PUMP STATION #30
HYDRAULIC REPORT
2X2 DESIGN

INTERSTATE 55 (STEVENSON EXPRESSWAY)
AT HOMAN AVENUE
P-91-762-10

CHICAGO, COOK COUNTY, ILLINOIS

Prepared for:

Illinois Department of Transportation
201 West Center Court
Schaumburg, IL 60196

Prepared By:

Christopher B. Burke Engineering, Ltd.
9575 W. Higgins Road
Rosemont, IL 60018

CBBEL Project No. 11-0203

VOLUME 2 OF 2

September 2019
Revised January 2022
Final April 2022

CHRISTOPHER B. BURKE ENGINEERING, LTD.
9575 West Higgins Road, Suite 600
Rosemont, Illinois 60018-4920 Tel (847) 823-0500 Fax (847) 823-0520

LIST OF SECTIONS

Volume 1

Volume 2

Section 11
Pump Schedule, Mass Routing Calculations, and Mass Curve Plot

EXISTING CONDITIONS

Conduit n851 ss from N851 to N934

CALCULATED BY KCB DATE 12/14/2021
CHECKED BY JPC DATE 12/15/2021
SCALE PUMP CYCLING CALCULATION

MAIN PUMPS

PUMPING RATE = 13,300 GPM

USABLE STORAGE (EL. 558.2 TO EL 562.70) = 3,381 CF

STORAGE VOLUME = USABLE STORAGE X 7.48 GAL/CF
= 3,381 CF x 7.48 GAL/CF
= 25,290 GAL ✓ JPC

CYCLING TIME (BASED ON HEC 24 SECTION 7.2.9.1)

$$\text{CYCLING TIME} = \frac{4 \times \text{VOLUME}}{\text{PUMPING RATE}}$$

$$= \frac{4 \times 25{,}290 \text{ GAL}}{13{,}300 \text{ GAL/MIN.}}$$

= 7.6 MIN. ✓ JPC

$$\text{CONVERTING TO STARTS/HR} = \frac{60 \text{ MIN/HR}}{\text{CYCLING TIME}}$$

$$= \frac{60 \text{ MIN/HR}}{7.6 \text{ MIN/START}}$$

$$= 7.9 \frac{\text{STARTS}}{\text{HR}} < 15 \frac{\text{STARTS}}{\text{HR}} \quad ✓ \quad ✓ \text{JPC}$$

MAX STARTS/HR (BASED ON PUMP MFG MOTOR DATA) = 15 STARTS/HR.

SHEET NO. 1 OF 1
CALCULATED BY ICB DATE 12/14/2021
CHECKED BY DATE
SCALE PUMP CYCLING CALCULATION

LOW FLOW PUMPS

PUMPING RATE = 2,700 GPM (BASED ON PUMP NAMEPLATE)

USABLE STORAGE (EL. 557.2 TO EL. 558.2) = 710 CF

STORAGE VOLUME = USABLE STORAGE × 7.48 GAL/CF
= 710 CF × 7.48 GAL/CF
= 5,311 GAL ✓ JPC

CYCLING TIME (BASED ON HEC 22 SECTION 7.2.9.1)

$$\text{CYCLING TIME} = \frac{4 \times \text{VOLUME}}{\text{PUMPING RATE}}$$

$$= \frac{4 \times 5311 \text{ GAL}}{2{,}700 \text{ GAL/MIN}}$$

= 7.8 MIN ✓ JPC

$$\text{CONVERTING TO STARTS/HR} = \frac{60 \text{ MIN/HR}}{\text{CYCLING TIME}}$$

$$= \frac{60 \text{ MIN/HR}}{7.8 \text{ MIN/START}}$$

$$= 7.7 \text{ STARTS/HR} < 8 \text{ STARTS/HR}$$ ✓ ✓ JPC

MAX STARTS/HR (BASED ON GRUNDFOS EMAIL DATED 2/7/2017) = 8 STARTS/HR

Note: Picture might not correspond to the current configuration.

General

Shrouded single or multi-channel impeller pumps with large throughlets and single volute pump casing for liquids containing solids and fibres. Cast iron design with double sealing technology.

Impeller

Impeller material	Grey cast iron
Discharge Flange Diameter	19 11/16 inch
Inlet diameter	23 5/8 inch
Impeller diameter	575 mm
Number of blades	3
4 1/8 inch	4 1/8 inch

Motor

Motor #	C0765.000 43-56-10AA-W 170hp
Approval	Standard
Stator variant	1
Frequency	60 Hz
Rated voltage	460 V
Number of poles	10
Phases	3~

PROJECT 110203; PUMP STATION 30

Estimated Conceptual Cost of Finalist Alternative A - 1,013 lft of 84" RCP SS in median

August 19, 2019

DESCRIPTION - open cut	UNIT	QUANTITY	UNIT PRICE	COST
OPEN CUT 84" STORM SEWER. Includes trench box	FOOT	1,013	$ 700.00	$709,100
TRENCH BACKFILL	FOOT	1,013	$ 350.00	$354,550
DROP SHAFT MANHOLE (17'-30'). Includes complete connections to proposed storm sewer	EACH	6	$ 10,000.00	$60,000
CONTAMINATED SOIL HAUL OFF	FOOT	1,013	$ 550.00	$557,150
DEWATERING	FOOT	1,013	$ 100.00	$101,300
MAINTENANCE OF TRAFFIC	LSUM	1	$ 50,000.00	$50,000
		SUBTOTAL		$1,832,100
		25% CONTINGENCY		$458,025
		TOTAL		$2,290,125

DESCRIPTION - bored/tunneled	UNIT	QUANTITY	UNIT PRICE	COST
STORM SEWER 84" JACKED (includes cost for three boring shafts)	FOOT	1,013	$ 2,500.00	$2,532,500
DROP SHAFT MANHOLE (17'-30'). Includes complete connections to proposed storm sewer	EACH	6	$ 20,000.00	$120,000
CONTAMINATED SOIL HAUL OFF	LSUM	1	$ 55,000.00	$55,000
DEWATERING	FOOT	1,013	$ 100.00	$101,300
MAINTENANCE OF TRAFFIC	LSUM	1	$ 50,000.00	$50,000
		SUBTOTAL		$2,858,800
		25% CONTINGENCY		$714,700
		TOTAL		$3,573,500

COSTS DO NOT INCLUDE GEOTECHNICAL OR ENVIRONMENTAL STUDIES OR SPECIAL REMEDIATION FOR CONTAMINATED SOILS

NO GROUND RESTORATION, AS MEDIAN WILL BE PAVED.

PROJECT 110203; PUMP STATION 30

Estimated Conceptual Cost of Finalist Alternative C - 1200 lft of 72" RCP SS in S. ROW

August 19, 2019

DESCRIPTION - open cut	UNIT	QUANTITY	UNIT PRICE	COST
OPEN CUT 72" STORM SEWER. Includes trench box	FOOT	1,200	$ 650.00	$780,000
STORM SEWER 48" JACKED (includes cost for one boring shaft)	FOOT	100	$ 2,000.00	$200,000
DROP SHAFT MANHOLE (17'-30'). Includes complete connections to proposed storm sewer	EACH	5	$ 10,000.00	$50,000
CONTAMINATED SOIL HAUL OFF	FOOT	1,200	$ 550.00	$660,000

2017 PUMP UPGRADE ALTERNATIVES MEMO - FOR REFERENCE ONLY

I-55 PUMP STATION NO. 30
Pump Upgrade Alternatives
Rev. 01/10/17

2017 Pump Alt. Memo - For Reference Only. It was agreed that the existing pumping rate will be maintained.

1.0 EXISTING CONDITIONS

The Pump Station No. 30 was originally designed with 4 vertical turbine type pumps each rated at 10,000 gpm (22.3 cfs) for a total pumping capacity of 89 cfs with four pumps operating. Each pump discharged through a steel tube and flap gate into the discharge chamber. Improvements were designed in 1999 to remove the four existing turbine pumps and discharge tubes and replace them with 170 Hp submersible centrifugal type pumps and ductile iron discharge piping with elastomeric check valves. The rating of the current 170 Hp pumping units is shown on the plans to be 13,300 gpm each pump (29.6 cfs each pump) for a total pumping capacity with four pumps running of approximately 118.5 cfs. There is an existing 54" diameter RCP storm sewer that conveys storm water to the pump station.

2.0 PROPOSED CONDITIONS

From modeling the drainage system:
Maximum 50-year inflow to station = 125 cfs.
Maximum 100-year inflow to station = 152 cfs.

CBBEL reviewed the following two proposed conditions for pump upgrades. While not common practice, the 100-year event was conservatively considered as the controlling case for upsizing the pumps because, as discussed in the Hydraulic Report narrative Section 3.3.1, "The existing pump station and main drain system meets freeboard requirements for the 50-year critical duration storm event, but does not meet freeboard requirements for the 100-year critical duration storm event".

***Please Note**: Pump Alternatives No. 1 and 2 apply only to the pump station and do not correlate with the numbered Drainage Alternatives discussed elsewhere in the report.*

Pump Alternative No. 1: Four pumps each rated at 17,000 gpm (38 cfs) for a total pumping capacity of 152 cfs with four pumps operating.

Pump Alternative No. 2: Three pumps each rated at 51 cfs with a standby pump rated at 51 cfs (4 pumps each rated at approximately 23,000 gpm) for a total pumping capacity of approximately 153 cfs with three pumps operating.

2.1 PUMP ALTERNATIVE NO. 1

Pump Alternative No. 1 consists of the removal of the four existing 170 Hp submersible centrifugal pumps and ductile iron discharge piping and replacing with four 170 Hp submersible axial flow propeller pumps each mounted in a steel discharge tube approximately 32" diameter. The painted steel discharge tube would be installed within the existing floor openings and be supported from the bottom floor slab. The submersible axial flow pump sits inside the steel tube and is removed out the top through an opening in the roof (and associated roof hatch) and a crane. See attached exhibit of a proposed axial flow pump and discharge tube. The proposed pumps would be similar to Flygt Model 7061/706 with 170 Hp motors each rated at approximately 17,000 gpm (38 cfs). See attached catalog information of the proposed Flygt axial flow pumps.

The proposed pumps' motor horsepower (170 Hp) matches the existing centrifugal pumps to be removed thus requiring minimal modifications to the existing electrical pump control gear. The proposed pumps are shown in the attached exhibits in plan and section view. The existing centerline to centerline pump spacing of approximately 7 ft. has been verified with the pump manufacturer as being adequate for the application. Estimated costs for this alternative are as shown in the following table:

Pump Alternative No. 1: Engineer's Preliminary Opinion of Probable Construction Cost

Item No.	Description of Work	Unit	Qty.	Unit Cost	Amount
1	Pumps	Each	4	$150,000	$600,000
2	Discharge Tubes	Each	4	$50,000	$200,000
3	Roof Hatches	Each	4	$25,000	$100,000
4	Demolition/Removal Existing Pumps & Piping	Each	4	$25,000	$100,000
	Contingency 10%				$100,000
				Total Pump Alternative No. 1	$1.1 million

2.2 PUMP ALTERNATIVE NO. 2

Pump Alternative No. 2 consists of providing the 100-year pumping capacity and including a standby pump, therefore, the 100-year maximum inflow rate was divided among three pumping units (instead of four) and the fourth pump would be considered a standby. For this alternative, each proposed pump is rated at approximately 23,000 gpm (51 cfs), and would be equipped with a 240 Hp submersible motor on the same Flygt Pump Model 7061/736 axial flow pump platform mounted in a painted steel discharge tube approximately 32 inches in diameter. The electrical service to the station would need to be upgraded for Pump Upgrade Alternative No. 2 to accommodate the higher horsepower motors resulting in modifications to the Motor Control Center. The existing centerline to centerline pump spacing of approximately 7 ft. has been verified with the pump manufacturer as being adequate for the application.

Pump Alternative No. 2: Engineer's Preliminary Opinion of Probable Construction Cost

Item No.	Description of Work	Unit	Qty.	Unit Cost	Amount
1	Pumps	Each	4	$160,000	$640,000
2	Discharge Tubes	Each	4	$50,000	$200,000
3	Roof Hatches	Each	4	$25,000	$100,000
4	Demolition/Removal Existing Pumps & Piping	Each	4	$25,000	$100,000
5	Electrical Modifications	L Sum	1	$300,000	$300,000
	Contingency 10%				$150,000
				Total Pump Alternative No. 2	$1.5 million

Subject: IDOT Pump Station #30 - Pump Information
Attachments: Existing Pump Set Points_Submersible Pumps.pdf; Proposed Pump Set Points_Submersible Pumps.pdf; Pump Station No. 30.072016.pdf; D1P917620-sht-mech_1.pdf; D1P917620-sht-mech_2.pdf; 170Hp Column Pump-4 pumps operating.pdf; 240Hp Column Pump-3 pumps operating.pdf

Dave,

Attached are the following:

1) Pump station system head and manufacturer pump curves based on the existing pump set points:

   2nd Lag Pump on = 565.0 *(This corresponds to the Min TDH on the attached graph)*
   1st Lag Pump on = 564.0
   Lead Pump on = 563.0
   Pump off=558.50 *(This corresponds to the Max TDH on the attached graph)*

2) Pump station system head and manufacturer pump curves based on lowering the existing "pump on" points by 1 ft:

   2nd Lag Pump on = 564.0 *(This corresponds to the Min TDH on the attached graph)*
   1st Lag Pump on = 563.0
   Lead Pump on = 562.0
   Pump off=558.50 *(This corresponds to the Max TDH on the attached graph)*

   I am not sure if this helps you minimize the amount of storage you will need to provide; however, this is the lowest we would recommend setting the pump "on" points to.

3) Pump Upgrade Alternatives Narrative
4) Plan and Section Exhibits (referenced in the Pump Upgrade Alternatives Narrative)
5) Pump catalog cuts for design Alternative No. 1 (referenced in the Pump Upgrade Alternatives Narrative)
6) Pump catalog cuts for design Alternative No. 2 (referenced in the Pump Upgrade Alternatives Narrative)

Let me know if you need anything else.
Thank you.

Section 15
Correspondence

From: Winograd, Esther B
To: Ilene Dailey
Cc: Dave Vogel
Subject: I-55, pump station # 30, low flow pump.
Date: Tuesday, February 07, 2017 3:05:31 PM
Attachments: image001.png
Image02032017.pdf

Hi Ilene,

We just received the attached information from our Electrical Section.
The email below notes that the pump cycling is 8 starts/stops per hour (which is equivalent to every 7.5 minutes).
Looks like this is the best information we have for this pump.
Please include this information in the report where relevant. The letter and attachment should also be included in the correspondence section.

Thanks

Esther Winograd

Esther,

Please see the attached file and the email below. It is regarding the low flow pump in PS-30. I met couple people from Grundfos at PS-24 and asked them to help in this regard. I am not sure how accurate the provided information are. I hope this information would be helpful for you.

Omar-

We found the original order which has the dimensions and order information (see attached

document).
The pumps have Reliance motors which are classified as 'special duty'. They are rated at 8 starts/stops per hour.

Kind regards,

Kenneth Adomaitis

Subject: From Omar Zenki -IDOT

Gentlemen,

It was a pleasure meeting you yesterday at IDOT PS-24. This is the Yeomans pump mdoel number that I mentioned to you: (X32OTY), 50 HP, 2700 GPM. Those numbers were taken from the pump's nameplate. I appreciate your help in determining the rated number of starts per hour. We do not know the year of production of the pump. The pump is currently installed in IDOT pump station 30. It is located at the Stevenson Expressway (I-55) and Kedzie Avenue in Chicago.

Thank you,

Omar Zenki

PHONE CONVERSATION LOG

DATE: May 10, 2017

PERSON (Contacted/Calling): Santos Batista

AFFILIATION: IDOT Hydraulics

PHONE NUMBER: (847) 705-4764

CBBEL REPRESENTATIVE: David Vogel, PE

PROJECT NAME: IDOT Pump Station #30

PROJECT NUMBER: 11-0203

COPIES TO: Ilene Dailey
Project File

SUBJECT: Pump Station #30 Existing Conditions XP-SWMM Analysis

NOTES:

Santos called to discuss his findings regarding the existing conditions kinematic XP-SWMM model results and mass flow routing:

- He did not find any errors in the XP-SWMM input data, mass routing data, or system storage calculations.
- He is getting similar XP-SWMM results as CBBEL (50-yr within 0.1 ft of mass route, 100-year different by ~4 ft). He attributes the large 100-year difference to XP-SWMM instability in the full main drain conduit. He attempted to input stability weirs within the main drain, but could not reduce the peak WSEL in the wet pit with this method. He noted that this is an issue that IDOT has run into before in other pump station situations where the main drain is full.
- CBBEL should submit the XP-SWMM model to XP customer support to seek resolution to the instability.
- If no further improvements can be made, CBBEL should proceed with the proposed conditions kinematic analysis.

- A face-to-face meeting between IDOT and CBBEL is not necessary at this time.

N:\Idot\110203.00001\Admin\Phone Log - IDOT.051017.doc

IDOT Hydraulics Coordination Meeting Summary

Date:	March 24, 2017
Time:	8:00 AM
Location:	IDOT Traffic Conference Room 201 West Center Court Schaumburg, IL 60196
Attendees:	See Sign-in Sheet

1. The meeting commenced at 8:00 AM.
2. The main goal of the meeting was to discuss the preferred "disconnect" modeling methodology. Additional discussion centered on the need for expanded narrative, tables, and references to provide clarity in the pump station hydraulic report (HR).
3. The general setup of the Existing and Proposed Dynamic Models is acceptable. The following items should be added to the narrative:
    a. Discuss why only overland flow routing was used, and not storage, to avoid double-counting storage on the pavement.
    b. Discuss where the surveyed rim elevations are provided in the Existing Dynamic Model, and how those relate to the spill crest elevations. Overland flow elevations include rim elevation plus flow depth.
4. The following steps are recommended for completing the Existing and Proposed Kinematic (disconnect) Models:
    a. Existing Kinematic Model
        i. Change the XP-SWMM Hydraulics Routing Control Method to kinematic
        ii. Change ponding type for nodes in the model to "Sealed" as appropriate
        iii. Eliminate any surface storage
        iv. Disconnect the main drain from the pump station as is currently done
        v. Use the resulting existing kinematic flow hydrograph at the 60-inch diameter pipe outfall in the existing mass flow routing
        vi. It is expected that the water elevation in the wet well from the Existing Dynamic Model should closely match the elevation found by mass flow routing.
    b. Proposed Kinematic Model
        i. Change the CN values in the Existing Kinematic model to represent the proposed land use (paved median)
        ii. Make no other changes to the Existing Kinematic model

   iii. Use the resulting proposed kinematic flow hydrograph at the 60-inch diameter pipe outfall in the proposed mass flow routing.
   iv. It is expected that the water elevation in the wet well from the Proposed Dynamic Model will closely match the elevation found by mass flow routing.

5. The following items should be completed:
   a. File names for models must include the terms “kinematic” and “dynamic”
   b. Table headings must include the terms “kinematic” and “dynamic”
   c. Add clearly labeled Proposed Conditions sections in the narrative
   d. Check flow rates in the model vs. report
   e. Add references in the narrative and tables indicating where all data comes from
   f. Add proposed condition flow rates, etc. into the report.
   g. Disconnect results reported in the summary tables should come from the kinematic hydrograph mass flow routing
   h. The 50-year and 100-year critical storms should be provided in the same XP-SWMM model run
6. Usable Storage spreadsheet calculations and procedures need more explanation.
   a. Lead on storage – Lead off storage = Usable storage
   b. Describe how usable storage was calculated, including procedures incorporated into spreadsheet.
7. Clarify the total tributary area to the pump station. Clarify if flow from the RR yard does or does not contribute. What is the actual total tributary area? What areas are not tributary?
8. IDOT Flooding Reports – How do the XP-SWMM elevations compare to the flooding report depths? What is the expected pavement flooding depth per the historic flooding reports?
9. In the narrative, add the following information:
   a. Provide tables for hydrologic input parameters for both existing and proposed conditions.
   b. Create XP-SWMM Link/Node Summary Table including invert elevations, pipe lengths, and pipe sizes for both existing and proposed conditions.
   c. Explain the differences and which is the correct elevation (577 or 568) for volume calculation vs. the old SPACECO pump station report.
   d. List the capacity of the outflow pipe.
   e. Add explanation / check if the overflow pipe surcharges and water flows back to the pump station. Verify that there’s an overflow link.
   f. Add details about the cycle times for low flow and high flow pumps. Are the pumps meeting allowable cycle times/ # of cycles per hour?
   g. Check flow rate units. Okay to list in both GPM and CFS
   h. Add more detail to proposed condition with invert/length/flow rate
   i. Add SCADA tables into the report for existing and proposed pumps

10. IDOT agreed that CBBEL can send updated models and draft revised narrative for interim review before a full resubmittal is made.

Action Items are Items 3 through 9 above.

The meeting adjourned at 8:50 AM.

The foregoing is considered to be a true and accurate summary of all items discussed.

I-55 MANAGED LANE PROJECT

Pump Station 30 – IDOT Hydraulics

Meeting Data/Time:	September 15, 2016 9:00 AM - 11:00 AM
Meeting Location:	IDOT Materials Conference Room 201 West Center Court Schaumburg, IL 60196
Invited to Attend:	IDOT, Stantec, CBBEL

Agenda:

I. Introductions

II. Project Objectives & Design Parameters
   - Freeboard, conveyance, pump station operations

III. Project Constraints
   - Median vs. south ROW, PESA/PSI, constructability, MOT

IV. Concept Alternatives and Preliminary Cost Estimates

V. Alternative Selection

IDOT Hydraulics Coordination Meeting Summary

Date:	September 15, 2016
Time:	9:00 AM
Location:	IDOT Materials Conference Room 201 West Center Court Schaumburg, IL 60196
Attendees:	See Sign-in Sheet

1. The meeting commenced at 9:05 AM.
2. The goal of the meeting was to determine which proposed alternatives should be carried forward to detailed analysis in the pump station hydraulic report (HR).
3. The meeting opened with discussion of the issues with the existing pump station and main drain, including:
    a. insufficient freeboard (the calculated existing conditions 100-year water surface elevation (WSE) is above the low rim in the sag),
    b. lack of a standby pump, as all four installed pumps run during large storm events, and
    c. insufficient conveyance capacity for the 50-year flow in the main drain (hydraulic grade line (HGL) above the top of the pipe).
4. CBBEL was asked to determine the 50-year freeboard for the existing condition with only three pumps running.
5. The following design parameters for the proposed condition, including added impervious area due to median paving, were agreed upon:
    a. Provide 0.0' of freeboard to the edge of pavement (EOP) in the sag for the 100-year event and a minimum of 2' of freeboard for the 50-year storm event. There is no need to provide greater 100-year EOP protection. (For preliminary analysis purposes, provision of 0.5' freeboard for the 100-year design is used for some alternates rather than to the exact low edge of pavement.)
    b. Reconfigure the pump station to operate with three pumps running and one standby pump.
    c. Conveyance/HGL in the existing main drain is no longer a design consideration.
6. Project constraints include concerns about underground construction based on the PESA. The PESA document identifies Recognized Environmental Conditions (RECs) along this section of I-55 such that Phase II testing is likely to be required for any of the proposed additional storage pipe/vault options whether in the median or south ROW.
7. Discussion of constructability and maintenance of traffic (MOT) centered on pipe boring/jacking and the required launching and receiving pits. At this time, it appears construction of the median area will

need to be completed in one construction season for the entire length of I-55. As such, concern was expressed regarding the adverse schedule implications with constructing a deep pipe in the median.

8. CBBEL offered that the proposed length of pipe can be shortened to start just east of the eastern RR bridge, since the overall main drain conveyance is no longer a design parameter. The relative size of the pits compared to the available space in the median and shoulder was discussed, as were other constraints such as RR bridge foundations and sign supports in the median. IDOT expressed concern about unknown utilities in the south ROW.
9. Discussion moved to the proposed alternatives that have been analyzed at a concept level using XP-SWMM. These earlier alternatives include downstream storage and conveyance options. Earlier alternatives also include replacing the existing pumps with upsized pumps. An alternative for intercepting off site flow from the RR yard north of I-55 was also considered. For reasons including cost and constructability, the above-mentioned earlier alternatives were not selected. Of the remaining alternatives for improved upstream storage and conveyance, some can be tweaked to meet the design parameters. The remaining alternatives include a new conveyance/storage pipe located in the median, as well as storage/conveyance options in the south ROW.
10. Construction of a concrete storage vault near the pump station will require structural review, which will add time to the schedule. Junction chambers to interconnect a proposed pipe to the existing main drain will also likely require structural review.
11. IDOT stated that they have recently installed pump station storage vaults, including a 4.2 AF vault located near the Dan Ryan south leg of the Circle Interchange, as well as one at Ohio Street near the Kennedy.
12. CBBEL will prepare optimized XP-SWMM analyses for the three finalist alternatives listed below. The finalist alternatives will be sized for only 3 of the existing pumps running. The finalist alternatives are:
    a. Median pipe (estimated at approx. 84" RCP) from east of the eastern RR bridge to upstream of the pump station, with interconnections to existing main drain in the median. Assumed to be jacked/bored. Provides both storage and conveyance.
    b. Concrete storage vault located near the pump station in the S. ROW, connected to the existing 60" main drain. Provides storage only.
    c. South ROW Pipe (estimated at approx. 84" RCP) from east of the eastern RR bridge to upstream of the pump station. IDOT stressed that this pipe should be connected to the existing 60" main drain at both the upstream and downstream ends. Requires jacking/boring of one pipe under the NB pavement to connect to the existing main drain near the eastern RR bridge, perhaps at a higher elevation. Additional MHs will be installed at approximately 500' intervals for maintenance access. Provides storage and some conveyance.
13. CBBEL will investigate optimization of the 3 existing pumps with 1 standby pump operations. IDOT Hydraulics will coordinate review of the pump operations with IDOT Electrical.
14. CBBEL will provide a final alternatives spreadsheet to IDOT summarizing the layout, freeboard, and estimated construction costs for each, for IDOT to review and confirm the final selected alternative.
15. Stantec will assist with cost estimates. Stantec recently designed an 84" jacked pipe under the Tri-State, and also has costs available from Pump Station 24.

16. CBBEL will prepare detailed mass-curve routing for only the final selected alternative.
17. It is anticipated that the HR for PS 30 will be prepared with the median pipe alternative being the final selected alternative. The other 2 finalist alternatives will be included in the HR as hydraulically equivalent alternatives within the south ROW. These can be considered further if required due to MOT and construction schedule requirements. These other finalist alternatives will be presented at the concept (XP-SWMM) level to confirm storage volume and HGL. The other considered but discarded alternatives will be discussed in the HR narrative without providing analyses.
18. Stantec will incorporate the final selected alternative into the PDP and Location Drainage Study.

Action Items are described in Items 4 and 12 through 18 above.

The meeting adjourned at 10:20 AM.

The foregoing is considered to be a true and accurate record of all items discussed.

Esther,

The SCADA system is the primary controller which overrides the backup hard wired controls, the Standby pump is programmed to be called at a set point elevation as indicated on the SCADA pump controls.

However if the SCADA system fail, the hard wired system which is a backup control of pump operation will prevent a standby pump coming online unless there is a main pump failure.

Thank You

Subject: RE: I-55 pump station # 30

Naser- can you verify if, at pump station # 30, the standby pump is wired such that it will start at a higher water elevation even when all other pumps are working?
We need this info for our pump station hydraulic report and analyses.
Thanks

Esther,

Naser ask me to provide you with some pump station #30 information. I have attached the control elevation information sheet to this E-Mail.

Location : Stevenson Expressway (I-55)and Kedzie Ave in Chicago.
The stations rated capacity is 39900 GPM.
It is a wet pit type station and the square footage is 809. 13,300 GPM
There is two source of electric power.
See attached for center line of inflow.
The main pumps are Flygt model # 3551 170 HP 1330 GPM. This year capacity test all main tested at approx 15000 GPM.
The low flow pump is a Yeomans model# X32OTY 50HP 2700 GPM This year capacity tested at approx 3000 GPM.

Please let me know if you need any other information no sure what you are looking for.

FLYGT
a xylem brand

From: Joseph F. Marino [mailto:jmarino@cbbel.com]
Sent: Tuesday, July 16, 2013 2:25 PM
To: McMahon, Shannon - Xylem
Subject: IDOT PS 30

Shannon,

I'm following up on my phone call earlier in case I talked a bit too fast.
Here's the information I have:
IDOT PS30 – Homan Ave PS off I-55
Flygt model #3551
170 Hp
13,300 gpm

Propeller/axial style pump
24" discharge
36 ft of static lift

Can you find me any info (catalog info, curves, shop dwgs)

Thank you,

Joseph F. Marino, PE

GRG

DATE:	DAY:	TIME: AM/PM	INFORMANT:
11/9/00	Thursday	1:19pm	Mr. Bomicino @ Edens Yard

SUBJECT: Flooding in a Construction Zone

LOCATION:	COUNTY:	LOAD AND WEIGHT:
NEB Stevenson @ Kedzie entrance	Cook	

*** PUBLIC/MEDIA EMERGENCY INFORMATION DISTRIBUTION***

CONGESTION LIMITS DUE TO INCIDENT:

HAR	CMS	CRT	DOT-INFO EXT#

SPRINGFIELD NOTIFIED (WHO/TIME) FAX TO SPFLD. (TIME)

DETAILS AND NOTIFICATIONS IN CHRONOLOGICAL ORDER

TIME (AM/PM)

Mr. Bomicino @ Edens Yard called in and advised Control that there is a foot-and-a-half of water at the bottom of the NEB Stevenson Kedzie entrance ramp.

1:21pm Control notified Laura @ Walsh Construction. She will get a couple of pumps out there and call back when completed.

(FPK)

3:33 PM RC#935 (Monterubio) called Control advising of the above flooding condition.

3:35 PM Control spoke with Laura at Walsh Construction. She stated that Knight Engineering has to authorize Walsh for any work to be done.

3:36 PM Control spoke with Dennis at Knight Engineering in regards to the above. He stated RE Ahmad Karim advised them they had to authorize work through Karim first befor doing anything. Dennis advised that he sent his own people out, who cleared some leaves off the sewer grate, which water began to recede. Control updated him one the report from the ETP driver. Dennis advised that he will go and check the location again. Control requested a call back.

3:38 PM Control tried Karim at field office, answering machine.

3:39 PM Control paged Karim.

3:57 PM Control sent second page to Karim.

4:00 PM Ahmad Karim called Control and advised of the above. They did not do any construction this year on the ramp due to the Damen Ave work from the city. Karim advised that should be maintenance's responsibility, and Control advised him of previous responses that they did not accept back maintenance. Karim stated the problem is under Kedzie Ave somewhere, and until they open up the pavement, there is nothing they can do. The water will go down, just slowly. Karim stated

IB I-55 at BNSF RR Viaduct-2.J...

OB I-55 at BNSF RR Viaduct-1.J...

OB I-55 At BNSF RR Viaduct.JPG...

Please take a look at the attached clogged inlets at the above location due to the accumulation of roadway and construction debris. The inlets need cleaning before the next rainstorm to avoid further flooding conditions. Some of the debris has made its way to the pumping station which requires cleaning.

We will have to schedule pumping station cleaning to minimize the damage and wear to the pumps. However, we will need a good effort to keep the debris from coming in to the pumping station. There is a huge amount of construction debris due to grinding of the pavement that needs to be swept and removed from the roadway. We can't afford downtime for pump repair or replacement, which takes too long.

Thank You

From: Thompson, David A

Operations and Communications Center
District One - Incident Report

DATE: 06/23/2010 DAY: Wednesday TIME: 06:30 PM INFORMANT: RC 913 (McHugh -ETP Supervisor)

SUBJECT: Full Expressway Closure - Flooding

LOCATION: Stevenson I-55 East of Pulaski COUNTY: Cook

PUBLIC/MEDIA EMERGENCY INFORMATION DISTRIBUTION

CONGESTION LIMITS DUE TO INCIDENT:

HAR: CMS: CRT: DOT-INFO EXT#

SPRINGFIELD NOTIFIED (WHO/TIME): FAX TO SPFLD. (TIME):

DETAILS AND NOTIFICATIONS IN CHRONOLOGICAL ORDER

6/23/2010

6:30 PM	DAT	Mr. McHugh (ETP Supervisor) requested the Stevenson Yard be called out for flooding issue on Stevenson near Central Park (East of Pulaski)
6:34 PM	DAT	Mr. Gale (Stevenson LW) was informed of request for response.
7:15 PM	DAT	Mr. Neven (Stevenson Tech.) is aware of issue and is en route.
7:55 PM	DAT	TSC (Courtney) was informed of the closure and messages on the DMS signs were requested.
9:03 PM	DAT	The Southwest Stevenson is now blocked from Lake Shore Drive to Pulaski. Ramps form Lake Shore Drive and King Dr. are being blocked by Chicago Police and the ramps from the Dan Ryan to the Stevenson are blocked by ETP units.
9:15 PM	DAT	DMS signs are being updated to reflect the closure from the Ryan to the Stevenson.
9:23 PM	DAT	An emergency message was placed on the HAR.
9:25 PM	DAT	Meade reported multiple Pump Stations are without power from ComEd including Pump Station # 30. RFW
9:28 PM	DAT	Mr. Iacullo called about the Pump Station # 30 issue and requested a call from Mr. Gholeh.
9:30 PM	DAT	The following ETP Units are assisting in the operation, RC 935 Berrios, RC 967 Escamilla, RC 927 Hughes, RC 940 Piwceicz, RC 928 Hollins, RC 938 Tomas, and RC 969 Dehoyes.
9:33 PM	DAT	Jim Balo (Meade) has been en route for 2+ hours and is still not on scene, very heavy traffic in area.
9:55 PM	DAT	RC 913 informed the NEB Closure has moved back to NEB Harlem IL 53 Exit as there is a wide spread power outage affecting the City streets off the Stevenson.
11:27 PM	DAT	Received an update from Jim Balo at Pump Station #30, They are installing a small generator for lighting, a large generator is en route to run the pumps, an ETA of 2 + hours if expected. Naser Gholeh is also on scene and confirmed information. The generator is being rented from Patton.

6/24/2010

5:02 AM	GH	RC 681 informs that all ramps are open.
5:12 AM	GH	Station One - Springfield (Tim) informed of the reopening.

Good Morning Roman,

I don't have lane closures on SB I-55 over RR. I have a left shoulder closure on NB I-55 over BCR RR (approximately .3 miles east of Cicero). I drove by the jobsite this morning and there didn't appear to be any lanes blocked.

Thank you,

Subject: RE: Pump Station #30 Pipe Verification Survey | I-55 ML
Attachments: DOC.PDF; IDOT Structure Detail 09-04-2015.pdf

Hi Ilene,

Our survey unit provided the attached information which confirms that the pipe segments in question are 60" in diameter as noted in the original plans (not 54"). The consultant who performed the survey, Claassen, White & Ass., actually had a surveyor go down into the manhole to take the measurements.
The surveyors also noted a 1' siltation in the line, which needs to be addressed. The siltation may have been caused by faulty drainage structures further west which were included in a drainage investigation report. After repair of the drainage structures we will request our Bureau of Maintenance to clean the line; however, if they cannot do it, it should be called for in the report.
Please proceed accordingly with the pump station report.
Thanks

Subject: RE: Pump Station #30 Pipe Verification Survey | I-55 ML

Esther,

Lin Engineering accessed PS 30 and confirmed the main drain coming into the pump station (called the "intake pipe" by Lin) is 60". The attached documentation from Lin confirms that finding. The field book includes a drawing showing the locations that the photos were taken. Photo 10 is the 60" into the pump station.

The drawing showing a 54" into PS 30 is a 2014 version of Stantec's EDP. Dustin can give you information about that. The drawing is meant to show the limits of the proposed resurvey. The EDP will be updated to incorporate the final survey measurements.

FYI, below is a Table showing the various sources of pipe size information for the last five pipe segments into PS 30. It will be good to get final verification of the sizes.

CBBEL Main Drain Segment Number

Data Source:	7 (under W. RR)	8 (under E. RR)	9	10	11 (into PS 30)
IDOT 1962 Constr.	54"	54"	60"	60"	60"
IDOT 1999 Metric	54"	54"	54"	54"	54"
Stantec 2014 EDP	42"	48"	54"	54"	54"
Lin 2014 Survey	42"	42"	42"/48"	48"	48"
Lin 2015 Survey	54"	54"	54"	54"	60"

Subject: RE: Pump Station #30 Pipe Verification Survey | I-55 ML

John,

Esther and I discussed this a few minutes ago.

Hydraulics Section received conflicting pipe sizes shown on the plan view (i.e., 54 inch pipe coming to Pump station shown) and shown on profile view (60 inch coming to the pump station??).
Can our Surveyors do this? The pipes within the three manholes are 30 to 40 deep. Can ask him, but I would think special equipment needed.

Scope looks reasonable.

Subject: Pump Station #30 Pipe Verification Survey

John,

As discussed on today's conference call, please see below for the scope of the pipe verification survey with attached exhibits:

> Provide field verification of the pipe size and invert elevation for the main line storm pipes identified on the attached exhibit. The survey limits include three (3) manholes between Pulaski Road and Pump Station #30 and require the measurement of the existing mainline storm sewer and include the pipe into

the pump station. Survey should include measurements of the vertical and horizontal and include an explanation of the procedures used to measure the pipe to confirm the pipe shape, i.e. circular, elliptical, arch, etc. If the upstream inflow pipe into MH 81-45 does not measure 54", extend the survey up to MH 81-39 to confirm the size. Photos of the pipes if possible. Refer to the attached Survey Limits.pdf exhibit for the location and schedule of the previously surveyed pipe sizes and inverts.

The focus of the verification is to provide an accurate account of the mainline storm sewer sizes that drain to the pump station. The attached Pipe Comparison_Record vs Survey.pdf shows the conflicting data sets between the historic record and surveyed data.

Comparing the original plans to the survey data, the three pipe segment upstream of the outlet pipe are the focus. The historic plans show 60" and the survey shows 54".

The following gentlemen has been identified in previous correspondence as a contact for Pump Station #30:

Dan Vanderbilt
Pump Station Technician
Ph: 708-524-2145
Daniel.vanderbilt@illinois.gov

The rim elevations are good. We can request benchmark information from Lin as well.

Measure down procedure

We used a level rod with a 2' "L" square attached to the end to have an extended zero for offset pipes. A lath cut to the size of the diameter of the manhole was laid across the opening of the manhole to get a good zero for rim elevation. When pipes were clear of sediment we used just the square. If there was sediment we attached a range pole with a sharp point at a known distance from bottom of level rod to tip of range pole to achieve correct measure down. To get the pipe size we would lift the level rod until the "L" square was in contact with the top of the pipe and level. The measured distance to top of pipe then had the width of the "L" square subtracted from it to get a true top of pipe measurement. Then we subtracted the top of pipe measurement from the measure down measurement to get the pipe size. When possible on the 24" pipes we also confirmed the size by fitting the 2' "L" square into the pipe. All measurements were performed multiple times to ensure accuracy.

For structure number 52874 we added multiple range poles to the top of the level rod to reach the bottom and achieved the measure down by top of rod height plus the added measured distance on the range poles. As a check we used a cloth tape with a weighted end. The pipe sizes could not be checked on this structure, we used the known pipe sizes from the structure to the southwest and the pump station intake pipe.

Pump station measurement

We were able to get access to the pump station. The points located are the four corners of a concrete pad with a grate covering an access point. The measure down was obtained by adding the distance from grate to ground level at bottom of station, the distance from ground level to the top of pipe and the size of the pipe. We were able to get direct access to the intake pipe to obtain the size.
