CHAPTER 1 B75 APPENDIX OVERVIEW

1.1 INTRODUCTION

The purpose of this Appendix is to update the results and conclusions of the April 2022 Pump Station #30 (PS 30) Hydraulic Report 2x2 Design with the Illinois State Water Survey (ISWS) Bulletin 75 (B75) rainfall depths and Huff distributions. The subject Pump Station Hydraulic Report was started before Bulletin 75 was released and used Bulletin 70 (B70) isohyetal depths. This report updates the existing conditions results using B75 Northeast Sectional data and proposes upstream storage alternatives that meet the design criteria presented in the 2x2 Hydraulic Report. The upstream alternatives include combinations of the previous 2x2 Finalist Alternatives A, B, and C. New alternatives such as upsized storm sewer in the shoulders or downstream storage or increased conveyance were not analyzed but may be considered in Phase II.

It should be noted that this study utilized XP-SWMM 2014 to be consistent with the 2x2 Hydraulic Report. Use of other versions of XP-SWMM may provide slightly different model results. The Phase II designer should use the newest version of XP-SWMM at the time.

The proposed I-55 roadway improvement increases traffic capacity by developing two "managed" lanes in each direction by converting the median to additional travel lanes and minimal widening to the outside. This is referred to as the "2x2" proposed design. Please refer to the PS 30 2x2 Hydraulic Report dated April 2022 for the 2x2 geometry and proposed storage alternatives using the original B70 rainfall depths.

CHAPTER 2 BULLETIN 75 VS. BULLETIN 70

2.1 RAINFALL DEPTHS

Bulletin 75 Northeast (NE) Sectional rainfall depths are on average 14% higher than the B70 isohyetal depths used in the original PS 30 2x2 Hydraulic Report. A comparison of the rainfall depths is provided below in Table 2-1. Excerpts from the ISWS B75 Report and the isohyetal calculations for PS 30 are provided in Section 1.

Note that there is an unexpected coincidence in rainfall depths between the new B75 50-year NE Sectional values and the original B70 isohyetal 100-year values.

Storm Duration (hr)	Rainfall Depth (in)				Huff Quartile
	50-Year		100-Year		
	B70 Isohyetal	B75 NE Sectional	B70 Isohyetal	B75 NE Sectional	
0.25	1.78	2.03	2.03	2.32	1st
0.5	2.44	2.78	2.78	3.17	1st
1	3.10	3.53	3.53	4.03	1st

18	6.20	7.05	7.05	8.06	3rd

Table 2-1 Rainfall Depths Comparison

2.2 HUFF DISTRIBUTIONS

As part of the Bulletin 75 update, new Huff distributions were developed. As a result, the Huff distributions are in 24 increments for the same quartiles. Table 2-2 contains the updated Bulletin 75 Quartiles.

Portion of Storm	First Quaritle	Second Quaritle	Third Quaritle	Fourth Quaritle
0/24	0.00	0.00	0.00	0.00
1/24	8.36	2.29	2.05	2.31
2/24	17.73	4.82	4.31	4.79
3/24	28.11	7.78	6.67	7.12
4/24	38.33	11.33	9.12	9.78
5/24	47.45	15.79	11.71	12.53
6/24	55.50	21.39	14.36	15.23
7/24	62.25	28.41	16.91	17.91
8/24	67.22	36.44	19.64	20.33
9/24	70.82	45.29	22.78	22.83
10/24	74.17	54.35	26.33	25.41
11/24	76.97	62.38	30.93	28.35
12/24	79.81	69.76	36.35	31.25
13/24	82.55	75.48	43.92	33.90
14/24	85.18	80.38	52.11	36.33
15/24	87.40	84.70	61.02	38.61
16/24	89.47	87.81	69.89	41.24
17/24	91.17	90.22	78.19	45.08
18/24	92.70	92.17	84.92	51.29

23/24	98.85	98.84	98.56	96.04
24/24	100.00	100.00	100.00	100.00

Table 2-2 Bulletin 75 Huff Distrubution Values

CHAPTER 3 HYDROLOGIC & HYDRAULIC ANALYSIS

This chapter presents a description of the XP Software Stormwater and Wastewater Management Model (XP-SWMM) hydrologic and hydraulic modeling used for this analysis. Chapter 3.1 will only discuss the existing conditions results from the B75 update to the April 2022 PS 30 2x2 Hydraulic Report. Please refer to the full Hydraulic Report for discussion of how the model was built.

3.1 EXISTING CONDITIONS RESULTS COMPARISION

3.1.1 EXISTING CONDITIONS KINEMATIC MODELING

A critical duration analysis was performed to determine peak 50-year and 100-year flow rates to the existing pump station using B75 rainfall depths and Huff distributions ('Existing DISCONNECT Kinematic upsize pipe_B75.xp').

A summary of the differences between the B70 and B75, existing Kinematic analysis results are provided in Table 3-1 below. The critical duration storm event was used to evaluate the existing pump station because it is the most conservative. This study modeled the system in XP-SWMM 2014. Use of other versions of XP-SWMM may provide slightly different model results.

Storm Duration (hr)	Peak Flowrate (cfs)				Flow Volume (ft^3)	
	100-Year		50-Year		100-Year	50-Year
	B70	B75	B70	B75	B75	B75
0.25	124.9	158.2	100.9	128.5		
0.5*	150.3	184.3	123.6	151.7	292,086	245,181
1	141.1	176.8	117.4	147.3		
2	112.3	141.5	93.8	119.3		

* Critical duration

Table 3-1 Existing Conditions DISCONNECT Kinematic Critical Duration Analysis Summary

In comparing the flows between B70 and B75, the flows are approximately 25% higher for the B75 results. This is within the expected range.

3.1.2 EXISTING CONDITIONS DYNAMIC MODELING

The existing conditions XP-SWMM Dynamic model was updated using the B75 rainfall depths and Huff distributions. The existing conditions XP-SWMM Existing Conditions Dynamic analysis results are summarized in Table 3-2 below and compared. In addition, the XP-SWMM model titled ('Existing FINAL 12_2021_B75_v14.xp') is provided on the CD in Section 6.

Max Pump Rate		Storage (ft^3) (at elevation 577.3 ft)		Peak Elevation at Roadway Sag (NAVD88, ft)				Lowest Pavement Elevation (NAVD88, ft)	Freeboard (ft)			
				50-yr		100-yr			50-yr		100-yr	
cfs	gpm	Wet Well	Storm Sewers	B70	B75	B70	B75		B70	B75	B70	B75
118	53,200	13,806	47,019	573.76	578.21	577.91	578.95	577.31	3.55	-0.9	-0.6	-1.64

Table 3-2 Existing Conditions Dynamic XP-SWMM Results

Many of the existing conditions observations found in the April 2022 PS 30 Hydraulic Report are repeated in the updated B75 Appendix version. Below are additional comparisons:

- As expected, the Existing Conditions Dynamic model critical 100-year, 0.5-hour peak flow rate of 159.0 cfs entering the wet well is slightly lower than the rate of 184.3 cfs from the Kinematic model. (See XP-SWMM Conduit N851 SS.)
- The existing pump station and main drain system do not meet freeboard requirements for the 50-year or 100 critical duration storm event.
- Based on the Dynamic model's results, the existing main drain storm sewer line upstream of the pump station is inadequate to convey the peak 50-year or 100-year runoff rate under gravity flow conditions.
- The XP-SWMM B75 models continue to show no overflow from the areas east and west of the subway for the 50-year and 100-year, critical duration storm events;
- The modeling results 'Existing FINAL 12_2021_B75_v14.xp' indicate a peak 100-year water surface elevation of 578.95 feet at surveyed Structure 10559 (Node N867), which is located at the outer edge of southbound Lane 3 just west of the railroad tracks. Based on Cook County's 1-foot topography, this would put standing water in southbound Lane 3 for an approximately 450-foot section of roadway.
- XP-SWMM modeling results 'Existing FINAL 12_2021_B75_v14.xp' show that peak Hydraulic Grade Line (HGL) in the 54-inch diameter storm sewer downstream of the pump station is above the crown for the 50-year and 100-year storm events. The peak HGL is below existing ground elevations for the 50-year event. The 100-year HGL is slightly above the rim elevations at the I-55 median ditch and causes a small amount of overland flow down the median towards the pump station drainage system, which is reflected in the model by overland flow links. The gravity total flow capacity of the 54" discharge pipe out of the pump station is 100 cfs. The peak HGL for the 50-year and 100-year storm events (598.8 feet 50-yr, 598.7 feet 100-yr) is also above the invert of the 24-inch diameter pump discharge pipes (EL = 591.5 feet) in the discharge chamber.
- The results based on the B75 rainfall depths and Huff distributions have increased calculated WSEs as expected.

3.1.3 EXISTING CONDITIONS MASS CURVE ROUTING

Mass curves were generated for the 50-year and 100-year design storm events and are included in Section 3. A separate kinematic XP-SWMM model that disconnects the existing pump station and assumes a free flow outlet was created to determine the inflow hydrograph for each return interval ('Existing DISCONNECT Kinematic upsize pipe_B75.xp'). The inflow hydrograph to the pump station was taken from the incoming storm sewer to the pump station for a 30-minute duration. The mass curve tabulations and plots use a 1-minute time interval to facilitate curve smoothness without generating excessive output data. The XP-SWMM peak inflow rates to the pump station are 151.7 cfs and 184.3 cfs for the 50-year and 100-year storm events, respectively. The pump flow rates in the model use the nominal rates, which is a more conservative approach than using the performance curves.

Comparison of the mass curves to the XP-SWMM model output shows a close correlation between pump on/off times. The calculated wet well elevation varies for both the 50-year and 100-year event. Previous experience has shown that an undersized main drain scenario can produce model instability resulting in more significant differences between XP-SWMM and mass routing results as reflected in the original Hydraulic Report. The updated B75 results are higher than the original report but are within the expected range. Therefore, the XP-SWMM models provide verification of the output generated by the mass curves. A comparison summary is provided in Table 3-3.

	Wet Well EL (ft)	Lead on (min)	Lag #1 on (min)	Lag #2 on (min)	Standby On (min)
	50-yr				
XP-SWMM	571.3	15	15	16	16
Mass Route	566.7	14	16	18	21
	100-yr				
XP-SWMM	572.9	14	14	15	15
Mass Route	569.0	13	15	17	19

Table 3-3 Existing Conditions Dynamic Model vs. Mass Routing Summary

3.2 PROPOSED CONDITIONS

The proposed B75 update was applied to the two alternatives from the April 2022 2x2 Hydraulic Report, as it is believed that the 2x2 is the selected geometric configuration for future I-55 improvements. Please refer to the April 2022 PS-30 Hydraulic report 2x2 for discussion on the proposed configuration of I-55 and the conclusion of the B70 selected alternatives.

3.2.1 PROPOSED CONDITIONS KINEMATIC MODELING

A proposed conditions kinematic disconnect model (Proposed DISCONNECT Kinematic upsize pipe_B75.xp) was developed by adjusting the CN values for the affected subbasins in the existing conditions kinematic disconnect model. Peak flow rates for the previously identified critical duration storm event are summarized in Table 3-4.

State	Storm Duration (hr)	Peak Flowrate (cfs)				Flow Volume (ft^3)			
		100-Year		50-Year		100-Year		50-Year	
		B75	B70	B75	B70	B75	B70	B75	B70
Existing	0.5*	184.3	150.2	151.7	123.4	292,086	245,138	245,182	205,118
Proposed		204.7	169.6	170.9	141.2	315,539	267,448	267,635	226,504

Table 3-4 Proposed Disconnect Kinematic Model Summary

3.2.2 PROPOSED CONDITIONS DYNAMIC MODELING

Three original finalist alternatives were developed for the project for the B70 report. Finalist Alternative A provides increased storage and conveyance by installing a parallel median storm sewer system interconnected with the existing main drain. Finalist Alternative B consists of constructing a new storage vault upstream of PS 30 in the south ROW, with a single connection point to the main drain. Finalist Alternative C (Selected Alternative) consists of a parallel storm sewer located in the south ROW and interconnected to the existing main drain at the upstream and downstream ends.

As part of the B75 update, Alternatives A and C were rerun using the updated rainfall depths and distributions. Based on the original 2x2 B70 analysis, Alternative B was not a viable solution for the 2x2, so it was not considered as part of this analysis. Comparisons of the original B70 results to the updated B75 results are provided in Table 3-5.

Alternative	# of Main Pumps	Pump Rate (cfs)	Peak Elevation at Roadway Sag (ft, NAVD 88) Node N867 1-Hour Critical				Lowest Inlet Elevation (NAVD 88, ft)	Freeboard (ft)			
			100-year		50-year			100-year		50-year	
			B75	B70	B75	B70		B75	B70	B75	B70
FINAL 'A'	3 + 1 standby	88.8	579.05	576.89	577.78	573.7	577.31	-1.74	0.42	-0.47	3.61
FINAL 'C'			579.2	576.96	577.9	573.82		-1.89	0.35	-0.59	3.49

Table 3-5 Original Finalist Alternatives B75 Results

The results reported in Table 3-5 indicate the original Finalist Alternatives do not meet the design criteria outlined in the original April 2022 Hydraulic Report when using the updated B75 rainfall data. In particular, the edge of pavement protection requirement is not met. These results are expected as the B75 50-year rainfall depth is equivalent to the B70 100-year rainfall depth. It should be noted that the original Hydraulic Report stated that the I-55 main drain was undersized under B70 existing conditions. Therefore, the main drain and its laterals may require additional improvements not considered in this update.

This update look***s*** at providing feasible alternatives based on combinations of the previously selected alternatives with no modifications to the main drain. Table 3-6 summarizes the results of the proposed Bulletin 75 alternatives. Additional alternatives with only one single oversized pipe either in the median or south ROW were looked at, but they did not meet the proposed design criteria.

Alternative	# of Main Pumps	Pump Rate (cfs)	Peak Elevation at Roadway Sag (ft, NAVD 88) Node N867		Wet Well EL (ft, NAVD 88) Critical		Lowest Inlet Elevation (NAVD 88, ft)	Freeboard (ft)	
			100-year	50-year	100-year	50-year		100-year	50-year
Alt 1	3 + 1 standby	88.8	577.2	574.1	574.0 (SWMM) 570.1 (MASS)	572.1 (SWMM) 567.7 (MASS)	577.31	0.11	3.21
Alt 2			577.1	574.8				0.21	2.51
Alt 3			577.2	575.31				0.11	2

Table 3-6 Proposed B75 Finalist Alternatives

3.2.2.1 ALTERNATIVE 1 A+C – PARALLEL MEDIAN SEWER and SOUTH ROW SEWER

Alternative 1 is to install 1,013 feet of 84-inch diameter parallel storm sewer within the median between invert elevations 567.2 ft and 570.2 ft. The new storm sewer connects to the existing main drain at existing manholes located approximately at Station 1201+72 and Station 1210+15. The most upstream extension allows the median system to pick up additional runoff from the median and north pavement. Additionally, there would be 1,200 feet of 72-inch diameter parallel storm sewer within the south ROW between inverts 564.8 ft and 565.0 ft installed. The parallel sewer is proposed to tie into the existing main drain at the upstream end through a 48-inch diameter storm sewer at approximately Station 1201+72. It will be necessary to bore/tunnel the 48-inch storm sewer under the pavement to connect to the existing main drain. The downstream end of the 72-inch storm sewer is proposed to tie back into the main drain just upstream of PS 30. The new storage volume added under Finalist Alternative C is approximately 74,160 ft^3. The new storage volume added under Finalist Alternative A is approximately 38,990 ft^3. PS 30 operation is proposed to be updated to include three main pumps at 13,300 gpm (29.6 cfs) and one stand-by pump at 13,300 gpm (29.6 cfs). The low flow pump remains unchanged.

Alternative 1 is the recommended alternative. Mass routing for Alternative 1 is provided in Section 3. A schematic of Alterative 1 is provided as Exhibit 1 in Section 4. Installing the pipe by

boring/tunneling increases the concept estimated construction cost to $5,258,835. Cost information is provided in Section 4.

3.2.2.2 ALTERNATIVE 2 – A+B PARALLEL MEDIAN SEWER and STORAGE VAULT IN S. ROW

Finalist Alternative 2 proposes installing 1,013 feet of 84-inch diameter parallel storm sewer within the median between invert elevations 567.2 ft and 570.2 ft. The new storm sewer connects to the existing main drain at existing manholes located approximately at Station 1201+72 and Station 1210+15. The most upstream extension allows the median system to pick up additional runoff from the median and north pavement. Additionally, there will be the need to construct an approximately 70,000 ft^3 vault within the south ROW at invert 563.0 ft. The 40 ft x 2500 ft x 7 ft vault connects to the existing main drain upstream of PS 30. PS 30 operation is proposed to be updated to include three main pumps at 13,300 gpm (29.6 cfs) and one stand-by pump at 13,300 gpm (29.6 cfs). The low flow pump remains unchanged. The new storage volume added under Alternative 3 is approximately 108,980 ft^3. A schematic of Finalist Alternative 2 is provided as Exhibit 2 in Section 4. No cost estimate was provided as this is not the recommended alternative.

3.2.2.3 ALTERNATIVE 3 C+B – PARALLEL STORM SEWER + STORAGE VAULT IN SOUTH ROW

Alternative 3 is to install 950 feet of 72-inch diameter parallel storm sewer within the south ROW between inverts 564.8 ft and 565.0 ft. The parallel sewer is proposed to tie into a proposed storage vault. It will be necessary to bore/tunnel the 48-inch storm sewer under the pavement to connect to the existing main drain. The downstream end of the 72-inch storm sewer is proposed to tie into a proposed approximately 70,000 ft^3 vault within the south ROW at invert 563.0 ft. The 40 ft x 2500 ft x 7 ft vault connects to the existing main drain upstream of PS 30. PS 30 operation is proposed to be updated to include three main pumps at 13,300 gpm (29.6 cfs) and one stand-by pump at 13,300 gpm (29.6 cfs). The low flow pump remains unchanged. The new storage volume added under Alternative 3 is approximately 101,521 ft^3. A schematic of Alternative 3 is provided as Exhibit 3 in Section 4. No cost estimate was provided as this is not the recommended alternative.

CHAPTER 4 CONCLUSIONS

Based on the detailed evaluation of improvements presented in the previous chapters, conclusions are provided below.

4.1 DESIGN SUMMARY

As analyzed with the Bulletin 75 update, the existing pump station and main drain system does not meet freeboard requirements at the sag for the 50-year critical duration storm event under existing pavement conditions; the main drain does not provide 50-year capacity under gravity flow conditions. The existing system also does not provide 100-year edge of pavement protection.

Alternatives 1-3, as presented in Chapter 3, meet the 50-year and 100-year freeboard requirements. This was demonstrated in the XP-SWMM computer modeling described in Chapter 3, HYDROLOGIC & HYDRAULIC ANALYSIS. These alternatives include combinations of the previous 2x2 Finalist Alternatives A, B, and C. The proposed Alternative 1 is the recommended alternative. Cost and constructability were considered in determining the finalist alternatives and in the choice of Alternative 1 as the selected alternative.

Constructability issues in the median include room for open cut and boring/jacking pits, the possibility of contaminated soils, proximity to bridge pier footings and sign supports, connections to the existing main drain at the upstream and downstream ends of the new sewer, and maintenance of traffic. Constructability issues in the south ROW are similar. They include open cut vs. boring/jacking, the possibility of contaminated soils, proximity to light pole foundations, and connections to the existing main drain near the median. In all cases, updated hydraulic analysis and additional geotechnical and environmental studies are recommended during Phase II design. There may be other solutions involving further improvements associated with I-55 main drain and laterals that should be investigate as part of Phase II. Additionally Phase II should considered using an updated version of XP-SWMM.

4.2 RECOMMENDATION

Based on the results of the hydrologic and hydraulic analysis discussed in Chapter 3, the existing PS 30 system does not meet IDOT freeboard requirements for the 50/100-year, critical duration storm events. The main drain is insufficient to convey the 50-year or 100-year design flowrate under gravity conditions, as shown on the XP-SWMM storm sewer profiles provided in Section 5. The existing main drain was not evaluated to be upsized; additional conveyance and storage could be provided in the median along with further sewer improvements along the shoulder. Alternatively, system operation may be improved by constructing stormwater storage volume upstream of the pump station. The proposed alternatives provide variations of providing upstream storage volume and conveyance. Alternative 1 is the selected alternative.

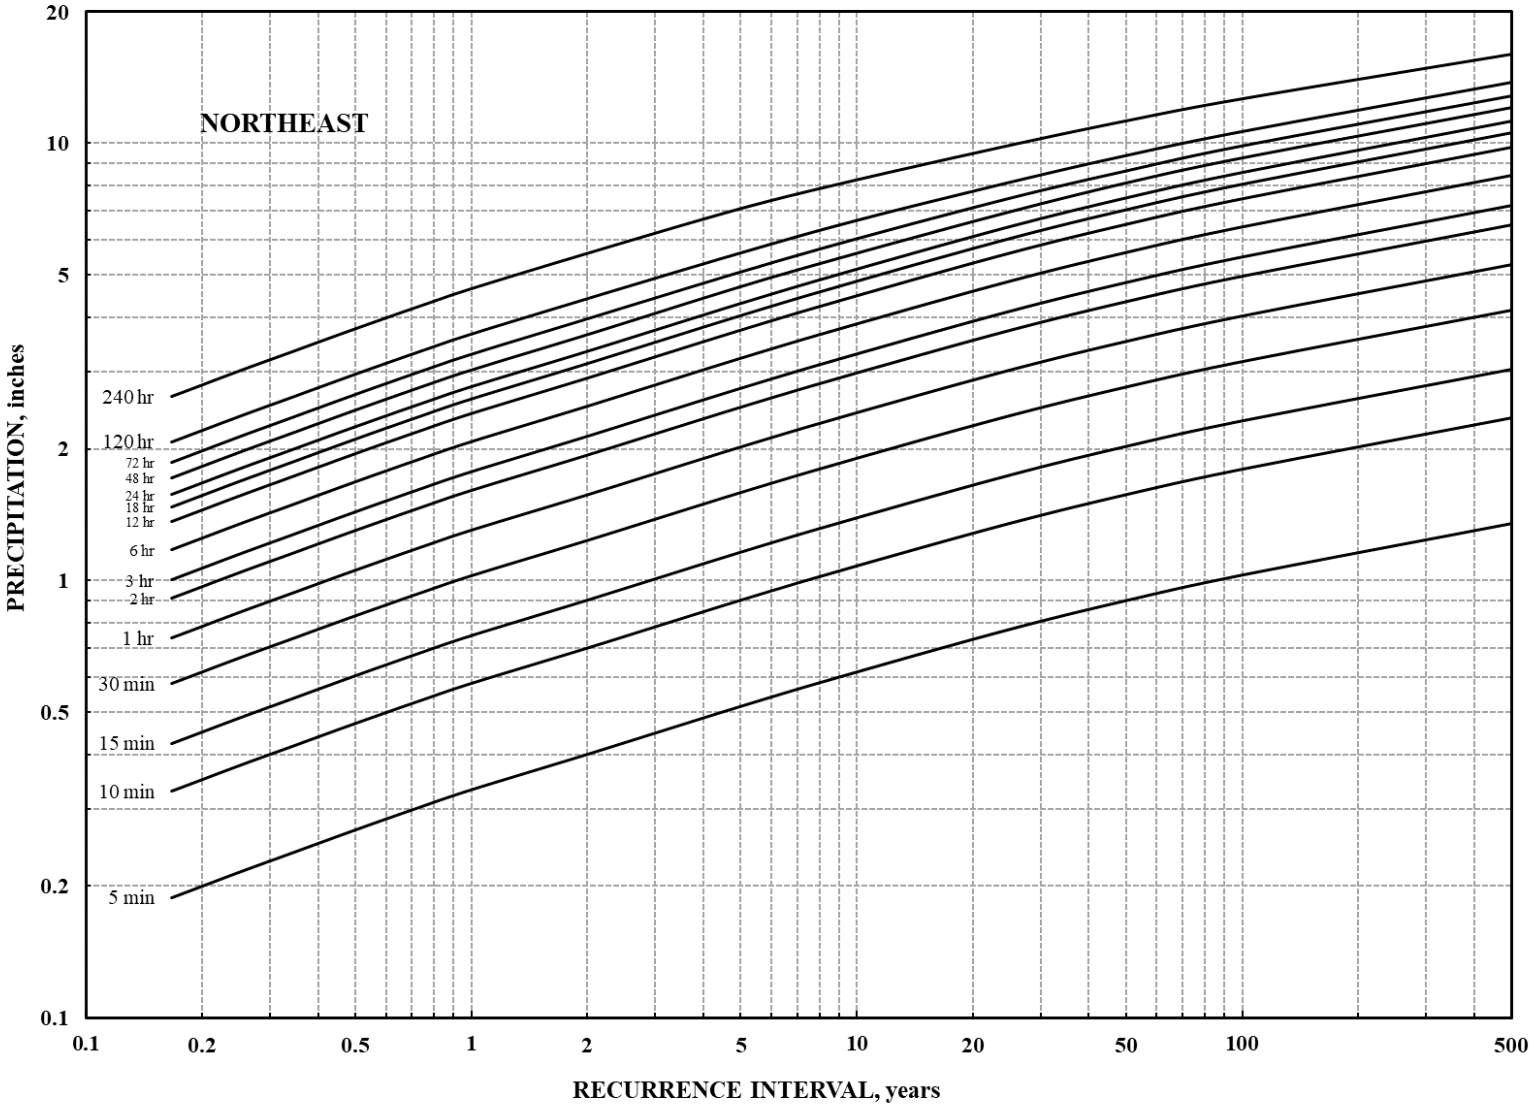

Figure 10. Precipitation frequency estimates for Section 2 (Northeast)

small areas (10–50 square miles), and large areas (50–400 square miles), respectively. The values in these tables are shown in percentages of total rainfall for each quartile. Corresponding Huff curves with comparisons to the results obtained in this study are shown in Figures 42–44. The new updated curves are like the original Huff curves, except for the fourth quartile, for areas 10–50 and 50–400 square miles, and for the first quartile for areas 0–10 square miles. Similar to Circular 173, it is recommended to use the first-quartile curves for design durations of 6 hours and less, the second-quartile designs involving storm durations between 6 and 12 hours, the third-quartile storms for storms between 12 and 24 hours, and the fourth-quartile distribution for storms longer than 24 hours.

Table 26. Median Time Distribution of Heavy Storm Rainfall, Using the Mean of All Point Time Distributions (0 to 10 square miles) from Gages in the CCPN and IVPN. Units are a percentage of the total accumulated precipitation within the storm.

Portion of the Storm	First Quartile	Second Quartile	Third Quartile	Fourth Quartile

PROJECT 110203; PUMP STATION 30

Estimated Conceptual Cost of B75 Alternative A - 1,013 lft of 84" RCP SS in median and 1200 lft of 72'

1.27.2022

DESCRIPTION - open cut	UNIT	QUANTITY	UNIT PRICE	COST
OPEN CUT 84" STORM SEWER. Includes trench box	FOOT	1,013	$ 700.00	$709,100
OPEN CUT 72" STORM SEWER. Includes trench box	FOOT	1,200	$ 650.00	$780,000
STORM SEWER 48" JACKED (includes cost for one boring shaft)	FOOT	100	$ 2,000.00	$200,000
TRENCH BACKFILL	FOOT	1,013	$ 350.00	$354,550
DROP SHAFT MANHOLE (17'-30'). Includes complete connections to proposed storm sewer	EACH	11	$ 10,000.00	$110,000
BACKFILL & TOPSOIL	CU FT	322,839	$ 1.75	$564,968
CONTAMINATED SOIL HAUL OFF	FOOT	2,213	$ 550.00	$1,217,150
DEWATERING	FOOT	2,213	$ 100.00	$221,300
MAINTENANCE OF TRAFFIC	LSUM	1	$ 50,000.00	$50,000
		SUBTOTAL		$4,207,068
		25% CONTINGENCY		$1,051,767
		TOTAL		$5,258,835
