximately 15.2 m (450 ft) east of the Cahokia Canal and extends east along the northern half of Site 1 to the eastern edge of the tract.

Do normal environmental conditions exist at this site? Yes: X No:
 Have the vegetation, soils, and/or hydrology been significantly disturbed? Yes: No: X

VEGETATION

Dominant Plant Species	Indicator Status	Stratum
<i>Populus deltoides</i>	FAC+	tree
<i>Fraxinus pennsylvanica</i>	FACW	sapling
<i>Populus deltoides</i>	FAC+	sapling
<i>Carex hyalinolepis</i>	OBL	herb
<i>Toxicodendron radicans</i>	FAC+	herb

Percentage of dominant species that are OBL, FACW, FAC+, or FAC: 100%

Hydrophytic vegetation? Yes: X No:**Rationale:** More than 50% of the dominants are OBL, FACW, FAC+ or FAC**SOILS**

Series and phase: Undetermined (inundated area)

On Madison County hydric soils list?: Yes: No: X

Is the soil a histosol? Yes: No: X

Histic epipedon present? Yes: No: X

Redox concentrations: Yes: No: Undet: X

Redox depletions: Yes: No: Undet: X

Matrix color: NA

Other hydric soil indicators: Soil is saturated.

Hydric soils: Yes: X No:**Rationale:** This site was inundated. This soil is ponded for a long duration or a very long duration during the growing season. This characteristic is evidence of a hydric soil.

ROUTINE ON-SITE WETLAND DETERMINATION

Site 3 (page 2 of 3)

Field Investigators: Larimore, Plocher, Ketzner, and Keene

Date: October 8, 2008

Project Name: Eckmann mitigation site

State: Illinois **County:** Madison **Applicant:** IDOT District 8

Site Name: wet floodplain forest

SPECIES LIST

Scientific name	Common name	Stratum	Wetland indicator status	C†
<i>Acer saccharinum</i>	silver maple	sapling	FACW	1
<i>Asparagus officinalis</i>	asparagus	herb	FACU	*
<i>Bidens frondosa</i>	beggar's ticks	herb	FACW	1
<i>Campsis radicans</i>	trumpet creeper	herb/woody vine	FAC	2
<i>Carex hyalinolepis</i>	sedge	herb	OBL	4
<i>Cassia fasciculata</i>	partridge pea	herb	FACU-	1
<i>Cornus racemosa</i>	gray dogwood	shrub	FACW-	2
<i>Cynanchum laeve</i>	blue vine	herb	FAC	1
<i>Eclipta prostrata</i>	yerba de tajo	herb	FACW	2
<i>Fraxinus pennsylvanica</i>	green ash	shrub/sapling	FACW	2
<i>Hibiscus laevis</i>	halberd leaf rose mallow	herb	OBL	4
<i>Juncus torreyi</i>	Torrey's rush	herb	FACW	3
<i>Lemna minor</i>	duckweed	herb	OBL	3
<i>Lysimachia nummularia</i>	moneywort	herb	FACW+	*
<i>Morus alba</i>	white mulberry	shrub	FAC	*
<i>Panicum dichotomiflorum</i>	fall panicum	herb	FACW-	0
<i>Panicum virgatum</i>	switchgrass	herb	FAC+	4
<i>Phalaris arundinacea</i>	reed canarygrass	herb	FACW+	*
<i>Phragmites australis</i>	common reed	herb	FACW+	1
<i>Populus deltoides</i>	cottonwood	tree/sapling	FAC+	2
<i>Rumex crispus</i>	curly dock	herb	FAC+	*
<i>Salix amygdaloides</i>	peach leaf willow	sapling	FACW	4
<i>Scirpus validus</i>	great bulrush	herb	OBL	4
<i>Solidago gigantea</i>	late goldenrod	herb	FACW	3
<i>Stachys tenuifolia</i>	slender leaf betony	herb	OBL	5
<i>Toxicodendron radicans</i>	poison ivy	herb/woody vine	FAC+	1
<i>Ulmus americana</i>	American elm	seedling	FACW-	5
<i>Xanthium strumarium</i>	cocklebur	herb	FAC	0

= Coefficient of Conservatism (Taft et al. 1997)

* Non-native species

Percent weedy or non-native: 11/28 = 39.3%

$$mCv = \sum C/N = 55/23 = 2.39$$

$$FQI = \sum C/\sqrt{N} = 55/\sqrt{23} = 11.5 \quad \text{Quality} = \text{fair}$$

ROUTINE ON-SITE WETLAND DETERMINATION

Site 4 (page 1 of 2)

Field Investigators: Larimore, Plocher, Ketzner, and Keene**Date:** October 8, 2008**Project Name:** Eckmann mitigation site**State:** Illinois **County:** Madison **Applicant:** IDOT District 8**Site Name:** forbland**Legal Description:** S 1/2 of NE 1/4 and NE 1/4 of NE 1/4 Sec 25, T 3 N, R 9 W**Location** This forbland is located on the west side of the tract, adjacent to the east edge of Cahokia Canal, 0.8 km (0.5 mi) west of I 255.

Do normal environmental conditions exist at this site? Yes: X No:
 Have the vegetation, soils, and/or hydrology been significantly disturbed? Yes: No: X

VEGETATION

Dominant Plant Species	Indicator Status	Stratum
<i>Setaria faberi</i>	FACU+	herb
<i>Solidago canadensis</i>	FACU	herb

Percentage of dominant species that are OBL, FACW, FAC+, or FAC: 0%

Hydrophytic vegetation? Yes: No: X**Rationale:** Less than 50% of the dominants are OBL, FACW, FAC+ or FAC**SOILS**

Series and phase: Petrolia silty clay loam

On Illinois State hydric soils list? Yes: X No:

Is the soil a histosol? Yes: No: X

Histic epipedon present? Yes: No: X

Redox concentrations: Yes: X No:

Redox depletions: Yes: X No:

Matrix color: 2.5Y 4/1

Other indicators: This soil is found in low areas.

Hydric soils: Yes: X No:**Rationale:** The Natural Resources Conservation Service classifies Petrolia silty clay loam as having aquic conditions. This soil has iron masses, iron depletions, and an iron depleted matrix. Furthermore, this soil meets the NRCS hydric soil indicator F3 (depleted matrix). These characteristics are evidence of a hydric soil.

ROUTINE ON-SITE WETLAND DETERMINATION

Site 4 (page 2 of 2)

Field Investigators: Larimore, Plocher, Ketzner, and Keene

Date: October 8, 2008

Project Name: Eckmann mitigation site

State: Illinois **County:** Madison **Applicant:** IDOT District 8

Site Name: forbland

Legal Description: S 1/2 of NE 1/4 and NE 1/4 of NE 1/4 Sec 25, T 3 N, R 9 W

Location This forbland is located on the west side of the tract, adjacent to the east edge of Cahokia Canal, 0.8 km (0.5 mi) west of I 255.

HYDROLOGY

Inundated: Yes: No: Depth of standing water: NA

Depth to saturated soil: 0.25 m (10 in)

Overview of hydrological flow through the system: This site receives water through precipitation, sheet flow from adjacent higher ground, and occasionally from backflow of adjacent wetlands.

Water leaves the site by way of soil infiltration, evapotranspiration and by sheet flow into adjacent wetlands.

Size of immediate watershed: < 13 km² (5 mi²) The Mississippi has a watershed greater than 25,920 km² (10,000 mi²).

Other field evidence observed: none

Wetland hydrology? Yes: No:

Rationale: Topographic position indicates that water leaves this site quickly. In our opinion this site is not flooded or saturated long enough during the growing season to satisfy the wetland hydrology criterion.

DETERMINATION AND RATIONALE:

Is the site a wetland? Yes: No:

Rationale for decision: Dominant hydrophytic vegetation is present; however, wetland hydrology, and hydric soils are not. Therefore, the wetland criteria are not all met and this site is not a wetland. This site was not coded as wetland by the NWI.
